Celadonite from India.—The London Chamber of Commerce have been advised by the Imperial Mineral Resources Bureau, 2, Queen Anne's Gate Buildings, Dartmouth Street, London, S.W. 1, that they have received a sample of green earth (celadonite) from India which may be of interest to paint manufacturers. Any interested firms are invited to apply to the Imperial Mineral Resources Bureau for further particulars.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN SEPTEMBER.

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during the month of September, 1923, compared with 1921 and 1922. As from April 1, 1923, the export trade of the Irish Free State is excluded from the returns.

(To be concluded.)

REPORTS OF COMPANIES.

English Beet Sugar Corporation, Ltd.

The annual general meeting was held in London on Tuesday, Mr. J. C. Graham (chairman) presiding. The chairman, in moving the adoption of the report and accounts, said: Your directors have no hesitation in saying that the climate and soil of these islands having proved to be eminently suitable for the cultivation of first-class sugar beet, this new industry cannot fail to be beneficial to the country generally, and that in a short time, if carefully fostered, it will be a leading factor in that resuscitation of agricultural prosperity which is so much desired by statesmen and economists. Dealing with the general aspect of the question, I would point out that the consumer pays no more for home-produced sugar than he does for the imported article, and the quality of English sugar is better than most grades of imported sugars. It has been argued, however, that the British consumer is prejudiced as a taxpayer by reason of the loss of revenue arising from the remission of Excise duty. My reply to that is that against the non-payment of Excise duty must be set off the increased income-tax which will be paid into the National Exchequer as a result of the successful working of the beet sugar industry. And it must be remembered that not only will the farmers and the sugar companies pay income-tax on their profits, but the subsidiary industries will also pay tax on their increased earnings. For example, the railways will have more traffic, the makers of machinery and stores will receive more orders, and the suppliers of fuel, fertilisers, bags, limestone, and many other articles will have a share in the general increase of trade, and I think we may safely assume that all these people will make a profit. Nor must it be forgotten that the owners of sugar factories pay local rates and in many ways add to the prosperity of the district in which the factories are situated.

Looking at the matter from the national point of view, we must surely come to the conclusion that it is good policy in these days of agricultural depression to provide the farmer with a remunerative source of income, the labourer with employment and the trader with orders, besides which I suppose it will be admitted by all parties that it is most desirable that the country should not be dependent upon foreign supplies of sugar in time of war, should war unfortunately occur.

Electrolytic Zinc Company of Australasia, Ltd.

The gross profit for the year ended June 30, after writing £20,000. off investigational research and general development account and carrying £90,000. to reserve for depreciation, was £401,808. (against £93,841. for the preceding year, in which period the plant was only in operation for seven months). After adding £2,614., representing income from property and sundry receipts, and deducting profit and loss items, including £48,000. as provision for income taxes, the net profit was £285,406. Adding £76,593. brought forward there was an available balance of £361,999 This has been disposed of by writing off preference shares and debenture issue expenses, £74,482.; by providing for co-operative council activities at Risdon, £7,500.; by carrying to debenture sinking fund reserve, £12,640.; by carrying to equalisation reserve, £40,000.; and by the payment of dividends Nos. 1 and 3, £149,115., leaving a balance of £78,262. to be carried forward. The output was 31,283 tons electrolytic zinc; silver-lead product containing 4,344 tons lead and 691,052oz silver. The plant was completed during the year and further installations to ensure ample supplies and accumulate a reserve are being proceeded with.

North Broken Hill, Ltd.

The profit and loss account is credited with mine production, £597,215.; adjustment in respect of production previous period, £48,190.; and interest, rent, and dividends, £28,116., making a total of £673,521. Mine expenditure, £295,236.; administration, insurance, debenture interest, etc., £24,140.; provision for taxes and royalties, £49,365.; and reserve for depreciation, £20,000., are deducted, leaving £284,780. carried to appropriation account. This amount, with £30,000., the balance forward, has been appropriated thus:—Dividends Nos. 52 to 54, in all 6s. per £1. share, £180,000.; debenture sinking fund, £13,333.; appropriation for plant expenditure, £52.000., leaving a balance of £69,447. Surplus liquid assets amount to £532,454., exclusive of shares and debentures in other companies which are valued in the balance sheet at £448,525.

Nigerian Tin Corporation, Ltd.

The directors submit accounts for two years to December 31, 1922. Net loss for period amounts to £23,203., from which is deducted credit of £1,510. brought in, leaving debit balance £21,693. Included in this is £2,306. for interest in general settlement with Niger Co. and £10,626. loss on realisation of investments. Directors have written down investments by transfer of £35,878. standing to credit of reserve. Of the £40,000. of debenture stock created in March, 1922, only £23,595. has been issued.

Eastern Chemical Company, Ltd.

Result of working for year to March 31 last, after further writing down of stocks to replacement cost, and allowing for depreciation, was a loss of £10,503. Serious trade depression in India, combined with keen local competition and dumping of German chemical products at prices much below world values and cost of manufacture in India, resulted in a reduced output at company's works and smaller gross profits. Directors are unable to recommend a dividend.

Siamese Tin Syndicate, Ltd.

The net profits for 1922, after writing off £5,787. for depreciation, amounting to £26,278. (against £25,126. for 1921), while £1,964. was brought forward. The directors propose a final dividend of 5 per cent., making 15 per cent. for the year (the same), and after providing £6,000. for taxation, and £2,050. for directors' additional remuneration, there is a balance of £2,192. to be carried forward.

DIVIDENDS.

Borax Consolidated, Ltd.—Interim dividend of 1s. per share or 5 per cent., less tax, on the deferred ordinary shares in respect of the year ended September 30. Dividend for the preceding year was the same.

A. and F. Pears, Ltd.—Profit for year to June 30 last was £99,676. Dividend is proposed on the ordinary of 20 per cent., placing to reserve £5,000., making this fund £135,000., and carrying forward £16,876.

Angela Nitrate Company, Ltd.—Interim dividend of 10 per cent., or 2s. per share, less tax, payable on November 12. A year ago an interim dividend of 5 per cent., less tax, was declared.

Anglo-Chilean Nitrate and Railway Company, Ltd.—Interim dividend on account of 1923 of 1s. per preference share and 1s. per ordinary share, both free of tax, being 5 per cent. on each class (the same as a year ago), payable on November 14.

Nitrate Railways Company, Ltd.—Interim dividend at the rate of 3½ per cent.—*i.e.*, 7s. per share (less tax), payable November 15, upon the ordinary (unconverted) and the preferred converted ordinary shares. No dividend was paid at this time last year.

Pease and Partners, Ltd.—Interim dividend on ordinary of 3 per cent., free of tax, payable November 16.

Salar del Carmen Nitrate Company, Ltd.—The directors have declared an interim dividend of 5 per cent., less income-tax, on account of the profits for the current year.

Olympic Portland Cement Company, Ltd.—Interim dividend of 5 per cent., less tax, in respect of year 1923, payable November 15.

NEW COMPANIES.

Decolourising Materials, Ltd.—Private company. Capital £1,000. Office: 25, Market Street, Manchester.

Oxford Growers Supply Company, Ltd.—Private company. Capital £400. Manufacturers, suppliers, and exporters of fertilisers, etc. Address: 76, Islip Road, Oxford.

W. Craig Mitchell and Co., Ltd.—Private company. Capital £4,000. Chemical manufacturers, etc. Office: 288, Shields Road, Glasgow.

Celite Products Corporation.—Capital 25,000 dollars in 100-dollar shares. Incorporated in U.S.A., July 20, 1923. Importers and exporters of and dealers in infusorial and diatomaceous earth, etc. British address: Windsor House, Victoria Street, S.W., where J. E. Burgess is authorised to accept service.

FERTILISER NEWS.

Nitrate of Soda.—Shipments during the first half of October were rather lower than for the corresponding period of last year. Total exports amounted to 75,000 tons, of which 54,000 was destined for Europe and Egypt, 19,000 to the United States, and 2,000 to other countries. Deliveries from ports in Europe amounted to about 27,000 tons, against 20,000 tons last year. Stocks in ports on October 15, therefore, were about 210,000 tons, which, with about 175,000 tons afloat, makes the visible supply for Europe some 385,000 tons, compared with 312,000 tons at the same date in 1922. Not all the nitrate which is arriving over here has been officially sold, or, indeed, sold at all, the facilities given by the Chilean Government allowing the exportation of large quantities for storage purposes in the consuming countries. It will doubtless be found that unsold stocks will reach a much larger figure in Europe and America before the close of the present season. No new sales have been made by the Producers' Association, as is to be expected with such heavy speculative commitments already entered into by importers. There is very little activity on the Continent at the present high prices, although a leading authority says "the market has been firm, with business at a minimum, the wide fluctuations in Continental currencies having for the time being proved a deterrent to consuming buyers contracting ahead." Labour troubles in Chile are spreading at the ports, and this fact is probably the reason for the smaller shipment figures previously referred to. Strikes are said to be in operation at Iquique, Junin, and Pisagua, mainly, it is to be inferred, on the question of wages. Outside help is being sought, but the general labour shortage will doubtless compel the producers and exporters to increase their handling costs by granting the men's demands. Still another blow for this hardly-used industry! There being nothing to oppose it, however, it will be easy for the producers to raise prices to the unfortunate agriculturists in order to maintain profits. As Dr. Curtis, of the United States, has recently pointed out, the only effective opposition to the nitrate industry is the development of synthetic nitrogen production, and when this takes place the Chilean producers, backed by the Chilean Government, will be able to reduce prices to a level at which it will be very difficult to compete. So far as the United Kingdom is concerned, very little of the nitrate coming in is finding its way to the agriculturalist, owing to the relatively much cheaper sulphate of ammonia, which is in good supply.

Basic Slag and Superphosphate.—Overseas trade in basic slag during September suffered a severe setback, exports dropping from 4972 tons in August to 260 tons in September, while imports rose from 2,978 tons to 7,542 tons. This falling-off reflects the increasing depression in the iron and steel trade, which during the latter part of last year and the earlier part of the present one was in a state of comparative activity. Since May of this year some 33 furnaces have gone out of blast, and the outlook continues to be gloomy. Compared with last year, however, trade has been better on the nine months' totals, 67,536 tons being imported, against 42,264 for the same period last year; while exports amounted to 17,518 tons, compared with 6,086 tons. At the present time inquiry is very fair, and the reduction in prices on the East Coast has resulted in some attention. Exports of superphosphate are a shade better, though trade in this material is mainly on the importing side. The position here is still very difficult, and manufacturers are finding it increasingly difficult to keep on producing at prices which do not suffice to cover actual cost of production. The unstinted importation since the war, from countries where the rate of exchange allows an unfair advantage, has played havoc with the home industry. At the same time, it has to be remembered that before the war the cold breath of competition was felt from Belgium, when British manufacturers made a working arrangement with Continental producers by which the competing with lower-priced imported material was eliminated. The increasing difficulties in the maintenance of this arrangement since the war, however, led to its falling through, with the result that the only hope for the British industry appears to be a tariff on the imported foreign material. Imports of phosphate rock during September totalled 32,373 tons, compared with 31,584 tons in August, and 44,856 tons in September, 1922. Aggregate figures for the nine months were 254,455 tons in 1923, against 287,032 tons in 1922.

Radioactivity of Chilean Nitrate.—In connection with the frequently debated question of the radio-activity of Chilean sodium nitrate, it is interesting to note that F. Diaz de Rada, working at the Institute de Radiactividad at Madrid, has obtained conclusive evidence that such radio-activity exists. After a long series of carefully repeated experiments, he has concluded that every gramme of average "caliche" contains 1.28×10^{-7} milligrammes of active constituent.

SOUTH WALES NOTES.

[Specially Contributed.]

There is a steady continued improvement in the tinplate trade. Contrary to expectations, quotations have a tendency to harden, the chief factor undoubtedly being the stiffening in pig-iron prices. A fair number of orders have been received during the week and several of the factories are now assured of steady work over January next. The request for galvanised and blacksheets is good, and manufacturers are accepting orders for the first quarter of next year. There is a stronger tendency in cokes, and the outlook for the by-product ovens is much better. Sulphate of ammonia is now a very firm market with a very fair export trade. The patent-fuel industry is in a stagnant condition, the prices of pitch having an adverse effect with the situation. Quotations on the basis of £7. 5s. per ton have been firmly adhered to. Creosote remains very firm, while the naphthas are somewhat quiet. There is a better movement for tars, and that for road purposes is quoted at £1. 13s. 9d. put in owners 4-gallon cask; the crude tar is fetching £4. 7s. 9d. per ton on rail at ovens. The Van lead mines near Llanidloes which have been idle for over three years were one of the largest lead concerns in the United Kingdom. The proprietors have decided to sell the plant as "the prospect of British lead and zinc mining being revived on a remunerative basis within a reasonable time seems absolutely hopeless."

During the week, imports included 541 tons copper ore, 104 tons silver ore, and 98 tons lead ores from Arica, 5cwt. chloride of ammonia from Hamburg, 265 tons silica from Antwerp, 54 tons calcium carbide from Amsterdam, 20 tons zinc ashes from Montreal, 27 tons copper ore from Hamburg, 5 tons ferro chrome from Gothenburg to Swansea; 107cwt. zinc oxide from Antwerp, 400 gallons acetic acid from Rotterdam, 90 tons bog ore, 3 tons calcium carbide, and 5 tons gums and resins from Antwerp, 1½cwt. caustic soda, 1 ton toilet soaps, 102cwt. red lead, 60cwt. copal gum from Antwerp, and 3 tons paint compositions from Brussels to Cardiff. Included in the exports were 485 tons sulphate of ammonia to Dunkirk, 500 gallons coal tar, 26 tons naphthalene to Antwerp, and 36 tons green copperas to Montreal from Cardiff.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(Specially Contributed.)

The coal and coking trades are in a fairly satisfactory condition, and, despite the lack of normal activity in the consuming industries, the production is being wholly absorbed. Fuel for local industrial purposes is a slow trade, but the local landsale market is picking up rapidly, and is an average seasonal trade. No change respecting coke is to be reported, but it is to be noted that East Coast coke is in keener request, and the supplies to the furnaces on low-phosphorus iron are nearly 1,000 tons larger than they were a week ago. From that it may be inferred that the proposition of low-phosphorus iron being smelted has been increased. There is, however, no reason to believe that the local coke will be in any less sharper demand. There is undoubtedly a more cheerful tone in the pig-iron market, and the way in which smelters are pressing for coke supplies suggests that makers are strongly under the impression that shortly they will be compelled to put additional furnaces into blast. Everything points at the present time to a greater pressure on the coking plants in a month or two, and it is more than ever evident that the coal and coking industries are in for a busy winter. There will be little need, therefore, for Continental business. Smelters here are paying 29s. to 32s. per ton for coke, according to carbon content, and Continental users 32s. to 36s. per ton, f.o.b.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Ashby Soaps, Ltd., Derby. — Registered October 4, £12,500. deb., to R. Dobson and ano., Manchester.

British Cyanides Company, Ltd., London, E.C. — Registered October 6, deb., to Barclays Bank, Ltd., securing all moneys due or to become due to the bank.

British Oil and Fuel Conservation, Ltd., London, W.C.—Registered October 3, £2,000. (not ex.) mort., to O. Williams, Crossways, Cowbridge.

Lactine, Ltd., Yiewsley, manufacturing chemists.—Registered October 4, £5,000. debs. (filed under sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £2,000.

Reliance Fuel Company, Ltd., London, E.C.—Registered October 2, £500. mort., to Mrs. M. J. Hopkin, Delfan, Coedcae, Llanelly.

Silver Springs Bleaching and Dyeing Company, Ltd., Timbersbrook.—Registered October 3, £599. 5s. mort., to North Staffordshire Permanent Economic Benefit Building Society, Newcastle-under-Lyme.

Ward (Samuel) and Co., Ltd., London, S.E., paint manufacturers.—Registered October 8, £6,000. debs.

SATISFACTION.

Mabor, Ltd. (late Magnesia Syndicate, Ltd.), London, W. —Satisfaction registered October 6, £400., registered January 23, 1920.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Caustic Lime and Macadam Company, Ltd.—Resolved September 19, confirmed October 5: That the company be voluntarily wound up. T. E. Gardner, City Chambers, Bradford, liquidator.

New Cross Glass Works, Ltd.—C. S. Steel, 34-36, Gresham Street, E.C., appointed receiver September 26.

Tarslag, Ltd.—Resolved September 19, confirmed October 4: That the company be voluntarily wound up. T. Whitehead, Tees Bridge Slag Works, Stockton-on-Tees, liquidator.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Boor, G., and Co., and D. W. Greenhough and Son (Leonard Geo. Boor and Geo. David Greenhough), 65, Fenchurch Street, E.C., chemical and mineral merchants, brokers and agents. September 30. Debts by G. D. Greenhough, who continues. (October 12.)

Buckle, Crossley and Co. (Jno. Wm. Buckle and Geo. Herbert Beanland), Victoria Dyeworks, Cemetery Road, Bradford, piece dyers and finishers. December 31, 1922. Debts by J. W. Buckle. (October 9.)

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Bradley and Bliss, 6, London Street, Reading; manufacturing chemists; £21 2s. 10d. September 4.

Daley, Saml. Fielding, 5, Gorsey Hey, Westhoughton; soap manufacturer; £34. 12s. 4d. September 12.

Hall, Harry H., Old Bent-ho., Littleborough; dyer; £14. 16s. 8d. July 27.

Hall, Mathew, 181, Queen Victoria Street, E.C. (trading as Esitol Chemical Company); £43. 17s. 4d. September 13.

Hermann and Co., Britannia Colour Works, Grimsby; colour makers; £10. 12s. 5d. September 13.

Lewis, Edwd., and Co., Orion, Pontardawe; polish manufacturers; £16. 17s. 10d. September 11.

United Laboratories and Chemical Company, Ltd., 97, Queen Victoria Street, E.C.; £14. 13s. 4d. September 11.

Wilson's Asbestos Cement, Ltd., 79, Queen Street, E.C.; £18. 1s. 10d.; September 14.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 8th to 13th (inclusive).

Filtration or Separation of Liquids. Alexander, H. M. 25,342.
Hardening Products of Condensation from Phenols and Aldehydes. Amalith Chemische Industrie Ges.; Deutsch, L.; and Thorn, I. 25,274.
Products of Condensation from Phenols and Aldehydes. Amalith Chemische Industrie Ges.; Deutsch, L.; and Thorn, I. 25,275 and 25,276.
Material for Treatment of Oils. Bibra, C. J. von; and Prutzmann, P. W. 25,005.
Centrifugal Filters and Separators. Bishop, C. A.; and Lilleshall Co., Ltd. 25,093.
Solders for Aluminium. Brook, F. E.; and Were, E. J. 25,313.
Apparatus for Electrolysis of Water. Casale, L. 25,279.
Obtaining a Deposition of Chromium by Electrolysis. Coignard, A. J. 25,584.
Hydrogenation of Naphthalene. Coke, B. E.; and Maxted, E. B. 25,312.
Purifying Manganese Ores. Dutt, W. 24,968.
Centrifugal Separators. Empson, A. W. 25,587.
Condensation Products of the Anthraquinone Series. Farbwerke vorm. Meister, Lucius, and Brüning. 25,482.
Mono-azo Dyestuffs. Farbwerke vorm. Meister, Lucius, and Brüning. 25,483.
Apparatus for Estimating Hydration and Progress of Beating in Paper Pulp. Hargreaves, H. 25,537.
Emulsions of Bismuth Salts. Hoffmann-La Roche & Co., Akt.-Ges., F. 25,478.
Mixing Materials with Rubber Latex. Hopkinson, E. 25,026.
Cellulose Acetate. Levy, L. A. 25,254.
Emulsifying Apparatus. Morris, E. E. 25,334 and 25,335.
Mercurial Phenols. Saccharin-Fabrik Akt.-Ges. vorm. Fahlberg, List, and Co.; and Kluges, A. 25,299.
Explosives. Scott, A. C. 25,140.
Reduction of Slag. Soc. Anon. des Chaux et Ciments de Lefarge et due Teil. 25,360.
Naphthalene Derivatives and Dyestuffs Therefrom. Soc. of Chemical Industry in Basle. 25,043.
Titanium Compounds. Spence and Sons, Ltd., P.; Spence, H.; and Llewellyn, W. B. 25,328 and 25,329.
Soap. Wake, G. R. 24,962.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

1922.

Cellulose Derivatives. Lilienfeld, Dr. L. 9,465. **177,809** and **177,810**
Artificial Resins and Oleoresins. Wuyts, H. 17,956. **204,754**
Solutions of Cellulose Esters. Nitrogen Corporation. 18,150. **189,416**
Waterproofing Cellulose. Moeller, Dr. F. 21,049. **184,462**
Separation of Proteins and Lactose from Whey. Adeane, C. R. W.; Whetham, W. C. D.; and Harding, L. 23,121. **204,847**
Chromium Oxide from Chrome Iron Ore. Mond, A. L. (*Chemische Fabrik Griesheim-Elektron*). 25,720. **204,886**
Vulcanisation of Rubber. Skellon, H.; Roberts, T. H.; and Clarke, H. B. R. 27,114. **204,902**
Capillary Process of Transferring Liquids Applicable to Chemical Reactions, Photography, Dyeing, Tannery, and the Like. 33,331. **190,148**
Recovering the Solvents Used in the Extraction of Oil and Fatty Bodies. Soc. Générale d'Evaporation Procédés Prache et Bouillon. 33,790. **190,174**
Treatment of Coal Tar. Richards, W. E. W.; and Siluminite Insulator Co., Ltd. 34,642. **204,976**

1923.

Explosives with Liquefied Gases. De Wendel et Cie, Les Petits Fils de F. 1,040. **192,063**
Lecithin from Vegetable Matters. Bollmann, H. 4,707. **205,011**
Reduction of Dioxyperylene. Pereira, H. 15,642. **199,401**
Dinitro Perylene Quinone. Pereira, H. 15,643. **199,720**
Cellulose Derivatives. Lilienfeld, Dr. L. 22,160. **203,346** and **203,347**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Heavy and Light Magnesia Hydrate. Monterumici, R. 24,477. **205,078**
Silicic Acid Gels. Farbenfabriken vorm. F. Bayer and Co. 24,495. **205,081**
Pure Table Salt. Angel, E. G. R. 24,911. **205,103**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Electrolytic Cells. J. P. Scott, Toronto, Canada. British Patent, **202,882,** of 1922.

A gas-generator comprises an anolyte and container 27, Fig. 2, to which all the anode compartments of the cells are separately connected so as to allow a free circulation of electrolyte, maintained by the evolution of gas, within the structure; the cathode compartments are similarly connected to a catholyte container 28. The cells comprise partitions 10 and diaphragms 13 separated by and insulated from frames 14, members 75 running the whole width of the frames, and two rows of rings 29, 30, apertures in the partitions and diaphragms registering with others in the members 75 and with the rings 29, 30 to form ducts (which are made water-tight by washers). A number of superposed layers or inter-woven plies 24 of wire mesh are clamped by bolts 26 to frames 25 on either side of the partitions 10 to constitute bipolar

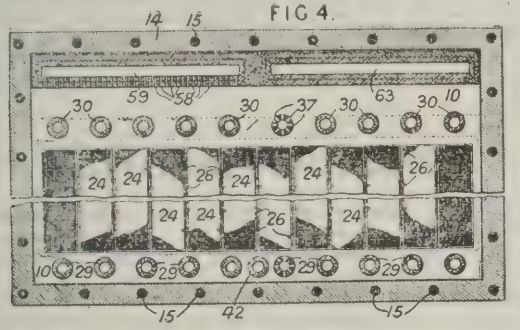

FIG 4.

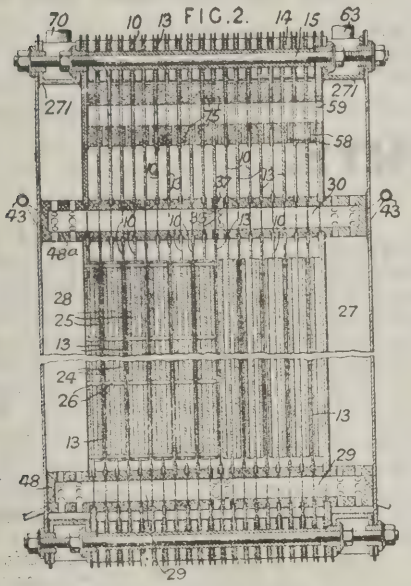

FIG.2.

electrodes. As shown in Fig. 4, the members 75 form a gas-duct 59 connected by passages 58 with the anode compartment of each cell, and a gas-duct 63 connected with the cathode compartments. Each of the ducts formed by the rings 29, 30 is divided by a partition 36 into two parts connected by passages 37 with the anode and cathode compartments. Each of the ducts formed by the rings 29, 30 is divided by a partition 36 into two parts connected by passages 37 with the anode and cathode compartments respectively of one cell only by passages in terminal rings 48, 48a and with the anolyte and catholyte chambers. The chambers 27, 28 are connected at the bottom by a duct 42. All surfaces in contact with the electrolyte except the electrodes are of insulating material. The diaphragms are preferably of pure asbestos cloth densely woven, and their edges may be impregnated with vulcanised soft rubber. The outer walls of the end cells are separated from the outer walls of the chambers 27, 28 by channel frames 271. The whole apparatus is secured together by insulated bolts 15. The gases are withdrawn by pipes 63, 70. The apparatus may be cooled by water-sprays 43. An installation may consist of several units as above described mounted on rails with intervening spaces and connected with common gas mains and electrolyte supply tanks; the units are connected in series.

Washable and Fireproof Paper. Hydroloid, Ltd., Westminster. (Exportingenieure für Papier und Zellstofftechnik Ges., Berlin.) British Patents **202,883** and **202,884,** of 1922.

A washable paper for maps, charts, wall-paper, cheques, etc., is obtained by impregnating raw paper with sizing-material by first passing it through a bath containing animal size, casein, etc., and then pressing the solution into the paper by means of rollers, the paper being hardened by means of alum, etc., applied with the size or subsequently.—A washable paper obtained as described above is rendered fireproof by passing it through a bath containing a solution of ammonium phosphate, ammonium sulphate, or zinc chloride. Specification 169,676 is referred to.

Rapid Manufacture of Soaps. A. Welter, Krefeld, Rheinhafen, Germany British Patent, **202,710,** of 1922.

Soaps are made in from 5 to 60 minutes by mixing fatty acids at a temperature a little above their melting points with approximately but no more than double the weight of calcined soda necessary for complete saponification, and allowing the mass to stand, whereby only bicarbonate of soda and more or less anhydrous soaps result. The mass may be extruded while pasty, or may be cooled and ground, and the powder may be compressed into cakes or briquettes. Part, say 20 per cent., of the soda may be replaced by potash, and up to 20 per cent. of the fatty acid by resin, and the soda must not contain more than 30 per cent. of water. A solvent such as turpentine, carbon tetrachloride, or benzol or its homologues may be mixed with the fatty acid. In an example 1,000 kilos. of molten distilled fatty acids of cotton-seed oil having an acidity number of 202 are mixed with 50 kilos. of turpentine oil and agitated with 400 kilos. of calcined soda at 30° C. In other examples olein, palm oil, fatty acid, and coconut oil fatty acid, are treated at 30-35° C

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Aromatic Sulphonic Acids. Rheinische Kampfer-Fabrik Ges., Dusseldorf, Germany. British Patent, **202,975.** Convention date, Aug. 23, 1922.

Aromatic sulphonic acids having halogens in the aromatic nucleus have their halogen atoms replaced by hydrogen atoms by treatment with hydrogen in aqueous alkaline solution in the presence of a hydrogenising catalyst. The aromatic nucleus may be benzene, naphthalene, anthracene, etc., and other groups, such as alkyl, hydroxy, nitro and amino groups, may be present therein. The hydrogen may or may not be under pressure, and temperatures of 20-300° C. are employed. Suitable catalysts are nickel, cobalt, copper, platinum and palladium, and the metal may be deposited in colloidal form on carriers such as kieselguhr or calcium carbonate. For producing the alkaline solution, hydroxides or carbonates of the alkali or alkaline earth metals are used. Examples are given of the dehalogenation of *p*-brombenzene sulphonic acid, 2-chlor-*p*-cymene-3-sulphonic acid and 2-brom-*p*-cymene-3-sulphonic acid using a nickel catalyst and hydrogen under a pressure of 10-30 atmospheres and of the dehalogenation of 2-brom-*p*-cymene-3-sulphuric acid by treatment with hydrogen at ordinary pressure for several days in presence of a nickel catalyst.

Preparation of Stable Persalts. F. Noll, Düsseldorf, Germany. British Patent, **202,985.** Convention date, August 28, 1922.

The materials, such as sodium carbonate or hydroxide, borax, etc., from which persalts are to be prepared are first treated with a reagent to remove any metal compound which might act catalytically upon the finished product so as to cause liberation of oxygen. The reagent is allowed to act for a sufficient time, such as several days, to ensure that the impurity, which may be in colloidal solution, shall precipitate, and the precipitate is removed by filtration. The reagents mentioned as suitable are alkali monosilicates and disilicates. In the examples a solution of borax and caustic soda is treated with sodium disilicate and allowed to stand

for two or three days at 30-35° C. The filtered solution is cooled to 0-5° C. and hydrogen peroxide is added, the perborate being precipitated; and sodium carbonate solution is purified in a similar manner, filtered, and treated with hydrogen peroxide at 0-5° C. for the production of the percarbonate. Persalts prepared in this manner are stable and do not need the addition of protective substances.

Reducing Iron Oxides. G. Constant, and A. Bruzac, Paris. British Patent, **202,970.** Convention date, August 22, 1922.

Oxides, particularly iron oxide, are reduced by passing a charge of reducing gas into contact with the oxide in a reducing chamber, passing the residual gas into contact with carbon to transform the contained carbon dioxide into carbon monoxide, and passing the regenerated gas again into the reducing chamber, and so on, so that the proportion of carbon monoxide in the gas progressively increases, excess being removed from time to time. In a plant illustrated, the initial charge of gas is obtained from a producer and is passed to a reducing chamber, the residual gas being passed through a cooler, blower, and valve to the producer. The producer is blown at intervals, a holder being interposed in the passage to the reducing chamber to provide continuity during the times when the producer is cut out for blowing. Excess gas is led off through a suitable pipe. Two producers may be used to ensure continuity of reduction, one of the producers being blown while the other is regenerating the gas.

Pumps for Acids. E. A. Gaillard, Barcelona, Spain. British Patent, **202,316.** Convention date, August 12, 1922.

A pump for acids and other liquids has a number of grooves, slots, or recesses on the periphery of the piston or on the inner surface of the cylinder, cut preferably at an angle of 45 degrees to the surface with the openings downwards. One of the upper grooves in the cylinder may have an overflow connection to the suction tank, and the upper end of the cylinder may be flared and provided with an aperture connecting it to the tank.

Resinous Compositions. Consortium für Elektrochemische Industrie Ges., Munich, Germany. British Patent, **201,916.** Convention date, August 7, 1922.

Natural and artificial resins are improved by the addition of organic compounds containing hydroxyl or carbonyl groups, or derivatives of such compounds. Suitable substances are dioxystearic acid, ricinoleic acid, salicylic acid, castor oil, phenol, mesityl oxide, phorone, dioxyabietic acid, etc. They may be incorporated with the resin by the aid of solvents, heat, or pressure. The resin may be hardened by esterification, by the addition of metallic compounds, such as aluminium oxide, or by thermal treatment either before or after the incorporation of the additional substances.

Fireproofing Compositions. A. Eichengrün, Berlin. British Patent, **202,302.** Convention date, August 10, 1922.

A solution of ammonium bromide and an "easily volatilisable" substance such as an ammonium salt of phosphoric, boric, etc., acids, is used as a fireproofing-agent. Materials impregnated with these compounds are placed on or near fires to be extinguished. Hygroscopic substances such as glycerine, glucose, lactic acid, etc., may be added to the solution.

PUBLICATIONS RECEIVED.

International Review of the Science and Practice of Agriculture.—New Series, Vol. 1., No. 3 (July-September, 1923). The quarterly publication of the International Institute of Agriculture at Rome. Price 4s., post free.

Report of the Oxygen Research Committee.—Published for the Department of Scientific and Industrial Research. London: H.M. Stationery Office; price 8s. 6d. net.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—Prices are being maintained fairly well in this market, and there are isolated instances of prices hardening, which is due to the prevailing state of affairs in Germany. The question of continued supplies from this source is now a matter of doubt. **Acetic Acid,** 80% pure, about £48.; 80% technical, about £47.; 98% glacial, about £60. in casks and £72. in glass demijohns, ex wharf London; prices on spot are rather easy at the values quoted, but the Continental position points to higher prices before long. **Acetone,** British Government specification, about £124. per ton, in drums; this market keeps very steady, with inquiry good. **Alum,** lump, in casks, about £10. to £10. 10s. per ton, on spot; dealers are offering at these rates, but little business is being done. **Arsenic,** Cornish, white powdered, spot, about £61. 10s.; f.o.r. Cornwall, about £58. per ton; prices are being maintained, and inquiry for export has been good, but actual business is poor; the tone of the market is unsteady. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. to 1s. 6d.; a fair amount of business has been on the market, with quoted prices steady. **Bleaching Powder,** 35—37%, on spot, about £10. to £10. 10s. per ton; dealers are quoting at these rates with not much inquiry. **Barium Chloride,** 98—100%, about £15. per ton; this market remains dull, but prices are steady. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices for home trade keep steady at these rates; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered at £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers' prices for home trade, packages free, carriage paid, are unchanged. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices, for home trade only, are level on the week; dealers are offering some grades at competitive prices. **Citric Acid,** B.P. crystals, about 1s. 4d. per lb., less 5%, nominal; hardly any demand; this market is very weak. **Cream of Tartar,** 99—100%, about 85s. per cwt.; the market is much steadier this week, and tends to harden a little. **Epsom Salts,** commercial crystals, about £4. 10s. per ton, in bags; dealers offering at about this figure find business slow and small. **Formaldehyde,** 40% volume, about £62. to £63. per ton; importers seem to be cutting the market for the limited business about; the market seems likely to be held up, and may perhaps harden. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; inquiry from dealers offering at about this rate is not good. **Lead Acetate,** brown, about £41. 10s.; white, about £42. 10s. per ton; this market is a shade firmer this week, and may advance further. **Litharge,** imported, about £35. 10s. per ton; dealers are doing a little business at about this figure. **Lithopone,** 30% Continental red seal, about £22. 10s. to £23. per ton; the spot position is now very firm, and higher prices are expected. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; imported material is offered on spot at these prices, which may advance. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers' prices are unchanged. **Oxalic Acid,**

6d. per lb.; this market continues on the quiet side, and prices as quoted are none too firm. **Carbonate of Potash,** 90—92%, £26. to £27.; 96—98%, about £29. per ton; this market is holding very well, and is likely to harden before long. **Chlorate of Potash,** crystals and granular, about 2¾d. per lb.; dealers quoted rates show no change; inquiry poor. **Caustic Potash,** 88—92%, about £31. to £32. per ton; the movement in prices is likely to be upwards here; spot stocks are not large. **Permanganate of Potash,** commercial quality, about 9d. per lb.; at this level the market keeps steady, with occasional business being done. **Prussiate of Potash,** yellow, about 10½d. per lb.; dealers have made a further reduction in prices; market still dull and weak. **Sulphate of Potash,** 90%, about £11. per ton, ex ship; this market shows no change on the week. **Mercury,** about £9. 10s. to £9. 15s. per bottle of 75—76lb., net; the spot position remains dull, and prices are rather unsteady. **Red Lead,** imported, about £35. 10s. per ton; dealers quoting at this price find business poor. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white, about £25. to £26. per ton; holders of spot supplies are firm at these prices, and the market is likely to advance. **Saltcake,** ground and unground, home trade, about £4. 10s. per ton; prices for export are somewhat dearer; the market keeps very steady. **Acetate of Soda,** about £24. 15s. per ton, on spot; a few parcels are available, with not much inquiry about. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton; in drums, ex wharf shipping port; dealers' prices are kept up to these levels, with business showing no improvement. British makers' prices to home consumers on contract are at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags, carriage paid to destination; British makers continue to quote for home trade only at this price. **Bichromate of Soda,** home trade, 4½d. per lb.; British makers' prices are kept at this old level. **Cyanide of Soda,** export, about 8d. to 8½d. per lb.; British makers' prices are quoted, and are unchanged. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags, carriage paid to any station in Great Britain; British makers' quote at this price, for home trade only. **Hyposulphite of Soda,** pea crystals, about £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £10. to £10. 5s. per ton, in casks; spot prices show an advance here, and the market holds firm. **Nitrate of Soda,** about £13. 5s. per ton, f.o.r. or f.o.b.; the position is unchanged on the week. **Nitrite of Soda,** 100%, about £26. 10s. to £27. per ton; this item is inclined to be a little firmer. **Prussiate of Soda,** about 5½d. per lb.; the market quotation is at this lower figure, with but the limited business passing. **Sodium Sulphide,** 60—62% solid, about £14. per ton; broken, about £15. per ton; 60—68% concentrated, about £14. per ton, in casks; dealers' prices are steady, with the market quiet. **Tin Crystals,** about 1s. 4d. per lb.; unchanged on the week. **Tartaric Acid,** B.P. crystals, about 1s. 1½d. per lb., less 5%; this is the market quotation, but any sales would be at a much lower figure for spot goods available. **White Lead,** imported, about £42. per ton; dealers offering imported material at about this figure, with occasional business about. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers continue to quote at about these prices.

Pharmaceutical Chemicals.—The general hardening in the spot position commented upon some weeks ago continues. The many advances in spot prices recorded this week are all due to the critical state of affairs in Germany, where supplies are either much dearer or are unobtainable. **Acetanilid,** crystals and powder, 1s. 11d. to 2s. per lb.; spot holders are quoting at these much higher figures, and are in no hurry to clear. **Acetyl-Salicylic Acid,** B.P., 3s. 1½d. to 3s. 2d. per lb.; a further advance in spot prices is recorded, and this movement may continue. **Benzoic Acid,** B.P., 2s. 4d. to 2s. 6d. per lb.; owing to scarcity of inquiry, these prices are more or less nominal. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per ton; spot supplies are offered at this price, with the demand poor. **Salicylic Acid,** B.P., 2s. 3d. to 2s. 4d. per lb.; at these rates the spot position is very firm, and may advance before long. **Tannic Acid,** leviss, 3s. 4d. to 3s. 6d. per lb.; this market keeps a very steady tone, with a fair volume of business being done. **Amidopyrin,** about 14s. 6d. per lb; dealers are holding firm at this rate; inquiry is small. **Ammonium Bromide,** B.P., 7¼d. to 7½d. per lb.; this market continues to improve, although business is rather slow. **Benzonaphthol,** about 5s. per lb., nominal; the market has been idle. **Betanaphthol,** resublimed, 1s. 11d. to 2s. per lb.; inquiry remains poor, but prices are rather firmer on spot. **Benzaldehyde 03,** about 3s. per lb.; at this old figure the spot position keeps quite steady. **Calcium Lactate,** 1s. 9d. per lb.; dealers are quoting at about this figure, with not much doing. **Chloral Hydrate,** duty paid, 4s. 2d. to 4s. 3d. per lb.; the spot price has hardened, and may advance still further. **Creosote,** B.P., about 2s. 6d. per lb.; the spot position keeps very steady at this price. **Creosote Carbonate,** about 8s. 6d. per lb.; dealers' prices are maintained at this price, with business lacking. **Guaiacol Carbonate,** about 10s. 9d. to 11s. per lb.; a further material advance is recorded here, with the market firm. **Hexamine,** 4s. per lb.; the spot price seems quite steady at this price, and an advance would not be an unexpected happening. **Hydroquinone,** 3s. 6d. to 3s. 9d. per lb.; dealers are quoting at these higher rates this week, but it is doubtful if much business has been done at these higher levels. **Methyl Salicylate,** 2s. 8½d. to 2s. 9½d. per lb.; at these prices the spot position is firm, and something in the way of an advance is probable. **Methyl Sulphonal,** about 15s. per lb.; little inquiry for this article is made, with spot holders quoting at unchanged rates. **Paraformaldehyde,** 3s. 8d. to 3s. 9d. per lb.; slightly higher prices are being quoted on spot. **Paraldehyde,** 1s. 5½d. to 1s. 6d. per lb.; the tone on spot is stronger, and prices tend to advance. **Phenacetin,** 6s. 8d. to 6s. 9d. per lb.; a sharp advance in spot values is recorded here, and still higher rates are predicted. **Phenazone,** 7s. 10d. to 8s. per lb.; a further advance in spot values is recorded, and this movement is likely to continue. **Phenolphthalein,** 7s. 6d. to 7s. 9d. per lb.; spot quotations are made at these higher rates. **Potassium Bromide,** B.P., crystals and granular, 6¾d. to 7d. per lb.; the tone on spot is much healthier, and prices are moving upwards. **Potassium Permanganate,** B.P., 9½d. per lb.; spot prices are well held at this level, with a fair inquiry being received. **Potassium Sulphoguaiacolate,** about 5s. 9d. to 6s. per lb.; holders of spot supplies have put their prices up to these levels. **Resorcin,** about 5s. 6d. to 5s. 9d. per lb.; the tendency here is for a slight advance in spot values. **Sodium Bromide,** B.P., crystals and granular, 7¾d. to 8d. per lb.; although there has been little improvement in business, the spot position is much healthier this week. **Sodium Salicylate,** B.P., crystals, 2s. 9d. to 2s. 10d.; powder, 2s. 8d. to 2s. 9d. per lb.; the spot position keeps firm at these rates, and any movement is likely to be towards higher rates. **Sulphonal,** about 14s. 9d. per lb.; this market is perhaps a shade firmer this week, but there is little doing. **Terpin Hydrate,** about 1s. 9d. per lb.; at this rate the spot market is very steady. **Thymol,** about 15s. per lb.; spot offers from dealers are kept at this level, with business slow.

Coal-tar Products, Intermediates, Etc.—A number of reductions in prices is recorded this week. Business has been very poor, and many items are still unsteady. Pyridine and pitch are bright features. **Aniline Salt,** about 9½d. per lb., casks free; the spot price is steady at this figure, with inquiry poor. **Aniline Oil,** about 9d. per lb., drums free; after the reduction notified last week the spot position is steadier. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; this market is not at all active; prices quoted are about the same. **Benzol,** about 1s. 3½d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; this market remains dull, with prices unsteady. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; the market has again been quiet, and quoted rates are unchanged. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; prices quoted are unaltered, but the market is dull and weak. **Naphtha,** about 1s. 2d. per gallon; a sharp reduction in prices is recorded, with the market quiet. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; this market has remained dull, and quoted rates are weak. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; business remains slow, with quotations unchanged; market weak. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; this market is unchanged on the week. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; this market keeps very steady at this old price. **Creosote Oil,** about 9¼d. per gallon, f.ob.; prices are again a shade weaker, with business very slow. **Carbolic Acid,** crystals, about 1s. 1½d. per lb., f.o.b.; slightly cheaper rates are being quoted here, with matters very dull. **Naphthalene,** about

£19. per ton; this market has weakened, with lower prices now being quoted; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; candles, £28.; tablets, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; this market remains quiet. **Pyridine** has again advanced on spot, and the tone remains firm at the higher rate of 22s. per gallon. **Hexamethylene** is a firm market, and quotations are fully maintained at 3s. 9d. to 4s. per gallon, with an advance likely. **Pure Methyl Alcohol,** about £90. per ton, in drums ex wharf London; this item keeps very steady at this level, and inquiry has been fair. **Pitch,** about 140s. per ton, f.o.b. East Coast; prices and the tone of the market has improved considerably; business has not been great, but supplies appear to be restricted.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £59. 15s. to £59. 17s. 6d., cash; £60. 10s. to £60. 12s. 6d., three months; electrolytic, £63. 10s. to £64. 10s. **Tin**: Standard, £204. 10s. to £204. 15s., cash; £202. to £202. 5s., three months; Straits, £205. 10s.; English, £205. 5s. **Lead,** soft foreign, £28. 15s., prompt; English, £30.; chemical sheet, 36s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 5s.; hard, £28. **Antimony,** English regulus, 99%, £32. 5s. to £33. 10s.; special brands, £38. 10s. to £39. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 10s. **Bismuth,** 10s. **Platinum,** 500s. per oz. **Wolfram,** spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand for heavy chemicals continues quiet both for home and export account, and values all round remain in buyers' favour. The quotations for alkali products are maintained at recent rates, but so far little or no business for forward delivery has been arranged. **Bleaching Powder,** softwoods, is quiet at £11. 5s., on rails makers' works. **Chlorates** are moving off slowly: **Potash** at 3d., and **Soda** at 2¾d., per lb. **Bichromates** are unchanged at 5¾d. and 4¼d. for **Potash** and **Soda** respectively, carriage paid to customers' works. **Glauber's Salt** weak at 70s. per ton, carriage paid. Roasted **Saltcake** is in only small request, and price remains steady at £4. 10s. carriage paid, and £4. 15s. to £5. per ton f.o.b. for export. **Copper Sulphate** is in small demand, and price remains nominal at £25. 10s. to £26., f.o.b. American **Sulphur,** firm at £5. 5s. on rails. **Phosphate of Soda,** lower at £14. 10s. per ton; commercial **Hyposulphite of Soda,** £9. 10s. on rails. **Nitrite of Soda** is firm at £26. 10s., ex store. **Sulphide of Soda,** crystals, in casks, £9. per ton, carriage paid. White powdered Cornish **Arsenic** is steadier at 60s., on rails works, with rather better inquiry. Yellow **Prussiate of Potash,** lower at 11½d. per lb., carriage paid, but **Soda** steady at 5¾d. per lb. **Carbonate of Potash,** 90—92%, easier at £23. 10s., c.i.f.; solid **Caustic,** 88—90%, firm at £29. to £30., ex store. Owing to falling-off in demand, **Acetic Acid** and **Acetate of Soda** have a lower tendency. Grey **Acetate of Lime** continues scarce at £21. 10s., c.i.f.; brown unaltered at £11. 10s., carriage paid. Miscible **Wood Naphtha,** weak at 6s. 3d. per gallon. **Acetone,** lower at £124. per ton. **Lead Salts** are firm; foreign white **Acetate** £41. 10s., brown £45.; and **Nitrate** £42. per ton, carriage paid. **Barium Chloride,** dull at £14. 10s. per ton. **Tartaric Acid,** 1s. 1d. per lb.; **Citric,** lower at 1s. 4½d. **Oxalic Acid,** unchanged at 5¾d. to 6d. per lb., carriage paid. **Permanganate of Potash,** commercial quality, lower at 8½d. per lb., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Steady demand for **Tinplates,** with firm prices on the basis of £1. 3s. 1½d. per standard box., f.o.b. **Galvanised Sheets** in good request, and quotations firmer on the basis of £19. 7s. 6d. per ton. **Copper** prices easier, with some business done at £60. 7s. 6d. per ton cash, and £61. 2s. 6d. three months. **Tin** cheaper, with prompt at £201. 12s. 6d. cash, and three months £200. 7s. 6d. **Lead** slightly dearer at £27. 17s. 6d. prompt, and £27. 2s. 6d. three months, for foreign; English, £29. 10s. **Spelter** more freely offered, with quiet trade at £33. 7s. 6d. per ton prompt, and £32. 6s. 3d three months. **Zinc Sheets,** £39. 7s. 6d. per ton. **Linseed Oil,** raw, easier at £2. 1s. 9d. per cwt. prompt, and £1. 19s. 6d. three months; boiled, £2. 7s. 3d. **Rape Oil,** £1. 19s. 3d. **Cottonseed Oil** quiet, with common edible at £2. 4s. 3d., and deodorised £2. 7s. 3d. **Cod Oil,** more active at £33. 12s. 6d. per ton. **Olive Oil,** £40. 17s. 6d. per ton. **Turpentine** firm and steady, with American refined at £3. 14s. 9d. per cwt. prompt, and £3. 16s. 6d. three months. **Coconut Oil,** quiet at £2. 4s. 9d. per cwt. for Ceylon. **Palm Oil** steady and in gooo request; softs, £36. 5s. 3d.; mediums, £36. 5s. 3d.; Lagos £36. 15s. 6d., and hards £36. 15s. per ton. **Oxalic Acid** met with better inquiry at 6¼d. per lb. **Sulphate of Ammonia** firm, with export business at £14. 3s. 6d. per ton, f.o.b.; and home prices at £14. 12s. 6d. for 4-ton lots, delivered. **Pitch,** slightly dearer at £6. 19s. 6d. per ton. **Creosote** very firm; 8¾d. per gallon, f.o.r. **Benzol,** 1s. 4½d. per gallon. **Sulphate of Copper,** dull at £26. 2s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda,** quiet but steady at £13. 7s. 6d. per ton, f.o.b. **Bone Meal** rather slow, with prompt Indian 9s. 3d. per cwt., in bags. **Copperas,** very dull at £2. 2s. 6d. per ton, delivery London or equal. **Arsenic** met with better inquiry at £60. 7s. 6d. per ton for white powdered. **Sulphuric Acid,** in fair demand at late rates. **Coal** prices remained steady, and supplies plentiful: Best Admiralty smokeless, £1. 7s. 6d.; seconds, £1. 5s. 3d.; ordinaries, £1. 5s. 6d.; Monmouthshire black vein, £1. 4s. 6d.; coking, small, £1. per ton, all f.o.b. **Patent Fuel,** rather quiet from £1. 9s. to £1. 11s. per ton, f.o.b. **Coke,** fairly active; export qualities, £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, on rail at ovens. **Anthracite** has a good demand, but supplies are large: Best large, £2. 5s.; seconds, £1. 15s.; Paris and French nuts, £2. 17s. 6d. per ton, all f.o.b.

LIVERPOOL CHEMICAL MARKET. Wednesday.

A steady demand for chemicals of the heavier class, though on a moderate scale for home-trade uses, has been experienced through the week and continues at date. In the export branch of the trade a very fair business has been done, and shipments have been made more freely. **Bleaching Powder** has had a quietly steady sale; the price for spot and for export is £11. 5s. per ton; special prices are, according to requirements, being quoted for contracts. **Chloride of Calcium** has been rather more in demand, and has had a fair shipment to foreign ports; it is £5. 12s. 6d. per ton. **Caustic Soda** has sold more freely for home-trade use, and has had a fairly active shipment; spot is £19. 7s. 6d. per ton for 76%; special prices are quoted for contracts, according to requirements. **Bicarbonate of Soda** has been in good request for use in the U.K., and is £10. 10s. per ton, carriage paid, for the home trade; shipments on foreign account have again been on a large scale. **Soda Crystals** have sold with some freedom for use in the U.K.; the price is £5. 5s. per ton, carriage paid, to home-trade users. **Nitrate of Soda** has had a moderate sale, and is £13. 5s. to £13. 10s. per ton. **Borax** has had a very fair inquiry; commercial grades are—crystals £25. per ton, powdered £26. per ton; higher grades—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has again been in good demand, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** has been in quietly steady request, and is 4¾d. per lb. to stated ports. **Ammonia Alkali** has been well inquired for on home-trade account, and has again been shipped largely for export; it is £7. 10s. per ton, f.o.r. at works, for spot; with special prices for contracts, and £8. per ton for export, varying according to destination. **Hyposulphite of Soda** has been more inquired for, and is £10. per ton, in 2cwt. bags, for commercial, and £15. to £15. 10s. per ton for the photographic quality, in 1cwt. kegs. **Sulphide of Soda** has been quieter, and is £14. 10s. to £15. per ton for solid, and £8. 15s. to £9. per ton for crystals. **Chlorate of Soda** has been but little in request, and is 3d. per lb. **Phosphate of Soda** has been inactive, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been quiet, and is 6d. per lb. **Yellow Prussiate of Potash** has had a very limited inquiry, and the price has eased; it may be given as 1s. to 1s. 0¼d. per lb. **Red Prussiate** has again been in moderate demand, and is 3s. per lb. **Carbonate of Potash** has been quiet, and is £25. to £30. per ton. **Nitrate of Potash**

has been steadily called for, and is £29. to £30. per ton. **Chlorate of Potash** continues to meet with a fair inquiry, and is 3½d. to 4d. per lb. **Caustic Potash** has been rather more in request, and is £29. to £30. per ton. **Permanganate of Potash** has been in moderate demand, and is 9d. to 9½d. per lb. **Bichromate of Potash** has been in fair request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has had a steady inquiry; first quality is £60., and second quality £57. per ton. **Sulphate of Ammonia** has been but little in demand for use in the U.K., but has had a fairly heavy shipment for foreign ports; neutral of 25¾% is £14. 12s. 6d. per ton, and ordinary of 25¼% £13. 9s. 6d. per ton; for November deliveries 2s. 6d. per ton more than the prices given is quoted. **Carbonate of Ammonia** continues to sell rather freely, and is 4d. per lb. **Muriate of Ammonia** has been in moderate demand, and is £32. per ton. **Magnesia** has sold with some freedom; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a quietly steady sale; prices are £11. per ton for use in the U.K., and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has again had a fair inquiry, and is £8. to £10. 10s. per ton, according to quality. **Sulphur** has been in very fair demand; flowers are £10. per ton; roll is £8. 10s. per ton; rock, £8. to £8. 10s. per ton; and American, £5. 5s. to £5. 10s. per ton. **Tartaric Acid** has been quieter, and the price is slightly easier; it is 1s. 1½d. to 1s. 2d. per lb. **Cream of Tartar** has had a rather free sale, and is £4. 10s. per cwt. **Boric Acid** has been in good request; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. to £60. per ton. **Citric Acid** has been lethargic, and the price is lower; it may be given as 1s. 5½d. to 1s. 6d. per lb. **Oxalic Acid** has been very quiet, and is 6d. per lb. **White Acetate of Lead** has been quieter, and is £42. to £42. 10s. per ton. **Sulphate of Copepr** has had a very limited sale for home-trade use or for export; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has again been in very fair demand; quotations are still irregular; from £60. to £61. per ton may be given as the price of white powdered.

WEST OF SCOTLAND CHEMICALS.

Wednesday.

Business in the Glasgow chemical market has been on the better side during the past week, and there has been a fair demand on home-trade account. The main interest, however, is in the export market, where inquiries have been more numerous. There are no price changes, with the exception of a slight reduction in arsenic and potassium prussiate. Quotations, net at Glasgow, are as follows:—**Alum**, lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic**, white powdered, lower at £66. per ton on spot; a steady market. **Barium Chloride**, £14. 10s. per ton; at this price the market remains steady. **Bleaching Powder**, quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid**, crystals, £48. per ton, makers' prices; demand rather poor. **Borax**, crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride**, 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid**, 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate**, £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar**, £4. 3s. 6d. per cwt. for 99% at Glasgow; quotation steady, but inquiry small. **Lead Acetate**, white, £41. 10s. per ton on spot; brown, more inquiry at £43. per ton; Continental material offering at cheaper rates. **Magnesium Chloride**, £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid**, quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax**, 2½d. per lb.; a steady export trade. **Potassium Bichromate**, 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate**, lower at 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate**, 1s. 1½d. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac**, first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre**, £1. 12s. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate**, 4¾d. per lb.; unchanged. **Sodium Chlorate**, 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate**, 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate**, £9. 15s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic**, 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid**, 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

FORMALDEHYDE—
Montreal, 56 brls.; New York, 5 brls.; Philadelphia, 133 brls.

FORMIC ACID—
Hamburg, 168 crbys.

GELATINE—
Rouen, 10 bls.

GLUCOSE—
New York, 20 brls.

GLUE—
Antwerp, 15 bls.; Amsterdam, 1 ble.; Rotterdam, 20 bgs.

GLYCERINE—
Rotterdam, 5 pkgs.

LITHOPONE—
Antwerp, 8 cks.
Hamburg, 20 cks.

MAGNESITE—
Amsterdam, 200 bgs.
Rotterdam, 247 bgs.

MAGNESIUM SULPHATE
Rotterdam, 100 bgs.

MINERAL COLOURS *otherwise undescribed*
Bremen, 50 bgs.

OLEINE—
Antwerp, 2 cks.

OXALIC ACID
Rotterdam, 15 cks.

PARAFFIN WAX
New York, 100 bgs.
Philadelphia, 124 brls.

PHOSPHORUS
Montreal, 94 drms.

POTASSIUM CARBONATE—
Hamburg, 6 brls.

POTASSIUM NITRATE—
Antwerp, 100 bgs.

POTASSIUM PRUSSIATE—
Rouen, 7 cks.

ROSIN—
Bordeaux, 200 cks.
Mobile, 1,000 brls.

SALT—
Hamburg, 150 bgs.

SALTPETRE—
Rotterdam, 75 bgs.

SILVER SALTS (*otherwise undes.*)—
Philadelphia, 33 cks.

SOAP—
Philadelphia, 1,007 bxs.

SODIUM ACETATE—
Rouen, 50 bgs.

SODIUM BICHROMATE—
Baltimore, 75 cks.

SODIUM CHLORATE—
Rouen, 100 cks.

SODIUM PHOSPHATE—
Amsterdam, 33 cks.
Hamburg, 37 brls.

STEARINE—
Antwerp, 55 bgs.

TANNING MATERIALS—
Unspecified
New York, 20 brls.
Norfolk, 55 brls.

TURPENTINE—
Pensacila, 650 brls.

WAX (*otherwise undescribed*)—
Baltimore, 125 brls. : New York, 20 brls.

WAX (*otherwise undescribed*)—
Philadelphia, 975 brls.

ZINC DUST—
Antwerp 224 cs., 40 cks.

ZINC OXIDE—
Antwerp, 40 cks.

NEWCASTLE-ON-TYNE

Week ending October 20.

ACETIC ACID—
Rotterdam, 27 cks.

BARYTES—
Antwerp, 250 bgs.

CALCIUM CARBIDE—
Christiania, 713 drms.
Rotterdam, 780 drms.

CHEMICALS (*otherwise undescribed*)
Bremen, 30 cks.

FORMIC ACID—
Rotterdam, 30 cks.

GLUE—
Antwerp, 139 pkgs., 1 crt.

PYRITES—
Bergen, 1 cs.

SALTPETRE—
Rotterdam, 20 cks.

WHITE LEAD—
Antwerp, 19 cks.
New York, 33 cks.

ZINC OXIDE—
Rotterdam, 5 cks.

N. & S. SHIELDS.

Week ending October 20.

NIL.

EXPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending October 20.

CHEMICALS (*otherwise undescribed*)
Alexandria, 100 pkgs. : Beira, 20 pkgs. ; Delagoa Bay, 405 cs. ; Durban, 255 pkgs. ; Natal, 36 pkgs. ; New York, 2,050 pkgs. ; Valparaiso, 6 cks. ; Vera Cruz, 150 pkgs.

COAL TAR PRODUCTS—
Creosote
Delagoa Bay, 2,520 galls.
Naphthalene
New York, 4 c.
Tar
Beira, 10 c. ; Durban, 2 t. 10 c., and £28. ; Natal, 2 t. ; Pto. Mexico, £20.
Unspecified
Oporto, £104.

PARAFFIN WAX—
Pt. Said, 10 t.

SHEEP DIP—
Beira, 18 t. 19 c.
Delagoa Bay, 9 t. 10 c.
Kilindini, £34.
Natal, 9 t. 10 c.

SOAP—
Ahwaz, 2 t. 6 c. ; Alexandria, 1 t. 4 c. ; Beira, 4 t. 2 c. ; Durban, 1 t.

SODA ASH—
Oporto, 1 t.

SULPHURIC ACID—
Bagdad, 2 t. 10 c.

WAX (*otherwise undescribed*)—
Alexandria, £44.

GRANGEMOUTH.

Week ending October 20.

CHEMICALS (*otherwise undescribed*)
Bergen, 1 t. 18 c.
Christiania, 5 cks., 8 drms.
Trondhjem, 5 c.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Rotterdam, 2 t. 10 c.

PITCH (*otherwise undescribed*)—
Christiania, 72 brls.
Christiansand, 45 t.

HULL.

Week ending October 16.

ACID (*otherwise undescribed*)—
San Francisco, 35 drms.

AMMONIUM SULPHATE—
Amsterdam, a qty.

CHEMICALS (*otherwise undescribed*)
Alexandria, 120 drms. : Abo, 70 pkgs. ; Amsterdam, 11 cs., 20 cks., 1 pkg., 20 drms. ; Copenhagen, 4 cs., 57 cks., 6 drms. ; Gothenburg, 78 pkgs. ; Genoa, 55 drms., 4 cs. ; Hamburg, 38 cks., 195 cs., 274 pkgs.

CHEMICALS (*otherwise undescribed*)
Norrkoping, 17 cks., 6 kgs.
Reval, 2 cs.
Rotterdam, 7 drms.

COAL TAR PRODUCTS—
Creosote
Tacoma, 19 drms.
Naphthalene
Rotterdam, 490 bgs.
Pitch
Baltimore, 20 brls. ; Dunkirk, 180 t. : Hamburg, 11 cks.

FERRO MANGANESE—
Portland, 50 t.

FERTILISERS (*otherwise undes.*)—
Baltimore, 2,239 bgs.

GLUE—
Abo, 7 bgs.

GLYCERINE—
Amsterdam, 100 drms.

LITHARGE—
Vancouver, 29 cks.

SOAP—
Amsterdam, 500 cs. ; Gothenburg, 1,020 cs. ; Lisbon, 50 drms., 40 cs. ; Malta, 10 cs. ; Piraeus, 5 brls., 20 cs. ; Rotterdam, 30 bls. ; Stockholm, 1 cs. ; Vancouver, 50 cs.

TURPENTINE—
Copenhagen, 6 cks.

LEITH.

Week ending October 20.

IODINE—
Dunkirk, 4 overcasks.

PARAFFIN WAX—
Antwerp, 48 bgs.
Dunkirk, 34 bgs.

SHEEP DIP—
Reykjavik, 4 cs. ; Skafteros, 100 drms. ; Vik, 75 drms., 5 cs.

SOAP—
Budardal, 4 cs. ; Hafnarfjord, 1 ck. ; Olafsvik, 2 cks. ; Reykjavik, 8 cks. ; Stokkeseyri, 1 ck.

SODA—
Budardal, 5 bgs.
Westmanno, 10 bgs.

LIVERPOOL.

Week ending October 18.

ACETIC ACID—
Auckland, 1 c., £10.
Algoa Bay, 1 c., £10.

ALBUMEN—
Kotka, 2 t. 1 c., £103.
Melbourne, 5 c., £44.

ALUM—
Hamburg, 10 t. 1 c., £181.
Singapore, 1 t., £18.

ALUMINIUM SULPHATE—
Drammen, 5 t., £38. ; Kotka, 200 t., £1,837. ; Vera Cruz, 50 t., £462.

AMMONIA (ANHYDROUS)—
Lisbon, 5 c., £49.

AMMONIUM CARBONATE—
Aarhus, 3 t., £75. ; Bilbao, 1 t. 9 c., £38. ; Buenos Aires, 2 t. 9 c., £82. ; Copenhagen, 3 t., £75. ; Calcutta, 2 t., £67 ; Constantinople, 1 t. 14 c., £46. ; Cartagena, Spain, 2 t., £48. ; Christiania, 1 t., £29. ; Hamburg, 1 t. 19 c., £46. ; Hong Kong, 1 t., £36. ; New York, 7 t. 1 c., £186. ; Nantes, 10 c., £15. ; Norrkoping, 14 c., £18. ; Rotterdam, 1 t., £23. ; Trondhjem, 10 c., £14. ; Valencia, 10 c., £15.

AMMONIUM CHLORIDE—
Bombay, 5 t., £203. ; Bilbao, 5 t. 5 c., £174. ; Bourgas, 2 t., £84. ; Durban, 1 t. 8 c., £60. ; Karachi, 10 c., £18. ; Marseilles, 2 t. 17 c., £89. ; Philadelphia, 15 t. 4 c., £561. ; Valencia, 3 t. 4 c., £110. ; Valparaiso, 2 t. 19 c., £99.

AMMONIUM SULPHATE—
Hong Kong, 60 t., £960. ; Las Palmas, 60 t., £865. ; Naples, 116 t. 2 c., £1,646. ; Palermo, 19 t. 19 c., £288. ; Patras, 20 t., £295. ; Pt. Louis, 50 t., £786.

ANTIFOULING PAINT—
Bombay, 2 t. 10 c., £251. ; Dunedin, 2 t., £252. ; Fremantle, 10 c., £11. ; Pt. Said, 4 c., £23. ; Punta Arenas, 19 c., £107. ; Sourabaya, 6 t. 17 c., £585.

ARSENIC—
Christiania, 17 c., £61.
Malmo, 11 c., £34.

ARSENIOUS ACID—
Melbourne, 2 c., £166.

BARIUM CHLORIDE—
Bordeaux, 5 t., £80.

BITUMEN—
Valparaiso, 19 t. 1 c., £450.

BLEACHING POWDER—
Algoa Bay, 3 t., £35. ; Bangkok, 1 t., £12. ; Bombay, 55 t., £669. ; Calcutta, 11 t. 4 c., £133. ; Callao, 1 t., £12. ; Durban, 2 t., £24. ; Iquique, 1 t. 3 c., £14. ; Montreal, 14 t. 8 c., £131. ; Madras, 4 c., £18. ; Patras, 1 t. 10 c., £16. ; Perth, 1 t., £12. ; Tampico, 15 t. 3 c., £223. ; Vera Cruz, 2 t., £24.

BOILER COMPOSITION—
Christchurch, 2 t., £14. ; Colombo, 15 c., £11. ; Durban, 1 t. 10 c., £67. ; Pto. Colombia, 1 t., £11. ; Wellington, 2 t., £14.

BORAX—
Barcelona, 1 t., £25. ; Kingston, 4 c., £5. ; Madras, 2 t. 10 c., £63. ; Santos, 1 t. 19 c., £52. ; Sekondi, 1 c., £3 10s.

BORIC ACID—
Barcelona, 2 t. 6 c., £121. ; Colombo, 2 c., £5 5s. ; Calcutta, 3 c., £9. ; Cartagena, Spain, 10 c., £25. ; Durban, 1 c., £4. ; Vera Cruz, 1 c., £3.

CALCIUM CARBIDE—
Lagos, 13 c., £16.

CALCIUM CHLORIDE—
Fremantle, 72 t. 10 c., £436.
Melbourne, 27 t. 2 c., £162.

CELLULOSE ACETATE—
Montreal, 2 c., £26.

CHEMICALS (*otherwise undescribed*)
Adelaide, 1 t. 1 c., £12. ; Alexandria, 1 t., £26. ; Bombay, 6 t. 5 c., £156. ; Bilbao, 2 t., £21. ; Calcutta, 10 t., £250. ; Constantinople, 10 c., £28. ; Gijon, 1 t., £11. ; Lyttleton, 2 t., £52. ; Melbourne, 8 t. 5 c., £674. ; Montreal, 6 t., £36. ; Piraeus, 2 t., £52. ; Sydney, 14 t., £359. ; Teneriffe, 5 t. 5 c., £13. ; Vancouver, B.C., 1 t., £11. ; Wellington, 2 t., £54.

CHLORINE—
Calcutta, 13 c., £22.

CHROME ALUM—
Malmo, 2 t., £36.

CHROMIUM ACETATE—
Vera Cruz, 1 t. 13 c., £107.

CITRIC ACID—
Melbourne, 1 t., £157. ; New Plymouth, 3 c., £30. ; Sydney, 10 c., £79.

COAL TAR PRODUCTS—
Carbolic Acid
Adelaide, 1 c., £9. ; Bombay, 2 c., £22. ; Calcutta, 10 c., £68. ; Fremantle, 2 c., £14. ; Kobe, 5 t., £618. ; Melbourne, 4 c., £31. ; New York, 1 c., £17. ; Sydney, 2 t. 17 c., £131. ; Tientsin, 1 c., £12. ; Switzerland, 3 t., £392.
Creosote
Durban, 8 c., £10. ; New York, 14 t. 9 c., £666. ; Perth, 9 c., £15. ; Rotterdam, 2 t. 15 c., £68.
Dinitrochlorbenzol
Dairen, 10 t. 3 c., £799.
Naphthalene
Algoa Bay, 4 t. 15 c., £83.
Orthocresol
Switzerland, 2 t. 1 qr., £314.
Paranitrochlorbenzol
Swirzerland, 3 c., £22.
Tar
Bombay, 1 t., £28. ; Bathurst, 1 t. 1 c., £12. ; Falklands, 2 t. 9 c., £25. ; Lagos, 4 c., £15. ; Maranham, 1 t. 4 c., £12.
Unspecified
Champerico, 19 c., £49. ; New York, 4 t., £676. ; San Francisco, 25 t. 15 c., £1,193.

COBALT OXIDE—
Leghorn, 1 c., £45.
Oporto, 2 qrs., £18.

COBALT SULPHATE—
Santos, 5 c., £87.

COPPER SULPHATE—
Algoa Bay, 4 c., 2 qrs., £6. ; Beyrout, 14 c., £19. ; Cape town, 9 c., £13. ; Dunedin, 1 t., £27. ; Fremantle, 9 t., £238. ; Monte Video, 9 t. 17 c., £243. ; Pt. Said, 14 t. 15 c., £365. ; Soerabaya, 200 t., £499. ; Trondhjem, 1 t. 1 c., £26. ; Wellington, 3 t. 5 c., £83.

CREAM OF TARTAR—
Auckland, 1 t., £86. ; Melbourne, 3 t., £264. ; Sydney, 10 c., £45.

CRYOLITE—
Buenos Aires, 1 t. 9 c., £50.

DISINFECTANTS (*otherwise undes.*)
Amsterdam, 3 c., £80. ; Antwerp, 11 c., £64. ; Bombay, 27 t. 16 c., £146. ; Boston, 66 t. 18 c., £2,842. ; Bolivia, 4 c. 2 qrs., £13. ; Cape Coast, 7 c., £17. ; Callao, 1 t., £96. ; Colombo, 4 t. 1 c., £134. ; Durban, 2 t. 9 c., £92. ; East London, 8 c., £53. ; Karachi, 3 pkgs, £18. ; Lyttleton, 25 t., £889. ; La Guaira, 5 c., £45. ; Maranham, 7 c., £34. ; Montreal, 3 t. 8 c., £136. ; New York, 104 t. 7 c., £4,201. ; Oamaru, 2 c., £13. ; Rangoon, 8 t. 5 c., £412. ; San Francisco, 10 t. 3 c., £389. ; Sekondi, 4 c. 2 qrs., £15. ; Wellington, 12 c., £112.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 16 t. 6 c., £1,618.
Indigo
Shanghai, 42 t. 14 c., £5,972.
Tientsin, 35 t. 14 c., £4,980.
Unspecified
Auckland, 1 c., £12. ; Adelaide, 3 c., £29. ; Accra, 1 qr., £14. ; Boston, 1 c., £38. ; Buenos Aires, 2 c., £26. ; Bordeaux, 10 c., £180. ; Calcutta, 1 c., £34. ; Danzig, 5 t. 10 c., £505. ; Dunedin 1 t. 2 c., £325. ; Hamburg, 2 t. 6 c., £481. ; Lyttleton, 5 c., £73. ; Melbourne, 1 t. 9 c. 2 qrs., £531. ; Montreal, 2 t. 11 c., £275. ; Madras, 2 t., £280. ; Oamaru, 8 c., £74. ; Pernambuco, 1 t. 9 c., £344. ; Sydney, 1 t. 12 c., £389. ; Shanghai, 1 t., £203. ; Wellington, 1 qr., £10.

DYESTUFFS (NATURAL)—
Annatto
New York, 2 t., £177.
Logwood
Singapore, 8 c., £34.
Orchil
New York, 3 t. 9 c., £134.
Unspecified
Rio de Janeiro, 15 c., £63.

FORMALDEHYDE—
Adelaide, 1 t., £35.

GLYCERINE—
Antwerp, 2 t. 18 c., £197. ; Cape Town, 10 c., £45. ; Christchurch, 1 t., £93. ; Dunedin, 10 c., £47. ; Durban, 1 t., £78. ; East London, 10 c., £46. ; Kobe, 49 t. 4 c., £3,920. ; Oamaru, 10 c., £47. ; Pacas Mayo, 4 c. 2 qrs., £23. ; Salonika, 1 t., £72. ; Shanghai, 10 t. 15 c., £689.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
Buenos Aires, 6 c., £196.

HYDROCHLORIC ACID—
Beira, 1 t. 4 c., £27.

HYDROFLUORIC ACID—
Bahia, 8 c., £48.
Melbourne, 6 c., £51.

IODOFORM—
Abonema, 11¼ lb., £15.
Accra, 9 lb., £15.

LACTIC ACID—
Auckland, 14 c., £29.
Calcutta, 4 c. 3 qrs., £10.

LEAD ACETATE—
Auckland, 5 t. 1 c., £218.
Sydney, 10 c., £19.

MAGNESIA (CALCINED)—
Sydney, 1 t., £46.

MAGNESITE (CALCINED)—
Bahia, 1 t., £125.

MAGNESIUM CARBONATE—
Sydney, 10 c., £23.

MANGESIUM SULPHATE—
Abonema, 1 c., £2. ; Bathurst, 2 qrs., £1. ; Bonny, 1 c., £2 5s. ; Calabar, 1 c., £1 5s. ; Duala, 3 qrs., £1. ; Durban, 1 c., £1. ; Lagos, 1 c., £1 5s. ; Pt. Harcourt, 7 c., £10. ; Suez, 2 c., £2 5s. ; Sierra Leone, 11 c., £14. ; Trinidad, 3 c. 1 qrs., £3. ; Winnebah, 5 c., £7. 5s.

MANGANESE BORATE—
Sydney, 5 c., £24.

NICKEL SULPHATE—
Tientsin, 2 t. 10 c., £85.

OXALIC ACID—
Melbourne, 1 t., £59.

PHOSPHORUS—
P. Colombia, 3 c., £25. ; Launceston, 1 c., £10. ; Santos, 9 c., £52.

PITCH (*otherwise undescribed*)—
Auckland, 64 t. 7 c., £2,299. ; Calcutta, 23 t. 8 c., £576. ; Hamburg, 1 t. 4 c., £16. ; Lyttleton, 10 t. 11 c., £383.

PLATING SALTS—
Shanghai, 2 c., £23.

POTASSIUM IODIDE—
Pt. Harcourt, 2 c. 2 qrs., £268.

POTASSIUM PERMANGANATE—
New York, 1 c., £15.

POTASSIUM PRUSSIATE—
Karachi, 2 c., £21.
Tarragona, 10 c., £57.

POTASSIUM SILICATE—
Bilbao, 1 t., £23.

SALAMMONIAC—
Bourgas, 6 c., £17. ; Melbourne, 5 c., £14. ; Piraeus, 2 t. 1 c., £119. ; Varna, 9 c., £24.

SALICYLIC ACID—
Mombasa, 2 qrs., £12.

SALTCAKE—
Three Rivers, 3,507 t., £15,781.

SHEEP DIP—
Auckland, 1 t. 12 c., £97. ; Buenaventura, 4 c., £23. ; Buenos Aires, 77 t. 7 c., £4,010. ; Cape Town, 5 t. 10 c., £250. ; Comadoro Riverdavia, 4 t. 14 c., £175. ; Durban, 2 t. 19 c., £197. ; Fremantle, 4 t., £258. ; New York, 14 c., £49. ; Pt. Aden, 20 pkgs. ; Batavia, 20 kgs. ; Bombay, 100 kgs. ; Demerara, 48 pkgs. ; Karachi, 100 pkgs. ; Pt. of Spain, 25 pkgs.

SODIUM BICARBONATE—
Alexandria, 100 kgs. ; Auckland, 733 pkgs. ; Bari, 47 kgs. ; Brisbane, 199 pkgs., 7 kgs. ; Buenos Aires, 200 cks. ; Cape Town, 35 pkgs. ; Constanza, 150 pkgs. ; Copenhagen, 45 pkgs. ; Danzig, 10 cks. ; Dar-es-Salaam, 100 pkgs. ; Delagoa Bay, 50 pkgs. ; Demerara, 25 pkgs. ; Halifax, N.S., 100 pkgs. ; Karachi, 1,000 pkgs. ; Kilindini, 25 kgs. ; Kobe, 1,938 pkgs. ; Leghorn, 85 pkgs. ; Malta, 20 kgs. ; Melbourne, 529 pkgs. ; Moji, 1,723 bgs. ; Newcastle, 59 pkgs. ; Odense, 4 cks. ; Piraeus, 40 pkgs. ; St. Lucia, 10 kgs. ; Sydney, 739 kgs. ; Stockholm, 85 kgs. ; Trinidad, 45 kgs. ; Sydney, 20 kgs. ; Valparaiso 100 kgs. ; Wellington, 310 kgs.

SODIUM BISULPHITE—
Matanzas, 20 drms.
Monte Video, 10 drms.

SODIUM HYDROSULPHITE—
Dunedin, 20 pkgs. ; Singapore, 4 cks. ; Sydney, 20 kgs.

SODIUM HYPOSULPHITE—
Auckland, 20 pkgs.
Rouen, 40 kgs.

SODIUM PHOSPHATE—
Calcutta, 9 kgs.

SODIUM SALTS (*otherwise undes.*)
Christiania, 34 cks.

SODIUM SILICATE—
Adelaide, 172 pkgs. ; Boston, 50 cks. ; Calcutta, 57 bgs., 26 drms. ; Durban, 37 pkgs. ; Geelong, 7 cks. ; Montreal, qnty. ; Pto. Cabello, 25 drms. ; Rio de Janeiro, 10 pkgs. ; Sydney, 16 pkgs. ; Wellington, 3 pkgs.

SODIUM SULPHIDE—
Auckland, 11 drms. ; Genoa, 66 pkgs. ; Melbourne, 7 drms. ; Sydney, 78 drms., 10 cks.

SODIUM SULPHITE—
Melbourne, 28 cks.

STEARINE—
Paita, 50 bgs.

TALLOW—
Copenhagen, 29 trcs.

LONDON.

OFFICIAL AMENDMENT.

From return for week ending July 4, 1923, deduct—

DISINFECTANTS (*otherwise undes.*)
Ahwaz, 10 c., £25.

Week ending October 17.

ACETIC ACID—
Mauritius (F.), 5 cs., £23.

ACETONE—
Gothenburg (F.), 16 drms., £628.

ACETYL SALICYLIC ACID—
Bombay, 3 cs. (pt.), £15.; Fremantle, 1 cs., £9.; Melbourne, 1 cs., £17.; Shanghai, 2 cs. (pt.), £8.

AMMONIA—
Accra, 5 cs., £9.; Amsterdam, 6 cs., £11.; Antwerp, 20 cs., £100.; Bombay, 24 cs., £45.; Buenos Aires, 18 cs., £44.; Calabar, 4 cs., £7.; Calcutta, 5 cs., £9.; Canton, 6 cs., £23.; Cape Town, 30 cs., £51.; Durban, 18 cs., £32.; Karachi, 8 cs., £14.; Madras, 3 cs., £5.; Monte Video, 4 cs., £13.; Pt. Elizabeth, 36 cs., £71.; Shanghai, 2 cs., £5.; Singapore, 16 cs., £29.; Suva, 9 cs., £16.

AMMONIA (ANHYDROUS)
Rotterdam, 20 cylds., £156.
Singapore, 1 cyld., £14.

AMMONIUM BROMIDE
Melbourne, 1 cs., £7.

AMMONIUM CARBONATE—
Antwerp, 2 t. 14 c., £70.; Calcutta, 5 c., £23.; Cape Town, 2 c., £6.; Dunkirk, 1 t. 19 c., £58.; Genoa, 6 t. 18 c., £180; Hamburg, 7 t., £152.; Helsingborg, 1 t. 10 c., £46.; Mauritius, 3 c., £8.; Paris, 12 t. 17 c., £306.; Penang, 9 c., £24.; Rouen, 1 t., £32.; Singapore, 1 t. 10 c., £93.

AMMONIUM CHLORIDE—
Auckland, 1 t. 10 c., £50.; Canton, 5 kgs., £14.; Dar-es-Salaam, 10 kgs., £19.; Rotterdam, 1 ck., £13.

AMMONIUM NITRATE—
Antwerp, 89 t. 16 c., £2,314.; Piraeus, 12 t. 15 c., £312.; Rouen, 20 t., £520.

AMMONIUM SULPHIDE
Alexandria, 7 cs., £7.

AMYL ACETATE
Melbourne, 1 cs., £5.

ANTIMONY SULPHIDE—
Copenhagen, 2 cks., £23.
Pt. Alegre, 10 cks., £14.

ARSENIC—
Otago, 5 drms., £21.; Santos, 50 drms., £191.; Trieste (F.), 200 cs., £580.

ARSENIC SULPHIDE—
New York, 4 cks., £22.

BARIUM CARBONATE
Sydney, 4 cks., £16.

BENZOIC ACID—
Lyttleton, 1 cs., £5.
Paris, 4 cks., £50.

BISMUTH CARBONATE—
Cape Town, 3 cs. (pt.), £7.; Christchurch, 1 cs. (pt.), £18.; Melbourne, 2 cs., £139.; Wellington, 1 cs. (pt.), £18.

BISMUTH NITRATE—
Hamburg, 1 cs., £10.

BISMUTH SALTS (*otherwise undes.*)
Calcutta, 1 ck., 1 cs. (pt.), £120.

BISMUTH SUBNITRATE
Bushire, 1 cs. (pt.), £6.

BISULPHITE OF LIME
Sydney, 1 c., £8.

BONE MEAL—
Channel Is., 17 t. 16 c., £130.

BORIC ACID—
Alexandretta, 2 c., £7.; Bagdad, 6 c., £20.; Bombay, 1 t. 5 c., £84. Calcutta, 5 c., £19.; Canton, 1 t., £70.; Cape Town, 1 t., £51.; Cologne, 1 t. 19 c. (F.), £96.; Singapore, 2 c., £7.; Wellington, 4 c., £34.

BORAX—
Benkoelen, 1 t. 11 c., £122.; Delagoa Bay, 2 c., £5.; Durban, 10 c., £26.; Rotterdam, 1 t. 10 c. (F.), £39.

CALCIUM CARBIDE—
Accra, 6 c., £5.; Bagdad, 4 c., £9.; Callao, 2 t., £35.; Channel Islands, 10 c., £9.; Dar-es-Salaam (F.), 2 t., £29.; Nukualofa (F.), 10 c., £8.; Sekondi, 7 c., £9.; Pt. Swettenham (F.), 2 t. 9 c., £37.

CALCIUM CHLORIDE—
Townsville, 29 drms., £64.

CARBON (RETORT)—
Boulogne, bulk, 141 t., £318.

CAUSTIC POTASH—
Wellington (F.), 3 drms., £7.

CAUSTIC SODA—
Cape Town, 1 t., £27.; Jamaica, 1 c., £14.; Melbourne, 1 t. 6 c., £40.; Townsville, 9 t. 16 c., £183.

CHEMICALS (*otherwise undescribed*)
Adelaide, 5 cs., £225.; Alexandria, 14 cs. (pt.), £131.; Alexandria, 2 cs. (pt.), (F.), £6.; Auckland, 7 pkgs., £33.; Beira, 7 pkgs., £90.; Bombay, 5 pkgs. (F.), £13.; Brisbane, 24 cs., £210.; Bushire, 3 cs. (pt.), £5.; Calcutta, 20 cs. (pt.), £61.; Calcutta, 2 cs. (F.), £8.; Canton, 7 pkgs., £14.; Cape Town, 8 pkgs., £14.; Christchurch, 2 cs., £6.; Cologne, 80 pkgs., £193.; Colombo, 6 pkgs., £7.; Dar-es-Salaam, 2 cs., £13.; Delagoa Bay, 2 cs., £6.; Delagoa Bay, 1 cs. (F.), £6.; Dunedin, 10 cs. (pt.), £51.; Durban, 8 cs. (pt.), £15.; Fremantle, 12 pkgs., £186.; Gothenburg, 13 pkgs., £26.; Haifa, 4 pkgs., £29.; Hankow, 20 cs. (pt.), £43.; Hankow, 50 pkgs., £125.; Helsingfors, 10 pkgs. (F.), £48.; Hong Kong, 9 cs. (pt.) £130.; Jamaica, 13 cs., £69.; Karachi, 1 drm., £7.; Kilindini, 5 cs. (pt.), £5.; Lyttleton, 4 cs. (pt.), £17.; Madras, 31 pkgs., £126.; Malta, 8 pkgs., £13.; Manzanillo, 30 pkgs., £75.; Manzanillo, 30 pkgs. (F.), £75.; Mauritius, 12 pkgs., £14.; Melbourne, 29 pkgs. (pt.), £340.; Napier, 2 cs., (pt.), £12.; New York, 2 cs. (pt.), £6.; Otago, 12 cs., £306.; Punta Arenas, 5 pkgs., £7.; Rotterdam, 50 pkgs., £130.; Rotterdam, 25 pkgs. (F.), £275.; Santos, 370 pkgs., £979.; Singapore, 6 pkgs., £14.; Suez, 6 pkgs., £18.; Sydney, 118 pkgs. (pt.), £1,737.; Teneriffe, 3 cs., £12.; Tiflis, 20 pkgs., £50.; Toronto, 2 ds. (pt.), £16.; Trinidad, 4 pkgs., £7.; Wellington, 31 pkgs. (pt.), £197.; Winnepeg, 2 cs. (pt.), £15.

CHROMIUM OXIDE—
Melbourne, 2 cks., £35.

CITRIC ACID—
Accra, 1 c., £8.; Antwerp, 10 c., £83.; Auckland, 11 c., £91.; Barbados, 1 c., £12.; Barcelona, 1 t., £166.; Cape Town, 10 c. (F.), £85.; Christchurch, 1 cs., £7.; Durban, 1 c. (F.), £6.; Durban, 10 c., £89.; East London, 3 c., £32.; Fremantle, 5 c., £42.; Gijon, 10 c., £83.; Hong Kong, 10 c., £95.; Jamaica, 1 c., £9.; Lyttleton, 5 c., £42.; Melbourne, 10 c., £83.; Perth, 1 t., £166.; Pt. Elizabeth, 1 c. (F.), £11.; Pt. Elizabeth, 2 c., £18.; Swatow, 1 c., £12.; Sydney, 1 t., £166.; Vera Cruz, 5 c., £42.; Wanganui, 1 c., £8.; Wellington, 3 c., £28.; Westport, 1 c., £9.

COAL TAR PRODUCTS—
Carbolic Acid
H. Kong, 1 cs. £8.; Malta, 34 pks., £82.; Sydney, 3 cks., £17.

COAL TAR PRODUCTS—
Dinitrotoluol
Piraeus, 2 cks., £45.
Mirbane Oil
Durban, 2 drms., £7.
Suva, 2 drms., £9.
Naphtha
Wellington, 5 drms., £9.
Naphthalene
Jamaica, 15 cs., £50.
Sydney, 20 cks., £45.
Pitch
Antwerp (bulk), 500 t., £3,813.; Boulogne, 25 cks., £86.; France, (bulk), 260 t., £1,664.; Melbourne, 1 brl., £9.; Nukualofa, 5 cs., £5.; Pt. Said, 46 cks., £100. Sierra Leone, 4 cks., £5.; Switzerland, 14 cks., £34.
Tar
Beira, 60 drms., £7.; Durban, 1 cs. £7.; Wellington, 20 drms., £8.

COBALT ACETATE—
Antwerp (F.), 1 cs., £25.

COBALT OXIDE—
Amsterdam (F.), 2 cs., £180.; Brussels, 5 cs., £251.; Genoa (F.), 7 pkgs., £1,938.; Paris (F.), 1 cs., £75.; Paris, 28 cs., £1,951.

COBALT SULPHATE—
Sydney, 5 kgs., £89.

COPPER SULPHATE—
Lagos, 4 c., £6.

CREAM OF TARTAR—
Adelaide, 7 t. 10 c., £639.; Auckland, 10 c., £43.; Brisbane, 1 t. 15 c., £152.; Cairns, 5 c., £32.; Cape Town, 4 c. (F.), £27.; Channel Islands, 1 c., £5.; Delagoa Bay, 1 c. (F.), £7.; Dunedin, 5 c., £22.; East London, 1 c., £5.; Fremantle, 1 t., £87.; Hobart, 1 t. 10 c., £130.; Lyttleton, 9 t. 10 c., £868; Melbourne, 13 t., £1,126.; Mossel Bay, 5 c. (F.), £34.; Pt. Elizabeth, 2 c. (F.), £18.; Sydney, 14 t., £1,214.; Townsville, 1 t., £87.; Wanganui, 1 t., £87.

CUPROUS OXIDE—
Paris, 1 drm., £13.

DISINFECTANTS (*otherwise undes.*)
Auckland, 1 t. 18 c., £40.; Bangkok, 4 t. 3 c., £140.; Barbados, 1 c., £11.; Belewan, 3 t. 1 c., £113.; Bermuda, 15 c., £23.; Bombay, 3 t. 8 c., £138.; Calcutta, 4 t. 16 c., £155.; Canton, 12 c., £21.; Cape Town, 7 t. 6 c., £244.; Christchurch, 6 t. 6 c., £988.; Colombo, 4 t. 4 c., £233.; Dar-es-Salaam, 1 c., £7.; Delagoa Bay, 5 t. 17 c., £136.; Demerara, 7 c., £11.; Durban, 3 c., £7.; Famagusta, 5 c., £15.; Gibraltar, 3 t., £28.; Haifa, 1 c., £5.; Hong Kong, 1 t. 12 c., £19.; Jamaica, 5 t. 12 c., £171.; Karachi, 1 c., £7.; Kilindini, 8 c., £36.; Medan, 4 c., £8.; Penang, 12 c., £32.; Pt. Elizabeth, 2 t. 6 c., £88.; Rangoon, 19 c., £28.; Rio de Janeiro, 2 t. 19 c., £165.; Sekondi, 2 c., £8.; Shanghai, 10 c., £15.; Sydney, 1 t. 13 c., £117.; Winnebah, 7 c., £16.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 30 kgs., £180.
Unspecified
Adelaide, 1 cs., £10.; Barbados, 3 cs. (pt.), £13.; Durban, 1 cs., £7.; Jamaica, 1 cs. (pt.), £9.; Melbourne, 17 pkgs. (pt.), 1 ck., £283.; Nukualofa, 1 cs., £10.; Penang, 1 cs., £16.; Sydney, 4 pkgs., £52.; Suva, 3 kgs., £43.; Wellington, 12 kgs., £176.

ETHER—
Alexandretta, 1 cs., £5.; Bagdad, 4 cs., £13.; Bushire, 3 cs., £6.; Canton, 1 cs., £9.; Lyttleton, 2 cs., £16.; Montreal, 3 cs., £34.; Tientsin, 1 cs., £5.

FERTILISERS (*otherwise undes.*)—
Barbados, 15 t., £151.; Beira, 2 t., £24.; Bermuda, 1 t., £15.; Channel Islands, 2 t. 17 c., £41.; Grimstad, 2 t., £50.; New York, 2 t. 14 c., £70.; Stockholm, 1 t., £25.

FORMALDEHYDE—
Barbados (F.), 1 brl., £16.; Barcelona, 5 cks., £75.; Cape Town (F.), 1 ck., £41.; Gibraltar, 2 cs., £15.

GLYCERINE—
Amsterdam, 6 t. 1 c., £300.; Bagdad, 2 c., £9.; Bushire, 1 c., £7.; Calcutta, 2 c., £24.; Canton, 2 c., £11.; Hong Kong, 1 t., £92.; Monte Video, 1 c., £5.; Riga, 10 c., £47.

GUANO—
Demerara (F.), 50 t., £813.

HYDRIODIC ACID—
Otago, 1 drm., £6.

HYDROCHLORIC ACID—
Alexandria, 2 c., £5.; Benkoelen, 1 t. 2 c., £50.; Colombo, 13 c., £15.

HYDROCYANIC ACID—
Melbourne, 2 cs., £15.

HYDROFLUORIC ACID—
East London, 1 cs., £7.
Pt. Elizabeth, 1 cs., £8.

HYDROGEN PEROXIDE—
Antofagasta, 3 cs., £8.
Colombo, 1 cs., £6.

HYPOPHOSPHOROUS ACID
Sydney, 2 cs., £14.

IODIDES (*otherwise undescribed*)
Alexandria, 1 cs. (pt.), £48.
Calcutta, 1 cs. (pt.), £50.

IODINE—
Bombay, 1 cs. (pt.), £26.; Brussels (F.), 1 cs., £47.; Cape Town, 1 cs. (pt.), £26.; Calcutta, 1 cs., £96.; Naples, 2 cs., £124.; Paris (F.), 60 kgs., £4,380.; Rio de Janeiro, 1 cs., £73.

IODINE (RESUBLIMED)—
Brussels, 14 cs. (pt.), £588.
Melbourne, 1 cs. (pt.), £104.

IRON AMMONIUM CITRATE—
Bombay, 5 cs. (pt.), £16.

IRON HYPOPHOSPHITE—
Sydney, 3 cs., £28.

IRON PERCHLORIDE—
Melbourne, 5 crts., £7.

IRON SULPHIDE—
Lyttleton, 1 cs., £16.

LEAD ACETATE—
Fremantle, 23 kgs., £49.

MAGNESIA—
Auckland, 10 cs., £24.
Singapore, 2 cs., £5.
Sydney, 50 cs., £121.
Wellington, 10 kgs., 10 cs., £48.

MAGNESIUM CARBONATE—
Auckland, 1 cs., £6.; Calcutta, 1 cs., £5.; Rio de Janeiro, 10 cks., £60.; Sydney, 20 cs., £33.; Trinidad, 1 cs., £6.; Wellington 2 cs., 1 tank (pt.), £14.

MAGNESIUM SULPHATE—
Auckland, 10 c., £13.; Barbados, 10 c., £10.; Bombay, 5 c., £6.; Brisbane, 2 t. 9 c., £56.; Buenos Aires, 3 c., £6.; Cairns, 12 c., £13.; Canterbury, 5 c., £6.; Canton, 5 c., £5.; Cape Town, 5 c., £6.; Christchurch, 9 c., £27.; Delagoa Bay, 5 c., £6.; Demerara, 10 cks., £8.; Durban, 15 c., £19.; Gisborne, 11 c., £13.; Greymouth, 5 c., £6.; Melbourne, 9 t. 1 c., £206.; Montreal, 2 t. 10 c., £34.; Mossel Bay, 6 c., £8.; Pt. Elizabeth, 2 c., £6.; Rockhampton, 4 t. 6 c., £93.; Singapore, 11 c., £8.; Suva, 5 c., £6.; Townsville, 1 t. 3 c., £26.; Wellington, 1 t. 1 c., £25.

MERCURY BICHLORIDE—
Montreal, 2 cs., £83.

MERCURY OXIDE—
Bushire, 1 cs. (pt.), £12.

METHYL ACETONE—
Copenhagen, 7 drms., £148.

METHYL SALICYLATE—
Brisbane (F.), 1 cs., £8.
Durban, 1 cs., £5.
Melbourne (F.), 1 cs., £9.
Sydney, 4 cs., £55.

NICKEL SALTS (*otherwise undes.*)—
Kobe, 2 cks., £25.

NITRIC ACID—
Alexandria, 1 c., £6.
Singapore, 1 c., £10.

OXALIC ACID—
Calcutta, 1 cs., £5.

PHOSPHATE OF LIME—
Cape Town, 10 c., £18.

PHOSPHORIC ACID—
Lyttleton, 6 cs., £37.
Melbourne, 1 cs., £7.

PICRIC ACID—
Singapore, 1 cs., £6.

PLATINUM CHLORIDE—
Melbourne, 1 cs., £1,123.

POTASSIUM BICARBONATE—
Wellington, 2 kgs., £6.

POTASSIUM BROMIDE—
Hobart, 1 ck., £5.
Paris, 8 cs., 5 cks., 15 pkgs., £230.

POTASSIUM CARBONATE—
Suva (F.), 1 ck., £10.
Sydney (F.), 4 cks., £34.

POTASSIUM CHLORIDE—
Colombo, 4 cs., £12.

POTASSIUM CITRATE—
Bombay, 5 cs. (pt.), £15.; Calcutta, 1 cs. (pt.), £7.; Christchurch, 1 cs. (pt.), £6.; Durban, 1 cs. (pt.), £7.; Hobart, 4 cs., £54.; Montreal, 3 cs., £46.

POTASSIUM CYANIDE—
Canton, 8 cs., £93.
Singapore, 2 cs., £24.

POTASSIUM IODIDE—
Accra, 1 cs., £24.; Antwerp, 1 cs., £86.; Auckland, 1 cs., £88.; Bangkok, 1 cs., £52.; Bombay, 1 cs., £88.; Brisbane, 1 cs., £88.; Brussels, 13 cs. (pt.), £286.; Calcutta, 2 cs. (pt.), £42.; East London, 1 cs. (pt.), £7.; Naples, 7 cs., £398.; Otago, 1 cs., £90.; Rio de Janeiro, 2 cs., £190.; Wellington, 2 cs. (pt.), £11.

POTASSIUM METABISULPHITE
Adelaide, 3 cs., £9.

POTASSIUM OXALATE—
Lyttleton, 1 kg., £8.

POTASSIUM PERMANGANATE—
Adelaide, 2 drms., £8.; Auckland (F.), 1 cs., £5.; Lyttleton (F.), 3 cs., £11.; Otago, 2 cs., £8.; Suva, 1 ck., £11.; Wellington, 2 drms., £8.

POTASSIUM PRUSSIATE—
Fremantle, 2 kgs., £14.
Sydney, 6 kgs., £29.

POTASSIUM SULPHATE—
Demerara, 30 bgs., £37.

SALAMMONIAC—
Auckland, 1 brl., £6.; East London, 2 kgs., £6.; Lyttleton, 1 ck., £14.

SALICYLATES (*otherwise undes.*)—
Shanghai, 1 cs. (pt.), £7.
Sydney, 9 cs., £351.

SALICYLIC ACID—
Jamaica, 1 kg., £7.
Wanganui, 1 kg., £12.

SALTPETRE—
Fremantle, 2 t. 10 c., £105.; Melbourne, 2 c., £7.; Mossel Bay, 3 c., £6.; Pt. Elizabeth, 9 c., £21.; Sydney, 10 c., £20.

SHEEP DIP—
Cape Town, 5 t. 5 c., £140.; Durban, 5 t. 17 c., £158.; East London, 2 t. 4 c., £56.; Pt. Elizabeth, 2 t. 4 c., £56.

SILVER NITRATE—
East London, 1 cs. (pt.), £11.

SODA ASH—
Penang, 1 t. 5 c., £26.
Townsville, 10 t. 17 c., £88.

SODA CRYSTALS—
Bangkok, 5 c., £20.; Barbados, 10 c., £7.; Mauritius, 6 c., £5.

SODIUM ACID PYROPHOSPHATE
Sydney, 2 c., £8.

SODIUM ARSENITE—
Durban, 3 t. 16 c., £274.

SODIUM BENZOATE—
Dunkirk, 4 c., £49.
Mauritius, 1 cs. (pt.), £7.

SODIUM BICARBONATE—
Accra, 12 c., £7.; Alexandria, 2 c., £7.; Brussels, 9 c., £13.; Calcutta, 12 c., £37.; Cape Town, 5 c., £8.; Constantinople, 10 c., £26.; Delagoa Bay, 4 c., £6.; Durban, 11 c., £17.; Montreal, 9 c., £26.; Mossel Bay, 6 c., £9.; Pt. Elizabeth, 4 c., £6.; Rockhampton, 6 t., £66.; Vancouver, 7 c., £17.

SODIUM BISULPHATE—
Sydney, 1 c., £8.

SODIUM BISULPHITE—
Antwerp, 2 t., £36.; Buenos Aires, 10 t., £180.; Copenhagen, 5 t., £95.; Paris, 5 c., £5.; Penang, 2 t., £11.; Sourabaya, 2 t. 1 c., £45.

SODIUM CARBONATE—
Benkoelen, 8 c., £11.

SODIUM CITRATE—
Melbourne, 1 c., £5.
Montreal, 1 t. 1 c., £206.

SODIUM CYANIDE—
Durban (F.), 2 t. 19 c., £220.; Haifa, 8 c., £65.; Townsville, 2 t., £240.

SODIUM HYDROSULPHITE—
Nevis, 1 c., £11.

SODIUM HYPOSULPHITE—
Pt. Sudan, 5 c., £6.

SODUIM IODIDE—
Auckland, 1 cs. (pt.), £7.; Brussels, 3 cs. (pt.), £25.; Melbourne, 1 cs. (pt.), £6.; Naples, 8 c., £755.

SODIUM SALICYLATE—
Bagdad, 1 c., £14.; Christchurch, 1 c., £7.; Melbourne, 1 c., £13.

SODIUM SALTS (*otherwise undes.*)
Calcutta, 1 cs. (pt.), £8.

SODIUM SILICATE—
Durban, 8 c., £12.; Pt. Elizabeth, 1 t. 9 c., £49.; Townsville, 6 t. 1 c., £56.

SODIUM SULPHATE—
Durban, 20 cs., £5.

SODIUM SULPHITE—
Demerara, 11 c., £8.; Lyttleton, 1 t., £29.; Sydney, 1 t. 4 c., £36.

SODIUM SULPHITE (ANHYDROUS)
Penang, 10 c., £14.

SODIUM TARTRATE—
Canton, 2 c., £12.
Sydney, 1 t., £72.

SPENT OXIDE—
Amsterdam, qty., £437.

SULPHUR DIOXIDE—
Alexandria, 12 cylds., £37.

SULPHURIC ACID—
Accra, 14 c., £37.; Bagdad, 2 c., £15.; Calcutta, 6 t. 4 c., £223.; Colombo, 1 t. 10 c., £36.; Haifa, 2 t. 6 c., £310.; Madras, 2 c., £10.; Sekondi, 2 t. 4 c., £40.

TARTARIC ACID—
Adelaide, 1 t. 15 c., £216.; Auckland, 7 c., £43.; Bermuda, 1 c., £5.; Brisbane, 3 t. 5 c., £397.; Cape Town, 1 c. (F.), £9.; Dunedin, 7 c., £42.; Durban, 1 c. (F.), £9.; East London, 2 c., £15.; Fremantle, 1 t., £122.; Hong Kong, 10 c., £78.; Lyttleton, 5 c., £31.; Melbourne, 9 t. 10 c., £1,159.; Montreal, 5 c., £37.; Mossel Bay, 1 c. (F.), £9.; Paris, 2 t., £235.; Perth, 1 t. 10 c., £183.; Pt. Alma, 10 c., £61.; Pt. Eliazbeth, 6 c., £39.; Pt. Elizabeth, 2 c. (F.), £18.; Rotterdam, 5 c., £31.; Vera Cruz, 2 c., £12.; Wellington, 2 c., £18.; Westport, 1 c., £7.

THORIUM NITRATE
Sydney, 2 cs., £85.

TIN OXIDE—
Brussels, 3 cks., £70.

TITANIUM POTASSIUM OXALATE
Cape Town, 2 cks., £16.

ZINC OXIDE—
Buenos Aires, 3 cks., £10.; Bergen, 15 cks., £37.; Copenhagen, 170 cks., £593.; Dunedin, 1 cs., £5.; New York, 9 cs., £56.; Puerto de Progreso (F.) 10 c. £23.; Sydney, 2 cs., £12.; Tampico, 30 cks., £130.; Toronto, 3 cks., £34.

Week ending October 20

BEESWAX

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE INTERPRETATION OF THE SAFEGUARDING ACT.

DURING the past fortnight a point of considerable importance to chemical merchants and importers has arisen in connection with the interpretation by the Customs authorities of the Safeguarding of Industries Act (Part I). One of the clauses to the Act states that "The value of any imported goods, for the purpose of the Act, shall be taken to be the price which an importer would give for the goods if the goods were delivered to him freight and insurance paid, in bond at the port of importation, and duty shall be paid on that value as fixed by the Commissioners." In the past the Customs have adopted a logical interpretation of this clause, and have made it a general practice to accept importers' c.i.f. invoices as evidence of "the value of the goods in bond"; and the amount of duty levied has been based on such invoices. Early last week, however, a circular was issued by H.M. Customs in London to all Dock Officers in Great Britain instructing them to scrutinise all invoices submitted by importers, and that all cases where the "invoice value" of the goods specified thereon appears to be below the fair market price, should be referred to the Customs' Headquarters in London for consideration. These instructions have already been translated into action, and in several cases where the Customs have admitted the importers' invoices as being perfectly *bona-fide*, and where they were also quite satisfied that the price stated is the actual price paid, additional duty has been levied on the grounds that the invoice price was not a "fair market price" at the date the goods were landed in this country. It appears that the reason given for this action on the part of the Customs authorities is that they have had occasion recently to suspect the genuineness of invoices in certain isolated cases. Whilst, however, it may be true that such falsified invoices have been submitted in a few cases, there is no ground for believing that this is a practice adopted by any but a very small minority of merchants. It is rather strange that if the Customs believe that they are legally empowered under the Act to disregard *bona-fide* invoice prices, and to estimate their own prices for the purpose of levying duty, they have not taken advantage of these powers before now. It is common knowledge that the 33⅓ per cent. import duty has proved a very inadequate protection, and that duty-paid imported chemicals have been able to undersell

the home-produced products in a large number of cases. For our own part, however, much as we may sympathise with the attitude of the Customs, we cannot see how they are empowered under Part I of the Safeguarding of Industries Act to adopt their present attitude, since special provisions for these and similar cases are made under Part II. of the Act. There is nothing in the Act to prevent a scheduled article being charged double duty under both Parts; but neither is there any provision whereby a Part II. duty can be levied on an article prior to a Special Order having been obtained under Part II. The dislocation caused in chemical merchants' business by the new Customs' decision has already been considerable, and the British Chemical and Dyestuffs Traders' Association is pressing for the withdrawal of the instructions, but so far the efforts have been without avail. On Monday a deputation from the Association argued the whole matter out with the Customs for over two hours, but the latter would not modify their position. It seems that the only course will be to take a test action to the referee, and this, we understand, is the probable intention of the Association.

THE PROGRESS OF THE B.A.C.

Few organisations have had to encounter such a succession of difficulties during their early years as has the British Association of Chemists, and it is no mean tribute to the energy and executive ability of the council and officers, and to the enthusiasm of the members, that the Association was able to produce such a favourable report and balance sheet at the sixth annual meeting at Birmingham last Saturday. The past year, as the president, Dr. Levinstein, stated, has probably been the most critical one in the history of the Association, and a favourable balance sheet, even though resultant to some extent on a curtailment in the Association's activities, is a very satisfactory achievement. The policy of the council in not increasing the annual subscription is, we think, a wise one, and it is to be hoped that the appeal of the Association for an increase in membership will meet with the success it merits. In the establishment of the Unemployment Benefit Fund, the Association adopted a bold policy, and although the scheme is, after all, still in the experimental stage, the results so far achieved are highly promising. The original idea of an organisation principally to safeguard the economic interests of the chemist was viewed with misgivings in some quarters, and the registration of the Association as a trade union enhanced these misgivings among the older chemists. It is safe to assume, however, that these fears—which never rested on any solid foundation—have now vanished, and chemists are realising that a movement having as its principal objective the raising of the economic status of the chemist, affords also a practical method of raising his social, professional, and political status. The relations between the British Association of Chemists and the Institute of Chemistry occasioned much discussion at the Birmingham meeting. We suspect there is a certain amount of feeling amongst the members of the former body that the latter is not doing all it might to help the younger and non-competitive organisation. We ourselves can make no comment on this point, but cannot help recalling that it was the inception of the B.A.C. some seven years ago that aroused the Institute to activity from a state which could only be described as moribund.

ARBITRATION IN THE CHEMICAL TRADE.

The judgment of Mr. Justice Greer in the case *Scrimaglio* v. *Thornett and Fehr*, gives a decision on a rather important point in arbitration law, so far as it relates to the chemical trade. A contract was entered into between the plaintiffs and the defendants which contained the arbitration clause: "Any dispute arising out of the contract shall be settled by arbitration in London in the usual way." A dispute did arise, and the defendants interpreting the words "the usual way" to mean under the rules formulated by the British Chemical Trade Association, according to which each side appoints an arbitrator, and the two arbitrators, if they differ, appoint an umpire, did appoint their arbitrator. The plaintiffs, however, did not appoint one, and the defendants' arbitrator delivered his award, which the plaintiffs refused to accept. The plaintiffs held that the words "in London in the usual way" meant under the Arbitration Act, and by an arbitrator appointed by the court. Mr. Justice Greer, in giving his decision in favour of the defendants, stated he was satisfied that the arbitration clause referred to the chemical trade, and hence to the procedure of the British Chemical Trade Association. Leave to appeal has been granted, and it is thus possible that the decision may be reversed; but, as the matter stands, it is now established that unless special provision to the contrary is made in a contract, the B.C.T.A. procedure is the one implied.

GOVERNMENT REMUNERATION OF SCIENTIFIC TALENT.

A fortnight ago, commenting in these columns on the address of Lord Salisbury to the Imperial Conference, we made some reference to his remarks on the remuneration of scientific men in the Government service, and pointed out that his words as reported in the Press might give the impression that the Government were willing to exploit scientific talent by giving it a lower rate of remuneration than it could obtain in the service of private industry. Lord Salisbury now informs us—in a letter we publish on another page—that he was referring not to the permanent scientific staff of the Department, but to the distinguished men who serve on the Advisory Council and similar bodies, and who in many cases forego voluntarily the honorarium offered them. We are pleased to publish Lord Salisbury's remarks, and to learn that the impression we gained, rather naturally, from the report of his speech does not represent the true facts.

THE RARE ALKALI METALS.

LITHIUM, RUBIDIUM, AND CAESIUM.

By "Investigator."

IN 1817 a new earth was discovered by Arfvedson and termed "lithia" by the discoverer, because, unlike soda and potash, it was not at the time recognised as a constituent of plant ash. Caesium and rubidium were discovered by Bunsen and Kirchhoff in Dürkheim water in 1860 and 1861, the former being the first element to be detected spectroscopically. On account of their strong resemblance to potassium compounds, those of caesium and rubidium had long escaped detection, until differentiation was possible with the aid of the spectroscope.

By the method of positive ray analysis, F. W. Aston and J. J. Thomson (*Nature*, 1921) have now revealed the composite nature of lithium and rubidium, the former consisting of isotopes of masses 6 and 7, the latter of isotopes of masses 85 and 87. Caesium, however, has not been resolved. According to Hahn and Rothenbach (*Chem. Zentr.*, 1919), like potassium, the salts of rubidium are radioactive, but no activity could be detected in caesium salts. Compared with thorium, the activity is only one-tenth, although greater than that of potassium, while the product of the radioactive change should be a strontium isotope. The periodic classification of the elements predicts the existence of an alkali metal of higher atomic weight than caesium. In the search for this new element, Dennis and Wyckoff (*J. Amer. Chem. Soc.*, 1920), subjected a large quantity of caesium chloride to fractional crystallisation and precipitation, but no evidence of its presence was obtained.

The Occurrence of Lithium.

Contrary to the expectations of its discoverer, lithium is present in land- and marine-plant ashes, notably in tobacco ash, to the extent of 0.07 per cent. Milk, blood, and human organs, particularly the lungs, also contain lithium compounds. As lithium chloride, the element occurs in most mineral springs and in sea water, some Cornish wells containing as much as 30 grains per gallon; while, together with strontium, it is present to an even greater extent in the Italian Salsomaggioro water. Data with regard to the principal lithium-bearing minerals are contained in the following table:—

Mineral.	*Occurrence.*	*Li_2O Content.* Per Cent.
Lepidolite or lithia mica, $9SiO_2$, $3Al_2O_3$, K_2O, $4LiF$.	Rozena (Moravia), and Pala, California.	6
Petalite $30SiO_2$, $4Al_2O_3$, Na_2O, $2Li_2O$..	Uto Island, Sweden, Maine, U.S.A.	5
Spodumene, $15SiO_2$, $4Al_2O_3$, $3Li_2O$..	S. Dakota, U.S.A. ..	5–7
Amblygonite and Montrebrasite, $AlPO_4$, LiF, $AlPO_4$, $4LiOH$.	Montrebras, France, California.	10
Triphylite and Lithiophylite, $LiMnPO_4$ $LiFePO_4$.		8–9½

Zinnwaldite, another lithia-bearing mica, is usually found in tin-mining areas, particularly those of Cornwall, while Arfvedson first discovered lithia in the petalite present in the iron mines of Utö Island, near Stockholm. A glassy variety of the latter mineral, known as castorite, is found in the island of Elba. Spodumene frequently occurs in South Dakota in the form of large prismatic crystals, one gigantic specimen yielding 37 tons of the mineral. Kunzite, a variety of spodumene, finds application as a gem-stone. The fluorphosphate amblygonite very often resembles felspar in appearance.

Lithium Extraction from Silicate Minerals.

In the separation of lithium chloride from non-phosphatic minerals, such as lepidolite, the finely powdered material is mixed with concentrated sulphuric acid, and the resulting agglomerate calcined in a reverberatory furnace to yield sulphates and silica. While still warm, the mass is lixiviated with water, and the solution treated with the calculated quantity of potassium sulphate necessary to form alum with the aluminium sulphate. Not being very soluble, the potassium alum separates out as a fine meal, while any residual aluminium salts are precipitated as alumina by the addition of milk of lime. Barium chloride, in correct quantity, is now added, with the result that the solution will consist substantially of lithium and potassium chlorides—if lepidolite was the raw material,—together with small amounts of sodium and calcium chlorides. After evaporation to dryness, the lithium and calcium chlorides are dissolved out with absolute alcohol, the alcohol is evaporated, and the calcium and any heavy metal salts are removed by treatment with ammonium carbonate and sulphide respectively. The filtered solution is then taken to dryness, and the residue freed from ammonium salts by heating.

In a modification of this process, after decantation from the alum, whiting is added and the solution boiled, when the residual alum is precipitated as alunite by the aluminium hydroxide formed. After removing magnesium and heavy metals as hydroxides with milk of lime, the concentrated solution of sulphates is treated with potassium carbonate, and the sparingly soluble lithium carbonate collected.

According to a recent specification, a lithium-potassium ore is heated with potassium sulphate to a temperature of about 800° C. After lixiviation, the solution of sulphates is treated with sufficient ammonia to throw out iron, aluminium, and magnesium as hydroxides, and to render the potassium sulphate insoluble. From the clear solution, the lithium is obtained as carbonate (*U.S. Pat.* 1,430,877, of 1922).

Lithium Salts from Minerals Containing Phosphates.

A mixture of amblygonite and sodium bisulphite is heated in cast-iron retorts, any silicon fluoride and hydrofluoric-acid vapours being collected. After extracting the mass, the clear liquor is freed from aluminium, iron, and copper by the addition of sufficient sodium carbonate for the purpose. On further treatment with sodium carbonate, the lithium is thrown out of the filtrate as lithium carbonate. In the case of triphylite (substantially lithium manganous phosphate), the material is dissolved in hydrochloric acid, and, after oxidation with nitric acid and neutralisation, the phosphoric acid is removed by precipitation with a ferric salt. To the filtrate, barium sulphide is added to precipitate the manganese, any excess of barium is removed with ammonium carbonate, the clear liquor evaporated to dryness, and the residue heated to drive off ammonium compounds. The residues from the foregoing processes are rich in phosphates, and find application as fertilisers.

A very direct extraction process, due to Zell, consists in heating the lithium ore with carbon in a current of acetylene, so that the volatile lithium hydrogen carbide is formed. On decomposing this with water, the products are acetylene and lithium hydroxide. According to Willard and Smith's recent investigation (*J. Amer. Chem. Soc.*, 1922), lithium can be separated effectively from sodium in one operation by treating a solution of the mixed perchlorates in *n*-butyl alcohol with an alcoholic solution of hydrochloric acid, when only sodium chloride is precipitated.

Occurrence and Extraction of Caesium and Rubidium.

Caesium occurs free from rubidium, to the extent of about 30 per cent., in pollucite, a rare aluminium silicate found in Elba. As chloride, it is present in certain mineral waters, notably in that from the Wheal Cliff Mine (Yorks). Usually it is found, together with rubidium, in lithium ores, certain lepidolites containing about 0.4 and 0.2 per cent. of caesium and rubidium respectively. To isolate them the alums obtained as a by-product in lithium extraction are subjected to fractional crystallisation, potassium alum being 22 times more soluble than the caesium compound. With antimony chloride, caesium chloride forms a sparingly soluble double chloride $SbCl_3.6CsCl$, a property which is utilised in the separation of caesium from rubidium. A large variety of minerals contain rubidium, although carnallite, which contains about 0.025 per cent., is the chief source. In the extraction of potassium chloride from this mineral, the mother liquors are treated with aluminium sulphate, and the sparingly soluble rubidium alum crystallised out. Although very widely distributed in plant-life, rubidium cannot replace potassium as a plant food.

Isolation and Properties of the Metallic Elements.

Owing to the low volatility of metallic lithium, it cannot be obtained by igniting the carbonate with carbon or the hydroxide with iron, the older methods applicable to sodium and potassium. The usual method, a modification of that used by Bunsen, is to electrolyse fused lithium bromide containing 10—15 per cent. of the chloride, with a current of 100amps. at 10 volts, the cathode being carbon and the anodes iron rods. Another method, due to Kahlenburg, is to electrolyse a pyridine solution of lithium chloride, when the solvent unites with the liberated chlorine, leaving the metal unaffected.

Rubidiun. can be isolated by heating a mixture of the carbonate, carbon, and chalk in a still, or by distilling the chloride with metallic calcium in an iron retort. A similar process is applicable in the case of caesium, but this element is most readily obtained by heating the hydroxide with aluminium in a nickel still. Electrolytic methods, such as the electrolysis of a mixture of the cyanide with barium cyanide, using aluminium electrodes, can also be used.

Lithium metal is the lightest solid known, and will float on paraffin. With increasing atomic weight the density rises, but the melting-point falls. Thus the specific gravities (at 15° C.) and the melting-points are 0.59, 1.5, 1.9, and 180° C., 38.5° C., 26.5° C. for litnium, rubidium, and caesium respectively. The order of reactivity is that of increasing atomic weight—caesium, the most electro-positive element, decomposing water with violence at very low temperatures, to form the hydroxide, which is the strongest known base. Lithium, on the other hand, tarnishes much less rapidly than the other alkali metals.

All three metals combine with hydrogen to form hydrides. These compounds yield formates with carbon dioxide, amides and hydrogen with ammonia, phosphine with phosphorus, nitrides and amides with nitrogen, and hydrogen with water. By the last reaction, 1 gramme of lithium hydride (LiH) will yield the large volume of 2.8 litres of hydrogen. Lithium will combine with nitrogen, even at ordinary temperatures, to form black lithium nitride Li_3N, a compound which unites with hydrogen with the formation of the very hydroscopic lithamide $LiNH_2$. The latter is decomposed by water with the liberation of hydrogen and ammonia.

Like sodium, lithium forms several amalgams, and can be alloyed with antimony, tin, and lead. These alloys have higher melting-points than either of the constituent metals, and constitute powerful reducing agents. Recently a large range of lithium-aluminium alloys has been patented as being suitable for constructional purposes, one such composition consisting of aluminium (85 per cent.), zinc (12 per cent.), lithium (½ per cent), together with copper, manganese, or nickel (*Brit. Pat.* 147,903, of 1920).

The More Important Lithium Compounds.

As is to be expected from the first element of a group, the compounds of lithium are abnormal, in that they show many differences from the compounds of the rest of the group. In many respects lithium resembles calcium, and acts as a bridge between the alkali-metal group and that of the alkaline-earth metals.

Lithium oxide can be obtained by heating the nitrate. It dissolves slowly in water to form lithium hydroxide, a substance which is not so deliquescent as the corresponding compounds of sodium and potassium. Also, unlike the latter, it is insoluble in alcohol. Lithium hydroxide is usually prepared from the carbonate by boiling with milk of lime. Two carbonates are formed, $LiHCO_3$ and Li_2CO_3, the bicarbonate being the more soluble of the two, the carbonate being only sparingly soluble. In both these respects lithium behaves more like calcium than the other alkali metals. Thus on adding a solution of sodium carbonate to lithium-chloride solution, lithium carbonate separates out, a property utilised in the extraction of lithium from its ores. The normal carbonate is less soluble in hot water than in cold. Lithium carbonate can be prepared from the chloride by adding a hot concentrated solution to an ammoniacal solution of ammonium carbonate. It is quite insoluble in alcohol, decomposes at 600° C., and melts more readily than the sodium and potassium compounds. The commercial product usually contains 98.5 per cent Li_2CO_3.

Like calcium chloride, but unlike the chlorides of the other metals of the alkali group, lithium chloride is deliquescent, and, on heating, tends to become basic through loss of hydrochloric acid. It will dissolve in alcohol, resembling calcium chloride in this respect, but differing from the other chlorides. Ether will also dissolve lithium chloride, a property not possessed by the chlorides of sodium, potassium, or calcium. Like the calcium compound, lithium chloride will absorb ammonia at low temperatures (– 18° C.), with the formation of a series of compounds $LiCl.NH_3$ to $LiCl.4NH_3$. Lithium fluoride is much less soluble than the corresponding sodium or potassium compounds, being similar to calcium fluoride in this respect.

Lithium phosphate, Li_3PO_4, like calcium phosphate, is only slightly soluble, and is precipitated when disodium hydrogen phosphate is added to a lithium salt solution. This disparity in solubility, compared with the sodium and potassium salts, is utilised in the separation of lithium from other alkali metals. Lithium sulphate forms a double salt with potassium sulphate, but does not form alums. The latter property is turned to advantage in the extraction of lithium from its ores. There is no acid sulphate.

On fusing lithium carbonate with silica, the resulting silicates do not give amorphous glasses on cooling, as in the case of sodium or potassium carbonates, but the product is crystalline, like most metal silicates. Two varieties of lithium metasilicate—soluble and insoluble—are known. Amorphous silicic acid, dried at 100° C., will dissolve slowly in 5 per cent. lithium hydroxide at ordinary temperatures, the latter resembling sodium and potassium hydroxides in this respect. On heating this solution to about 80° C., however, a white, granular, insoluble silicate is formed, with composition represented by the formula $Li_2SiO_3.H_2O$. The latter compound can also be obtained by treating concentrated sodium metasilicate solution with the equivalent quantity of lithium chloride in the presence of lithium hydroxide and heating to about 80° C.

Some Complex Compounds of Rubidium and Caesium.

The chlorides of rubidium and caesium form double salts with a wide variety of metallic chlorides, many of these having found application in microchemical analysis. Thus, according to Bayer (*Monatsh. Chem.*, 1920), characteristic crystalline double chlorides of the general formula xAgCl.y.RbCl are formed when solutions of rubidium chloride and silver salts are mixed. Part of the silver chloride in these double salts is replaceable by gold chloride, the rubidum-gold-silver chloride which results crystallising in blood-red platelets and prisms. A similar compound is formed with caesium chloride, but this crystallises in cubes and stars. As analogous compounds are not formed with potassium chloride, the formation of these triple salts will serve to detect traces of rubidium or caesium in the presence of potassium. The smallest quantities recognisable by this reaction are 0.1 microgramme* in the cases of gold, rubidium or caesium, and 0.01 microgramme in the case of silver. Rubidium and caesium, like all the alkali metals, form chloroplatinates of the general formula X_2PtCl_6. At ordinary temperatures the solubilities of the rubidium and caesium compounds are of the order of 0.13 and 0.02 respectively, the value for potassium chloroplatinate being 0.7.

In addition to the commoner rubidium alums, a large number of these compounds have been prepared from rubidium sulphate and the sulphates of indium, titanium, iridium, and vanadium. An iron rubidium selenium alum, $Rb_2SeO_4.Fe_2(SO_4)_3.24H_2O$, can be obtained by treating a solution of ferric hydroxide in excess selenic acid with rubidium carbonate. The product forms pale violet crystals which melt to a deep-red liquid at about 45° C. Like potassium, caesium and rubidium form a variety of complex compounds with the halogens, such derivatives as RbClBrI and $CsICl_4$ being known. Rubidium ammonium bromide, $RbBr.3NH_4Br$., has been recommended as a good substitute for potassium bromide as an hypnotic and for other pharmacological purposes.

Applications of Lithium Compounds.

It has been proposed to incorporate lithium alumino-silicates, particularly lepidolite, in glass, to increase the fluidity of the melt and to improve the tensile strength, thermo-resistance, and appearance of the finished product (*U.S. Pat.* 1,261,015, of 1918). With the same objects, a recent patent proposes to use mixtures of lepidolite with zinc oxide or boric acid (*Brit. Pat.* 200,020, of 1922). Lithium minerals containing fluorine have been used to produce the opaque effect in opal glass, while another suggestion is to add lithium silicates to enamels in order to increase their fluidity.

According to the Badische Company (*Brit. Pat.* 173,097, of 1922), lithium formate decomposes at about 400° C. with the formation of methyl alcohol and acetone as the principal products. The decomposition is best carried out in revolving drums, in a current of moist hydrogen and under reduced pressure, the heating-bath consisting of fused salt such as potassium nitrate. The formate is prepared at the start by treating a solution of lithium carbonate (or hydroxide) at above 120° C. with carbon monoxide at a pressure of about 700lb. per square inch, the absorption being represented by the equation:—

* A microgramme is one-thousandth of a milligramme.—Ed., *C.T.J. and C.E.*

$$Li_2CO_3 + H_2O + 2CO = 2HCO_2Li + CO_2.$$

A mixture of carbonate and carbon results from the decomposition, and this is reconverted to formate. Lithium hydroxide is used in certain types of accumulator, the bromides and iodide have found applications in photography, while the chloride is utilised in firework manufacture and the cyanide in X-ray work. The chloride and fluoride also enter into the composition of certain welding fluxes for aluminium (*Brit. Pat.* 170,343, of 1920).

Lithium Compounds in Medicine.

A large proportion of the lithium compounds produced is utilised for the preparation of lithia water (which usually contains 10 grains of lithium carbonate per pint), and medicinal compounds. Formerly such salts as the benzoate, quinate, hippurate, and formate, but particularly the citrate and carbonate, were administered for affections due to the accumulation of uric acid in the system, on account of the high solubility of lithium urate. The adverse effect of lithium compounds on the nervous system, however, has led to their replacement by organic bases—notably piperazine,—which form even more soluble salts with uric acid. Lithium citrate is generally prepared by dissolving lithium carbonate (100 parts) in citric acid (186.5 parts), and can be obtained either as anhydrous non-deliquescent powder or as crystals (with $4H_2O$).

Other notable medicinal compounds are the diuretics, lithium theobromine salicylate, lithium potassium tartrate, and lithium acetate, while lithium glycerophosphates are useful in cases of neurasthenia. Lithium theobromine is four times as active as the free purine base itself, and is prepared by treating lithium hydroxide with excess of the base. The lithium salt of acetylsalicylic acid is prepared by treating lithium carbonate with the equivalent amount of the acid in the presence of organic solvents or a small quantity of water (*Brit. Pat.* 171,281, of 1920). To improve the keeping quality, 5 per cent. of sodium bicarbonate may be incorporated in the tablets.

American Production of Lithium Minerals.

According to a report of the Geological Survey of the United States, the output of lithium minerals for certain years was as follows, there being evidence of a much-increased production: —

	Short Tons.	Value.
1903	1,150	£4,800
1904	575	£1,000
1919	6,287	—

The output in 1919 was nearly ten times greater than in 1916, the bulk of the material being mined in California and South Dakota.

SODIUM SULPHATE IN CANADA.

EXPLOITATION OF NATURAL DEPOSITS.

SOME interesting information regarding the extensive sodium-sulphate deposits of Western Canada was contained in a paper read by I. H. Cole, of the Canadian Department of Mines, at the annual meeting on October 3 of the Southern Saskatchewan branch of the Canadian Mining and Metallurgical Institute. According to a report by our Toronto correspondent, there are known to be 90 of such deposits in the Province of Saskatchewan, of which only six have been thoroughly investigated by the Department of Mines. These show probable yields of between seventeen and twenty million tons of sodium sulphate, which, if developed, could supply the growing Canadian demand, now met by large importations from Britain and the United States.

The only deposit now being worked is at Muskiki Lake, near Dana, where the Salts and Chemical Company have spent about 500,000 dollars in developing the property. The Bishopric and Lent Company, of Cincinnati, Ohio, are erecting a plant at Frederick Lake, near Expanse, and expect to begin operations shortly. The principal deposits in the southern part of the Province are south of Lake Johnson and in the sandhills of the Empress district north of Swift Current. In the northern part of the Province many deposits occur around Macklin, and a belt extends across the Province with contents estimated at from half a million tons for some of the smaller lakes, to fifteen million tons in some of the larger lakes.

BLEACHING WITH HYDROGEN PEROXIDE.

VALUABLE PRACTICAL PAPER AND DISCUSSION.

LECTURING to the London Section of the Society of Dyers and Colourists on Thursday, October 25, Mr. I. E. Weber, chief chemist to Messrs. B. Laporte, Ltd., of Luton and Bradford, advocated the claims of hydrogen peroxide as a bleaching agent over those of the sulphur dioxide bleach. The principal advantages advanced were that the bleach is more permanent, and that the process is a much more convenient one to work. Speaking of the SO_2 process, which Mr. Weber called bleaching by reduction, it was stated that the sulphur stove has changed little since it was first used, and is still uncomfortable to work because of the suffocating fumes. The SO_2 bleach is not permanent, as after a short time the yellow colour returns to the wool. One theory held is that the sulphurous acid formed by the SO_2, with the moisture in the material to be bleached, combines with the yellow compound to give a colourless bisulphite addition compound which is unstable and breaks up, giving the original colour. A further objection to the stoved white is its effect on dyestuffs, which are readily destroyed by sulphur dioxide. The lecturer said he had known of dyed goods the colour of which had been absolutely spoiled because they were shipped in the same crate as stoved goods.

Hydrogen Peroxide for Cotton Bleaching, a Future Probability.

Dealing with hydrogen peroxide bleaching—an oxidation process as opposed to a reduction process—Mr. Weber said the ideal bleach is one which will destroy the colouring matter and leave the fibres intact, and he claimed that hydrogen peroxide is such a bleach. What hypochlorite had done for the bleaching of cotton, hydrogen peroxide was doing for the bleaching of wool; but even for cotton, hydrogen peroxide was superior to hypochlorite, especially in the fine counts, and the day would no doubt arrive when the price of hydrogen peroxide would allow of its extended use in the bleaching of cotton. The white was a purer white than with the SO_2 bleach, and the fibres did not tender. Further, garments bleached with peroxide do not possess an unpleasant odour when the wearer perspires, and the sterilising properties of the peroxide render the goods capable of being stored without creating mildew. Since merely water is left after bleaching, the goods do not need the rinsing required by other bleaches.

Materials for Bleaching-tank Construction.

After some details of manufacture and methods of testing volume strength, Mr. Weber pointed out that the stability of hydrogen peroxide is unaffected by the weakness or strength of the solution, and discussed the most suitable types of materials to be used in plants for bleaching with this process. Whilst the materials which may be used are many, there are disadvantages in some of them. Wood, for instance, disintegrates owing to the prolonged action of the peroxide, although wooden tanks may be given a new lease of life by pegging them and giving them a coat of half an inch of concrete. Lead-lined vats are sometimes used, but an alkaline solution of peroxide acts on the lead, forming a lead peroxide, which may scale off as dust on to the goods. Enamelled vessels, either enamelled cast iron or steel, make excellent baths. Porcelain, although unacted on by the peroxide, does not stand the wear and tear of the bleaching plant, and is liable readily to crack. A very serviceable bleaching tank can be made of glazed and blue bricks, the glazed bricks being inside and the blue bricks outside. The tank should be built on a concrete bottom, and the joints between the bricks should be thin. Such a bleaching tank should last for years.

For heating up the bath, lead or tin coils should be used. Tin resists the action of weak peroxide solutions well, and repays the initial expense. The coil is laid across the floor of the bleaching tank and is covered with a perforated false bottom to prevent the goods coming into contact with it and so burning them. As to the effect of various metals on hydrogen peroxide, as affecting the materials of which the bleaching tanks are made, Mr. Weber gave the results of tests in this connection. These tests were made on 100 c.c. of a 6.3 volume acid peroxide. The metal and peroxide were placed in a round-bottomed flask to which was attached a

double surface reflux condenser. After heating for half an hour on a water bath, the peroxide was cooled for 15 minutes and tested. The temperature of the peroxide in the flask whilst being heated on the bath was 92° C., and from the detailed figures given it is seen that copper, or alloys of copper, decompose peroxide when it is acid, whilst lead, tin, antimony and nickel are satisfactory. Bearing metals which are alloys of lead, tin and antimony, can be safely used. These tests, as a matter of fact, confirm what is found in practice.

Neutralising the Acidity of Hydrogen Peroxide.

A number of other practical points were then touched upon, relating in turn to the water, the hydrogen peroxide, and the alkali necessary to neutralise the acidity of the hydrogen peroxide. A softened water was recommended, and the importance of keeping iron salts out of the water was emphasised. As to the use of a suitable indicator, the general statement that the solution should be faintly alkaline to litmus was regarded as indefinite, and this very indefiniteness was said to be due to the poor qualities of litmus as an indicator. The lecturer said he had made tests which had convinced him that phenol-red is a much more satisfactory indicator, and should be a help in neutralising the bath. For this latter purpose, a preference was expressed for silicate of soda over ammonia, as in large-scale trials with 300 or 400lb. of wool it was shown that one-third the cost of hydrogen peroxide used in bleaching can be saved by neutralising with silicate of soda.

Difficulties in Leather Bleaching.

Questioned with regard to the bleaching of leather, Mr. Weber said that his experience in this connection, for the production of white gloves, had not so far been successful. One of the troubles was due to the acid used in tanning. For example, in bleaching white woollen rugs, on steeping the leather and wool in the peroxide, the peroxide turned acid, and it required an enormous amount of alkali to neutralise this acid.

Mr. R. B. Brown referred to substances used to improve the stability of the bath for other purposes, such as pyrophosphates, which he believed were used largely in straw bleaching, and asked whether these substances had also found application in the bleaching of wool, silk, and textiles.

Procedure in Straw Bleaching.

Mr. Weber, after commenting on the fact that those concerned with straw bleaching were very jealous of their processes, said that straw bleaching was a much more drastic process than wool bleaching. In straw bleaching there were a large number of operations which did not take place in wool bleaching, and therefore the quantity of pyrophosphate of soda required to neutralise a bath was so small in the latter case that his firm had never recommended its use. Also, it was no better than silicate of soda in the case of wool. With straw bleaching a very large amount of pyrophosphate of soda was used in the bath, and silicate of soda could not be used there, because it would destroy the straw fibre. In some straw bleaching processes much more ammonia was used than in any process of wool bleaching; as much as 2 pints of ammonia to 10 gallons, say, of hydrogen peroxide would be used, and the whole of the oxygen liberated in 6 hours. Whereas in straw bleaching the object was to use a strong bath and liberate the oxygen quickly, in the case of wool bleaching the object was to use a weak bath and liberate the oxygen slowly.

Advantages of Hydrogen Peroxide Over Sodium Peroxide.

Mr. Evan W. Walker asked what metal Mr. Weber recommended as the lining for the hydro-extractor used for extracting bleached goods, as he understood they were "hydroed" and the drainings passed back into the bleaching bath. Also, what did Mr. Weber say as to the comparative merits of hydrogen peroxide and sodium peroxide in connection with the bleaching of tussore.

Mr. Weber said that as a rule the goods were put into linen bags and hydroed, so that they did not come into contact with the sides of the hydro. Otherwise, the sides of the hydro were lined with some material, such as filter cloth. Another good method was to tin the inside of the hydro, to prevent damage to the hydro itself. As to the pipes for carrying hydrogen peroxide from one vat to another, lead was the best metal to use. As to the bleaching of tussore with sodium peroxide and hydrogen peroxide, the problem one would consider was that of cost. Hydrogen peroxide was being sold at a price which enabled it to compete quite readily with sodium peroxide for bleaching. In addition, with hydrogen peroxide there was not the risk of fire that there was with sodium peroxide. Further, there was risk of sodium peroxide getting on to goods and burning them, and the sodium peroxide had to be neutralised with an acid; sulphuric acid was used as a rule, and this meant an accumulation of sodium sulphate in the bath. There was not so much labour involved in making up the hydrogen peroxide bath as the sodium peroxide bath. Comparative trials had been made, and these showed that with sodium peroxide it cost 1.23d. per lb. to bleach, sulphuric acid and ammonia being used to neutralise. With hydrogen peroxide, using silicate of soda, the cost per lb. was 0.9d., so that in this particular instance, where there was something like 6,000lb. per week to bleach, it meant a saving of something like £4,000. per annum.

Mr. Walker asked the effect of these bleaches on aluminium. Alkalies affected aluminium very seriously, but it was remarkable that the sodium-carbonate solution, when it contained a proportion of silicate of soda, appeared to exercise no action.

Mr. Weber replied that peroxide without silicate of soda did attack aluminium, alumina being precipitated. He had not tried it with silicate of soda, but did not think it would stand up. He had tried chrome steel, which was a rustless steel, and which should be ideal for bleaching, but where there were flaws in the polished steel, ferric oxide occurred. Tungsten acted well when polished, but the weaknesses were shown up immediately.

Comparative Merits of 100-Volume Peroxide.

Asked whether the manufacture of 100-volume hydrogen peroxide, which was carried out in America and elsewhere, could be made a commercial success in this country, Mr. Weber pointed out that the difficulty here was that we had not the facilities for cheap power, but we were very fortunate in having a source of barytes, from which to make very high grade hydrogen peroxide. The only thing in favour of the 100-volume hydrogen peroxide was the advantage in handling, due to the smaller quantity needed for the same work as compared with the 12-volume peroxide. As to its bleaching properties, Messrs. Laporte had carried out exhaustive trials, using the foreign 100-volume peroxide against their own 12-volume, and had shown on each occasion that, where silicate of soda was used, and where the bleaching was carried on as they recommended, they could get better whites with their own 12-volume peroxide.

As to the delivery of hydrogen peroxide to the users, a tank lorry had been adopted. The peroxide was pumped direct from storage tanks into the lorries, and pumped out again into storage tanks at the users' works, from which it could be run direct into the vats. The 100-volume peroxide could not be handled in that way so conveniently, because it was much more corrosive. His firm had been making small quantities of 100-volume peroxide in this country, and hoped in time to be able to supply it to those who wanted the higher strengths, but he did not think the 100-volume peroxide would be demanded for wool bleaching.

In reply to another question, Mr. Weber said that, for bleaching purposes, no other preservative than acid was used. Referring to comments made in the Press as to damage caused by hydrogen peroxide, used for toilet purposes, being splashed on to cotton goods, Mr. Weber said it was the acid in the peroxide which caused the damage, but whether the damage was as frequent as the writer in the Press made out he doubted. This would hardly apply in the case of woollen goods anyhow, because the amount of acid required to make the peroxide stable in storage would not be sufficient to damage wool.

With regard to the silicate of soda, Mr. Weber said that 140 Tw. was used; 2lb. of 140 Tw. was used for 40 gallons of hydrogen peroxide, and this was diluted with water. There was a silicate of soda in powdered form being put on the market, in which the SiO_2 ratio was higher than in the ordinary 140 Tw., but whether the increased silica had an increased stabilising effect it was too early to say. It being suggested that alpha-naphthol-phthalein was a useful indicator for bleaching, Mr. Weber said he had tried it for the bleaching of wool, but had found that the phenol-red was the best.

BRITISH ASSOCIATION OF CHEMISTS.

"Take my advice. Unite! Hold high the standard of chemistry and chemical industry."—Lord Moulton.

Hon. General Secretary: Mr. I. Boodson, Bedford House, 108, Baker Street, London, W. 1.

Hon. Registrar: Dr. David Bain, The Woodlands, Crescent Road, Crumpsall, Manchester.

Hon. Treasurer: Mr. H. E. J. Cory, Bedford House, 108, Baker Street, London, W. 1.

Hon. Editor: Mr. A. Merrick, 4a Rossett Road, Great Crosby, Liverpool.

NOTICES.

Full information regarding the Association may be had on application to the Hon. General Secretary, to whom all applications for membership should be sent.

It is particularly requested that all changes of address be notified promptly to the Hon. General Secretary.

A register of members seeking appointments is kept at the registered offices of the Association. All inquiries should be addressed to the Hon. General Secretary.

Short articles, letters, etc., on matters of general interest are invited from members of the Association. These, together with all reports of meetings, should be sent to the Hon. Editor.

THE ANNUAL GENERAL MEETING.

THE sixth annual general meeting was held on Saturday, October 27, at the University of Birmingham, under the chairmanship of the President (Dr. H. Levinstein). There was a representative attendance.

The Treasurer's Statement.

The Hon. Treasurer (Mr. H. E. J. Cory), who moved the adoption of the statement of accounts, said that for the first time in four years their income on the general account had exceeded their expenditure. The present income, however, was quite insufficient to meet the needs of the Association, having regard both to the cost of covering adequately and completely the whole field of the B.A.C. activities, and to the attendant costs of administration, which, at present, absorbed approximately 60 per cent. of available income. An improvement in their financial position could come only through an extension in membership. The financial state of the Unemployment Benefit Fund was extremely satisfactory, and in spite of large calls, at the end of the year a substantial balance still remained. He recommended that the actual creation of the Special Reserve Fund be undertaken at an early date, and estimated that at least £100. per annum would be available for this purpose at the present rate of working. The administration of the Fund had entailed heavy additional work on the part of their staff. In that connection a special word of commendation was due to Mr. Mills, whose wholehearted efforts had made possible the success of this Fund.

The President said a very fair and excellent statement had been put before them, and reflected the greatest possible credit upon those responsible for supervising the finances of the Association.

Mr. E. F. Morris (Manchester) seconded the resolution, which was carried.

Report of Council.

Mr. W. E. Kay moved the adoption of the report of the Council. He said he would like to pay their congratulations to the Council and to Mr. R. Brightman, the Hon. Editor, for his informative and instructive articles which had done much to mould opinion among the members and to promote progress. His (Mr. Kay's) hope was that the Association would become absolutely representative in bulk membership of the chemists of the country, but frankly they had to admit they were, as yet, a long way off that ideal. There was no matter upon which the members could more usefully devote themselves than that of making known the objects of the Association. One of those main objects had relation to the Unemployment Benefit Fund. In this, the economic aspect of the Association had been brought to the forefront; the working of the Fund had represented, as it were, a leap into the unknown. The experience, so far, had been satisfactory; the Fund showed financial soundness; and it would appear that it would grow and prosper. They had experience to gain yet; they were not out of the wood; and a longer period of working was necessary to demonstrate definitely how far their scales of payment were adequate to meet possible demands upon the Fund.

With regard to "external relations" during the year, the negotiations with the National Union of Scientific Workers originated from the Scientific Workers; the desire on their own part being to work in accord with all bodies having similar ends to their own. Mr. Kay added that he had always felt that their natural line of association was with the Institute of Chemistry, and he clearly indicated this in the early days of the Association in letters he wrote to the *Chemical Trade Journal and Chemical Engineer.*

The President: We gave a stimulus to the Institute.

Tribute to the "Chemical Trade Journal and Chemical Engineer."

Mr. Kay replied that he quite agreed. In conclusion he expressed on behalf of the Council warm appreciation of the excellent services long rendered by their late Secretary, Mr. Price, and also by Mr. Brightman, the Editor of their journal; he was personally sorry he was not able to continue that work. In association with that, he would also like to refer to the most happy relations which existed between themselves and the *Chemical Trade Journal and Chemical Engineer*, and he recalled the voluminous correspondence that arose out of the attempt to found the B.A.C. From that time to the present the Editor had placed open the columns of that paper to any subject of real concern to the interests of chemistry, and as a member of the Council he would like to express their appreciation of that generous consideration.

Mr. E. R. Redgrove seconded, and stated that he there wished to support Mr. Kay's remarks regarding their relation with the Institute of Chemistry. He concluded with a tribute to the sterling service rendered by Mr. Kay; he had been largely instrumental for the success that had been achieved.

Discussion on the Report.

Dr. J. L. Hankey said they were sometimes asked what the Council was doing, but it was not always easy to give an answer because much of the work was of necessity to some extent confidential and it was frequently in the direction of consolidating the position of the Association. Their one great ideal was to raise the status of the professional chemist, and their efforts were to that end; they desired he should occupy that place in public opinion to which he was entitled.

Working of the Unemployment Benefit Fund.

Mr. A. S. Mills (Assistant Secretary), in reply to a question by Mr. Gibson, said that at the present time the Unemployment Benefit Fund took up nearly half of the actual office work. One quarter of the total rent was charged to the Fund, and one half of the typists' salary, general postages, and stationery. A larger disbursement would be really better for the Fund because it would indicate development. Mr. Cory (Hon. Treasurer) pointed out, on the same subject, that the administrative cost of the Fund showed a lower percentage than the general run of insurance companies having similar schemes.

Mr. Rowell said they had a right to more members because the Association was offering by their unemployment scheme to do what no other organisation of chemists could do. The Institute of Chemistry could not do it; nevertheless the Association had been of the greatest help to it; it had doubled the membership and they in turn were deserving of some return. In Birmingham there were a number of members who later were admitted into the Institute of Chemistry, and they had left the B.A.C. and his hope was that these men would return.

What the B.A.C. Really Means to the Chemist.

The President said the Association was something different from the other organisations, for its outlook and its functions were different. It was not a high-brow movement; it was not got up by professors and recognised people who had hitherto spoken for the chemical profession; and its work was not done behind closed doors and sealed windows. It was a movement started with open doors and windows, "from below." Their object was to get together all men who were engaged in factories and in chemistry generally, in the Association which was run by persons similar to themselves. In a corporate way it could help them in all kinds of difficulties that might arise; neither the Institute of Chemistry nor the Society of Chemical Industry could do this.

Alteration of Rules.

The President, speaking with regard to the suggested alterations of rules, pointed out that in the one case the

proposal was to give authority for the appointment of two vice-presidents instead of one, and the object was to enable them to appoint Mr. Kay. The other alteration in relation to the Unemployment Benefit Fund would remove an ambiguity.

The resolution, which was proposed by Mr. Johnson and seconded by Mr. Hills, was approved.

Election of Officers.

The President pointed out that the following nominations had been received:—President, Dr. Herbert Levinstein; vice-presidents, Mr. W. E. Kay and Mr. Fred Scholefield; hon. treasurer, Mr. Harold E. J. Cory; hon. general secretary, Mr. I. Boodson; hon. registrar, Dr. David Bain; and hon. editor, Mr. A. Merrick. Personally, he much regretted the loss of Mr. Kay from the office he had held for so many years; and he also regretted to say that Mr. Brightman was no longer able to carry on his duties as Editor; and he desired also to make a similar expression of regret with regard to Mr. Price. Dr. Hankey moved the resolution, which was seconded by Mr. Kay and carried. On the motion of Mr. Bath seconded by Mr. Rowell, Messrs. Hughes and Allen, were re-elected auditors.

The meeting concluded with a vote of thanks to the President; and the members then took tea, at the invitation of the Chemical Department at the University. Later, they inspected in that Department an exhibition of specimens and apparatus from the Research Section.

THE ANNUAL DINNER.

In the evening the annual dinner was held at the Queen's Hotel, Birmingham. The President (Dr. H. Levinstein) occupied the chair; and the guests of the evening included Professor G. T. Morgan (Chemical Department, University of Birmingham), Dr. E. B. Maxted (chairman, Birmingham and Midland Section of the Society of Chemical Industry), Dr. Sumpner (head of the Birmingham Municipal Technical School), Dr. Newton Friend (head of the Chemical Department, Birmingham Technical School), Major A. G. Church (National Union of Scientific Workers), and Dr. Stephen Miall (Federal Council of Pure and Applied Chemistry).

The toast "The B.A.C.," was proposed by the President, who said he was recently criticised for an observation, in relation to unemployment, which suggested what a wonderful thing it was to go into chemistry, and that fathers and mothers need not then worry about their boys and girls who entered into it. He pleaded "not guilty" to anything of that sort. What he said was that if new industries were developed and a bid made to secure the world's markets, there would be an opening for chemists which hitherto did not exist. The B.A.C. had a great opportunity, and definite functions not possessed by the Institute, and his sincere wish was that the Association would flourish, and continue to grow in strength and influence.

The toast, with which the name of Mr. W. E. Kay was coupled, was warmly received.

Mr. Kay, in reply, said his message to his fellow members was: "Try and increase the numerical strength of our Association and so enable us to serve the general body of chemists in this country."

Functions of the Various Societies.

The toast "Kindred Societies" was proposed by Mr. E. R. Redgrove. Dr. Maxted, who replied, said that chemical societies might be divided into two groups: those whose object was to further chemistry, and those whose aim was to further the chemist. Each group had its own importance and special work. They, of other societies, were conscious of the good work that was being done by the "B.A.C.," and to them their message could only be: "May they flourish and increase." They should not lose sight of the fact however that the real place of chemistry and of chemists was determined not by societies or organisations but by the standard of chemistry.

The toast "The Universities and Seats of Learning" was submitted by Dr. F. W. Kay, who coupled with the toast the names of Professor Morgan and Dr. Friend. The toast was honoured with enthusiasm. Professor Morgan replied, and expressed the hope that year by year the B.A.C. would meet in one of the Universities, and would thus come into closer communion with the young chemists who were receiving their training there. Dr. Newton Friend also expressed his appreciation of the honour done him, and a wish for the Association's success.

Mr. N. P. Booth (Birmingham) proposed the toast of "The Guests."

The Chemist and the Lawyer.

Dr. Stephen Miall, whose name was coupled with the toast, mentioned that he was probably the only one present who was not a chemist. He had been trained in the profession of the law, and it was of great interest to notice the extraordinary difference between the organisation of lawyers and the organisation of chemists. All the lawyers were members of one or two societies. That gave them the power of making their voices heard far greater than the power which chemists could exercise at the moment. To become a chemist was at least as difficult and involved as much prolonged study, probably more, as was necessary to become a lawyer. Yet the chemists seemed to make less impression upon the great body of the public, including the manufacturers of the country, than did their not more highly educated brothers in the law. The great factor which gave barristers their importance, power, and influence was the very strong and united public spirit that existed among them; there was a public feeling amongst themselves which was very dominant and hardly any barrister dare transgress the traditions which prevailed at the Bar. That public spirit was fostered and encouraged by the fact that barristers were accustomed when students, and after they had become practising barristers on circuit, to dine together, to get to know each other and to discuss not only points of law but of etiquette.

Mr. E. F. Morris submitted the toast of "The President."

The toast was warmly honoured and the President briefly replied.

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE REMUNERATION OF THE SCIENTIST IN GOVERNMENT RESEARCH.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Lord Salisbury has noticed with great pleasure your appreciative article on the co-operation of the different parts of the Empire in scientific research, dealt with in his recent speech to the Imperial Economic Conference. He would like, however, to assure you and your readers that when he spoke of the willingness of scientific men to place their services at the disposal of the Government and the community for "far less than the true remuneration of their great talents," he was referring not to the scientific staff of the Department, but to the distinguished men who serve on the Advisory Council and other committees and boards of the Department, most of them entirely gratuitously. The members of the Advisory Council are offered a modest honorarium, but it is not always accepted.—Yours, etc.,

Philip Farrer, Private Secretary.

Privy Council Office, London, S.W. 1,
October 29, 1923.

THE EMPIRE MARKET FOR BRITISH DYESTUFFS.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—There must be many who, while convinced Free Traders in a general sense, wish to see a vigorous reservation in favour of the British dyestuffs industry. Greater Britain's annual dyestuffs requirements are, roughly, these: South Africa, 50 tons; New Zealand 200 tons; Australia, 400 tons; Canada, 1,200 tons; India, 7,000 tons.

Now, in Australia it is forbidden for any manufacturer of foreign dyestuffs to send goods into the Commonwealth unless he has a license. Australia, however, is the only region of the British Empire which has set up this absolute prohibition against the outsider. In South Africa, German dyes are freely used. In Canada we hold at the moment only about one-tenth of the market. In India the German, paying the same rate of duty as we do, has just as much advantage, although it is not at all improbable that here terms could be arranged as between India and ourselves. Indeed, it seems to me that, before the Empire Premiers go home, some very definite understanding should be come to regarding the attitude of the Dominions to the Mother Country, at least as far as dyestuffs are concerned.—Yours, etc.,

Potters Bar, October 19, 1923. N. Grattan Doyle.

THE FUTURE OF THE ANALYTICAL CHEMIST.

STREATFEILD MEMORIAL LECTURE.

THE Streatfeild Memorial Lecture at the Finsbury Technical College, London, was delivered on Thursday, October 25. Mr. Julian L. Baker, who presided, explained the circumstances of the Lecture, which is in memory of F. W. Streatfeild, who was lecturer and demonstrator in chemistry at the Finsbury Technical College from 1883 to 1917 and died in March, 1918, when actually on the college staff. The Memorial Lecture has been made possible as the result of subscriptions amounting to £230., the income from which is allotted to the purpose in question and the award of a gold medal and portrait to the lecturer each year, together with a prize of £5 to the most proficient third-year chemical student.

The lecturer this year was Mr. E. M. Hawkins, public analyst at Canterbury, and he departed from the usual custom of dealing with a technical subject, devoting the lecture to a talk to students concerning the qualifications and openings for analytical chemists. The lecturer, who was one of Streatfeild's students—it is a condition of the arrangements that the lecturer shall be an old student of Streatfeild's,—first recalled many of the incidents that arose during the time he was under Streatfeild and acknowledged gratefully the help that was given him by his old teacher.

The Three Categories of Analytical Work.

Passing on to the main subject of his lecture, he said that analytical work can be divided roughly into three categories —viz., the public analyst, the works analyst, and the consulting chemist,—and he put forward the suggestion that these three branches will tend to become more and more distinct. Discussing the technical training of those who aim at entering the profession of analytical chemistry, it was urged that the old idea of treating the analyst in a different way from the chemist should be abandoned, and that it is necessary for an analyst to be a good chemist and for a chemist to be a good analyst. One reason for making this assertion was the lecturer's knowledge of men who had drifted into positions as analysts, but who, he said, could not, by any stretch of the imagination, be regarded as chemists. Thus there was a need for the broadest possible training for all those who aimed at becoming analytical chemists. He also uttered a warning against the tendency by some chemists to regard physics and mathematics as things they should not bother themselves with, because there was little chance in analytical chemistry generally for the man who disregarded physics and mathematics, or who did not have some knowledge of electrical science. One of the greatest needs of the analytical chemist was the ability to make accurate calculations.

After a word in praise of the examinations of the Institute of Chemistry and the manner in which they are framed to ascertain the students' practical knowledge, Mr. Hawkins recommended all those desiring to take up analytical chemistry to spend some period, after leaving college, in a food-producing or similar factory, in order to learn the details of the processes, and he ventured the opinion that such an experience would be of the greatest possible value later when the student might have a public appointment, in preventing him making impossible suggestions as regards manufacture. He himself had found the benefit of such an experience, and had never regretted the year he had so spent.

The Qualifications for the Analytical Chemist.

Passing to the most important qualifications for the analytical chemist, first place was given to accuracy, it being added that one of the most undesirable things was for a student not to know he was inaccurate in his work. Mr. Hawkins stated he had met those who had employed young men from college, and the complaint always was of inaccuracy. Another important essential was rapidity of work. A warning was also given concerning the very great amount of detail work which has to be done in the analytical laboratory, but the importance of such work was emphasised. On this aspect, too, reference was made to Streatfeild's contempt for what he often termed a kid-glove chemist, the man who did not like to get his hands dirty or his clothes spoiled. Emphasis was next laid upon the absolute necessity for clear expression in preparing reports, as so many valuable pieces of work have, said Mr. Hawkins, failed to attract the attention they deserve on account of inability of the investigator to express himself in simple and clear language. Further, the analytical chemist was impressed with the great necessity for being able to have confidence in his results and to justify them when occasion demands it.

New Openings in the Future.

Comparing the possibilities under the three headings into which the lecturer originally divided his subject, it was stated that although there might be a tendency for the number of analytical chemists employed by the Government and the municipalities to increase, experience did not suggest that that would be so, and therefore the number of openings would always be limited. To counterbalance this, however, the employment of analysts by manufacturing firms was becoming more and more common, and the openings here would increase very largely in the future. As to remuneration, an able man would be able to command equally high remuneration either as a public analyst or as a works analyst, although the works chemist in control might be better off. There was also the uncertainty of private employment, due to the state of trade, to be taken into account. As to the nature of the work, the works analyst might be more restricted in the scope of his operations, and the work of the public analyst or the consulting chemist, being the more varied, was the more interesting on that account.

Finally, Mr. Hawkins suggested that as time goes on the consulting chemist would become more and more separated from the public analyst and the works analyst. There would be an increasing number of the latter employed, and therefore only special problems which the works man was incapable of dealing with would be handed on to the consulting chemist. This implied a very high standard of ability on the part of the latter, which should be liberally paid for.

OUR BOOKSHELF.

Nitric Acid and Nitrates. A. Cottrell, M.Sc., F.I.C. London: Gurney and Jackson; 36s. net.

This volume forms a part of the new and enlarged edition of the late Professor Lunge's Sulphuric Acid and Alkali—a work which won unprecedented fame amongst technological books, whatever the subject. It is quite natural that the very able authorities who have been selected to write the special parts into which Lunge's work has now been divided should take full advantage of the wealth of information the late author provided; but so much has transpired in the way of development during the stress of recent years that a very large amount of new material demanded incorporation. In many ways efforts have been made to secure improved arrangement of various detail, and, on the whole, success has been achieved in this direction. Probably no type of chemical plant requires a more precise study of material used in its construction and its form and arrangement than a modern nitric-acid installation. The variety of types—or, at any rate, sections—of units employed are therefore easily accounted for. The false-bottom retort, with a view to economy in replacing cracked retorts, is described and illustrated. Retort setting and flue arrangements are indicative of progress made through careful study during the war. The many well-known and ingenious forms of condensers are discussed—Hart, S Pipe, Hough, Guttmann, etc., etc., and materials like Ironac, fused silica ware, and glass used in their construction. Absorption, pumping, and other details receive fair treatment, and incidental matter concerning the handling and disposal of nitre cake is presented. Regarding the latter, the paragraph "where conditions allow . . . . may be run into a good stream of water," etc., might very wisely have been left out. A very interesting batch of matter is contained in the reports of various large manufacturers containing accounts of their nitric-acid plant and processes, these being followed by reports from various H.M. factories. Fuel consumption, general process detail, patents akin to the subject are large features. There can be no doubt about the expert character of the book, its exactitude and thorough grasp of all essential detail being very apparent.

COMBINED GRINDING AND MIXING.*

USE OF PEBBLE OR BALL MILLS.

THE ball or pebble mill, as a medium for pulverising and grinding either dry or wet materials, is quite well known and is coming more and more into use in the various industries because of its simplicity, low maintenance cost, low power consumption, the elimination of expert attendance and the fact that it requires very little attention during its operation. Its application to mixing problems, although not quite as general, is also commanding very favourable attention, because it produces a very uniform mix. There is, however, one application that has not been developed to the same extent, and that is the combining of grinding and mixing in one operation. Before considering the latter subject, it might be well to go into the principles governing grinding and mixing in ball or pebble mills.

Essentially, the ball or pebble mill consists of a revolving cylinder usually lined with a material that will withstand impact and abrasion. The cylinder is partly filled with a charge of flint pebbles, porcelain balls, metal balls or other freely movable reducing bodies. The revolving of the cylinder causes the balls or pebbles to rise on one side of the cylinder until the force of gravity overcomes the centrifugal force. The pebbles then begin to roll and tumble to the bottom of the cylinder, and in this way a combined impact and attrition effect is produced. The speed at which the best grinding efficiency is produced will vary with the diameter of the mill, the coefficient of friction of the material that is to be ground or mixed, the size of feed and fineness of finished product desired.

The ideal condition for fine grinding is where the peripheral speed is such that the pebbles or balls will be carried up to a sufficient height, so they will roll and tumble over one another. It might be stated at this point that the foregoing does not apply to ball mills which are used for the preliminary crushing of large pieces of hard material. In a case of this kind, it is desirable to depend to a great extent on impact and consequently larger balls are used and the speed increased to the point where the balls actually drop through space.

Size of Balls or Pebbles.

Too little attention is given to the proper size of pebbles for the grinding of a certain kind of material to a given fineness. If the grinding consists in the reduction of a fairly coarse material, say about ¼in. to ½in., and it is not necessary to grind the finished product very fine, a large pebble or ball should be employed. If the feed consists of a mixture of coarse and fine material, it is advisable to take a mixture of small and large pebbles or balls. If the material is fed in a fairly fine condition, say from 8 to 20 mesh, and the resulting product is to be extremely fine, it is advisable to use small pebbles or balls. In other words, the idea in fine grinding is to have as many points of contact as possible with a pebble or ball of sufficient weight, so that the impact is sufficient to reduce the material to be ground. It can be readily seen from this that the ideal condition is obtained with maximum points of contact and with pebbles or balls of sufficient weight to grind or pulverise the material. This is true in either wet or dry grinding.

In the case of dry grinding, the moisture content of the material to be ground is very important and it has been definitely established that greater efficiency is obtained when the material is as free from moisture as possible. If the moisture content is increased, the time of grinding is invariably increased, and if there is an excessive amount of moisture present, the material will have a tendency to "ball" or pack.

The Most Suitable Grinding Charge.

There is a considerable difference of opinion as to what constitutes a proper grinding charge and the relation that the volume of the pebbles should bear to the total volume of the mill. In the case of dry materials, however, it has been the writer's experience in testing out a great many different materials that there is a certain definite relation among the total volume of the mill, volume of material and the volume of the pebbles as follows: The cylinder should be approximately half full of pebbles or balls and then a sufficient amount of material put in to slightly more than fill the voids or interstices in the mass of pebbles.

In the case of wet grinding—that is, the grinding of a solid in a liquid—the general practice is to charge the mill approximately half full of pebbles with sufficient material to bring the level slightly above the centre. Some users of mills, in wet grinding, charge the cylinder with material about three-quarters full, which usually results in an increase in grinding time, but a somewhat greater production per batch from the same size machine.

For wet grinding, the material should be of about the consistency of a heavy cream, or perhaps to illustrate this a little better, in the case of an ordinary house paint, slightly heavier than is best for regular brush work.

Advantages of Combined Mixing and Grinding.

The general advantages to be gained in combining grinding and mixing are as follows: 1. The labour charge is materially reduced. 2. A greater uniformity in the mix is secured. 3. In cases where a colour is to be mixed either with other materials or other colours, the increased grinding which the material will receive, during the time it is in the mill, will produce a greater tinting power and consequently a smaller amount of colour can be used to produce the same effect. 4. In the case of pharmaceutical and food products, the pebble or ball mill, therefore, is the ideal machine to use, as it is practically hermetically sealed during the operation. 5. In the case of wet grinding and mixing, the foregoing holds good and in many cases a greater saving can be made, as for instance in the case of the paint, varnish and lacquer industries.

Some Typical Uses.

In the grinding and mixing of paint, the usual method has been to pre-mix the pigment with the vehicle, then grind it through a paint mill and then thin down in a final mixer. These three operations can be combined in one in the pebble mill, as the pigment and vehicle can be introduced simultaneously, and if necessary, after grinding, a thinner can be added directly in the mill. Another advantage is the fact that with such a large number of pebbles and the many points of contact which are effected during the grinding of a charge, a thorough incorporation of the pigment in oils will naturally follow.

A few of the uses in which pebble or ball mills serve for combined grinding and mixing are flooring compounds, drugs and chemicals, face powders, coloured cements, and also in the blending and standardising of dyes, dry colours, etc. It might also be remembered that these mills can be used on either alkali or acid materials, as the linings can be made to resist almost any condition that may arise.

There are some industries which might find a greater use for this type of machine if they would realise that the mills can be built so that either a heating or cooling effect of the material can be accomplished, the material either ground under a vacuum or pressure or in the presence of a gas. In this way very often chemical reactions may be obtained at the same time that grinding and mixing are accomplished.

* From an article by H. F. Kleinfeldt, of the Abbé Engineering Co., New York, in *Chemical and Metallurgical Engineering*, Sept. 10, 1923.

THE ESTIMATION OF SELENIUM IN GLASS.

COLOURIMETRIC METHOD FOR MINUTE QUANTITIES.

AT the meeting of the Society of Glass Technology at Sheffield on October 17, to which reference was made last week, a paper on the above subject was read by Mr. A. Cousen, B.Sc., A.R.C.S., who, illustrating his remarks with experiments, said that the amount of selenium actually added to a glass batch as a decolourising agent was, in general, of an order sufficient to give only 1 part of the element per 42,000 parts of glass, or 0.0024 per cent., if no loss occurred. Since, however, selenium was volatile at the temperature of the furnace, values considerably less than the above were likely to be found. The only chemical method for estimating selenium in glass so far published was that of Fränkel, and this was not quite comparable, since it dealt with proportions of selenium at least ten times as great as those it was desired to estimate.

Practical Details of the Test.

The following modification of the Fränkel process was found to give results of fair accuracy. Twenty grammes of finely powdered glass were dissolved slowly in hydrofluoric acid, and after standing in the cold the products of decomposition, with the exception of selenium, were dissolved by pouring into excess of boiling water. The selenium itself

was filtered off on a filter pulp pad in a Gooch crucible. From the pad the selenium was removed by treating with a dilute chlorine solution (about one three-hundredth normal). To the filtered solution was added 1 c.c. of 5 per cent. gum arabic and 5 c.c. of half per cent. phenyl hydrazine hydrochloride—the whole being made up to 50 c.c. Colloidal selenium was obtained, a yellow colour slowly developing, which was after half an hour matched against a standard solution of sodium selenite similarly treated. The method on testing with synthetic mixtures gave results well within 0.0002 per cent. of the actual values, and a commercial glass, for which selenium had been used sufficient to give theoretically 0.0025 per cent., was found to contain actually only 0.0006 per cent. of the element.

BRITISH EMPIRE EXHIBITION.

THE PURE CHEMISTRY EXHIBIT.

DR. H. LEVINSTEIN, who is getting through an incredibly large amount of work in the organisation of the Pure Chemistry Exhibit at the British Empire Exhibition, in response to a unanimous invitation from the British Technical Press, gave a short address in London on Monday dealing with the conception, aspirations, organisation, and direct objects of this extremely important section of the chemical exhibit. He promised that the national life of the country and of our newer nations overseas will reveal itself in every branch of its activities. Clearly, therefore, chemical science must occupy a prominent position in any national demonstration of this kind, especially when we consider that whilst it is imperceptible to most, it is nevertheless clearly intertwined with our progress and position in industry, preservation of health, and enjoyment of all the cultured amenities of civilisation.

Organisation of the Exhibit.

The Pure Chemistry Exhibit is being organised by a committee composed of representatives of the Association of British Chemical Manufacturers, of the Chemical Society, of the Society of Chemical Industry, of the Institute of Chemistry, of the Society of Dyers and Colourists, of the Federal Council of Pure and Applied Chemistry—in fact, of all relevant scientific societies, supported and greatly assisted by the advice and co-operation of the Royal Society. It will, without a doubt, for ever destroy the illusion, which had some justification in the past, that our University training and research in chemistry is below the highest standard of other countries. This would not have been true in the same sense thirty years ago.

Nothing could be of greater importance than to give the general public, through the eye and in an interesting, fascinating way, greater appreciation of the value of chemical science in the affairs of life, and of the steps that precede great industrial or medicinal discoveries.

Details of the Exhibit.

The following details will serve to illustrate the very wide scope of this exhibit, showing also in each case the carefully chosen high authority who will handle the subject on the capacity of the convenor.

	Convenor.
Physics and Physical Chemistry.	
Structure of the Atom	Sir Ernest Rutherford, LL.D., F.R.S.
Spectroscopy.....	Professor J. C. McLennan, F.R.S.
Crystallography and Crystal Structure.	Sir Henry Miers, LL.D., F.R.S.
Valency Theories and Theories of Chemical Combination.	Dr. Arthur Lapworth, D.Sc. F.R.S.
Photography	Dr. T. Slater Price, F.I.C.
General Physical Chemistry	Professor F. G. Donnan, F.R.S.
Inorganic Chemistry.	
Atomic Weight Determination....	Dr. Alexander Scott, F.R.S.
Analysis: Hydrogen Ion Concentration.	A. Chaston Chapman, Esq., F.R.S.
General Inorganic	Professor E. C. C. Baly, M.Sc., F.R.S.
Flame, Fuel, and Explosion Waves	Professor A. Smithells, B.Sc., F.R.S.
Organic Chemistry.	Dr. Henry and Professor F. L. Pyman, D.Sc., F.R.S.
Bio-chemistry (Fermentation, Enzymes, etc.).	H. L. Baker, Esq., F.I.C.
Agricultural Chemistry	Sir John Russell, F.R.S.
Sugars (dealing largely with the work of Emil Fischer and its continuation as developed at St. Andrew's).	Principal J. C. Irvine, C.B.E., F.R.S.
Terpenes	Professor G. G. Henderson, LL.D., F.R.S.
Plant Colouring Matters	Professor I. M. Heilbron, D.S.O., F.I.C.
Coal Tar Colouring Matters	Dr. J. T. Hewitt, F.R.S.
General Organic Chemistry	Professor J. F. Thorpe, F.R.S.
Cellulose (Viscose, etc.)	C. F. Cross, Esq., B.Sc., F.R.S.
Catalysis (Production of Ammonia, Fat Hardening, etc.).	Dr. E. F. Armstrong, D.Sc., F.R.S.
Plastics (Synthetic Resins, etc.) ..	Dr. W. R. Ormandy
Apparatus	Commander R. E. Stokes-Rees.
Chemical Engineering	Professor J. W. Hinchley, A.R.S.M., F.I.C.
Historical (Old Manuscript, Apparatus, Prints, etc.).	R. B. Pilcher, Esq.

FATALITY AT A CHEMICAL WORKS.

DEATH FROM AMMONIA FUMES.

THE Birmingham City Coroner, on Friday of last week, held an inquiry into the circumstances of the death of Albert Victor Wooffinden (54), an ammonia plant attendant, of 10, Eliot Street, who died as the result of an accident at the chemical works of Messrs. Brotherton and Company, Nechells. Wooffinden had been in the employ of the firm for 17 years, and for the past eight or nine years had been working on the ammonia plant. Edward Fisher, a plumber, stated that on the previous Wednesday morning he was at work on a tower by the side of the ammonia plant There was a smell of gas, and, turning round, he saw Wooffinden standing on the platform near the boiler. Two minutes later witness noticed the man staggering to the handrail. He saw him fall from the platform, a distance of 11 feet. Witness rushed to the man's assistance, and found him unconscious on the floor.

John Daniels, another employee of the firm, said he saw Wooffinden at 10.30 on Wednesday morning, when he remarked, "I think we have a leakage here." About five minutes later the accident occurred. On examining the plant, witness found that the tap had been dismantled and the gas was blowing out. It was stated by Frederick Collett, plant superintendent, that it was not Wooffinden's job to dismantle the tap. If there was anything wrong it was his duty to report the matter so that it could be put right by a fitter. The actual cause of death was a fracture of the base of the skull.

A verdict of "Accidental death" was returned.

SULPHUR AS A FUNGICIDE.—Mr. Harry Curtis Young has recently published (*Annals of Missouri Botanical Garden*, 9, pp. 403-435, 1922) a valuable contribution to the much-investigated problem as to the reason for the toxicity of sulphur when used as a fungicide for the control of disease upon plants. He finds that sulphur owes its toxic properties to pentathionic acid, an oxidation compound formed from sulphur and water. On this account the sulphur needs to be applied in a very finely divided and therefore easily oxidised form, and he recommends colloidal sulphur liberated in a medium containing buffers so that it is easily maintained at a reaction between PH 4.0-5.5; above or below this hydrion concentration pentathionic acid is not stable. In the light of this general conclusion there is a brief discussion of the practical problem of producing a suitable sulphur spray or vapour, but the author's investigations on this side of the problem are still in progress.—*Nature.*

ITEMS OF INTEREST.

Australian Chemical Imports.—Imports of chemicals and drugs in July, 1923, were valued at £283,999., compared with £332,484. for July, 1922.

Nobel Medicine Awards.—The Nobel medicine prizes for 1923 have been awarded half each to Dr. F. G. Banting and Professor J. R. Macleod of Toronto, Canada, in connection with the discovery of insulin.

Obituary.—We regret to announce the death of Dr. J. E. Stead, the metallurgical chemist and senior partner in the firm of Messrs. Pattinson and Stead, Middlesbrough, which occurred on Wednesday, at Redcar, after prolonged illness, at the age of 72.

Business Notice.—It is announced that J. Brown and Co., Ltd., of Savile Town, Dewsbury, have taken over the business of Mr. Wm. C. Wakefield, Savile Town, Dewsbury, which is chiefly a production of hydrochloric acid, saltcake, and Glauber's salt.

Tariff Notes.—In the Board of Trade *Journal* dated October 25, particulars are given of the Colombian import duties on salt; and the Italian import duties on certain essential oils.—Details are also given of amended regulations on the importation of pharmaceutical specialities into Paraguay and into Spain.

Chemical Engineering Group.—A meeting of the Chemical Engineering Group of the Society of Chemical Industry will be held at the Chemical Industry Club, 2, Whitehall Court, London, S.W. 1, on Friday, November 16, when Professor J. W. Hinchley will read a paper entitled "A New Source of Potash, and its Industrial Exploitation."

Humber Portland Cement Merger.—The business of the Humber Portland Cement Company, Limited, whose works are situate at Melton, East Yorkshire, has been acquired by G. and T. Earle, Limited, Hull. Payment was made to shareholders in accordance with the terms of the circular issued earlier in the month—namely, at the rate of 30s. 3d. per £1. ordinary share

Tinplate Wage Dispute in South Wales.—Locomotive men and shunters in the Welsh tinplate industry have decided to tender next Monday 28 days' notice to terminate their contracts. They are demanding day rates of 13s. for locomotive drivers and 12s. for firemen, which represent an increase of two to three shillings on present rates. If the notices become effective over 3,000 workmen will be affected.

Steaming in Vertical Gas Retorts.—The Fuel Research Board of the Department of Scientific and Industrial Research has issued a report on the work carried out in continuation of the experiments described in the Report of the Fuel Research Board for 1920-21, First Section: Steaming in Vertical Gas Retorts. The new report gives the results of tests carried out at H.M. Fuel Research Station on the carbonisation of Wigan Arley coal in vertical retorts when various amounts of steam are introduced into the retorts.

Birmingham Technical School Laboratory.—Sir Robert Hadfield formally opened on Wednesday the new corrosion research laboratory and lecture-room in the chemistry Department of the Birmingham Municipal Technical School. The pharmaceutical laboratory also has been completely refitted. In addition to actual gifts, the school benefits by two grants made personally to the head of the department, Dr. Newton Friend—one of £150. from the Royal Society, and another of £100. from the Carnegie Research Fund for work on corrosion.

Importing German Chemicals.—Mr. A. Humphreys, president of the York Chamber of Trades, and chairman and managing director of Bleasdales, Ltd., manufacturing chemists, in a recent interview, said that he thought it most unfair that when British manufacturers had put down expensive plant to develop their industries, German manufacturers should be allowed to dump their products in this country at prices at which the home producer could not compete. His own branch of the trade dealt more particularly with synthetic chemicals, and he saw no practical difficulty in the way of imposing an adequate tariff. He knew there was the Reparations duty, but he thought that was more often evaded than not. He did not know that protection would be any special advantage to his own business, but he took a broader view, and in any event if the trade of the big industrial centres of the North continued to be hopelessly depressed through foreign dumping the trade of the wholesale distributing houses would be done.

British Coal Output.—The coal output for the week ended October 20 was 5,678,600 tons, compared with 5,626,000 tons in the preceding week. A year ago the output was 5,355,400 tons.

Salt Tender Result.—The Borough of Salford have been recommended to accept the tender of Murgtroyds Salt Works, Ltd., Manchester, for 100 tons of common salt at 39s. 11d. per ton for the Lighting and Cleansing Committee.

Manchester University Lectures.—A course of six lectures on "Recent Advances in Chemistry" is to be given at Manchester University by Professor Arthur Lapworth on Fridays (fortnightly) at 7.30 p.m., commencing Friday, November 2; course ticket, 5 shillings.

British Copper Sulphate in France. — For agricultural purposes, chiefly for spraying vines, France uses annually some 66,000 tons of copper sulphate, the British product enjoying a very high reputation. During the past year France imported 20,426 tons, of which 18,000 tons came from Great Britain.—*Chemist and Druggist.*

Benzol Works Fatality.—While an oil tank at the works of the National Benzol Company, Cardiff, was being cleared out, on Wednesday, two men and a lad were rendered unconscious. One, a depôt foreman named Mann, succumbed; and a second man—a labourer named Victor Breese—lies in the infirmary. The lad recovered.

Committee on Food Preservatives. — Sir William Joynson-Hicks, M.P., Minister of Health, has appointed Mr. P. A. Ellis-Richards, President of the Society of Public Analysts, to be a member of the Departmental Committee on Preservatives and Colouring Matters in Food in the place of Mr. Otto Hehner, who has resigned from the Committee.

Paper from Coconut Husks.—Still another material suggested for use in the manufacture of paper is the coconut husk, states the *Anglo-Norwegian Trade Journal*, but it is doubtful whether the cost of preparing and transporting the husks would be low enough to permit of their commercial use. A Philippine company which has large quantities of husks as a waste product in manufacturing desiccated coconut states the cost of drying husks, flattening them into rolls, and wrapping and baling them into bales of about 100 kilos at 19.80 dollars per metric ton.

Helium Storage Plant for U.S. Navy.—The American Navy Department has made plans for a large helium storage plant at its air station at Lakehurst, N.J. Ten helium containers which are steel cylinders 40 feet long and four feet in diameter, with a shell four inches thick, have been purchased. They will hold gas at a pressure of 2,000 pounds per square inch. These cylinders will be placed side by side underground, and concrete galleries at the ends of the series will carry the necessary piping and valves for control of admission and discharge of the helium, and facilitate inspection.

Position of Public Analyst at Manchester.—In asking for the appointment of an assistant public analyst, the Manchester Public Health Committee say that the work is more than can be covered by the public analyst himself. The public analyst has had to enlist unskilled and voluntary help from members of the staff of the laboratory who are not paid by the Corporation; he has been unable to take any time off since 1920, when he was appointed; in the event of illness there is no one to take his place; in addition to working a long day in the laboratory he has to carry work home every night and to work on Sundays as well, and he analyses about 3,000 samples per annum.—*Manchester Guardian.*

Personal.—The many friends in the gas and tar industries, of Mr. J. E. Barlow, director of Messrs. Hardman and Holden Limited, chemical manufacturers, Miles Platting, Manchester, will be interested to know that he completes fifty years service with the firm to-day, November 2. Mr. Barlow joined the firs as office boy on November 3, 1873, and in 1898, became secretary to the company. After holding this position until March 17, 1916, he was elected a director of the company, and now occupies the position of Sales Director.—Dr. Andrew Balfour, until recently Director of the Wellcome Bureau of Scientific Research, London, has been appointed Director the School of Hygiene, to be established as the result of the gift of the Rockefeller Foundation.—Mr. John Allan, F.C.S., has been proposed by the Council of the Manchester Literary and Philosophical Society for election as honorary secretary in succession to Dr. H. F. Coward.

American Platinum Imports.—Platinum imports into America during July dropped to 1,394oz. troy. Imports from Colombia were 827oz., which compares with a monthly average of 1,951oz., or a total of 11,705oz. for the first six months of 1923.

Platinum in the Transvaal.—Transvaal Platinum, Ltd., have acquired further mineral rights in the Waterberg district of the Transvaal, where platinum in payable quantities has been discovered by the Transvaal Consolidated Land and Exploration Company, Ltd. Prospecting has disclosed encouraging values, and sinking is now in progress with a view to testing values at depth.

Research in the Textile Industries.—Dr. A. E. Oxley, giving the fifth of a series of lectures on Monday week on the relation of science to industry, arranged by the Institute of Physics, emphasised the necessity of the application of scientific research to the textile industries. He pleaded for a close co-operation between the research worker and the highly skilled millhand, and said that an enormous unexplored field awaited investigation. At present only about twenty physicists were engaged on this work, but several hundred were needed if an industry that constituted a great national asset was to go forward to assured prosperity.

Institution of Chemical Engineers.—A meeting of the Institution of Chemical Engineers will be held at the Engineers' Club, Coventry Street, London, W. 1, on Wednesday, November 14, at 7.30 p.m., when the following two papers will be read and discussed:—(1) "A Study of the Conditions of Constant Rate of Flow in Filter Presses," by M. B. Donald and R. D. Hunneman. (2) "A Study of the Absorption Tower," by M. B. Donald and C. W. Tyson. The meeting will be preceded by a dinner, at 6.30 p.m., tickets for which can be obtained from the Hon. Secretary at the offices of the Institution, 307, Abbey House, Victoria Street, Westminster, S.W. 1.

British Colour Index.—At the annual smoking concert of the West Riding Section of the Society of Dyers and Colourists, held at Bradford on Friday last, Mr. H. Jennings (Chairman of the Section) announced that with the December issue the Society's Colour Index will be completed, and in January bound volumes will be available. The completion of the Index after three years' work, at a cost of £6,000., compared with the original estimate of £2,000., marks a distinct step forward by the British dyeing industry. Schultz's Farbstofftabellen was the standard index before the war, and contained particulars of 1,001 German and Swiss dyes in 432 pages. The new Colour Index contains details of 1,700 colours in 728 pages, and deals with the dyes of the whole world. It is anticipated that it will be recognised as the standard work of reference.

Stability of Sodium-Thiosulphate Solutions.—Since standard solutions of sodium thiosulphate are extensively used in volumetric analysis, the stability of these solutions is a matter of great importance. M. Kilpatrick and M. L. Kilpatrick (*Jour. Am. Chem. Soc.*, 1923, 45, 2132) have studied the stability of several one-hundredth normal solutions of this salt over a period of eight months. Freshly boiled redistilled water yielded a solution which was more permanent than those prepared with laboratory distilled water, ordinary redistilled water, and redistilled water through which air free from carbon dioxide had been bubbled. The stability of the solution was influenced but little by carbon dioxide, oxygen, and dilute sodium hydroxide. Decomposition of the solution was caused by the action of bacteria.—*Jrnl. Franklin Inst.*

Injuries Received While Trespassing.—At the Glasgow Court of Session, last week, Lord Constable gave judgment in an action by George Bitters, 34, Keyden Street, Kinning Park, Glasgow, against the Scottish Farmers' Dairy Company (Glasgow), Ltd., 2, Anderson Street, Kinning Park, Glasgow, for £300. as damages for injuries sustained by him on March 13, 1922. The plaintiff, who is 14 years of age, was playing with a number of other children about the defendants' yard when a barrel, which had contained benzol burst, and the plaintiff was projected about 30 yards and injured. The plaintiff maintained that the accident was due to the fault of the defendants in failing to take proper precautions. The defendants denied fault and pleaded contributory negligence The plaintiff was well aware that he was trespassing, and the barrel was maliciously interfered with. His Lordship dismissed the action on the ground that it was irrelevant.

COMING EVENTS.

Society of Chemical Industry (Manchester Section).—Joint meeting, **Friday, November 2,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Address: "Electrometric Methods in Analytical Chemistry," by Professor W. D. Treadwell, of Zurich.—**(London Section):** Meeting, **Monday, November 5,** at **8 p.m.,** at Burlington House, Piccadilly, W. 1. Paper: "The Use of Hydrogen Cyanide for the Fumigation of Ships," by G. W. Monier-Williams.

Society of Engineers.—Meeting, **Monday, November 5,** at **5.30 p.m.,** at Burlington House, W. Paper: "Lubrication," by W. Lee.

Society of Chemical Industry (Birmingham Section).—Meeting, **Tuesday, November 6,** at **7.15 p.m.,** at the University, Edmund Street, in co-operation with the Chemical Society. Papers: "The Amino Acetophenones as Colour Intermediates," by Professor G. T. Morgan and J. E. Moss; "Current Research at the Birmingham University," by Professor Morgan.

Institution of Civil Engineers. — Meeting; **Tuesday, November 6,** at **6 p.m.,** at Great George Street, Westminster, London, S.W. 1. Presidential address by Sir C. L. Morgan.

Society of Public Analysts. — Meeting, **Wednesday, November 7,** at **8 p.m.,** at Burlington House, Piccadilly, London, W. 1.

Society of Chemical Industry (South Wales Section).—Meeting, **Thursday, November 8,** at **7.30 p.m.,** at the Engineers' Institute, Park Place, Cardiff. Address by the President, Dr. E. F. Armstrong, on "The New Chemistry."

Chemical Society.—The Van der Waals Memorial Lecture. **Thursday, November 8,** at **8 p.m.,** at the Institution of Mechanical Engineers, Storey's Gate, Westminster, S.W. 1; to be delivered by Dr. J. H. Jeans.

Institute of Metals (London Section).—Meeting, **Thursday, November 8,** at **8 p.m.,** at the Royal School of Mines, South Kensington, London, S.W. 7. Paper: "Some Impressions of American Non-ferrous Metallurgy," by Dr. W. Rosenhain. —**(Sheffield Section):** Meeting, **Friday, November 9,** at **7.30 p.m.,** at the University, St. George's Square. Paper: "Substitutes for Platinum," by E. A. Smith.

Society of Dyers and Colourists (Manchester Junior Section).—Meeting, **Friday, November 9.** Paper: "Ice Colours" (with demonstration), by K. Saunders.

Institute of Metals (Scottish Section).—Meeting, **Monday, November 12,** at **7.30 p.m.,** at 39, Elmbank Crescent, Glasgow. Paper: "Nickel Alloys," by D. Turner.—**(Birmingham Section):** Meeting, **Tuesday, November 13,** at **7 p.m.,** at the Chamber of Commerce, New Street. Paper: "X-Rays and Crystal Structure," by Dr. H. B. Keene.—**(N.-E. Coast Section):** Meeting, **Tuesday, November 13,** at **7.30 p.m.,** at the Armstrong College, Newcastle-on-Tyne. Paper: "General Scientific Brass Foundry Work," by Dr. P. Longmuir. — **(Swansea Section):** Meeting, **Friday, November 16,** at **7.15 p.m.,** at University College, Singleton Park. Paper: "The Density of Alloys," by Professor Thomas Turner.

Hull Chemical and Engineering Society. — Meeting, **Tuesday, November 13,** at **7.45 p.m.,** at the Photographic Society's Rooms, Grey Street. Paper: "Heating Mediums, Past and Present," by E. G. T. Hill.

Institution of Chemical Engineers.—Meeting, **Wednesday, November 14,** at **7.30 p.m.,** at the Engineers' Club, Coventry Street, London, W. 1. Papers: "A Study of the Conditions of Constant Rate of Flow in Filter Presses," by M. B. Donald and R. D. Hunneman; "A Study of the Absorption Tower," by M. B. Donald and C. W. Tyson.

Society of Dyers and Colourists (West Riding Section).—Meeting, **Thursday, November 15.** Paper: "The Romance of Science," by Professor E. C. C. Baly.—**(Manchester Section):** Meeting, **Friday, November 16.** Paper: "Investigations into the Changes which Occur in Cotton Fabrics During Calendering and Beetling," by J. Huebner and V. Malwin.

Institute of Chemistry (Glasgow Section).—Discussion, **Friday, November 16,** at the Royal Technical College. Subject to be announced later.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN SEPTEMBER.

(Concluded from page 495.)

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during Sept., 1923, compared with 1921 and 1922. As from April 1, 1923, export trade of the Irish Free State is excluded from the Returns.

CHEMICAL TRADE OF THE NETHERLANDS.

SEPTEMBER IMPORTS AND EXPORTS.

THE following statistics, which have been furnished by the Bureau voor Buitenlandsche Bedrijfsberichten, of The Hague, show the amount and value of the Dutch trade in chemicals during the month of September, 1923.

Imports of Chemical Products.

		Kilogrammes.	Florins.
Calcium acetate	Total	50,000	10,000
	Belgium	50,000	10,000
Lead acetate	Total	3,000	1,000
Copper acetate	Total	—	1,000

Textile Technology as a Profession.—The Textile Institute, which held its annual conference at Leicester recently, is at present engaged in an effort to secure a royal charter of incorporation, and thus to set up a recognised qualification in textile technology.

LEGAL INTELLIGENCE.

ARBITRATION IN THE CHEMICAL TRADE.

Scrimaglio *v.* Thornett and Fehr.

In the King's Bench Commercial Court, on Thursday, October 25, Mr. Justice Greer continued the hearing of an action brought by Messrs. Scrimaglio, merchants, of Genoa, against Messrs. Thornett and Fehr, of Leadenhall Street, London, E.C., which arose out of a tallow contract and a soda ash deal.

Further evidence was given that the custom with regard to arbitrations was to appoint two arbitrators with power to appoint an umpire.

Counsel for the plaintiffs then contended that the arbitration was not held "in the usual way," and there was not sufficient evidence called to show that the arbitrator was entitled to act.

His Lordship, giving judgment, said the case was not without difficulty, arising out of business people preferring vague phrases to a clearer form. Under the contract the words were: "Any dispute arising out of this contract shall be settled by arbitration in London in the usual way." It was a clear, definite contract, which he would describe as an English and even a London one. He had to ask himself whether there was a "usual way" within the meaning of the contract. A great deal of evidence had been called which showed that, unless the contract contained stipulations to the contrary as to what was to be done, the custom in the chemical trade was to appoint two arbitrators and an umpire; and it was the rarest possible thing to happen to find a contract which provided for a single arbitrator. He was satisfied that the words, "in the usual way," referred to the chemical trade, and were in accordance with the practice of the trade. This resulted in it being necessary to appoint two arbitrators who, if they differed, appointed an umpire. The result was that on the preliminary point his decision was in favour of the defendants, and after deducting that item of the plaintiffs' claim which was admitted, he should give judgment for the defendants for £4,414. 12s. 7d., with costs.

Leave to appeal was granted on the usual terms.

IMPORTED "SALVAGE" FERTILISER.

A. J. R. Anderson, Ltd., v. G. Daniel.

In the Court of Appeal, on October 25, Lords Justices Bankes, Scrutton, and Atkin gave judgment allowing the appeal of George Daniel, a farmer, against whom judgment was given in the Malton County Court at the suit of A. J. R. Anderson, Ltd., of Pickering, for £77. 10s., the price of 10 tons of imported "salvage" fertiliser.

It appeared that the plaintiffs had bought some 60 tons of salvage mixture on Hull Docks, the stuff being brought by ships from the Continent with cargoes of nitrate of soda, ammonia compounds, potash, superphosphates, and basic slag. In unloading many bags and casks burst, and the contents fell into the hold and were mixed up. Some of the mixed-up stuff stopped as ballast in the holds, which at certain periods were cleared out by arrangement between the shipowner and the manure manufacturers, who were in the habit of selling it as "salvage," which meant this stuff out of the holds. It is the custom of the trade to sell this "salvage" without any analysis, as in the circumstances analyses would be impossible.

The County Court Judge found that, in view of the evidence of the plaintiffs with reference to the Hull trade in salvage, the plaintiffs had "a reasonable excuse" for not delivering an invoice, and therefore that the plaintiffs were entitled to judgment for the £77. claimed, with costs. But on appeal to the Divisional Court there was a difference of opinion, Mr. Justice Lush agreeing with the County Court Judge, and Mr. Justice Salter taking the contrary view. Hence the present appeal.

Lord Justice Bankes, giving judgment, said he agreed with the finding of fact that the substance in question was an imported fertiliser within Section 1 (1) of the Act of 1906, and it was clear, therefore, that the giving of an invoice was imperative, unless there was a reasonable excuse. On the facts, the County Court Judge could not in law come to the conclusion that there was a reasonable excuse within the meaning of the statute. The appeal would be allowed, with costs and judgment entered for defendant, also with costs.

The other Lords Justices concurred.

SULPHATE OF AMMONIA SALES DISPUTE.

British Sulphate of Ammonia Federation, Ltd. *v.* The South Metropolitan Gas Company.

In the King's Bench Commercial Court on Wednesday, Mr. Justice Greer commenced the hearing of an action brought by the British Sulphate of Ammonia Federation, Ltd. against the South Metropolitan Gas Company for a declaration that certain proceeds of sales of sulphate of ammonia were due to plaintiffs. Defendants denied liability.

Mr. Wright, K.C., for plaintiffs, said the action was to ascertain on what principles accounts were to be adjusted between the parties. The disputes which had arisen between the parties had reference to a scheme called the Equalisation Scheme, in operation during the years 1920-21, for the equalisation of prices of sulphate of ammonia. The members of the scheme were the makers of the commodity in this country. There had been an organisation in the trade previously, but in 1920 the Federation was formed as a limited liability company, and carried out a scheme of equalisation. They had about 90 per cent. of the makers in it, and the defendant gas company represented about five per cent. of the total output. The position of the maker was affected by his topographical position, and the Federation arranged for the distribution of the orders amongst the makers both for home and export trade, and the surpluses arising from the profits were distributed to the members. Towards the end of 1920, however, difficulties arose. By that time the foreign competition in the export market which was small when the war began had become operative again, as the productive capacity of foreign countries had largely increased. Under those circumstances the question had to be considered how the equalisation was to be dealt with in a falling export market with the home trade. It was in respect of this that the difference of opinion arose with the defendants. The agreement was worked by the Federation, according to the obligations imposed upon them, and the defendants now said because there was a special provision as to what was to be done in regard to export rules they were excluded from the other obligations, which plaintiffs said rested on them.

The hearing was adjourned.

APPLICATION FOR DEBTOR'S DISCHARGE.

Hugo Edward Mayer.

An application was made on October 26, for the discharge of Hugo Edward Mayer, merchant, 44, Chatsworth Road, Brondesbury, N.W., who was adjudicated bankrupt on June 14, 1921.

The Official Receiver in his report estimated the unsecured indebtedness at £6,960., and the sum of £2. 4s. 6d. had been realised from a bank balance. In May, 1918, debtor formed The Ink Manufacturing Supply Co., Ltd., the name of which was afterwards changed to the Blackamoor Chemicals and Colours, Ltd., and he acted as director until its liquidation in January, 1921. Regarding applicant's liability as surety to L. Jacobson and Co., Ltd., which he had helped to form, he said that the company had sold in 1919, caustic soda to one F. Nattero. A dispute arose regarding the strength of the soda and an action was brought against the company and settled in December, 1919 (after the company had gone into liquidation), on terms, *inter alia*, that he and his co-director guaranteed the payment to F. Nattero of £3,900. His co-director paid £300. and he £1,740., leaving a balance due and owing by the bankrupt of £1,860. He had received no consideration from the company in giving the guarantee.

The discharge was granted subject to a suspension of two years.

Colouring Paper with Insoluble Azo Colours.—The preparation of azo colours by treating with sodium nitrite a solution of a primary amine and the substance with which it is to be coupled in an oil, such as a liquid fatty acid, a glyceride, or a hydrocarbon containing a free fatty acid is claimed in a recent American patent specification (*U.S. Pat.* 1,462,613, of 1923). The fatty acid or acidified oil liberates nitrous acid and brings about diazotisation without the use of water or mineral acids, the presence of which is often disadvantageous. The method may be applied to printing on sized paper, which is impregnated with sodium nitrite and then treated with a solution in a fatty acid of the amine and coupling component. The use of the oily vehicle causes complete penetration of the paper, which cannot be achieved with aqueous solutions.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

United Kingdom.

The Commissioners of His Majesty's Works, etc., invite tenders, before 11 a.m. on November 13, for supply of soda crystals and soda ash. Forms of tender, etc., may be obtained on application to the Controller of Supplies, H.M. Office of Works, etc., King Charles Street, Westminster, London, S.W. 1.

Australia.

An Australian manufacturers' agent, at present in London, wishes to be put into touch with manufacturers of raw materials, heavy chemicals, etc. Letters should be addressed in the first instance to the Official Secretary, Commercial Branch, Australia House, Strand, London, W.C. 2, quoting reference No. 412/7/1/1/167.

Cyprus.

An agent resident in Larnaca desires to secure the representation of British manufacturers of varnishes, paints, colours, etc., on a commission basis. (Ref. No. 444.)

New Zealand.

A firm of agents resident in Auckland desires to obtain the representation of a British exporter of olive oil soap, shaving soap, and olive oil. (Ref. No. 445.)

Norway.

A commission agent in Christiania desires to secure the representation for Norway of British exporters of lubricating oils and greases. (Ref. No. 453.)

Spain.

A commission agent of Barcelona is desirous of securing the representation of British manufacturers of sulphate of ammonia, sulphate of copper, and superphosphates. (Ref. No. 454.)

Algeria.

A firm of commission agents established in Algiers desire to be placed in touch with British exporters of household and laundry soap. Correspondence in French. (Ref. No. 459.)

Guatemala.

A commission agent of Guatemala City is desirous of securing the representation of British firms manufacturing drugs and chemicals, patent medicines, perfumery, etc. (Ref. No. 468.)

REPORTS OF COMPANIES.

American Smelting and Refining Company.

The report states that the company has completed the financing for the construction of an arsenic plant and a new copper smelter at San Luis Potosi and a zinc smelter at Rosita. After deducting interest, depreciation, taxes, and miscellaneous adjustments, there was a net income of 5,096,045 dollars, an increase of 3,270,122 dollars over the same period for last year. As the preferred stock dividends for each six months amount to 1,750,000 dollars, there was left available for dividends upon the common stock 3,346,046 dollars. The board, in June, decided to resume dividends upon the common stock at the rate of 5 per cent. per annum, the first quarterly dividend of 1¼ per cent. being payable on August 1.

Lighting Trades, Ltd.

The directors' report for the year ending March 31, 1923, states that the trading of the year resulted in a loss of £14,872., to which has been added £56,689. for depreciation of stocks, £11,829. for depreciation of buildings, plant and machinery, £6,605. for investments depreciation, and £12,000. reserve for taxation, making a total debit balance for the year of £101,995.; to this must be added the £198,016. brought forward, plus £8,997. for preference dividend for half-year to March 31, 1922 (not paid out of profits), making a debit balance of £309,008. to be carried forward.

DIVIDENDS.

Brunner, Mond and Co., Ltd.—Interim dividend on the ordinary shares for six months ended September 30 at the rate of 7 per cent. per annum, payable on December 12. Last year the corresponding dividend was 7½ per cent.

Sadler and Co., Ltd. — Final dividend of 4 per cent., making 7 per cent. for the past year.

Ship Canal Portland Cement Manufacturers, Ltd.—The accounts for the year ended March 31 show a loss of £13,655., after providing for debenture, but £8,615. has been transferred from the employers' liability fund, and the surplus brought forward was reduced to £6,214., which it is proposed to carry to the new account.

Nitrate Producers' Steamship Company, Ltd.—Dividend at the rate of 7½ per cent. per annum (3s. 9d. per share net), payable on November 1.

Alfred Bird and Sons, Ltd.—Net profit for year ending March last is £80,000. Dividend of 21½ per cent., free of tax, again proposed, and £21,000. carried forward.

Wall Paper Manufacturers, Ltd.—Profit for the year ended August 31 last was £635,681. Final dividend of 6 per cent. on the ordinary shares, making with the 4 per cent. interim dividend already paid 10 per cent. for the year, a dividend of 10 per cent. on the deferred shares, and a transfer to reserve of £100,000., carrying forward a balance of £223,088.

Aguas Blancas Nitrate Company, Ltd. — Interim dividend on account of the year 1923 of 25 per cent., less tax, at 4s. 7½d. in the £., payable on November 30.

Ayrton Saunders and Co., Ltd.—Interim dividend on 7½ per cent. preference, payable, less tax, at 4s. 5d., on November 1.

REVISED RAILWAY CHARGES.

THE PROBLEM OF EXCEPTIONAL RATES.

BEFORE any real progress can be made by the Railway Rates Tribunal with the task of reviewing the new scales of charges it is essential that the problem associated with the retention of exceptional rates should be solved, states a correspondent to the *Times*. At one period it was expected that the bulk of the many millions of exceptional rates below the class rates, at which traffic is carried for various reasons, might be merged, under the new classification, in some of the additional classes into which traffic is to be grouped in the new system.

It is now realised that there are good reasons for the retention of a large number of the exceptional rates at present in operation. Under section 36 of the Railways Act, however, the bulk of the exceptional rates would disappear on and after the "appointed day," which will be that on which the new schedules of charges by order of the Railway Rates Tribunal come into operation. Power is granted to the managements of the railway groups to grant new exceptional rates after the appointed day in respect of the carriage of any merchandise, but it is obvious that this would be a long and tedious task. Faced with this difficulty, traders' organisations, in association with railway officials, have been endeavouring to frame a scheme by which those exceptional rates which it is desirable to retain may be grafted on to the new schedules. The subject has been again under review at a meeting of the Traders' Co-ordinating Committee—a body representing the leading business organisations—this week, and arrangements have been made for a conference with railway officials to-day (Friday), when, it is hoped, a scheme may be evolved which will obviate the labour and delays associated with a strict compliance with the letter of the Railways Act.

There is an additional reason why a solution of the exceptional rates problem should be found. It would appear to be impossible to fix standard charges at a level which would produce the standard revenue to which under the Railways Act the companies are entitled, until it is known what proportion of the total traffic, when the new schedules come into operation, will be carried at rates which in many instances are much below the class rates. At the present time more than half the total tonnage is charged at exceptional rates. On the percentage which may pass at such rates in the new era which will dawn on the appointed day estimates of railway revenue must to some extent be based. It will be seen, therefore, that the coming conference will have before it a fundamental issue.

FERTILISER NEWS.

Nitrate of Soda.—The efforts of the Chilean Government to assist the nitrate producers by temporarily suspending, or rather postponing the payment of the export tax on nitrate, have, in conjunction with difficulties in other directions, been responsible for a serious Budget deficit for the current year. The present Finance Minister, Señor Subercasseaux, had hoped to receive approximately 30,000,000 pesos revenue under the new income-tax act, which has, however, been held up in the Upper House. In view of the urgent necessity, therefore, the Minister conceived the idea of selling certain of the nitrate properties in the provinces of Tarapaca and Antofagasta, the proceeds of the sales to be applied to the reduction, or extinction, of the budget deficit. Introduced on July 28 into the Senate, its importance as a revenue measure assured the preference given to the proposal over all other pending business. A cable from Valparaiso under date of October 25 now states that the law has been passed by Congress, and the yield from the sales, which it is hoped will amount to about 30,000,000 pesos, will be at the disposal of the Minister of Finance. Particulars as to the conditions of sale, and information relative to the possible occupation on lease of the properties, is not yet available, but the condition of affairs disclosed does not encourage the hope of a definite reduction in the export tax on nitrate in the future. Stocks of nitrate in Chile, which have been steadily diminishing during the past twelve months or more, have been assisted on their downward course by the recent discovery in certain oficinas that stocks had been overestimated by some 26,000 tons. The amended figure at September 30 last, therefore, is 927,000 tons, the production during September amounting to 153,000 tons. As mentioned last week, shipments during the first half of October totalled 75,000 tons—approximately equivalent to the present rate of output. The general unsatisfactory position, combined with the lack of further sales, resulted in the Chilean exchange falling to the low level of 39 pesos to the £ sterling, during the earlier part of October, though there was a subsequent recovery to about 38.

Sulphate of Ammonia.—A further small advance in the price of this fertiliser brings the quotation for November to £14. 15s. per ton for the neutral quality, basis 25¾ per cent. ammonia. This is the Federation's official price for sulphate for home consumption, delivered to consumer's nearest station in 4 ton lots. On the basis of unit cost of nitrogen therefore, ammonium sulphate is still much cheaper than nitrate of soda, the values being about 14s. per unit in the case of the former, corresponding to a price of about £10. 18s. per ton for the latter, which is, at the present time, being sold at £13. 10s. per ton. The home-produced material is the cheapest form of nitrogen fertiliser in this country, though it must be admitted that the manufacturers are making very little profit at current prices. The present price for sulphate of ammonia, taking into account the improvement in the quality and higher guarantee of nitrogen content given, is considerably below the price for 1913, whereas costs of production are still very much higher than in that year. The main reason for the increased cost of production is, of course, the high price of sulphuric acid, and there is a general feeling among sulphate makers, who are the largest consumers of the acid produced in this country, that the price of acid is higher than it need be. In this connection, however, it is interesting to hear that a large new production may shortly be available, with the possibility of easier prices. The export market continues active, though values are only on about the same levels as for home consumption. For later delivery, higher prices are being asked, with indications of fair business. The loss of the pre-war American and German markets, and in part, the Japanese market, as a result of strenuous American competition during and since the war has restricted the market abroad for British material. At the present time, however, American production is only sufficing to fill domestic requirements, and any excess which does come on to the open market is priced too high for effective competition with the sulphate made in Great Britain. British manufacturers have taken full advantage of these conditions, as a glance at the statistics for 1923 will show, but it is to be feared that the re-entry of the United States as a serious competitive force will result in the closing to us of the markets in the Far East.

Other Fertilisers.—Potash fertilisers are reported to be in good demand, with kainit showing 12½ per cent. of potash at £1. 17s. per ton at London. The 14 per cent. grade is quoted at £2. 5s. per ton, and £2. 10s. at Liverpool. Sylvinite, 20 per cent., is not in so much request as kainit, although a cheaper fertiliser on the unit price. Chloride of potash remains at about £7. per ton, and sulphate at £10. 15s. Basic slag and superphosphate are in fair request at recent rates, prices for the former being for the 20-22 per cent. grade, £2. 5s.; 30 per cent., £2. 17s.; and 35 per cent., £3. 10s. per ton delivered. Superphosphate 30 per cent. is quoted at £3., and 35 per cent. at £3. 5s. per ton at London. Bone meal and steamed bone flour are in demand, and slightly dearer; bone meal containing 45 per cent. total phosphate being quoted at £8. 10s. at London, £9. at Liverpool, and £9. 10s. per ton at Bristol. Steamed bone flour showing 60 per cent. total phosphates is on offer at £6. 5s. per ton, and 10s. dearer at Liverpool, where fish guano is scarce and firm at £12. 10s. per ton for material giving 9-10 per cent. ammonia and 16-20 per cent. total phosphates.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(Specially Contributed.)

The pressure being exerted on the coking industry by the hematite pig-iron smelters at the present time is not of the heaviest, but it is, at all events, sufficient to compel the ovens to be worked fully, and a very considerable output is being obtained. That the pressure will be greater in the course of a month or two seems undoubted. It is quite certain now that in January a much larger proportion of the make of ordinary pig iron will be going into local consumption, and as soon as that is the case the lighting of additional furnaces will become necessary. Whether the increase in the demand for pig iron will come from the Continent is uncertain. The indications are that it will be home users, and not overseas consumers, who will absorb whatever expansion of output takes place. At the present time the Midlands is the only important consuming district. It is seldom that the coal and coking industries have been so busy at a time when only fourteen furnaces were in draught between Workington and Carnforth. The collieries are all working full time, but, in spite of that, the supplies of smalls are practically all reserved for the coking plants. Of best round coal for shipment there is an ample supply, and industrial fuel is in very small request. In addition to the local coke, the smelters in Cumberland and North Lancashire are taking nearly 9,000 tons weekly from the East Coast. Most of it, however, is going to the furnaces in the Furness area. Little of it is used in West Cumberland. Prices are steady, the local coke commanding from 29s. to 32s. per ton, according to carbon content. Continental users who are not at present taking other than inconsiderable parcels are paying from 32s. to 36s. Residuals are rather a low market. Sulphate of ammonia is on the easy side.

SOUTH WALES NOTES.

[Specially Contributed.]

The state of the tinplate trade continues good, and there is now sufficient work at all the factories to last over the remainder of the year. At some works, indeed, orders are in hand that will carry operations over the next quarter. The engine drivers and stokers intend on Monday to give notice to cease work in 28 days, unless their wage demands are satisfied. It is not thought that a strike will take place, but should this be the case, over 25,000 persons will be affected. Business in the galvanising industries is increasing, the Far Eastern markets having strengthened considerably. The spelter trade does not seem to improve, although there is a steady demand by the galvanised sheet manufacturers. Basic slag of local make is moving somewhat better. The copper industry remains stagnant, and there are no signs of re-starting the works which have now been idle for some two or three years. Cokes have a fair inquiry, with residuals in strong demand.

Among the imports were 46 tons copper ore from Arica, 20 tons zinc ores, 300 tons silica, 2 tons ferro chrome from Antwerp, 124 tons zinc ashes from Montreal, 58 tons ferro silicon from Christiania, 50 tons ditto from Riscoer to Swansea; 4 tons fish oil from Oporto, 48 tons zinc dross from Baltimore, 24 tons ditto from New York to Cardiff. Exports included 71 tons painters' colours to Capetown, 1,455 gallons wood naphtha to Sydney, and 9 tons zinc chloride to Antwerp from Newport.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Borax Consolidated, Ltd., London, E.C.—Registered October 12, Trust Deed dated October 9, 1923 (supplemental to Trust Deed dated October 10, 1912), securing £100,000. further 2nd debenture stock.

Catalytic Chemical Company, Ltd., Southall.—Registered October 9, £1,000. debentures.

Coleby, Ltd., London, E., chemists.—Registered October 12, £10,500. debentures.

Express Dyeing and Cleaning Company, Ltd., London, W. —Registered October 11, £500. (not ex.) charge, to Lloyds Bank, Ltd.

Synthetic Products Company, Ltd., London, E.C.—Registered October 13, £5,000. (not ex.) debenture, to King's Lynn Milling Company, Ltd., Alexandra Dock, King's Lynn.

SATISFACTION.

Wyke Dyeing Company, Ltd., Bradford.—Satisfaction registered October 11, £1,500., registered December 23, 1922.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Devon Hide, Skin and Manure Company, Ltd.—Resolved October 16: That the company be voluntarily wound up. C. E. B. M. Smith, 10 and 12, Victoria Street, Paignton, liquidator.

Henson and Son, Ltd., Peterborough, chemical manure manufacturers.—J. Stephenson ceased to act as receiver. October 8.

BANKRUPTCY INFORMATION.

Stansfield, Jno. Lord, Boothfold, Waterfoot, Bacup, chemical manufacturer. 1st meeting, O.R.'s, Manchester, November 1. Exam., County Police Court, Rochdale, November 30.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Humber Chemical Company, 23, North Walls, Hull; chemical manufacturers; £18. 16s. 6d. September 21.

Klero and Co., 80, Borough High Street, London, S.E.; ink manufacturers; £20. 11s. 8d. September 25.

Stansfield, J. L., Boothfold, Waterfoot; chemical manufacturer; £10. 13s. 3d. September 21.

Trefriw Mining Company, Ltd., and Crafnant Valley Lead and Zinc Mining Syndicate, Ltd.; registered offices, 86, Cross Street, Manchester; £62. 6s. 9d. September 14.

Turner Drug and Galenical Company, Ltd., Roden Street, Ilford; £86. 19s. 4d. July 3. (Remitted action.)

NEW COMPANIES.

Abbey Works, Ltd.—Private company. Capital £100. Manufacturers of earthenware, clays, chemicals, etc. Office: Abbey Works, High Street, Hanley, Staffs.

Aluminium Products, Ltd.—Private company. Capital £3,000, £1. shares (2,000 A. and 1,000 B.). Manufacturers of and dealers in aluminium and other metallic alloys, etc. Office: Stanhope Works, Park Street, Camden Town, N.W.

Northern Smokeless Fuels, Ltd. — Private company. Capital £2,000. Manufacturers of and dealers in briquettes and patent fuels in the U.K., Europe, or elsewhere. Solicitors: Cooper and Co., 54, Gresham Street, London, E.C.

Stuart, Roy and Co., Ltd.—Private company. Capital £100., 1s. shares. Manufacturers, producers, quarriers, refiners, storers, suppliers of and dealers in chemicals, etc. Office: The Hill, Darlaston, Staffs.

Warrington Products Company, Ltd.—Private company. Capital £2,000. Manufacturers of and dealers in animal products, etc. Address: Chorley Street, Warrington.

Irish B.P. Company, Ltd.—Private company. Capital £100,000. To purchase, import, and manufacture oil, etc. Registered by Miley and Miley, solicitors, 12, South Frederick Street, Dublin.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 15 to 20 (inclusive).

Dyeing Acetyl Cellulose. Baddiley, J.; British Dyestuffs Corporation, Ltd.; Hill, J.; Lawrie, L.; Shepherdson, A.; and Swann, H. 26,158.

Black Shades on Cellulose Acetate Materials. Blackshaw, H.; British Dyestuffs Corporation, Ltd.; and Lawrie, L. G. 26,029.

Substituted Products of an Aliphatic Arsinic Acid. Etablissements Poulenc Frères; and Oechslin, C. 26,163.

Commercial Products from Blood. Fitzgerald, F. W. V. 25,659.

Artificial Wood. Forster, A. 25,935.

Elevating and Controlling Supply of Acids. Guillaume, F. J. 25,961.

Valves for Gas Purifiers. Horsfall, J. E.; and Lumb, H. 25,769.

Distillation of Coal. Jones, F. W. Salisbury-; and Parker, C. H. 26,100.

Alcohol. Klein, E. 26,014.

Artificial Silk. Mandleberg and Co., Ltd., J.; and Rothband, H. L. 25,934.

Manufacture of Fertilisers. Messerschmitt, A.; and Schmidt, F. L. 26,053.

Anti-freezing Device for Gas-storage Cylinders. Pennington, A. M. 26,060.

Perylene Vat Dye. Pereira, H. 25,665.

3.10. Perylene Quinone. Pereira, H. 25,666.

Resinous Materials. Potts, H. E. (*Canadian Electro Products Co., Ltd.*). 25,990.

Atomising and Oxidising Oils. Schofield, H. 25,732.

Naphthaquinone Derivatives. Soc. Anon. des Matières Colorantes et Produits Chimiques de Saint-Denis.; Lantz, R.; and Wahl, A. 26,037.

Dyestuffs. Soc. Anon. des Matières Colorantes et Produits Chimiques de Saint-Denis; Lantz, R.; and Wahl, A. 26,154.

Rendering Porous Electrodes Impermeable to Liquids. Soc. Anon. Le Carbone. 26,140.

Urea and Its Compounds. Soc. des Produits Azotes. 26,164.

Hydrogen. Soc. L'Oxyhydrique Française. 25,936.

Burning of Sulphur. Texas Gulf Sulphur Co. 25,698.

Separation of Insoluble Substances from Each Other. Traube, I. 25,641.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

1922.

Treating Tin Ores and Concentrates. Lockwood, A. A. 10,554. **205,122**

Ferrous Alloys and Weatherproof Articles Therefrom. Skelley, J. M.; and Continuous Reaction Co., Ltd. 12,878. **205,125**

Recovery and Refining of Sulphur. Robinson, C. S. 16,289. **205,141**

Reducing Iron Ores. Dony, O.; and Spirlet, X. de. 17,849. **205,150**

Dye-solutions for Fast Colours. Geigy Soc. Anon., J. R.; and Luttin, K. 18,696. **205,166**

Phenol Formaldehyde Condensation Products. Petroff, G. 18,712. **205,167**

Moisture-absorbing Compositions. Moyer, P. S. 18,898. **205,173**

Electrolytic Extraction of Zinc. Hansgirg, Dr. F. 18,928. **205,176**

Protecting Inflammable Liquids Stored in Bulk from Fire. Sevian, V. 19,019. **205,181**

Cellulose Derivatives. Dreyfus, H. 19,256. **205,195**

Sulphur Dioxide. Houseman, C. R.; and British Oxygen Co., Ltd. 19,820. **205,224**

Sweating of Paraffin and Like Waxes. Esling, F.; and Johnson and Co., Ltd., S. H. 20,465. **205,245**

Dichlor Fluorane. British Dyestuffs Corporation, Ltd.; and Hodgson, H. H. 20,831. **205,254**

Rain and Waterproof Distempers and Water Paints. Weller, H. O. 21,832. **205,262**

Chloridising Roasting of Ores. Mond, A. L. (*International Process and Engineering Corporation*). 22,243. **205,269**

Oxides of Nitrogen and Nitric Acid. Goodwin, C. J. 24,008. **205,288**

Drying of Ammonium Sulphate. Weymann, G. 24,941. **205,301**

Vat Dyestuffs. Johnson, J. Y. (*Badische Anilin and Soda Fabrik*). 25,209. **205,304**

Obtaining Metals from Their Chloride Vapours. Vermaes, S. J.; and Lijnden, L. L. J. van. 30,301. **188,657**

Compression, Storage, and Treatment of Gases. Naamlooze Vennootschap Algemeene Norit Maatschappij. 30,724. **188,665**

Albumose Solutions. Weidner, Dr. E. 33,877. **205,395**

1923.

Control Valves for Gases or Liquids. Hall, I.; and Howlett, J. H. 1,527. **205,413**

Continuous Production of Absolute Alcohol. Barbet et Fils et Cie, E. 2,461. **192,410**

Washing Material which has been Separated by Centrifugal Action. Chemische Fabrik Griesheim-Elektron; and Sander, Dr. F. 7,110. **205,430**

Agitating or Stirring Devices. Jackson, W. J. Mellersh- (*American Abrasive Metals Co.*). 7,266. **205,432**

Ethyl Alcohol from Sulphovinic Acid. Compagnie de Béthune Soc. Anon. 10,469. **197,315**

Glues Insoluble in Water. Svensson, O. 11,533. **205,446**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Synthetic Ammonia. Norsk Hydro-Electrisk Kvœlstofaktieselskab. 23,950. **205,477**

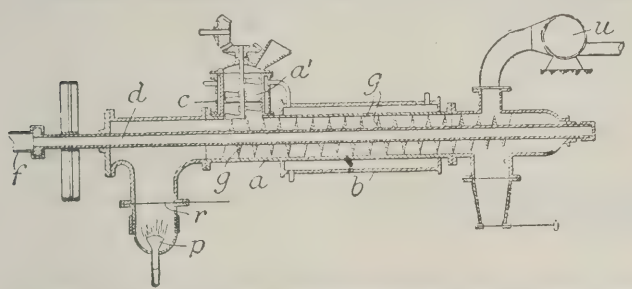
Condensation Products of the Anthraquinone Series. Farbwerke vorm. Meister, Lucius, and Brüning. 25,482. **205,502**

Mono-azo Dyestuffs. Farbwerke vorm. Meister, Lucius, and Brüning. 25,483. **205,503**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Ammonium Sulphate. A. H. Thwaite and Pease and Partners, Ltd., Darlington. British Patent, **203,013,** of 1922.

In apparatus for simultaneously neutralising, drying, and grinding crude ammonium sulphate, the salt is fed from the inlet hopper a^1 through a cylinder a provided with a hollow perforated rotary shaft d through which ammonia, or gas containing ammonia, is introduced from a stationary pipe f. A screw g mounted on the shaft d feeds the salt through



the cylinder and at the same time grinds it. The cylinder and the inlet hopper are heated by steam-jackets b, c, respectively. The drying may be assisted by passing hot air and combustion products from a burner p through the cylinder in the same direction as the salt, the flow of these gases being controlled by a damper r. The surplus gases are withdrawn by a fan u and treated for the recovery of ammonia.

Insoluble Black Azo Dye Produced on Fibre. A. G. Bloxam, London. (Chemische Fabrik Griesheim-Elektron, Frankfort-on-Main, Germany.) British Patent, **203,032,** of 1922.

Azo dyes are obtained by coupling diazotised arylazo-1-naphthylamines not containing sulphonic groups, with arylides of 2:3-oxynaphthoic acid; for the production of black shades on the fibre, the latter is impregnated with the arylide and dyed or printed with the diazo-azo compound. An example is given in which *o*-ethoxy-*m*-tolueneazo-1-naphthylamine is diazotised and coupled with the *p*-anisidide of 2:3-oxynaphthoic acid in the presence of Turkey-red oil. Examples are also given of baths for the production of the dyestuffs on yarn and piece-goods. A table is given of the shades yielded by numerous pairs of components. Specification 100,804, is referred to.

Nitroso Compounds. N. E. Siderfin, S. B. Tallantyre, and W. V. Shannon, Gas Light and Coke Company, Beckton, London; and W. L. Galbraith, Westminster British Patent, **203,060,** of 1922.

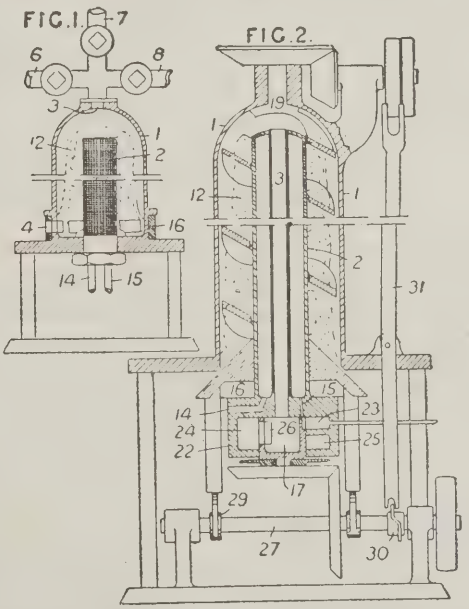
Nitroso compounds of organic substances are prepared by interaction of the organic compound and nitrosyl sulphuric acid, water or ice being added in regulated amount so that nitrous acid is liberated at such a rate as to permit efficient reaction with the organic compound. The nitrosyl acid may be previously diluted to the point at which dissociation sets in, further water or ice being then added as required; this mode of procedure is especially beneficial when the compound is readily sulphonated; the dilution may also be effected by addition of a dilute mineral acid. The process may also be carried out by dropping nitrosyl acid into a mixture of the compound with water or dilute mineral acid. The nitrosyl acid used should be almost freed from nitric acid; this can be done by heating to 150-200° C. or by treatment with sulphur dioxide. The process is particularly applicable as a step in the production of indophenols such as carbazole-indophenols.

Reactivating Nickel Catalysts. Technical Research Works, Ltd., and E. J. Lush, London. British Patent, **203,218,** of 1922.

Catalytic metallic surfaces, particularly those of the nickel employed in hydrogenating oils, etc., are activated or re-activated by subjecting them to electrolytic anodic oxidation, followed by reduction with hydrogen. Nickel or other metal, in the form of wool, turnings, plates, ribbons, rods or balls, is made the anode in a bath in which a salt which does not allow the metal to pass into solution, for example, sodium carbonate, is used as electrolyte. After its surface has been blackened uniformly, the anode is removed, washed, dried, and reduced with hydrogen at 250° C. for a short time. Spent catalysts can be treated in a similar way, after adhering oil has been removed.

Pressure Filters. G. C. Hurrell, London. British Patent, **203,162,** of 1922.

In pressure filters of the type in which the liquid to be filtered is forced into a vessel provided with surfaces for arresting solids and ducts for removing the filtered liquid, the liquid being forced into the filter until the desired thickness of cake is formed, and the cake then being washed and dried before removal, the filter comprises a cylindrical shell, Figs. 1 and 2, and an inner pervious tube 2. A plug or valve for opening or closing one end of the cylinder is provided and valves are fitted for the admission of liquid, wash-water, and compressed air. In the form shown in Fig. 1, the liquid is admitted through the pipe 6 and inlet 3 until the cake 12 is of the desired thickness, the filtrate being removed by the pipe 14. Compressed air is first admitted by the pipe 7, then wash-water through the pipe 8, and the cake is finally dried by a further supply of compressed air. The sleeve 16 is now



rotated to open ports 4, compressed air is admitted to the interior of the tube 2 by the pipe 15, and the cake is blown off and removed. In the form shown in Fig. 2, the filter is adapted to function automatically, the cake being removed at intervals by a worm 19. In this construction, an enlargement 22 of the tube 2 is provided with a number of valve chests, of which two, 24, 25, are shown. A sleeve 17 is rotatably mounted in the port 22, and is provided with a port 26 adapted to establish communication between the valve chests and the ingress tube 3, for the admission in turn of liquid, wash-water, and compressed air. The sleeve 17 is driven from a shaft 27, a pair of cams 29 on which close the plug 16 at the commencement of each operation, whilst a cam 30 actuates the belt shift-bar 31 to set in motion the worm 19. When the worm 19 is operated, an opening 15 registers with a port in the valve chest 23, which admits compressed air to dislodge the cake. The filtrate is removed by a pipe 14. The worm 19 may be dispensed with. Specification 174,116 is referred to.

PUBLICATIONS RECEIVED.

Vicona Separator or Vibrating Screen.—Mr. C. E. V. Hall, of Sheffield, sends us circulars of this patented plant used for separating various products in connection with grinding machinery. Novelty and efficiency are the outstanding features.

Wellconstruct Slotted Steel.—Constructors, Ltd., make a feature of patent slotted steel suitable for the formation of racks, bins, benches, shelving, etc. (Booklet available.)

The Business World.—A very bright booklet containing attractive views and commercial detail of the largest cities in the British Empire. The book also makes a special feature of the history, constitution, and activities of that very enterprising firm of chemical manufacturers, Messrs. F. W. Berk and Co., Ltd., who, apart from their large acid business, are turning out and selling many other chemical products used in various industries of importance.

Drying Machinery.—(Sheet No. 5,571) "Bloomsgrove" Cubing Machine (5,572). Messrs. Manlove, Alliott and Co., Ltd., send us illustrations of the above class of machinery, in the manufacture of which they are specialists. Accompanying the catalogue sheets are tabulated forms showing the exact information which should be sent with inquiries.

Rok Roofing.—Booklet giving, through photographs, some idea of the vast popularity of this well-known roofing amongst industrial concerns. D. Anderson and Sons, Ltd., Belfast.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," November 3, 1888.)

The New Salt Union.—There have been certain financial papers that have preached the sinfulness of the action of the present Salt Union, and they have prophesied an increase in the price of salt. Nothing could have been easier than this. It has been urged all along that the very *raison d'être* of the Salt Union was the paucity of profits in former years; the public had been getting the advantage at the manufacturer's expense; now the tables are turned, and it is certain that, financially, the undertaking will be a success, for a time at least, as there is no doubt such a price will be charged as will leave the Union a profit on their business. And who shall dare to say that this is not legitimate? Is the "natural course of trade" an operation by which a manufacturer shall be plundered by a not overscrupulous public?—a public which will gather round the threshing-floor to carry away all that may come to them for nothing, but who will clear away upon the first demand being made upon them. Do "the laws of supply and demand" require a surplus to be produced in order that it may be wasted. We would have it distinctly understood that we are not arguing for the imposition of fancy prices upon any article of industry, but we are certainly of opinion that unless a capitalist is able to secure a fair remuneration for his outlay, it is folly to expect any extension of the trade of the country.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—Business continues to be very quiet indeed. Prices in a few items have been rather easier, owing to weak spot holders. The state of affairs in Germany has not affected this market so far as is the case in the pharmaceutical section, where prices on spot have advanced all round. **Acetic Acid,** 80% technical, £46.; 80% pure, £48.; 98% glacial, £60. in casks, and £72. in glass demijohns, ex wharf London: spot values are about the same, with demand still rather poor. **Acetone,** British Government specification, about £124. per ton, in drums; the spot position keeps very steady at this level, with business quiet. **Alum,** lump, in casks, £10. to £10. 5s. per ton; dealers are offering imported material at about these figures. **Arsenic,** Cornish, white powdered, about £65. per ton, ex wharf; supplies are short, while there is a very good inquiry; the market is firm, and likely to advance. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; there has been little inquiry on the market; prices unchanged. **Bleaching Powder,** 35—37%, £10. to £10. 5s. per ton; dealers are quoting at these slightly easier rates on Continental material. **Barium Chloride,** 98—100%, about £14. 15s. to £15. per ton; offers of Continental material are now being made at these rather easier rates; business is quiet. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £31., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are maintained at these rates; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at—commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers' prices, for home trade only, packages free, carriage paid, are unchanged. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain. British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P., crystals, about 1s. 4d. per lb., less 5%, for spot goods; business remains very hard to find, and the market is exceedingly weak. **Cream of Tartar,** 99—100%, about 85s. per cwt., in one-ton lots; dealers are quoting steadily at about this figure, with occasional business about. **Epsom Salts,** commercial, crystals, £4. 10s. to £4. 15s. per ton, in bags; the spot position is a shade firmer, although business is still small. **Formaldehyde,** 40%, about £62. to £63. per ton; the demand is still unsatisfactory, and prices are rather unsteady. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers' prices are about the same, but the market is still flat. **Lead Acetate,** brown, about £41. 10s. to £42.; white, £42. to £43. per ton; spot supplies appear to be restricted, and prices quoted are fully maintained. **Litharge,** imported, about £35. 10s. per ton; dealers are offering at about this figure, with little doing. **Lithopone,** 30% Continental red seal, about £22. 10s. to £23. per ton; the position is unchanged; business limited; market steady. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; spot offers by importers are at these rates, with the demand poor. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers' prices show no change. **Oxalic Acid,** 5¾d. to 6d. per lb.; the demand here is still very small, and the market quotation has weakened. **Carbonate of Potash,** 90—92%, about £26.; 96—98%, about £27. 10s. per ton; spot values have weakened here, owing to lack of demand; some dealers seem willing to clear at a loss. **Chlorate of Potash,** crystals and granular, 2¾d. to 3d. per lb.; dealers are offering at about these rates, but are not finding much business. **Caustic Potash,** 88—92%, about £31. to £32. per ton; spot stocks are reported as limited, and some opinions favour advances in prices; on the other hand, some remarkably cheap offers are reported from the Continent. **Permanganate of Potash,** commercial quality, about 9d. per lb.; the market is very steady at this figure, and may advance a shade. **Prussiate of Potash,** yellow, about 10½d.; this figure is usually quoted, but most sales would be at a slightly easier figure; the demand remains poor. **Sulphate of Potash,** 90%, about £11. per ton, ex ship; the position shows no change on the week. **Mercury,** £9. 10s. to £9. 15s. per bottle; with business rather limited, the spot position remains unsteady. **Red Lead,** imported, about £35. 10s. per ton; importers are offering at about this level, with not much business about. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white crystals, £25.

to £26. per ton; supplies are available on spot, but there is not much demand at present; prices are well maintained. **Saltcake,** home trade, about £4. 10s. per ton; export prices are slightly higher; supplies available are restricted. **Acetate of Soda,** about £24. 15s. per ton; spot offers of small lots are being made at about this figure. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers continue to quote at these levels, with inquiry still small. British makers' prices to home consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers' prices to home trade only are unchanged, packages free, carriage paid; dealers are offering at competitive figures. **Bichromate of Soda,** home trade, 4½d. per lb.; all British makers are reported to be quoting at this level; export prices are rather dearer. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers quote at this price. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in free bags, carriage paid to destination; British makers quote at this unchanged figure, for home trade only. **Hyposulphite of Soda,** pea crystals, £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £10. to £10. 10s. per ton, in casks; spot offers are being made at these figures; opinions favour an advance in price. **Nitrate of Soda,** 96%, £13. 5s. per ton; quoted rates are unchanged on a steady market. **Nitrite of Soda,** 100%, about £26. 10s. per ton; the market is fully maintained at this rate. **Prussiate of Soda,** about 5½d. per lb.; last week's lower price is maintained, but business is still very slow and small. **Sodium Sulphide,** 60—62%, solid, about £14.; ditto, broken, about £15. per ton, in drums; dealers are offering at about these figures, with not much business doing. **Tin Crystals,** about 1s. 4d. per lb.; the market is unchanged. **Tartaric Acid,** B.P., crystals, about 1s. 1½d. per lb., less 5%; spot stocks are quoted nominally at this figure; any business would be at much lower rates. **White Lead,** imported, about £42. per ton; dealers continue to quote at about this figure, with inquiry limited. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' prices show no change.

Pharmaceutical Chemicals.—This market has experienced further advances in spot prices for many items. This movement, which we have commented upon for some weeks, is, of course, due to the firmer conditions on the Continent, especially in Germany. The spot prices of those articles usually obtained from Germany seem likely to move up to very high rates, and a shortage would not be unexpected. **Acetanilid,** crystals and powder, 2s. per lb.; a further advance in spot quotations is recorded, with the market firm. **Acetyl-Salicylic Acid,** B.P. 3s. 4d. to 3s. 6d. per lb.; this market has been moving up each day, and the lower price quoted here may be withdrawn by the time this report is published; supplies on spot are short. **Benzoic Acid,** 2s. 5d. to 2s. 6d. per lb., nominal; this market remains idle; it is considered that the price for B.P. material would be much higher than the figure quoted here. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; at this figure the spot position is quite firm; business is small. **Salicylic Acid,** B.P., 2s. 4d. to 2s. 5d. per lb.; this article continues to advance on spot, with the market very firm. **Tannic Acid,** leviss, 3s. 6d. per lb.; prices are firmer this week, with some little business doing. **Amidopyrin,** about 14s. 6d. per lb.; holders of spot supplies are quoting at this rate; demand small. **Ammonium Bromide,** about 7½d. per lb., according to quantity; the better tone reported last week is well sustained, and further advances in spot prices are expected. **Benzonaphthol,** about 5s. per lb., nominal; no business recorded here. **Betanaphthol,** resublimed, about 2s. per lb.; spot holders are quoting at this firmer figure, with not much business about. **Benzaldehyde 03,** about 3s. per lb.; this market keeps very steady, and some moderate business has been done. **Calcium Lactate,** 1s. 10d. to 1s. 11d. per lb.; spot supplies are quoted at these dearer rates, with the position steady. **Chloral Hydrate,** duty paid, about 4s. 3d. per lb.; the advance in spot prices continues, with the position very firm. **Creosote,** B.P., about 2s. 6d. per lb.; this market is fully maintained, with a slight advance expected in spot values. **Creosote Carbonate,** about 8s 6d per lb this market has been dull; quoted rates unchanged. **Guaiacol Carbonate,** 12s 6d. per lb.; after the recent big jumps in spot prices a further sharp advance is recorded, and this movement is likely to continue. **Hexamine,** 4s. to 4s. 2d. per lb.; the firmer tone reported here in last week's report is fully maintained. **Hydroquinone,** 3s. 7d. to 3s. 9d. per lb.; the market is fairly steady, but there is little business about. **Methyl Salicylate,** about 2s. 10d. per lb.; the limited spot supplies available are offered firm at this further advanced figure, and still higher rates are expected. **Methyl Sulphonal,** about 15s. per lb.; the position on spot is unchanged, with business dull. **Paraformaldehyde,** about 3s. 9d. per lb.; dealers are quoting in the region of this figure, with the demand small. **Paraldehyde,** about 1s. 6d. per lb.; some offers may be a shade under this rate, but the position seems firmer. **Phenacetin,** 7s. 6d. per lb.; another big jump in spot values is recorded, and it is uncertain what figure this article may move up to should supplies run short, which is quite possible. **Phenazone,** 8s. 6d. per lb.; this article continues to appreciate in value on spot, and some opinions favour still higher rates to come. **Phenolphthalein,** 7s. 9d. to 8s. per lb.; supplies on spot seem very scarce, and the figures quoted are more or less nominal. **Potassium Bromide,** B.P., crystals and granular, about 7d. per lb., according to quantity; the spot position continues to improve, and it seems likely that a full recovery in values will take place. **Potassium Permanganate,** B.P., 9½d. per lb.; at this unchanged figure the spot position is very steady, and may harden. **Potassium Sulphoguaiacolate,** about 6s. per lb.; owing to lack of demand, the figure quoted is given as the nominal value. **Resorcin,** about 5s. 9d. per lb.; spot holders are inclined to move their quotations up to this figure. **Salol,** 4s. per lb.; spot values have advanced very sharply, and may go still higher. **Sodium Benzoate,** 2s. 6d. per lb.; nominal on a neglected market. **Sodium Bromide,** B.P., crystals and granular, about 8d. per lb., according to quantity; with the other bromides, this article is improving on spot. **Sodium Diethylbarbiturate,** 18s. 6d. per lb.; spot holders are quoting at this figure, with little inquiry on the market. **Sodium Salicylate,** B.P., crystals, about 3s.; powder, about 2s. 10d. per lb.; values on spot have advanced again, and the movement continues; supplies here appear short, and any further imports must be at very dear rates. **Sulphonal,** about 15s. per lb.; business is lacking here; dealers' quotations are unchanged. **Terpin Hydrate,** about 1s. 9d. per lb.; spot prices are steady at this unchanged rate. **Thymol,** about 15s. per lb.; there is little inquiry for spot offers at about this figure.

Coal-tar Products, Intermediates, Etc. — Matters remain decidedly dull in this market, with prices quoted about the same, but some items are rather unsteady. **Aniline Salt,** about 9½d. per lb., casks free; quoted prices show no change, with the demand small. **Aniline Oil,** about 9d. per lb., drums free; dealers' quotations are level on the week, with little doing. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; the market quotations are steady, with business quiet. **Benzol,** about 1s. 3½d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; the demand is still slow, and prices as quoted are unsteady. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers packages; inquiry remains poor, with prices none too steady. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; dealers continue to quote at these figures on a dull market. **Naphtha,** about 1s. 2d. per gallon; the big drop in quoted rates recorded last week has not brought any improvement in demand. **Solvent Naphtha,** 90/160, 1s. 3d. per gallon, drums extra; the quoted price is unchanged so far, but the market is weak at this level. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; this market is likely to weaken in price; business remains dull. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; quoted rates are maintained at these levels. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; dealers' quotations are maintained at this rate, with business dull. **Creosote Oil,** about 9¼d. per gallon, f.o.b.; this market seems a little steadier after the recent declines in value, but business is still slow. **Carbolic Acid,** crystals, about 1s. 1½d. per lb. f.o.b.; the position is none too steady at last week's cheaper rate. **Naphthalene,** about £19. per ton; the lower offers mentioned last week have not improved business; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; tablets and candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; dealers' offers are steady at this level, with not much doing. **Pyridine,** 22s per gallon; the spot position keeps very firm at this higher level. **Hexamethylene,** 3s. 9d. to 4s. per gallon; these recently advanced rates are fully main-

tained on spot. **Pure Methyl Alcohol,** about £90. per ton, in drums, ex wharf London; importers' quotations are very steady in the region of this figure. **Pitch,** about 140s. per ton, f.o.b. East Coast; the better position reported last week has been steadily maintained, and prices are returned unchanged.

LONDON METAL MARKET

Wednesday.

Copper: Standard brands, £59. 15s. to £59. 17s. 6d., cash; £60. 5s. to £60. 7s. 6d., three months; electrolytic, £63. to £63. 10s. **Tin**: Standard, £207. 10s. to £207. 15s., cash; £204. 5s. to £204. 10s., three months; Straits, £208. 10s.; English, £208. 10s. **Lead,** soft foreign, £31. 10s., prompt; English, £32. 10s.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £32. 17s. 6d.; hard, £27. 15s. **Antimony,** English regulus, 99%, £32. 5s. to £33. 10s.; special brands, £38. 10s. to £39. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 15s. **Bismuth,** 10s. **Platinum,** £26. 10s. per oz.; scrap £24. 10s. **Wolfram,** spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** quotations are as follows: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET.

Wednesday.

There has been rather a better demand for heavy chemicals during the past week, but trade as a whole is still on the quiet side, both on home and export account. There are no alterations to report in quotations for alkali products, and works generally are fairly well engaged with orders. **Bleaching Powder** continues dull at £11. to £11. 5s., soft-wood casks, on rails makers' works. **Bichromates** and **Chlorates** are steadily maintained at recent rates, though business is only on the small side. The demand for **Copper Sulphate** is only slow, and quotations are easier at £25. to £25. 5s., f.o.b. Roasted **Saltcake** unchanged at £4. 10s., carriage paid. Imported cruue **Sulphur** is firm at £5. 5s. on rails. **Phosphate** and **Commercial Hyposulphite of Soda** continue in small request, and quotations are easy at £14. and £9. 10s. respectively. **Nitrite of Soda,** lower at £26., ex store. Concentrated **Sodium Sulphide,** weak at £14., carriage paid. There has been rather a sharp advance in the price of white powdered **Arsenic** during the past week owing to renewal of American demand, and quotations are firmly maintained at £65. to £66., on rails Cornish works. Yellow **Prussiate of Potash,** weaker at 11d. per lb.; **Soda,** steady at 5¾d. **Carbonate of Potash,** 90—92%, quiet at £23. 10s., c.i.f.; solid **Caustic,** 88—90%, firm at £29. per ton. **Acetic Acid** and **Acetate of Soda** have an easier tendency. Brown **Acetate of Lime,** scarce and dear at £12. per ton; grey, £22. **Acetone,** dull at £124. per ton. Miscible **Wood Naphtha,** slow of sale at 6s. per gallon. **Barium Chloride,** firm at £14. 10s. per ton. **Lead Salts** are dearer; white **Acetate** £42., brown £45., and **Lead Nitrate** £43., carriage paid. English **Litharge,** £40. per ton. Green **Copperas** moved off steadily, but prices show no improvement. **Oxalic Acid** unchanged at 5¾d. per lb., ex store. **Permanganate of Potash,** commercial quality, at 8½d. per lb., carriage paid.

SWANSEA MARKET REPORT.

Wednesday.

The **Tinplate** market had a steady demand, with a fair turnover on the basis of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** also in good demand at £19. 2s. 6d. per ton, f.o.b. **Copper** rather depressed, with prompt at £60. 2s. 6d. per ton, and three months £60. 12s. 6d. **Tin** fairly active, with an advancing tendency at £205. 2s. 6d. cash, and £202. 7s. 6d. three months. **Lead** dearer at £30. 7s. 6d. per ton prompt, and £27. 12s. 6d. forward. **Spelter** steady at £33. 7s. 6d. per ton prompt, and £32. 12s. 6d. three months. **Zinc Sheets** in good demand at £39. 12s. 6d. per ton, on rail makers' works, for prompt, and £38. 12s. 6d. three months. **Sulphate of Copper** dull at £25. 17s. 6d. per ton, less 5%, in casks, f.o.b. **Sulphate of Ammonia** quietly steady, with neutral quality at £14. 15s. per ton over delivery November. **Nitrate of Soda** steady at £13. 7s. 6d. per ton prompt. **Bone Meal** in poor demand, with Indian prompt at £9. 2s. 6d. per ton. **Rape Oil** quiet; best refined £2. 6s. 3d. per cwt., net, in barrels. **Cod Oil** very steady; Newfoundland, at docks, £2. 5s. 3d. per cwt.; English, £1. 15s. 6d., f.o.b. **Coconut Oil** steady, with Ceylon at £2. 4s. 3d. per cwt. **Linseed Oil,** raw £2. 5s. 3d., and boiled £2. 7s. 3d., per cwt. **Cottonseed Oil** in good demand; common edible £2. 3s. 3d., and deodorised £2. 6s. 3d. per cwt. **Castor Oil,** very firm at £2. 18s. 6d. for best prompt, and £2. 12s. 6d. per cwt. in barrels, ex ship. **Olive Oil** quiet, with Spanish offered at £66. 17s. 6d. per ton, ex ship. **Oxalic Acid,** slow trade at 6¼d. per lb., f.o.r. **Arsenic** in better demand, with scarcity of offers; white powdered at £60. 17s. 6d. per ton. **Copperas,** poor demand at £2. 2s. 6d. per ton for 4-ton lots, f.o.r. **Sulphuric Acid** in good demand at unchanged rates. **Pitch** remains firm at £6. 17s 6d. per ton for high-grade quality, ex ship. **Benzol** in good demand at 1s. 4½d. per gallon, f.o.r. **Creosote** firm at 8¾d. per gallon, f.o.r. **Palm Oil** quietly steady; Lagos £36. 15s., softs £36., mediums £36. 10s., and hards £36. 15s. per ton. **Turpentine** quiet, with American prompt at £3. 14s. 9d per cwt. In the **Coal** trade buyers received some concessions: Best Admiralty smokeless £1. 7s. 6d., seconds £1. 6s.; ordinaries, £1. 5s. 6d.; Monmouthshire black vein, £1. 6s. 6d., all f.o.b. **Anthracite** in good demand; best large, £2. 6s.; Paris and French nuts, £2. 17s. 6d. per ton, f.o.b. **Patent Fuel,** dearer from £1. 9s. to £1. 12s. per ton, f.o.b. **Cokes** very steady; export, £2. 2s. 6d., f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks at ovens.

LIVERPOOL CHEMICAL MARKET.

Wednesday.

The demand for chemicals of the heavier class, for use in the United Kingdom, has been very fair, a slight improvement on the recent condition being noticeable. In the export branch of the trade business has been moderately active, shipments being on a fairly large scale. **Bleaching Powder** continues in quietly steady demand for the home trade, and has moved more freely in the export branch; spot is £11. 5s. per ton; for contracts, rates are quoted according to requirements. **Chloride of Calcium** has been quiet, and is £5. 12s. 6d. per ton. **Caustic Soda** has been in fair request for home-trade use, and has again had an active shipment; spot is £19. 7s. 6d. per ton for 76%, with special prices for contracts, according to requirements. **Bicarbonate of Soda** has been steadily called for on U.K. account, and has been freely shipped for foreign ports; the price is £10. 10s. per ton, carriage paid, for the home trade. **Soda Crystals** have again sold somewhat freely for use in the U.K.; the price is £5. 5s. per ton, carriage paid, to home-trade buyers. **Nitrate of Soda** has been in quietly steady demand, and is £13. 5s. to £13. 10s. per ton. **Borax** has been in rather good request; commercial grades are—crystals £25. per ton, powdered £26.; higher grades—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has been quieter, and is £4. 10s. to £5. per ton for home-trade use, and £5. to £6. per ton for export. **Bichromate of Soda** has had a moderate inquiry, and is 4¾d. per lb. to stated ports. **Ammonia Alkali** has been in very fair demand on home-trade account, and has had an active shipment; it is £7. 10s. per ton, f.o.r. at works, for spot; special prices being quoted in contracts; for export, £8. per ton, varying somewhat according to destination, is quoted. **Hyposulphite of Soda** has been in fair request; it is £10. per ton, in 2cwt. bags, for commercial, and £15. to £15. 10s. per ton for photographic, in 1cwt. kegs. **Sulphide of Soda** has moved but slowly; it is £14. 10s. to £15. per ton for solid, and £8. 15s to £9. per ton for crystals. **Chlorate of Soda** has been very quiet, and is 3d. per lb. **Phosphate of Soda** has been but little in demand, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has been quiet, and is 6d. per lb. **Yellow Prussiate of Potash** has had a moderate sale, and the price has again eased; it may be given as 11½d. to 1s. per lb. **Red Prussiate** has been quiet, and is 3s. per lb. **Carbonate of Potash** has been more in request, and is £25. to £30. per ton **Nitrate of Potash** has sold with some freedom, and is £29. to £30. per ton. **Chlorate of Potash** has had a limited inquiry, and is 3½d. to 4d. per lb. **Caustic Potash** has been in very fair demand, and is £29. to £30. per ton. **Permanganate of Potash** has been rather more in request, and is 9d. to 9½d. per lb. **Bichromate of Potash** has again been in fair request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has sold more readily; first quality is £60., and second quality £57. per ton. **Sulphate of Ammonia** has been very quiet on home-trade account, but has had a

fairly free shipment on export account; neutral of 25¾% is £14. 15s. per ton, and ordinary of 25¼% £13. 12s. per ton, for November, for home-trade uses. **Carbonate of Ammonia** has been in rather good demand, and is 4d. per lb. **Muriate of Ammonia** has been quieter, and is £32. per ton. **Magnesia** continues to sell somewhat freely; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been in very limited demand; it is £11. per ton for use in the U.K., and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been quieter, and is £8. to £11. per ton, according to quality. **Sulphur** has been in good request; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s. per ton, and American £5. 10s. per ton. **Tartaric Acid** has been but little in request, and the price has again eased; it may be given as 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has had a steady and very fair sale, and is £4. 10s. per cwt. **Boric Acid** has had a rather free inquiry; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. to £60. per ton. **Citric Acid** has had a slow sale, and the price has been weak; it may be given as 1s. 5½d. per lb. **Oxalic Acid** has been but little in demand, and is 6d. per lb. **White Acetate of Lead** has moved but slowly, and is £42. to £42. 10s. per ton. **Sulphate of Copper** has been rather more in request on home-trade account, and has had a fair shipment for overseas ports; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been quiet; white powdered is £60. to £61. per ton.

WEST OF SCOTLAND CHEMICALS.

Wednesday.

There has been a slight improvement in the demand for chemicals over the past week on home-trade account, though inquiries for export have fallen off a little. Prices generally continue at about previous figures, but arsenic and brown acetate of lead are both dearer. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, dearer at £67. per ton on spot; a steady market. **Barium Chloride,** £14. 10s. per ton; at this price the market remains steady. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £27. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 3s. per cwt. for 99% at Glasgow; quotation steady, but inquiry small. **Lead Acetate,** white, £41. 10s. per ton on spot; brown, more inquiry at £44. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 1½d. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 12s. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 10s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; rather easier in tone, and inclined to be dull. **Tartaric Acid,** 1s. 2d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

LIST OF CONTRACTIONS USED IN THE IMPORT AND EXPORT LIST.

Beaumont, 1,016 bgs.

PHOSPHORUS—
Montreal, 94 drms.

PITCH (STEARINE)—
Rotterdam, 53 brls.

POTASSIUM CARBONATE—
Hamburg, 11 brls.

RED LEAD—
Ghent, 2 cks.

ROSIN—
Savannah, 250 brls.

SOAP—
Rotterdam, 6 cks.

SODA—
Antwerp, 26 cks.

SODIUM ACETATE—
Amsterdam, 24 cks.
Antwerp, 32 kgs.

SODIUM NITRITE—
Skien, 113 cks.

SODIUM PHOSPHATE—
Hamburg, 7 cks.

STEARINE—
Antwerp, 128 bgs.

TALLOW—
Sarpsborg, 720 brls.

TARTARIC ACID—
Amsterdam, 4 cks., 100 kgs.

TIN OXIDE—
Hamburg, 10 cks.

TURPENTINE—
Savannah, 200 brls.

WAX (*otherwise undescribed*)—
Baltimore, 200 brls.
Norfolk, 250 brls.

WHITE LEAD—
Ghent, 38 cks.

ZINC DUST—
Antwerp, 50 cks.

ZINC OXIDE—
Antwerp, 51 cs.
Rotterdam, 10 cks.

NEWCASTLE-ON-TYNE

Week ending October 27.

ANTIMONY—
Hamburg, 1,000 cs.

CALCIUM CARBIDE—
Christiania, 1,085 drms.

FERRO TITANIUM—
Stavanger, 150 cs.

GLUE—
Antwerp, 20 bls.

LITHOPONE—
Antwerp, 8 cks.

SALT—
Hamburg, 420 bgs.

SALTPETRE—
Stavanger, 1 kg.

STEARINE—
Antwerp, 13 bgs.

TAR (WOOD)—
Hamburg, 10 brls.

N. & S. SHIELDS.

Week ending October 27.

NIL.

* Entered under the Safeguarding of Industries Act.

EXPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending October 27.

BOILER COMPOSITION—
Gothenburg, 1 t.

CHEMICALS (*otherwise undescribed*)
Cape Town, 41 pkgs.; Coquimbo, 60 drms.; East London, 13 pkgs. Hamburg, 17 pkgs.; New York, 228 pkgs.

COAL TAR PRODUCTS—
Creosote
San Antonio, 182 t. 13 c.
Tar
Cape Town, 4 t. 12 c.
Unspecified
Hamburg, 1 t. 14 c.

DISINFECTANTS (*otherwise undes.*)
Algoa Bay, 9 c.
Cape Town, 650 galls.

PITCH (*otherwise undescribed*)—
Antwerp, 100 t.

POTASSIUM BICHROMATE—
Hamburg, 7 c.

SPERMACETTI WAX—
Hamburg, 1 t. 1 c. 2 qrs.
New York, 1 t. 7 c.

TALLOW—
Hamburg, 10 t.

GRANGEMOUTH.

Week ending October 27.

CHEMICALS (*otherwise undescribed*)
Christiania, 2 drms.
Rouen, 45 pkgs.

NAPHTHA (*otherwise undescribed*)
Rouen, 68 drms.

PARAFFIN WAX—
Bordeaux, 312 bgs.
Nantes, 88 bgs.
Rouen, 528 bgs.

HULL.

OFFICIAL AMENDMENT.

From return for week ending September 14, deduct—

SULPHUR—
Amsterdam, 50 bgs.

Week ending October 23.

ALUM—
Montreal, 3 cks., 5 kgs., 137 bgs., 50 brls.

AMMONIUM SULPHATE—
Rotterdam, 2,542 bgs.

CHEMICALS (*otherwise undescribed*)
Antwerp, 596 drms.; Aalesund, 6 kgs.; Amsterdam, 30 cs., 34 drms.; Christiania, 5 cks., 19 pkgs., 10 cs., 4 drms.; Copenhagen, 6 cs., 120 drms.; Gruz, 1 cs.; Gothenburg, 4 pkgs., 3 cs., 59 drms.; Halmstad, 4 cks.; Helsingfors, 25 cks., 1 cs.; Hamburg, 3 drms.; Malmo, 4 cks.; Montreal, 209 drms.; New York, 1 cs.; Raumo, 100 bgs.; Rotterdam, 7 cks., 3 drms.; Stavanger, 1 kg.; Wasa, 300 drms.

COAL TAR PRODUCTS—
Pitch
Christiania, 1 cs.; Leghorn, 50 cks.; Montreal, 15 brls.; New York, 266 brls.
Tar
Bombay, 120 drms.

DISINFECTANTS (*otherwise undes.*)
Bombay, 50 cs.; Callao, 25 drms.; Karachi, 360 drms.; Mazathan, 20 drms.; Montreal, 10 cks., 30 cs., 105 drms.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Wasa, 5 bxs.

DYESTUFFS (NATURAL)—
Logwood
Genoa, 2 cks., 46 bxs.

GELATINE—
Montreal, 52 bgs.

GLUE—
Copenhagen, 1 bg.; Gothenburg, 40 bgs.; Helsingfors, 112 bgs.; Montreal, 100 bgs.; New York, 140 bgs.; Stockholm, 1 cs.

GLYCERINE—
Montreal, 200 drms.

MINERAL WHITE—
Montreal, 100 bgs.
Stavanger, 5 bgs.

SALT—
Amsterdam, 124 cs.; Copenhagen, 215 cs.; Gothenburg, 50 cs.; Helsingfors, 10 cs.; Norrkoping, 20 cs.; Stockholm, 20 cs.

SOAP—
Constantinople, 5 brls.

STEARINE—
Raumo, 28 brls.

TURPENTINE—
Arica, 50 cs.
Christiania, 2 cks.

WOOD PRESERVATIVE—
Bombay, 4 cs., 200 drms.

LEITH.

Week ending October 27.

AMMONIUM SULPHATE—
Java, 20,560 bgs.

COAL TAR PRODUCTS—
Phthalic Anhydride
Rouen, 2 cks.

DISINFECTANTS (*otherwise undes.*)
Rouen, 25 cks.

POTASSIUM BICHROMATE—
Antwerp, 4 cks.

SODIUM BICHROMATE—
Antwerp, 16 cks.
Dunkirk, 29 cks.

TALLOW OIL—
Copenhagen, 50 tcs.

TAR (*otherwise undescribed*)—
Antwerp, 15 brls.

LIVERPOOL.

Week ending October 25.

ACETIC ACID—
Auckland, 3 c., £18.

ALUM—
Hamburg, 10 t. 3 c., £181.
Pt. Said, 5 c., £16.
Trieste, 5 t. 1 c., £91.

ALUMINIUM SULPHATE—
Bombay, 10 t., £99.
Cartagena, Col., 1 t., £16.
Wiborg, 50 t., £275.

ALUMINOFERRIC—
Vera Cruz, 24 t. 13 c., £141.

AMMONIA—
Calcutta, 11 c., £38.
Durban, 2 c. 3 qrs., £12.

AMMONIUM CARBONATE—
Barcelona, 1 t., £29.; Bari, 19 c., £24.; Constantinople, 19 c., £26.; Galatz, 3 t. 10 c., £84.; Hamburg, 4 t. 18 c., £115.; Melbourne, 1 t. 10 c., £50.; Marseilles, 2 t. 2 c., £56.; New York, 1 t., £28.; Piraeus, 2 t. 18 c., £99.; Rotterdam, 1 t., £30.; Rockhampton, 10 c., £17.; Sydney, 4 t. 6 c., £153.; Stockholm, 1 t. 9 c., £39.

AMMONIUM CHLORIDE—
Melbourne, 5 c., £13.; New York, 22 t. 18 c., £458.; Sydney, 1 t. 3 c., £36.; Salonika, 1 t., £41.

AMMONIUM SULPHATE—
Barcelona, 203 t. 10 c., £2,953.; Cape Town, 1 t., £66.; Hong Kong, 50 t., £812.; Las Palmas, 302 t., £4,287.; Naples, 35 t., £516.; Orotava, 5 t., £72.

AMMONIUM SULPHATE—
Oporto, 24 t. 4 c., £345.; Palermo, 10 t., £145.; Samarang, 349 t. 17 c., £5,511.; Sourabaya, 350 t. 7 c., £5,420.; Tarragona, 148 t. 4 c., £2,041.; Teneriffe, 23 t., £328.

AMYL ACETATE AND ALCOHOL—
Wellington, 20 gals., £25.

ANTIFOULING PAINT—
Brisbane, 5 c., £23.; Cape Town, 2 t., £136.; Calabar, 10 c., £36.; Kobe, 3 t., £300.; Rio de Janeiro, 4 t., £342.

ARSENIC—
Valencia, 1 t. 11 c. 2 qrs., £159.

ARSENIOUS ACID—
Rouen, 15 c., £65.

BARIUM CHLORIDE—
Rouen, 8 t., £124.

BLEACHING POWDER—
Algoa Bay, 1 t., £12.; Aarhus, 15 t. 4 c., £132.; Arica, 3 t. 1 c., £37.; Antofagasta, 2 t. 5 c., £29.; Bombay, 45 t., £540.; Buenos Aires, 24 t. 8 c., £244.; Calcutta, 30 t. 2 c., £296.; Corunna, 3 t. 14 c., £38.; Chicago, 12 t. 6 c., £340.; Delagoa Bay, 14 t. 19 c., £180.; Melbourne, 1 t. 1 c., £11.; Madras, 3 t., £36.; Odense, 60 t. 16 c., £547.; Oporto, 6 t. 12 c., £73.; Rio de Janeiro, 9 t. 17 c., £106.; Sydney, 1 t. 1 c., £11.; Santos, 10 t., £107.

BORAX—
Helsing' org, 2 t. 9c., £60.
Piraeus, 14 c., £23.
Vera Cruz, 5 t., £130.

BORIC ACID—
Bombay, 2 qrs., £2.; Cartagena (Col.), 10 c., £32.; East London, 1 c., £4.; Madras, 5 c., £23.; Seychelles, 1 c., £3.; Valparaiso, 2 c., £15.

CALCIUM CARBIDE—
Calabar, 14 c. 2 qrs., £15.; Iddo, 1 t. 2 c., £24.; Pt. Harcourt, 10 c., £10.; Sierra Leone, 19 c., £20.

CALCIUM CHLORIDE—
Adelaide, 9 t. 18 c., £56.; Algoa Bay, 2 t. 13 c., £15.; Buenos Aires, 40 t. 4 c., £161.; Brisbane, 11 t. 3 c., £66.; Fremantle, 2 t. 19 c., £17.; Guayaquil, 5 t. 4 c., £31.; Melbourne, 10 t. 4 c., £61.; Punta Arenas, 1 t. 12 c., £15.; Sydney, 15 t. 10 c., £267.

CARBONATE OF LIME—
Barcelona, 5t., £90.

CHEMICALS (*otherwise undescribed*)
Adelaide, 1 t., £25.; Auckland, 5 t., £130.; Bombay, 10 t., £250.; Brisbane, 2 t., £52.; Bahia Blanca, 26 t. 7 c., £1,375.; Bergen, 1 t., £26.; Copenhagen, 3 t., £30.; Cape Town, 16 c., £21.; Calcutta, 48 t. 16 c., £348.; Fremantle, 2 t., £54.; Hobart, 2 t. 13 c., £88.; Karachi, 2 qrs., £11.; Lisbon, 4 t., £100.; Monte Video, 50 t., £350.; Melbourne, 9 t. 1 c., £732.; New York, 14 t. 5 c., £36.; Patras, 1 t., £25.; Quebec, 10 t., £50.; Rosario, 50 t. 2 c., £35.; Sydney, 3 t., £79.; Singapore, 1 t. 1 c., £12.; Sourabaya, 32 t. 9 c., £81.; Sydney, 3 t., £79.; Shanghai, 14 t. 3 c., £376.; Valencia, 1 t., £25.; Wellington, 1 t. 2 c., £480.

CITRIC ACID—
Buenos Aires, 1 t. 18 c., £655.
Wellington, 5 c., £36.

COAL TAR PRODUCTS—
Benzyl Chloride
Amsterdam, 6 c., £39.
Carbolic Acid
Dunedin, 1 t., £54.; Genoa, 4 t. 9 c., £632.; Hamburg, 1 t. 5 c., £175.; Kobe, 10 t. 1 c., £1,219.; Sydney, 2 c., £15.; Switzerland, 13 c., £88.; Wellington, 2 c. 2 qrs., £19.

COAL TAR PRODUCTS—
Creosote
Alexandria, 1 t. 6 c., £26.
Montreal, 9 t. 6 c., £254.
Naphthalene
Mombasa, 5 t., £74.
Sydney, 2 t., £15.
Pitch
Antwerp, 10 t. 12 c., £191.
Rotterdam, 1 t. 13 c., £16.
Pyridine
Hamburg, 2 t. 19 c., £580.
New York, 2 t., £414.
Tar
Accra, 2 t. 14 c., £43.; Punta Arenas, 1 t. 4 c., £12.; Pt. Swettenham, 112 t. 10 c., £412.; Sekondi, 2 t. 3 c., £23.
Unspecified
Buenos Aires, 2 t. 10 c., £130.; Hamburg, 37 t. 19 c., £4,674.; Kobe, 5 t. 2 c., £1,263.; Rotterdam, 50 t., £1,520.

COPPER OXIDE—
Melbourne, 1 t., £69.

COPPER SULPHATE—
Christchurch, 1 t., £27.; Mollendo, 10 c., £14.; Monte Video, 7 t. 7 c., £189.; Oporto, 14 t., £342.; Sydney, 3 c., £5.; Tampico, 1 t., £24.; Wellington, 2 t. 10 c., £66.

CREAM OF TARTAR—
Auckland, 1 t., £116.; Dunedin, 2 t., £172.; Fremantle, 2 t., £172.; Invercargill, 1 t. 10 c., £129.; Launceston, 1 t., £86.; Melbourne, 5 t., £430.; Sydney, 3 t., £258.

DISINFECTANTS (*otherwise undes.*)
Auckland, 5 c., £37.; Bombay, 2 c., £21.; Cape Town, 1 t. 8 c., £23.; Cartagena (Col.), 3 t. 11 c., £156.; Durban, 3 t. 15 c., £67.; Dakar, 1 c., £12.; Las Palmas, 1 t., £28.; Madras, 4 t. 2 c., £98.; Pto. Cortes, 10 c., £30.; Quittah, 2 c., £12.; Singapore, 1 t., £33.; Trinidad, 7 c. 2 qrs., £11.; Vera Cruz, 3 c., £10.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Madras, 5 t., £746.
Indigo
Tsingtao, 23 t. 16 c., £3,320.
Unspecified
Bombay, 2 qrs., £16.; Barcelona, 14 c. 2 qrs., £160.; Genoa, 2 c., £15.; Lyttleton, 1 t. 8 c., £464.; Montreal, 2 t., £222.; Melbourne, 1 t. 7 c., £442.; Madras, 10 c., £716.; Oamaru, 10 c., £154.; Rio de Janeiro, 1 t. 4 c., £626.; Sydney, 1 c., £13.; Santos, 4 c., £119.; Shanghai, 1 t. 8 c., £380.; Wellington, 1 t. 4 c., £368.

DYESTUFFS (NATURAL)—
Logwood
Para, 2 c., £10.
Orchil
New York, 2 t. 15 c., £176.

ESSENTIAL OILS (SYNTHETIC)—
Durban, 9 c., £557.

FERTILISER (DRIED BLOOD)—
Las Palmas, 6 t. 10 c., £97.
Teneriffe, 2 t. 1 c., £30.

FERTILISERS (*otherwise undes.*)—
Baltimore, 100 t., £600.
Las Palmas, 5 t., £45.
Tarragona, 14 t. 17 c., £25.

SODIUM BISULPHITE—
Pt. Sudan, 110 drms.
Singapore, 50 drms.

SODIUM HYDROSULPHITE—
Pernambuco, 40 kgs.

SODIUM PHOSPHATE—
Danzig, 6 cs.

SODIUM PRUSSIATE—
Montreal, 10 cks.

SODIUM SILICATE—
Abo, 27 drms. ; Adelaide, 57 pkgs. ; Alexandria, 64 cks. ; Auckland, 32 pkgs. ; Brisbane, 10 pkgs. ; Buenos Aires, 74 drms. ; Delagoa Bay, 100 pkgs. ; Durban, 345 pkgs. ; Fremantle, 115 pkgs. ; Lyttleton, 10 pkgs. ; Monte Video, 30 bgs. ; Montreal, 16 pkgs. ; Shanghai, 250 bgs. ; Sydney, 120 cks., 29 dble. bgs. ; Tampico, 20 bgs. ; Vera Cruz, 82 cks.

SODIUM SULPHIDE—
Alexandria, 4 drms. ; Melbourne, 63 drms. ; Montreal, 95 drms. ; Rotterdam, 20 drms. ; Syra, 6 drms.

STEARINE—
Santander, 40 bgs.

TALLOW—
Danzig, 72 brls.

LONDON.

OFFICIAL AMENDMENTS.

From return for week ending July 4, 1923, deduct—

CITRIC ACID—
Cape Town, (F.), 15 c., £144.

From return for week ending July 11, 1923, deduct—

CHEMICALS (*otherwise undescribed*)
Antwerp, 50 pkgs., £143.

From return for week ending July 18, 1923, deduct—

BORIC ACID—
Colombo, 12 c., £66.

Week ending October 24.

ACETIC ACID—
Dunedin, 25 cs., £79.
Fremantle, 2 cs., £6.
Sydney, 14 pkgs. (pt.), £19.

ACETONE—
Sydney, 14 pkgs. (pt.), £17.

ACETYL SALICYLIC ACID
Adelaida, 3 cs. (pt.), £35. ; Calcutta, 1 cs. (pt.), £9. ; Cape Town, 4 cs. (pt.), £18. ; Melbourne, 2 cs., £35. ; Montreal, 6 cs. (pt.), £81. ; Sydney, 2 cs. (pt.), £46.

ALUM—
Cape Town, 8 brls., £37.
Mossel Bay, 8 brls., £37.
Pt. Elizabeth, 8 brls., 25 cs., £48.

AMMONIA—
Barcelona, 28 drms., £280. ; Bombay, 10 cs., £18. ; Buenos Aires, 10 cs., £18. ; Calcutta, 6 cs., £17. ; Channel Is., 6 cs., £11. ; Demerara, 2 cs., £5. ; Durban, 26 cs., £46. ; East London, 10 cs., £17. ; Monte Video, 40 pkgs., £55. ; Pt. Said, 4 cs., £7. ; Rio de Janeiro, 8 cs., £14. ; Shanghai, 5 cs., £9. ; Tientsin, 5 cs., £18.

AMMONIA (ANHYDROUS)
Aden, 6 cylds., £35. ; Bagdad, 9 cylds., £80. ; Bombay, 30 cs., £300. ; Durban, 55 cylds., £412. ; East London, 40 cylds., £300. ; Pt. Said, 6 cylds., £18.

AMMONIUM BROMIDE
Adelaide, 3 cs. (pt.), £5.
Sydney, 3 cs., £15.

AMMONIUM CARBONATE—
Calcutta, 3 c., £12. ; Dunedin, 5 c., £11. ; Durban, 2 c., £6. ; Memel, 1 t. 14 c., £42. ; Pt. Elizabeth, 4 c., £8. ; Valparaiso, 8 c., £23.

AMMONIUM CHLORIDE—
Calcutta, 2 cs., £15.
Pt. Swettenham, 8 kgs., £11.
Vancouver, 18 t. 11 c., £631.

AMMONIUM CITRATE—
Brisbane, 2 cs., £19.
Calcutta, 1 cs., £5.

AMMONIUM NITRATE
Antwerp, 30 t., £780.

AMMONIUM PERSULPHATE—
Sydney, 1 cs., £7.

AMMONIUM PHOSPHATE—
Santos, 3 c., £11.

AMMONIUM SULPHATE—
Cologne, 100 t., £1,400. ; Durban, 20 t., £270. ; Hong Kong, 100 t., £1,500. ; Las Palmas, 5 t. 10 c., £77.

ANTIMONY OXIDE—
Progress, 5 cks., £22.

ANTIMONY SULPHIDE—
Barcelona, 1 ck., £18. ; Copenhagen, 1 ck., £25. ; Christiania, 1 ck., £17. ; Hamburg, 5 cks., £87. ; Stockholm, 2 cks., £29.

ARSENIC—
Rotterdam, (F.), 100 cs., £375.
Wellington, 5 drms., £21.

BARIUM PEROXIDE—
Melbourne, 46 drms., £309.
Rotterdam, 30 drms., £445.

BENZOIC ACID—
Cape Town, 1 kg., £12.

BISMUTH AMMONIUM CITRATE
Calcutta, 1 cs., £9.

BISMUTH CARBONATE—
East London, 1 cs. (pt.), £18.
Perth, 1 cs., £71.
Wellington, 1 cs. (pt.), £73.

BISMUTH SALTS (*otherwise undes.*)
Athens, 1 cs., £31. ; Bombay, 1 cs. (pt.), £8. ; Calcutta, 1 cs., £49. ; Chungking, 16 cs. (pt.), £8. ; Famagusta, 1 cs., £9.

BITUMEN—
Pt. Swettenham, 46 cks., £138.

BONE MEAL—
Channel Is., 58 t., £484.

BORAX—
Amsterdam, 2 t. (F.), £52. ; Durban, 4 c., £11. ; Petrograd, 2 t. 4 c., £60. ; Pt. Elizabeth, 2 c., £5. ; Rotterdam, 2 t. (F.), £52. ; Singapore, 6 c., £9.

BORAX GLASS—
Cape Town, 3 c., £12.

BORIC ACID—
Famagusta, 3 c., £11. ; Fremantle, 2 c., £7. ; Mauritius, 2 c., £7. ; Pisco, 2 c., £11. ; Pt. Sudan, 3 c., £18. ; Salaverry, 10 c., £30.

BROMIDES (*otherwise undescribed*)
Sydney, 25 cs., £100.

CALCIUM CARBIDE—
Accra, (F.), 10 c., £8.
Madeira, 5 cs., £30.
Pt. Harcourt, 1 t., £19.

CALCIUM CHLORIDE—
Jamaica, 50 drms., £37.
Perth, 8 cks., £9.
Pt. Sudan, 20 drms., £49.

CALCIUM GLYCEROPHOSPHATE
Adelaide, 1 cs. (pt.), £13.

CALCIUM HYPOPHOSPHITE—
Yokohama, 5 cs., £60.

CALCIUM LACTATE—
Sydney, 1 cs., £11.

CARBON (RETORT)—
Boulogne, bulk, 149 t. 10 c., £449.

CARBON BISULPHIDE—
Delagoa Bay, 14 drms., £28.
Durban, 10 cs., £28.

CARBON TETRACHLORIDE—
Colombo, 1 cs., £6.

CAUSTIC POTASH—
Sydney, (F.), 3 drms., £7.
Wanganui, 2 drms., £20.

CHEMICALS (*otherwise undescribed*)
Adelaide, 1 cs. (pt.), 21 pkgs. (pt.), £62. ; Aden, 4 cs. (pt.), £7. ; Alexandria, 22 pkgs. (pt.), £73. ; Ascension Is., 5 cs., £60. ; Auckland, 2 pkgs., £6. ; Batavia, 6 cs., £9. ; Barcelona, 60 pkgs., £150. ; Barbados, 10 pkgs. (pt.), £18. ; Barranquilla, 10 pkgs. (pt.), £11. ; Beira, 2 pkgs. (pt.), £6. ; Bombay, 17 pkgs. (pt.), £48. ; Brisbane, 15 cs., £97. ; Calabar, 1 cs. (pt.), £5. ; Calcutta, 20 pkgs. (pt.), £59. ; Cape Town, 22 pkgs. (pt.), £49. ; Channel Is., 1 t. 6 c., £13. ; Chungking, 16 cs. (pt.), £11. ; Colombo, 11 cs. (pt.), £34. ; Demerara, 8 pkgs., £6. ; East London, 2 cs., £6. ; Fremantle, 1 cs., £30. ; Gothenburg, 10 pkgs. (F.), £50. ; Hankow, 5 cs. (pt.), £10. ; Hong Kong, 2 cs., £6. ; Inhambane, 4 kgs., £6. ; Jamaica, 7 pkgs. (pt.), £24. ; Karachi, 4 cs., £9. ; Kilindini, 4 cs., £144. ; Kobe, 1 cs. (pt.), £8. ; Madras, 8 pkgs., £11. ; Mauritius, 3 cs., £6. ; Melbourne, 7 cs. (pt.), £31. ; Montreal, 5 cs. (pt.), £38. ; Napier, 1 cs., £9. ; Pisco, 2 pkgs. (pt.), £5. ; Pt. Swettenham, 6 cs., £25. ; Rangoon, 15 pkgs. (pt.), £46. ; Ronneby, 200 pkgs., £500. ; Rotterdam, 4 pkgs., £6. ; Sekondi, 17 pkgs., £60. ; Seychelles, 4 pkgs., £5. ; Shanghai, 4 cs. (pt.), £9. ; Stockholm, 26 pkgs., £123. ; Sydney, 40 pkgs. (pt.), £619. ; Trinidad, 2 pkgs. (pt.), £6. ; Wellington, 3 pkgs., (F.), £8. ; Wellington, 28 pkgs. (pt.), £184. ; Yokohama, 2 cs. (F.), £140.

CHROMIUM OXIDE—
Rotterdam, 1 kg., £15.

CITRIC ACID—
Adelaide, 5 c., £38. ; Antwerp, 15 c., £114. ; Auckland, 8 c., £60. ; Basra, 1 c., £6. ; Beira, 1 c., £8. ; Calcutta, 3 cks., 2 c., £65. ; Hobart, 10 c., £75. ; Kobe, 10 c., £76. ; Limon, 1 c., £11. ; Melbourne, 2 t. 10 c., £377. ; Pt. Said, 2 c., £16. ; Pt. Sudan, 1 c., £12. ; Sydney, 3 t. 3 c., £477.

COAL TAR PYODUCTS
Benzol
Germany (F.), bulk, 373,153 galls., £24,877.
Trinidad, 1 cs., £6.
Carbolic Acid
Alexandria, 20 drms., £22.
Basra, 5 drms., £12.
Lagos, 8 drms., £7.
Wanganui, 10 drms., £12.
Creosote
Channel Is., 8 cks., £31.
Hamburg, bulk, 66,632 galls., £2,812.
N. Orleans and Galveston, bulk, 460,931 galls., £18,836.
Mirbane Oil
Christchurch, 1 brl., £15.
Naphthalene
Aden, 85 cks., £400. ; Bangkok, 5 cs., £11. ; Calcutta, 3 cks., £7. ; East London (F.), 10 cks., £11. ; Lagos, 1 cks., £7. ; New York, 387 bgs., £278.
Pitch
Colombo, 4 cks., £13. ; Demerara, 20 frkns., £29. ; Dunkirk, bulk, 249 t. 15 c., £1,561. ; Jamaica, 10 brls., £22. ; Kobe, 30 brls., £69. ; Sables d'Olonne, bulk, 1,010 t., £5,303.
Tar
Calcutta, 2 brls., £6.
Delagoa Bay, 50 drms., £13.

COBALT OXIDE—
Genoa, 5 pkgs., £1,113.
Tsingtau, 10 cs., £412.

COBALT SULPHATE—
Brussels, 5 cks., £75.
Gothenburg, 1 cs., £33.

COPPER SUBOXIDE—
Rotterdam (F.), 1 drm., £10.

COPPER SULPHATE—
Delagoa Bay, 15 c., £25.
Durban, 9 c., £11.

COPPERAS—
Barbados, 1 t., £9.

CREAM OF TARTAR—
Adelaide, 5 t., £425. ; Belize, 1 c. (F.), £8. ; Christiania, 2 c., £8. ; Durban, 2 c. (F.), £13. ; Durban, 2 c., £13. ; Karachi, 2 c. (F.), £12. ; Kobe, 5 t., £425. ; Launceston, 1 c., £5. ; Limon, 2 c., £10. ; Melbourne, 25 t., £2,128. ; Newcastle, 1 t., £85. ; Sydney, 17 t., £1,443.

CUPROUS OXIDE—
Calcutta, 2 drms., £31.

DIPHENYL OXIDE—
Newcastle, (F.), 2 cs. (pt.), £6.

DISINFECTANTS (*otherwise undes.*)
Aden, 2 c., £8. ; Alexandria, 3 c., £10. ; Amoy, 3 c., £10. ; Bangkok, 4, c., £8. ; Bombay, 6 c., £34. ; Calabar, 2 c., £6. ; Calcutta, 3 c., £70. ; Canton, 2 c., £22. ; Cape Town, 11 t. 8 c., £438. ; Christchurch, 3 c., £28. ; Colombo, 11 t. 10 c., £387. ; Demerara, 1 t. 4 c., £35. ; Durban, 4 t. 1 c., £113. ; East London, 2 t. 6 c., £88. ; Gibraltar, 4 c., £13. ; Iddo, 6 c., £8. ; Jamaica, 1 t. 17 c., £55. ; Kilindini, 2 c., £7. ; Lagos, 1 t. 1 c., £123. ; Limon, 2 c., £9. ; Lourenco Marques, 1 c., £32. ; Melbourne, 5 c., £63. ; Paris, 4 t. 12 c., £75. ; Penang, 1 t. 17 c., £48. ; Pt. Harcourt, 16 c., £49. ; Pt. Elizabeth, 2 c., £10. ; Pt. Swettenham, 5 c., £22. ; Sandakan, 3 c., £5. ; Sekondi, 8 c., £8. ; Shanghai, 2 c., £5. ; Singapore, 1 t. 11 c., £56. ; St. Kitts, 1 c., £5. ; St. Lucia, 4 c., £6. ; Sydney, 5 c., £47. ; Toronto, 1 cs., £5.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 11 cks., £318.
Unspecified
Cape Town, 1 cs. (pt.), £18. ; Melbourne, (F.), 4 kgs., £20., 41 pkgs., £1,238. ; Perth, 2 cs. (pt.), £25. ; Rosario, 1 cs. (pt.), £6. ; Sydney, 1 kg., £6. ; Trinidad, 1 cs., £6. ; Valencia, 1 cs. (pt.), £7.

ETHER—
Alexandria, 2 cs., £11. ; Batavia, 3 cs., £6. ; Bombay, 6 cs., £27. ; Chungking, 16 cs. (pt.), £6.

FERTILISERS (*otherwise undes.*)—
Boston, 1 t. 10 c., £40.
Channel Is., 14 t. 11 c., £120.

FORMALDEHYDE—
Barcelona, (F.), 5 cks., £69.
Madras, 1 ck., £17.

GALLIC ACID—
Melbourne, 1 cs., £17.

GLYCERINE—
Amsterdam (crude), 18 t. 6 c., £903. ; Amsterdam, 3 t. 18 c., £271. ; Barcelona, 1 t., £90. ; Barranquilla, 1 c., £6. ; Bombay, 1 c., £13. ; Fremantle, 3 c., £23. ; New York, 25 t. 3 c., £1,330. ; Pisco, 1 c., £7.

GUANO—
Barbados, 49 t. 2 c., £400.

GUANO (FISH)—
Yokohama, 50 t., £650.

HYDROCHLORIC ACID—
Madras, 5 c., £9.

HYDROFLUORIC ACID—
Bombay, 1 cs., £7. ; Brussels, 12 pkgs., £65. ; Pt. Elizabeth, 2 pkgs. (pt.), £19. ; Sydney, 4 cs., £35.

HYDROGEN PEROXIDE—
Iddo, 1 cs. (pt.), £15.
Kinshasa, 3 cs., £19.
Melbourne, 5 cs., £31.

HYPOPHOSPHITE OF LIME—
Paris, 6 cs., £112.
Sydney, 4 cs., £75.

HYPOPHOSPHOROUS ACID—
Sydney, 1 cs. (pt.), £6.

IODIDES (*otherwise undescribed*)—
Calcutta, 4 cs. (pt.), £112.
Copenhagen, 1 cs., £99.

IODINE—
Calcutta, 1 cs., £106. ; Calcutta, 1 cs. (pt.), £53. ; Perth, 1 cs., £79.

IODINE (RESUBLIMED)—
Bombay, 1 cs., £28.
Sydnay, 1 cs., £53.

IRON AMMONIUM CITRATE—
Bombay, 1 cs., £6.
Calcutta, 1 cs., £6.

IRON PERCHLORIDE—
Sydney, 5 drms., £7.

IRON SULPHATE—
Abadan, 6 cks., £6.
Sydney, 2 kgs., £6.

KIESELGUHR—
Piraeus, 10 c., £13.
Rio de Janeiro, (F.), 1 t. 8 c., £24.

LEAD NITRATE—
Sydney, 4 cks., £42.

LITHIUM BENZOATE—
Rio de Janeiro, 1 cs., £11.

MAGNESIA—
Auckland, 4 cs., £10. ; Basra, 1 cs., £5. ; Brisbane, 3 cs., £7. ; Bombay, 3 cs., £11. ; Christchurch, 8 cs., £19. ; Napier, 5 cs., £12. ; Newcastle, 10 cs., £24. ; Rio de Janeiro, 1 cs., £15. ; Wellington, 10 cs., £24.

MAGNESIUM CARBONATE—
Adelaide, 5 cs., £12. ; Barranquilla, 1 cs., £7. ; Perth, 10 cs., £12. ; Sydney, 12 cs., £31.

MAGNESIUM CITRATE—
Fremantle, 2 cs., £12.
Mollendo, 4 cs., £31.

MAGNESIUM SULPHATE—
Accra, 5 c., £6. ; Auckland, 15 c., £20. ; Bombay, 10 c., £14. ; Durban, 10 c., £11. ; East London, 10 c., £12. ; Fremantle, 5 c., £6. ; Honolulu, 10 c., £13. ; Jaffa, 17 c., £22. ; Jamaica, 4 c., £6. ; Karachi, 15 c., £22. ; Madras, 6 c., £6. ; Managua, 10 c., £13. ; Melbourne, 1 t. 6 c., £30. ; Monte Video, 6 c., £16. ; Newcastle, 10 c., £12. ; Pisco, 5 c., £6. ; Pt. Sudan, 5 t., £104. ; Sydney, 6 t. 5 c., £141.

MAGNESIUM SULPHITE—
Melbourne, 1 kg., £5.

MERCURIALS (*otherwise undes.*)—
Shanghai, 1 cs. (pt.), £13.
Singapore, 1 cs. (pt.), £11.

MERCURY OXIDE—
Calcutta, 1 kg., £45.

METHYL SALICYLATE—
Durban, (F.), 1 cs. (pt.), £8.

NITRIC ACID—
Madras, 5 c., £15.

OLEIC ACID—
Cape Town, 1 cs., £7.

OSMIC ACID—
Barranquilla, 2 cs. (pt.), £9.

OXALIC ACID—
Calcutta, 1 cs., £5.
Wellington, (F.), 1 ck., £7.

PHOSPHATE OF LIME—
Santos, 6 c., £8.

PHOSPHORIC ACID—
Dunedin, 2 cs., (pt.), £5.
Perth, 2 cs., £5.
Sydney, 48 cs., £140.

PHOSPHORUS—
Trinidad, 3 cs., £32.

POTASSIUM BICARBONATE—
Brussels, 2 cks., £6.
Calcutta, 1 ck., £6.

POTASSIUM CARBONATE—
Hong Kong, 5 cs., £18.

POTASSIUM CHLORATE—
Bombay, 4 cs., £7.
Trinidad, (F.), 10 cs., £19.

POTASSIUM CITRATE—
Bombay, 6 cs., £48.; Calcutta, 1 cs., £6.; Colombo, 1 cs. (pt.), £6.; Wellington, 2 cs., £23.

POTASSIUM CYANIDE—
Hong Kong, 3 cs., £49.
Petrograd, 9 kgs., £130.

POTASSIUM IODIDE—
Bangkok, 2 cs., £205.; Beira, 1 cs. (pt.), £22.; Bombay, 6 cs., £447.; Brisbane, 1 cs., £88.; Calcutta, 2 cs., 1 cs. (pt.), £198.; Changking, 16 cs. (pt.), £9.; Hankow, 5 cs. (pt.), £10.; Iddo, 2 cs., £96.; Jamaica, 2 cs. (pt.), £30.; Karachi, 1 cs., £22.; Pt. Sudan, 1 cs. (pt.), £43.; Singapore, 1 cs. (pt.), £65.; Sydney, 5 cs., £437.

POTASSIUM PRUSSIATE—
Hamburg, 23 cks., £515.; Melbourne, 6 kgs., £52.; Paris, 10 pkgs., £155.; Pt. Said, 1 kg., £10.; Rotterdam, 19 cks., £88.; Sydney, 1 kg., £7.

POTASSIUM SALTS (*otherwise un.*)
Colombo, 1 cs. (pt.), £5.
Toronto, 6 cs., £59.

POTASSIUM SULPHIDE—
Toronto, 6 kgs., £20.

POTASSIUM TARTRATE—
Pt. Sudan, 5 cs. (pt.), £51.

SALICYLATES (*otherwise undes.*)—
Montreal, 2 cs. (pt.), £17.

SALICYLIC ACID—
Calcutta, 1 cs., £13.
Shanghai, 1 cs., £12.
Switzerland, 10 cks., £177.

SALTPETRE—
Adelaide, 2 t., £82.; Bahia, 2 t. 9 c., £98.; Beira, 5 c. (F.), £9.; Cape Town, 15 c., £32.; Copenhagen, 6 c., £46.; Durban, 13 c., £28.; Sydney, 5 t., £204.

SHEEP DIP—
Buenos Aires, 17 c., £60.
Durban, 1 t. 18 c., £43.

SILVER NITRATE—
Auckland, 1 cs., £20.; C. Town, 1 cs. (pt.), £10.; Dunedin, 1 cs. (pt.) £19.; Rangoon, 1 cs. (pt.) £8.

SODA CRYSTALS—
Perth, 5 c., £19.

SODIUM ARSENITE—
Durban, 8 t. 18 c., £616.

SODIUM BENZOATE—
Calcutta, 1 c., £7.
Paris, 10 c., £130.
Shanghai, 9 c., £117.

SODIUM BICARBONATE—
Calcutta, 5 c., £15.; East London, 10 c., £14.; Fremantle, 5 c., £10.; Karachi, 2 c., £8.

SODIUM BISULPHITE
Bordeaux, 1 t., £21.

SODIUM CARBONATE—
Karachi, 1 c., £7.

SODIUM HYDROSULPHITE—
Cape Town, 1 kg., £11.

SODIUM HYPOPHOSPHITE—
Paris, 3 c., £64.
Sydney, 2 c., £43.

SODIUM HYPOSULPHITE—
Wellington, 3 c., £6.

SODIUM SALICYLATE—
Sydney, 1 c., £11.

SODIUM SILICATE—
Durban, 1 t. 1 c., £21.

SODIUM SULPHATE—
Timaru, 5 t., £64.
Wellington, 5 t., £64.

SODIUM SULPHIDE—
Wellington, 60 t. 7 c., £784.

SODIUM TARTRATE—
Brussels, 5 c., £24.
Fremantle, 5 c., £18.

SPENT OXIDE—
France, 180 t. £333.

STEARIC ACID—
Calcutta, 3 cs., £15.

SULPHUR—
Brussels, 6 c., £15.; Gothenburg, (F.), 5 t., £56.; Sydney, 2 c., £7.; Tientsin, 1 t., £10.

SULPHUR (FLOWERS)—
Aden, 5 c., £6.

SULPHURIC ACID—
Beira, 1 t., £21.; Madras, 1 t. 3 c., £30.; Mauritius, 1 c., £8.; Pt. Swettenham, 2 t. 2 c., £64.; Santos, 2 t., £143.

TARTARIC ACID—
Auckland, 7 c., £43.; Bermuda, 1 c., £7.; Calcutta, 2 c., £19.; Christiania, 2 t., (F.), £330.; Delagoa Bay, 6 c., £41.; Kobe, 11 t. 10 c., £1,380.; Limon, 2 c., £16.; Melbourne, 2 t. 10 c., £300.; Paris, 6 c., (F.), £17.; Pt. Elizabeth, 2 c., £14.; Reval, 5 c., (F.), £35.; Sydney, 1 t., £122.

ZINC OXIDE—
Adelaide, 2 kgs., £7.; Alexandria, 2 cks., £6.; Brisbane, 1 cs., £6.; Christiania, 20 cks., £37.; Hamburg, 53 cks., £210.; Perth, 2 kgs., £7.; Petrograd, 30 brls., £160.; Sydney, 4 cks., £51.

ZINC SULPHATE—
Sydney, 1 cs., £9.

Week ending October 27.

ANTIMONY REGULUS—
Durban, 2 t.
Iquique, 6 c.
Wellington, 10 t.

BEESWAX—
Belgrade, 1 t.

CARNAUBA WAX—
Kobe, 1 t.

CASEIN—
Pasages, £882.

CERESINE WAX—
Sydney, 5 c.

FERRO VANADIUM—
Paris, £460.

FULLER'S EARTH—
Boston, 2 t. 10 c.; Christiania, 25 t.; Los Angeles, 50 t.; Montreal, 25 t.; San Francisco, 45 t.; Seville, 20 t.; Tacoma, 50 t.; Toronto, 30 t.; Treport, 7 t.; Vancouver, 5 t.

GLUE, SIZE AND GELATINE—
Calcutta, 17 t. 10 c.; Colombo, 2 c.; Dunedin, 1 c.; Durban, 1 t. 14 c.; East London, 1 c.; Ghent, 25 t. 10 c.; Guayaquil, 1 c.; Hong Kong, 5 c.; Karachi, 1 c.; Kilindini, 1 t.; Lagos, 4 c.; Madras, 10 c.; Melbourne, 19 c.; Montreal, 2 t. 14 c.; Nelson, 1 c.; Paris, 4 t. 5 c.; New Plymouth, 3 c.; Perth, 3 c.; Philadelphia, 13 t. 8 c.; Pt. Elizabeth, 1 c.; Shanghai, 4 c.; Sydney, 3 c.; Wanganui, 1 c.

MINERAL WAX—
Brussels, 12 t.; Rouen, 10 c.; Sydney, 3 t.; Trieste, 17 c.

PLUMBAGO—
Malmo, 1 t.
Sekondi, 5 c.
Wellington, 10 c.

QUININE—
Bombay, 11,011 oz.
Calcutta, 10,064 oz.
Copenhagen, 1,938 oz.
Singapore, 1,600 oz.
Shanghai, 333 oz.
Sydney, 8,116 oz.
Toronto, 1,000 oz.

ROSIN—
Penang, 1 t. 1 c.
Rangoon, 3 t. 8 c.
Rotterdam, 1 t. 1 c.

SALT—
Bombay, 12 c.; Durban, 3 t. 19 c.; East London, 13 c.; Jamaica, 6 c.; Kilindini, 2 c.; Madras, 4 c.; Pt. Said, 3 c.; Pt. Sudan, 13 c.

SOAP—
Abadan, 3 c.; Addah, 3 t. 15 c.; Adelaide, 7 c.; Acera, 4 t. 15 c.; Ahwaz, 3 c.; Antwerp, 4 c.; Auckland, 5 c.; Brussels, 8 c.; Bombay, 11 t. 19 c.; Boston, 17 c.; Bremen, 1 c.; Calcutta, 14 c.; Constantinople, 2 c.; Delagoa Bay, 3 c.; Demerara, 3 c.; Dunedin, 1 c.; Durban, 3 t. 4 c.; East London, 3 c.; Fiji Is., 1 c.; Gibraltar, 9 c.; Gisborne, 1 c.; Hamburg, 11 c.; Hong Kong, 4 c.; Iddo, 2 c.; Jamaica, 1 t.; Karachi, 13 c.; Kilindini, 2 t. 14 c.; La Libertad, 1 c.; Lagos, 2 t. 10 c.; Lyttleton 1 c.; Madras, 5 c.; Mauritius, 1 t. 10 c.; Mombasa, 1 c.; Monte Video, 2 c.; Montreal, 8 c.; Naples, 2 c.; Penang, 12 c.; Pt. Elizabeth, 12 c.; Pt. Harcourt, 6 c.; Pt. Said, 1 t. 5 c.; Pt. Swettenham, 9 c.; Praia, 6 c.; Punta Arenas, 1 c.; Rio Gallegos, 8 c.; Rotterdam, 40 t. 2 c.; St. Helena, 2 c.; St. Lucia, 1 c.; Saltpond, 10 t.; Sekondi, 13 t. 19 c.; Shanghai, 1 c.; Sierra Leone, 1 c.; Sydney, 4 c.; Talcahuano, 3 c.; Tientsin, 4 c.; Toronto, 1 t. 4 c.; Trinidad, 11 t. 1 c.; Wellington, 7 c.; Winnebah, 8 t.; Zanzibar, 1 c.

STEARINE—
Rotterdam, 1,100 t.

TALLOW—
Antwerp, 13 t. 15 c.; Danzig, 20 t. 2 c.; Genoa, 40 t.; Hamburg, 25 t. 3 c.; Naples, 11 t. 10 c.; Rotterdam, 55 t. 18 c.; Wasa (Finland), 12 t. 1 c.

TAR (STOCKHOLM)—
Durban, 18 c
Kilindini, 12 c.
Rockhampton, 4 t. 10 c.

WAX (*otherwise undescribed*)—
Bordeaux, 1 t. 3 c.
Osaka, 18 c.

WHITE LEAD—
Auckland, £198.; Brussels, £40.; Channel Is., £40.; Christchurch, £80.; Delagoa Bay, £30.; East London, £53.; Dunedin, £12.; Fremantle, £85.; Irish Free State, £6.; Halifax, £80.; Iquique, £19.; Karachi, £4.; Lyttleton, £222.; Limon, £1.; Malta, £117.; Melbourne, £43.; Mossel Bay, £19.; Oamaru, £23.; Pt. Moresby, £85.; Pt. Said, £159.; Rangoon, £259.; Rosario £666.; Rotterdam, £23.; Singapore, £71.; Shanghai, £27.; Sydney, £583.; Timaru, £144.; Townsville, £45.; Trinidad, £41.; Wellington, £1,377.

MANCHESTER.

Week ending October 30.

AMMONIUM CARBONATE—
Portuguese Africa, 50 cks.

BLEACHING POWDER—
Brisbane, 11 cks.

CARBON BLACK—
Germany, a qnty.

COAL TAR PRODUCTS—
Naphthalene—
New York, 265 bgs.
Pitch
Aviles, 1,385 t.
Unspecified
Switzerland, 93 drms., 12 cks.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Bombay 1 drm., 4 cks.

FERRO MANGANESE—
Antwerp, 25 t.

SALT—
Montreal, 3,200 sks.
Quebec, 3,200 sks., 1,680 bgs.

SALTCAKE—
Gothenburg, 200 t. 3 c.

SODIUM SULPHATE—
Bombay, 2 cks.

SULPHUR—
Sydney, 10 cks.

NEWCASTLE-ON-TYNE

Week ending October 27.

ALUMINA—
Antwerp, 309 lbs.

AMMONIA—
Copenhagen, 5 brls.
Rotterdam, 1,541 bgs.

ANTIMONY—
Antwerp, 44 cks.; Montreal, 48 cks.; New York, 109 cks.; Rotterdam, 8 cks.

BARIUM SULPHATE (BLANC FIXE)—
Bergen, 12 cks.
Montreal, 39 cks.

BLEACHING POWDER—
Christiania, 73 cks.
Rotterdam, 155 cks., 96 pkgs.

CAUSTIC SODA—
Bergen, 21 drms.; Christiania, 121 drms.; Copenhagen, 82 drms.; Hamburg, 277 drms.; Rotterdam, 276 drms.

COAL TAR PRODUCTS—
Pitch
Antwerp, 1 kg.; Copenhagen, 1,281 t.; Dunkirk, 431 t.; Rotterdam, 2 crts.

COBALT SULPHATE—
Bergen, 1 cs.

IRON OXIDE—
Copenhagen, 2 cks.

LITHARGE—
Antwerp, 13 cks.; Copenhagen, 9 cks.; Hamburg, 6 cks.; Rotterdam, 106 cks.

MAGNESIA—
Hamburg, 6 cs.
Montreal, 19 cs.

MAGNESIUM CARBONATE—
Antwerp, 10 cs., 70 bgs.

MANGANESE—
Montreal, qnty.

RED LEAD—
Antwerp, 1 kg., 45 cks.; Bergen, 16 cks.; Copenhagen, 91 cks.; Christiania, 57 cks.; Montreal, 4 cks.; Rotterdam, 25t., 50 cks.

SOAP—
Bergen, 1 cs.
Copenhagen, 1 bx.
Rotterdam, 7 cks., 5 bgs.

SODA CRYSTALS—
Rotterdam, 5 bgs.

SODIUM SULPHATE—
Antwerp, 149 t.

TURPENTINE—
Rotterdam, 2 drms.

WHITE LEAD—
Antwerp, 2 pkgs., 2 trusses, 20 cks.; Copenhagen, 10 cks.; Rotterdam, 88 cks.

ZINC OXIDE—
Rotterdam, 1 ck.

ZINC ASHES—
Antwerp, 302 bgs.

N. & S. SHIELDS.

Week ending October 27.

NIL.

PRICES CURRENT.

WEDNESDAY, OCT. 31, 1923.

PREPARED BY MESSRS. HIGGINBOTTOM & Co., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, but it must be understood that the prices in different localities may vary.

		£	s.	d.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

CURRENT TOPICS.

THE ECONOMIC CONFERENCE AT WORK.

THE interest of the general public in the work of the Imperial Conference is already beginning to wane. It would, perhaps, have been too much to expect that after the broad outlines of policy had been formulated by the various Dominion and Colonial representatives, the detailed proceedings of the various committees should keep public interest sustained at its original high level. Yet the comparatively small amount of attention devoted at present by the general Press to the proceedings may easily give a wrong idea of the value of the work being done. The subject of outstanding importance was, of course, the extension of the system of mutual preferential tariffs within the Empire, and this has now become merged in the political controversy which threatens to bring upon us within the next few months the upheaval of a general election. Apart from this main question, however, there are under discussion many points of detail which, if settled satisfactorily, should go far in improving inter-Imperial commercial relationships and in smoothing the difficulties out of the path of Empire trade. These minor points include the immunity of State enterprises from taxation, a common Empire form of invoice and certificate for use by exporters, the improvement of Empire trade statistics, uniform enforcement of arbitration awards, and the elaboration of a common Empire patent system. On all of these matters special committees of the Imperial Economic Conference have presented their reports. So far as the first is concerned, the unanimous opinion is expressed that State enterprises shall be treated on exactly the same basis as private enterprises for the purposes of taxation. With regard to the second matter, a common form of invoice and shipping document has already been adopted by Australia, New Zealand, South Africa, and Newfoundland, and the Conference urges strongly that the system be adopted throughout the Empire. Concerning statistics, the Conference recommends that the British Board of Trade furnish inter-Empire trade statistics in greater detail than given at present. No one can question the value of reliable and up-to-date statistics in promoting the development of trade, and current British official statistics, valuable as they undoubtedly are, are certainly capable of improvement. To cite, for example, the case of chemical products; there is considerable room for increasing the number of individual products tabulated in the monthly

returns. It is to be hoped, therefore, that this particular recommendation of the Conference is destined to bear fruit. The desirability of establishing a uniform reciprocal system for the enforcement of arbitration awards is also emphasised by the Conference, and whilst there are many practical difficulties in the way of the realisation of this ideal, yet if the aim be kept consistently in view, such a system must in time be established. On the question of Empire patents, objections have been raised by the Canadian Government on the grounds that no reciprocal registration for Dominion patents exists at present, and until this state of affairs is modified, no important progress can be made, although the Conference recommends that the provisional scheme of the British Empire Patent Conference, 1922, be adopted by the Colonies and Protectorates. A further important matter under discussion by the Conference is whether a permanent committee should be established to act as a connecting link between the formal Conferences, and to see that the recommendations of these latter are kept constantly in sight. With the exception of the Canadian representative, unanimous approval of the project has been expressed by the delegates. It is difficult to see that much weight can be attached to the Canadian argument that the existence of a permanent Imperial Economic Committee will jeopardise the effectiveness of the periodic Conferences.

THE BRITISH INDUSTRIES FAIR.

As we indicate elsewhere in this issue, the arrangements for next year's British Industries Fair are now well advanced, both at Birmingham and at London, and there is every reason for believing that from the standpoints both of attendance of overseas buyers and of actual business directly or indirectly transacted, the success of the 1923 Fair will be eclipsed. At one time the opinion was generally expressed that the promotion of a Fair in 1924 would prove an undertaking doomed to failure, since many potential overseas customers who intended visiting England would postpone their visit until the British Empire Exhibition was opened. There is little doubt that such would have actually been the case had the dates at which the Fair is to be held remained the same as those of previous years. By altering the dates so as to bring them within the period at which the Wembley Exhibition will be open, however, the position has been entirely changed, and the confidence of the Fair promoters that the Empire Exhibition will, far from harming, materially aid the success of their enterprise, appears to be well founded. After all, the two projects have aims which are not altogether identical. The British Empire Exhibition is planned so as to attract the general public, and its success will depend very largely upon popular support. Its ultimate effects will, it is true, be reflected in increased trade both home and overseas, but its immediate economic results cannot be so marked as those of a trade fair. A further change for the better in the organisation of the Fair is the decision not to hold the Birmingham and London sections concurrently. This removes the cause for a complaint which we have heard on several occasions in past years. The main difficulty confronting the organisers of the 1924 British Industries Fair has been not so much to attract trade visitors, as to impress upon those home manufacturers who are exhibiting at Wembley the advisability of not neglecting the Fair. We understand, however, that the majority of the manufacturers who, at the outset, looked askance at the idea of organising two comprehensive exhibits, are beginning to see that a dual outlay and effort will probably be well rewarded.

PHARMACEUTICAL-CHEMICAL PRICES.

Inspection of our market reports will reveal the fact that during the past two or three weeks most pharmaceutical chemicals have shown marked increases in price, and that in some few instances the rise has been very great. Thus, in the case of methyl sulphonal and sulphonal, these products could be obtained last week at prices of about 15s. 6d. and 15s. per pound, respectively. To-day, however, the buyer who is fortunate enough to obtain small supplies has to pay almost double the above figures. In the majority of cases, however, the price increase has not been anything so pronounced, 10 per cent. probably being an average figure representing the rise during the period under consideration. These movements in the spot market are due to the practically complete cessation of German imports, the phenomenal rises occurring in those cases where the chemicals are not made here at all and the less pronounced rises indicating the sympathetic reaction of competitive British manufactures. Germany seems to be rapidly approaching complete economic and political chaos and to be reaping the reward of the deliberate policy of currency debasement she adopted three years ago. It is highly probable that the spot market for pharmaceutical chemicals which has reacted so promptly to the failure in German supply will continue firm, and that further alterations in prices will all be towards a higher level. Our fine chemical manufacturers are thus given an opportunity similar to that afforded the dyestuffs industry in the early days of the French occupation of the Ruhr, and we have little doubt they will respond with increased output. The slightly higher prices which consumers will be compelled to pay in the near future are an inevitable consequence of the law of supply and demand, but the benefit afforded the home industry by the temporary elimination of unfair competition must in the long run prove of as great an advantage to British consumers as to the manufacturers themselves.

THE CHEMISTS' DINNER.

The general approval which greeted the suggestion that the occasion be made the first of a series of similar dinners, to be held annually, was but one of a number of factors which indicated the success of the joint dinner held in London on Wednesday week by the Society of Chemical Industry, the Chemical Society, and the Institute of Chemistry. It was made clearly evident to those of us who were present that it is by social gatherings of this kind that the movement towards co-operation can best be advanced.

ELECTRO-PLATING WITH CHROMIUM.*

NEW METHOD USING CHROMIUM ANODES.

By K. W. Schwartz.†

CHROMIUM is a bluish-white metal with a specific gravity, when crystalline, of 6.92 at 20° C. It is exceedingly hard and can be drilled only with great care and difficulty. It maintains its bright, silver-like lustre almost indefinitely. Samples which were exposed to laboratory fumes for many months did not show any signs of tarnish or corrosion.

Chromium metal occurs in both an active and a passive state. In this respect it resembles iron, nickel, and cobalt. When active the metal dissolves readily in hydrochloric and hot sulphuric acids to give chromous salts. Hittorf (*Z. Phys. Chem.*, 30, 505 (1899)) states that in the presence of most strong oxidising agents, such as free chlorine, bromine, strong nitric acid, chromic acid, etc., chromium becomes passive. This probably accounts for the fact that chromium anodes have not been used hitherto in depositing the metal from chromic-acid solutions. Chromium metal can be immediately activated by making it cathode in an acid solution, by contact with concentrated acids at room temperature, by immersion in solutions of the chlorides of the alkalies or alkaline earths at temperatures near their boiling points.

According to Carveth, electrolytic chromium may occlude as much as 250 times its volume of hydrogen. The theoretical ampère-hour yield of the pure metal from a valency of three is 0.6458 gramme, and from a valency of six it is 0.3229 gramme.

Chromium has at least three different valencies. The single potentials, according to Luther (*Z. Phys. Chem.*, 36, 389 (1900)), assuming 0.56 volt for the Ostwald calomel electrode, are 0.3 volt for chromium against its divalent salts, 0.2 volt against its trivalent salts, and 0.9 volt against its hexavalent salts. Chromic oxide belongs to a class of oxides, including those of V, U, Ti, and Mn, which are not readily reduced to the metal. Chromic oxide is not reduced by hydrogen or CO at ordinary pressures. It is not acted upon by chlorine or sulphur fumes. Exposed to water or weak electrolytes it hydrolyses extremely slowly as compared with oxides of most other heavy metals. Chromic oxide forms a very adherent film on the chromium-metal or chromium-alloy surface. It is largely on account of these valuable properties of the metal and its oxide that we undertook the study of chromium-plating steel.

Historical Survey of Chromium-plating Processes.

Bunsen produced metallic chromium electrolytically by using a two-compartment cell and the chloride as electrolyte. Moller and Street (1898) took out patents in England and used as their cathode solution, chrome alum, sodium sulphate, and water, in equal parts by weight. Their current density was 40amps./sq. dm., and temperature 90° C. Their yield per ampère-hour indicates an efficiency of 30 per cent. Cowper-Coles (1900) found that a chromic-chloride solution 250g./L., at a temperature of 88° C. and a current density of 40-50amp./sq. ft. (5amp./sq. dm.) gave good deposits of chromium, especially when hydrochloric acid was added to redissolve the precipitated oxide.

J. Férée electrolysed solutions containing 100g./L. hydrochloric acid and 160g./L. crystalline chromic chloride with current densities of 15amp./sq. dm., obtaining, as he claimed, excellent deposits. Glaser (*Z. f. Elektrochemie*, 7, 656 (1901)) worked with chromic chloride, sulphate, and acetate in the cathode chamber, while the anolyte consisted of mineral acid or salt solutions. His results do not bear ready duplication, however.

Carveth and Mott (*J. Phys. Chem.*, 9, 231) investigated the electro-deposition of chromium from chloride and sulphate solutions, using a double-cell arrangement with lead anodes and copper cathodes. They concluded that chromium can be deposited from these solutions and that the presence of chromous salt appears essential to the successful depositions of the metal from chloride and sulphate solutions. Stirring was found to be undesirable. They recommend as yielding good results a solution containing 340g./L. chromium sulphate in the catholyte and dilute sulphuric acid (density 1.12 in anolyte, with a current density of 14ams./sq. dm. (130amps./sq. ft.). The nature of the anolyte affects the efficiency and deposit materially, as does also the temperature used.

Le Blanc (*Trans. Am. Electrochem. Soc.*, 9, 315 (1906)) found he could deposit chromium using a double-cell arrangement with lead anodes and copper cathodes, a current density of 15-20amp./sq. dm. and a catholyte concentration of 89g./L. of chromium. The anolyte was sulphuric acid of a specific gravity of 1.12, and the temperature used was 38-50° C. Only thin deposits were obtained; thicker deposits showed a tendency to crack and tree.

G. J. Sargent (*Trans Am. Electrochem. Soc.*, 37, 479 (1920)) examined various mixtures of chromic sulphate and chromic acid, and showed that the yield of chromium from chromic-acid solutions is greatly increased by the addition of small amounts of chromium sulphate. He obtained good thick deposits on copper, using a platinum anode and a single-cell arrangement.

E. Liebreich (*Z. f. Elektrochemie*, 27, 94 (1921)) used a lower voltage, with a carefully reduced chromic-acid solution. He obtained adherent deposits on iron, copper, nickel, and brass. His anodes were of platinum and also of iron; the current density was 10-85amp./sq. dm. His solutions contained from 100g./L. to 1,000g./L. of chromic acid, partially reduced to chromous acid. Without the addition of a little sulphuric acid there was a tendency for the cathode to coat over with a green deposit, presumably Cr_2O_3. The fluctuating voltages he obtained in the chromic-acid solutions he attributed "not to passivity," but to alternate reduction and reoxidation of the cathode product. Liebreich is continuing his investigations at the Reichsanstalt, Berlin.

Range of Present Investigations.

On account of the wide diversity of results and opinions of previous investigators, we decided to study: (1) The effect of chromium sulphate concentration at various current densities; (2) the effect of hydrogen-ion concentration; (3) the effect on the deposit upon substituting chromium anodes in place of lead and of platinum anodes; (4) the extent of the passivity of the chromium anodes after prolonged electrolysis. We also investigated the electrolytic corrosion of the chomium deposit, as compared to other metals and alloys, in such media as concentrated nitric acid, dilute nitric acid, sea water, molten tin, zinc, and brass.

Apparatus and Method.

In the cases where a two-compartment cell was used it consisted of an 800 c.c. beaker, into which a porous cup was placed to act as a diaphragm. The outer chamber was filled with dilute sulphuric acid with a specific gravity of 1.12. The anode used was a sheet-lead cylinder closely fitted around the porous cup. The cathode was either copper or sheet iron. In most cases, however, a single cell was used. This consisted of a 600 c.c. beaker, with two anodes (usually chromium) suspended in the solution, preferably by means of chromium-plated iron wires. The anodes of chromium were prepared by the Goldschmidt process. They were approximately 5 × 3.7 × 3.7cm. (2 × 1.5 × 1.5in.) in size.

The chromium sulphate and chromic acid used were Eimer and Amend's "chemically pure grade." All solutions were filtered before using. Cold chromic-acid solutions have little or no effect on the filter paper. The iron cathodes were electrolytically cleaned.

Discussion of Results.

Results of tests made on chromium-sulphate solutions varying from 395g./L. to 80g./L., and current densities varying from 16 to 2.7amp./sq. dm. (150 to 25amp./sq. ft.) were not encouraging. No satisfactory crystalline adherent plate of chromium on iron was obtained. At the lowest concentration used (80g./L.) a uniformly distributed deposit of a green oxide of chromium was produced.

With high concentrations of chromium sulphate, 350-400g./L., at current densities ranging from 2.7 to 16amp./sq.dm. (25-150amp./sq. ft.), with the hydrogen-ion concentration varied by introducing sulphuric acid into the bath in increasing amounts, no satisfactory deposit was obtained. At any given current density, as soon as a definite hydrogen-ion concentration was exceeded no deposit resulted. It appeared that the higher the acidity the higher the current density required for the deposition of chromium from its sulphate solution.

We next tried the solution recommended by G. J. Sargent —245g./L. chromic acid plus 3g./L. $Cr_2(SO_4)_3$. The anode was platinum and the cathode copper. The current density was

* Paper read before the American Electrochemical Society at Dayton, Ohio, U.S.A., on September 27, 1923.

† Electrochemical Laboratory, Columbia University, New York City.

10amp./sq. dm. (93amp./sq. ft.). A bright crystalline deposit was obtained, which proved satisfactory in all respects. In the next experiment an iron cathode was used and two chromium anodes were used in place of platinum. The cell was allowed to run for 22.5 hours. The voltage at the beginning and end of the run was 2.3; the current density was 10amp./sq. dm. (93amp./sq. ft.). The deposit was grey, adherent, crystalline, and satisfactory. The temperature of the electrolyte was 25° C.; there was no stirring aside from that brought about by the evolution of hydrogen. The chromium anodes showed no tendency to become passive, as would be ordinarily expected, since chromic acid is such a strong oxidising agent. It is possible that the presence of the sulphate ions counteracted the tendency for the anodes to become passive. The anodes lost appreciably in weight, and took on a smooth, silky appearance, as compared with the original rough and scratched surface which had been produced by grinding on an emery wheel.

We next made a series of runs, varying the concentration of the chromic acid, but keeping the content of chromium sulphate and the current density constant. It was found that good deposits could be obtained on iron, using chromium anodes, anywhere within the range from 200 to 400g./L. of chromic acid. The best concentration was found to be 245g./L. chromic acid plus 3g./L. chromium sulphate, which solution was designated as "C."

Using this solution "C," the effect of current density was determined over the range from 2.7 to 54amp./sq. dm. (25 to 500amp./sq. ft.). Good deposits were obtained up to about 16amp./sq. dm. (150amp./sq. ft.). Above this the deposits were dark at first, and after continued plating showed signs of cracking. The best current density to use for a bright adherent deposit proved to be between 10.8 and 13.4amp./sq. dm. (100 and 125amp./sq. ft.), with the electrolyte at room temperature. See the following table:—

Effect of Current Density on Deposit.

Solution: 245 g./L chromic acid, plus chromium sulphate 3 g./L. Room temperature. Anodes, chromium. Cathode, Fe, with exposed surface of 1 sq. in. No mechanical stirring.

Sample.	Time Min.	C.D. amp. sq. ft.	Voltage.	Description of Deposit.
1	120	90	2.3	Crystalline and adherent
2	60	45	2.3	Surface barely covered
3	120	125	2.5	Very good, bright, adherent
4	120	144	2.5	Grey, crystalline.
5	60	345	2.9	Dull, adherent, tendency to form yellow coating.
6	120	540	3.5	Grey at first, then turned yellow and finally cracked.

Cathode current efficiency tests were run with solution "C," using a copper coulometer in series, a current density of 13.8amp./sq. dm. (125amp./sq. ft.), chromium anodes and electrolyte at room temperature. A cathode current efficiency of 20 per cent. was obtained for bright deposits. This, at first glance, would seem low, but is explained by the fact that, together with chromium metal, hydrogen is always evolved at the cathode.

Again using solution "C," a run was made to study the effect of temperature. The current density used for the room temperature run was 13.4amp./sq. dm. (125amp./sq. ft.). The deposit was satisfactory. On making a run at 55–60° C. and the same current density, no plate resulted after two hours' operation, although the evolution of hydrogen at the cathode was quite rapid. However, upon doubling the current density a good plate resulted at this higher temperature.

Why Low-current Densities Cannot be Used.

The above phenomena suggest the following explanation:—Hydrogen was evolved in all of our plating experiments where metallic chromium was deposited, and it seems that the formation of a protective layer of hydrogen gas over the chromium is essential. At higher temperatures the tendency for hydrogen to escape and leave the surface of the cathode is much increased. To counteract this loss, hydrogen must be evolved more rapidly. To do this a higher current density is necessary. On making a determination of cathodic-current efficiency, using a copper coulometer, it was found that at higher current density, using a temperature of 55–60° C., there was no increase in efficiency. Hence nothing is gained in employing the higher temperature. This theory also explains why low-current densities cannot be used in chromium plating, for with low-current densities the hydrogen evolved is not sufficient to produce the protective layer needed to furnish the reducing atmosphere for preventing the newly deposited chromium from dissolving with the formation of a chromous salt.

Properties of Chromium Plate.

Exposure for weeks to the corrosive atmosphere of the laboratory produced no effect on the chromium plate, whereas iron corroded rapidly. Chromium-plated iron immersed in tap-water for a period of three weeks showed no signs of losing its lustre or of a tendency to corrode. Dipping the chromium plate into hot sulphuric acid or hydrochloric acid caused it to dissolve. Boiling in hot concentrated nitric acid for two hours produced no appreciable effect on the chromium plate.

A series of corrosion tests on various metals in order to compare them with chromium plate under similar conditions was then undertaken. These consisted in exposing weighed samples in closed containers to air saturated with (*a*) ammonia, (*b*) hydrochloric acid, (*c*) nitric acid, and (*d*) hydrogen-sulphide fumes, for a period of 192 hours. At the end of this period the samples were again weighed and the loss or gain in weight per unit of surface per year was calculated. The results show that the chromium plate stands up well in ammonia vapour, nitric-acid fumes, and hydrogen-sulphide fumes. It is practically on a par with duriron on exposure to nitric-acid fumes. Hydrochloric-acid vapour attacks chromium almost immediately.

The effect of electrolytic corrosion of chromium plate as compared to other metals was then determined. The corrosive media used were solutions of concentrated nitric acid, dilute nitric acid (concentrated acid plus an equal volume of water), and sea-water. Two runs were made, one using a current density of about 3.2amp./sq. dm. (30amp./sq. ft.), and the other using a current density of 1.6amp./sq. dm. (15amp./sq. ft.). Each extended over a period of 24 hours, weighings of cathode and anode being made before and after each run. The results show that chromium does not stand up under electrolytic corrosion nearly as well as it does under atmospheric corrosion. Of the materials tested—namely, chromium-plated iron, ordinary iron, aluminium, and duriron, —the last showed smallest loss due to electrolytic corrosion.

We attribute the inability of chromium-plated steel to withstand electrolytic corrosion to a "breakdown" of the protective surface film by the action of the electric current. With the aid of the current the acid ions will pass readily through the surface film and attack the virgin metal beneath, whereas in the case of atmospheric corrosion the migration of the acid through the film is extremely slow in comparison.

Under the microscope the chromium plate is uniform and free from holes due to occluded gases. Chromium plate has wearing qualities and hardness superior to ordinary iron, galvanised iron, and tinned iron. Chromium-covered iron is not attacked by molten tin, zinc, or brass, whereas ordinary iron disintegrates rapidly.

Conclusions.

1. Good adherent deposits of chromium on iron were obtained, using solutions containing 3g./L. chromium sulphate and from 200 to 400g./L. chromic acid.

2. The cathode-current density range for good deposits was found to be from 9.3 to 16amp./sq. dm. (100-150amp./sq. ft.).

3. Best results were obtained using Sargent's solution, containing 3g./L. chromium sulphate, 245g./L. chromic acid, and a current density of 13.4amp./sq. dm. (125amp./sq. ft.). The anodes used were chromium. The solution was at room temperature, and stirring in addition to that caused by the evolution of hydrogen was found unnecessary.

4. Chromium anodes in the above solution show no tendency to become passive, even after long and continuous plating operations. Chromium anodes are cheaper than platinum and better than lead.

5. The simultaneous evolution of hydrogen with chromium deposition on iron is essential to good results. The hydrogen appears to protect the freshly discharged metal and to counteract the great tendency of chromium to pass back to the chromous-ion stage. This tendency is particularly marked in the strongly oxidising medium of chromic acid.

6. Steel does not lose its temper during chromium plating.

DISINFECTANTS AND PRESERVATIVES.

A GENERAL SURVEY OF THE WHOLE FIELD.

By S. N. Brown, F.C.S.

IN the following article, a résumé is given of the germicidal powers of a number of products well-known in the chemical and allied industries. Owing to the strict control over these products made possible by the Rideal Walker test, consumers are now well safeguarded, and are able to satisfy themselves better as to the comparative merits of different brands of disinfectants acting under similar conditions.

Coal-tar Fluids.

These products are widely used for their excellent bactericidal action. They consist chiefly of phenolic bodies, and are usually of a dark colour, with a pronounced odour of coal tar. According to their solubility they can be divided into two classes:—(1) Those which form an emulsion with water; (2) those which form a clear solution in water.

In the first group, the insoluble constituents are emulsified with soda, soap, gelatine, resin or neutral oils. The second group consists of saponified tar acids. In their manufacture, potash, glycerine, alcohol and other agents are added to increase their solubility in water. A number of these are sold as proprietary articles and are not allowed to contain above 3 per cent. carbolic acid. In general, commercial disinfectant fluids are free from phenol and are in consequence less poisonous. The strength of these proprietary articles varies considerably, and the germicidal value has to be specified in certain contracts. Since the adoption of the Rideal Walker test, however, there has been a steady rise in the efficiency of commercial disinfectants.

The majority of commercial coal-tar disinfectants contain cresols which are less soluble than phenol. The well-known disinfectant "Lysol" contains 50 per cent. of cresols, but does not contain any carbolic acid. It is prepared by dissolving that portion of tar oil which distils between 190° and 200° C., in a neutral fat and afterwards saponifying the solution. The product is recommended for use as a 2 per cent. solution. "Izal" is a product obtained from the carbonisation of coke in close ovens. It is a reddish-brown liquid insoluble in water. It is a very good disinfectant, is non-toxic and non-caustic to higher animal life. It mixes with water in all proportions to form a milk-white emulsion. The strength of solution usually applied is 5 per cent. "Cyllen" is also a good disinfectant. It is made on the principle that the diphenyl radicle is less toxic and higher in germicidal power than the phenyl radicle.

Chlorine, Bleaching Powder, and Hypochlorites.

Under certain conditions chlorine is an efficient germicide, but its detrimental effect on plants, cotton, silk, and linen and also on the respiratory organs detracts from its general value. Although bleaching powder itself has strong deodourising properties, it is not a good germicide. It has been found indeed that a 1 per cent. solution takes so long as 12 hours to kill the less-resistant organisms. There are a number of hypochlorite solutions on the market containing varying amounts of available chlorine. "Eau de Javel," a chlorinated soda solution, contains 2.5 per cent. available chlorine. "Chloros" contains 10 per cent. of available chlorine. "Antifornin" is a solution of caustic soda and hypochlorites used in breweries.

The electrolytically-prepared solutions are somewhat more active than the ordinary hypochlorite solutions. The effective strength for local disinfection is 0.35 per cent. available chlorine. This solution kills non-sporing organisms in 5-10 minutes. Anthrax and enteritides spores are killed in 1½ hours. The soda preparations are better than bleaching powder for use in water purification. Sodium hypochlorite is best for sterilising swimming baths, as it removes algæ and fungi.

Other Halogen Disinfectant Products.

Iodine treatment combined with sodium thiosulphate has been successfully used in sterilising drinking water. Bromine is a powerful although dangerous disinfectant. It has been found that 20 parts per million sterilises *B. Typhosus* (in water) in less than 30 minutes.

Although largely employed in surgery, iodoform is much inferior to free iodine in germicidal action. Its reputation is far in advance of its merit. Chloroform is a mild disinfectant. To be effective a solution should be at least 1 per cent. in strength. Its volatility, insolubility in water, and narcotic effects are detrimental to its use.

Manganese and Arsenic Compounds.

The permanganates and manganates are known as Condy's fluids (red and green). In their use, care has to be taken to have an excess present such as is evidenced by a pink colour remaining. This colour, however, is very difficult to detect owing to the oxidation product (manganese dioxide) being formed. Hence, the use of these compounds may be very costly and inefficient. Nevertheless a good number of patents are still being taken out for the use of permanganate in water purification.

Arsenic is the basis of valuable insecticides—*e.g.*, sheep-dips from arsenious oxide and the sulphides of arsenic. Commercial preparations often contain arsenic compounds combined with tar products and nicotine. (See *Chemist and Druggist*, June 11, 1904; and *Rep. Dept. Commis. B. of Agric.*, leading to Sheep-dip Act, 1903; and Quibell, *J.S.C.I.*, 1907, 1266). The copper compounds "Paris Green" (aceto-arsenite), etc., are used for spraying and dusting trees.

Copper and Mercury Salts.

Cuprous chloride is considered to be the most active bactericidal salt of copper. It has a distinct action on lower organisms. The efficiency of cupric salts depends on the percentage of copper. Copper sulphate is largely used in killing agricultural parasites. Copper salts are also used for soaking seeds and as a preventive against potato blight. Copper lime sugar, and copper soap washes are used for trees. Bordeaux mixture (copper sulphate and lime) is used for vines and other crops. A mixture containing 75 per cent. of copper sulphate together with sulpho-carbolate and some free sulphur dioxide is sold as "Microsol" for use in stables and drains.

One of the most powerful disinfectants is mercuric chloride (corrosive sublimate). Its extended use is prohibited, however, by its relative high cost, its poisonous action on plants and animals and its precipitation by a large number of products such as hard water, sulphides, metals, and numerous salts. The addition of common salt or ammonium chloride increases the stability, but diminishes germicidal power. The Local Government Board recommend for disinfection: mercuric chloride, ½oz.; spirits of salt, 1oz. fluid; aniline blue, 5 grains (safety colouring), and water 3 gallons (1 in 962). Mercuric iodide and mercuric oxycyanide are both used in surgery. There are also a number of organic-mercury compounds on the market for use in medicine and surgery.

Formaldehyde.

The British Departmental Commission on Preservatives 1901 absolutely prohibits the use of formaldehyde in foods and drinks. The preservative action of wood smoke in smoked provisions is due entirely to formaldehyde. It is more powerful against bacteria than against yeast and mould fungi. Its advantages are its application in gaseous, liquid or solid form for fumigation, spraying, etc., its behaviour to other chemicals by which it is unaffected and also its negative action on metals and fabrics. As an insecticide formaldehyde is inferior to sulphurous acid, but it is an excellent deodourant.

Benzoic and Salicylic Acids.

Benzoic acid is a powerful antiseptic both in solution and in the vapour form. A saturated solution kills *B. Typhosus* in a few minutes. It is largely used in good preservatives, and for preventing the souring of milk. It also finds application in Friars Balsam.

As a food preservative salicylic acid is equal in effect to benzoic acid, although its physiological effect is more marked. The British Departmental Committee referred to above restricts its use to 1 gram per lb. in food and 1 grain per pint in liquids. A large number of food preservatives on the market are derivatives of salicylic acid.

Formic Acid-Preservatives.

Formic acid is a strong antiseptic, its Rideal-Walker co-efficient being much higher than that of acetic acid, for *B. Typhosus*. It has been found that 1 per cent. formic acid is equal in preservative action to 5 per cent. acetic acid. In the destruction of spores, however, it is less active than formaldehyde. Used as a preservative in foods, its taste is more pleasant than that of acetic acid and the odour not so noticeable. Foods containing up to 0.15 per cent. of formic acid have been proved to be physiologically harmless. There are a number of formic acid preservatives sold for use in fruit preservation. These contain various proportions of formic acid—*e.g.*, "Werderol" and "Fructol" contain

10-14 per cent., and "Alaret" from the "Nitrit Fabrik, Köpernick, 50-60 per cent. formic acid.

Boric Acid and Sulphur Compounds.

Though it is not a disinfectant, boric acid restricts the action of bacteria on food. Within certain limits, it keeps milk sweet for 24 hours without any appreciable effect on digestion. A British Departmental Committee recommends that boric acid and borax are to be used for milk, cream or margarine only in the following proportions:—0.50 per cent. H_3BO_3 in butter and margarine; and 0.40 per cent. H_3BO_3 in cream. (*Food Report* 10, *L.G.B* 1909).

The action of sulphur in the destruction of fungi and insects on plants is due to the formation of sulphurous acid. A solution made by boiling milk of lime with flowers of sulphur is largely used externally as an insecticide. The use of sulphur dioxide as a gas is of value in destroying vermin and combating insect-born diseases, but it has very little effect on micro-organisms. Sulphurous acid and bisulphites are widely used for checking fermentation and preserving food. The limit of SO_2 allowed is open to question, although 0.01 per cent. SO_2 has been suggested as a maximum.

Prussic acid and cyanogen are more destructive to insects than to lower organisms. In view of the highly poisonous nature of prussic acid, its use is restricted, although the gas has been used lately in fumigating ships.* Fruit trees are sometimes fumigated with prussic acid, as this is considered a better practice than spraying.

Ozone and Hydrogen Peroxide.

The use of ozone for sewage and water purification is well-known. Ozone in a concentration of 6lb. per million gallons destroyed all the bacteria in a sample of river water (sand-filtered Marne water) containing 28-320 bacteria per 1 c.c., with a mean frequency of *Coli* organisms of 1 per 100 c.c., with the exception of 1 per c.c. of spore-bearing organisms of the *Subtilles* type. Ozonised air under pressure has been used for destroying moulds and bacteria in brewers foul casks, and has been introduced into the wort in the latter part of fermentation to destroy noxious germs. In cold storage ozone is used for removing injurious organisms and odours and lessening the amount of refrigeration required.

Hydrogen peroxide is a bactericide. It does not injure foods, is innocuous and non-corrosive. A concentration of 1 in 100 H_2O_2, is sufficient to kill pathogenic organisms in 24 hours. It is of service in effecting pasteurisation at lower temperatures.

Hydrocarbons, Essential Oils, and Camphor.

Petroleum is well known as an insecticide, although dry cleaning with petroleum or petroleum-benzene does not kill *Typhosus*, whereas carbon tetrachloride is germicidal to *Typhosus* in 30 minutes. Benzene soap dissolved in benzene has no germicidal value. Products consisting of terpenes and oxidised products—*e.g.*, camphor, menthol, thymol, and eucalyptus have a limited sanitary value. A saturated solution of thymol in water arrests putrefaction and fermentation. Camphor is used as a personal prophylactic, but is insufficient to sterilise the air. It is used much in medicine and in block disinfectants such as "Sanoscent," "Camphotar," etc. The essential oil of eucalyptus is strongly germicidal.

Coal-tar Dyestuffs and Intermediates.

Considerable prominence was given last year to some very valuable work carried out by Fairbrother and Renshaw on the use of coal-tar dyes in medicine.† Among the intermediate products, naphthalene is a very feeble antiseptic and is absolutely no use as a disinfectant, but it is useful against domestic insects. Beta naphthol is an official remedy for disinfection in cases of cholera, typhoid, and scabies. Bechold (*Zeit. Angew. Chem.*, 1909, xxii, 2033) states that halogen substituted naphthols are more powerful than any other disinfectant except corrosive sublimate.

Pyridine is a strong insecticide. It mixes freely with water, has a very unpleasant odour and is volatile. In fact tobacco smoke owes its smell not to nicotine but to pyridine and its compounds. Tobacco smoke has been proved to kill the bacilli of cholera and pneumonia in 10-30 minutes. Nasal catarrh has also been overcome by tobacco smoke. Nicotine is used as an insecticide, and usually sold with the official guarantee of the percentage of nicotine. Richards cakes for fumigation are nicotine and camphor in definite proportions.

* Cyanogen chloride is to be substituted for hydrocyanic acid gas in the U.S. Quarantine Regulations relating to fumigation procedure. The change is based on the fact that cyanogen chloride is highly lachrymatory, even in non-lethal quantities, and for this reason it gives ample warning of its presence before it becomes concentrated in sufficient quantities to become fatal.—Ed. *C.T.J. and C.E.*

CHEMICAL STOCKS IN JAPAN.

LOSSES OCCASIONED BY THE EARTHQUAKE.

OUR Japanese commercial correspondent, writing from Osaka under date October 8, gives some important particulars as to the losses occasioned by the earthquake in the stocks of chemical products held in Japan. He states that as the majority of leading dealers in chemicals and drugs were situated in the Nippon-bashi district—the main business centre of Tokyo—the amount of damage and loss occasioned to their stocks was very great. One huge warehouse entirely devoted to the storing of chemicals was completely destroyed by fire, and many other warehouses suffered to almost as great an extent. The total value of the chemicals stored in Tokyo in the middle of August may be given as 3,200,000 yen, and it is estimated that goods to the value of well over 2,000,000 yen have been destroyed.

Possible Shortage of Caustic Soda.

The principal products included in this huge loss figure were sulphuric acid, potassium chlorate, caustic soda, and boric acid. With regard to caustic soda, Japanese chemical circles estimate that the total loss has been 4,500,000lb. in Tokyo and 4,000,000lb. in Yokohama. The loss of bleaching powder, however, was small, since it is customary not to keep large stocks in the seaports during the summer, but to ship the product inland to the ultimate consumers. Of the nine soda-manufacturing concerns in Japan, four sustained more or less damage to their plants, and it is calculated that they will not be able to resume full operations for at least another three months. It is evident that the supply of soda products both in Tokyo and Yokohama will fall short of the demand. The average yearly consumption of caustic soda in Japan is estimated at 40,000,000lb. for recent years, whilst the domestic production is given as 37,000,000lb. in 1922 and 21,000,000lb. in 1921, the balance being supplied by imports. It is possible though that the shortage of caustic soda in Tokyo and Yokohama may be relieved to some extent by transhipments from Kobe, since it is known that large stocks were accumulated at this latter port during the first half of this year.

Imports of Bleaching Powder and Potassium Chlorate Essential.

It would appear, however, that increased imports of bleaching powder and other chemicals are essential to meet the shortage in supply. This is particularly true in the case of potassium chlorate. Ever since May last, imports of this product have been of only limited extent, and a period of acute shortage in the Japanese market is inevitable. It is difficult to obtain exact figures as to the loss of sulphuric acid occasioned by the earthquake, yet it is generally believed that the total loss in Tokyo and Yokohama alone exceeds 4,000,000lb.

Silesian Zinc Industry. — The Polish-Silesian zinc industry is considerably affected by conditions in the Ruhr. The industry mines and smelts local ore, but manufactures only semi-finished products. Of these semi-manufactures, 50 per cent. are normally sent to the industries of the Ruhr for finishing. The development of a domestic refining industry in Polish Silesia is therefore advocated on the ground that it will, on the one hand, overcome the dependency on Germany and, on the other, enable a cheaper marketing of refined zinc and allied products in the domestic, Balkan, and eventually in the Russian markets. Such development, however, must look to foreign investment for its accomplishment, since sufficient domestic capital for expansion is not at present available.

THE MANUFACTURE OF SOFT SOAPS.

PRACTICABILITY OF POTASSIUM-FREE PRODUCTS.

DURING the war, when the shortage of potassium compounds was very acute in the United States, every effort was made to substitute sodium compounds in their place with the view to the preservation of the potash supplies for the essential needs of pharmacy, scientific work, and agriculture. One of the active steps taken was the formation of a joint committee of the American Chemical Society and the National Research Council under the title of the Committee on the Substitution of Potash by Soda. A suggestion put forward by this committee was the possibility of making commercially satisfactory soft soaps without the use of potash, and work to this end was carried out by F. C. Vilbrandt and E. V. Kyser, of the University of North Carolina. This work, which has only recently been completed, is described in the *American Perfumer and Essential Oil Review* (October, 1923), and from the account given we abstract what follows.

The article presents a series of formulæ for soft soaps, wherein the sodium salts have been partly and totally substituted for potassium compounds. The soaps thus produced are not haphazard substitutes, but are the equal of potassium-containing products in detergent and cleansing properties and for the preparation of certain pharmaceuticals. They are also inexpensive. The transparent variety, made from rosin, caustic soda, and fatty-acid stock is clear, lustrous, firm of texture, freely lathering, and readily soluble.

Definition of Soft Soap.

Considerable amounts of potassium salts are used annually in the manufacture of transparent and other soft soaps. In no place in the literature is it stated that a soft soap, clear and transparent the year round, can be produced with sodium salts to the exclusion of potash. Soft soap is understood to be a soap prepared chiefly from potash lye, and oil, of a soft, salve-like consistency, and containing more water chemically fixed than hard soap. According to Thorpe (*Dict. Appl. Chem.*) it is one in which the base used is preponderantly potash, small quantities, if any, of sodium hydroxide being employed in warm and hot seasons. It also is clearly stated that the presence of potassium carbonate is necessary to produce a clear transparency and of the proper consistency for handling, this compound being required to act as a filler to retain chemically the amount of water to hold it as soft soap.

Lambourn defines soft soap as made from low melting-point stock with potash, and states that modern practice has compelled the distinction that while all potash soaps are soft, all soft soaps are not exclusively made with potash; however, in the preparation of such a soap, "a potash-linseed oil soap is the only combination that will retain its transparency throughout winter and summer." For clear transparent soap, very soft soap stock and caustic potash are essential, because the presence of sodium compounds produce figging. Other references all show potassium salts to be an essential constituent. According to Brannt, the substitution of one-half of the potash by caustic soda causes the product to become turbid, short, and friable, but one-quarter substitution can be used in hot climates.

American Experimental Work.

The usual "boil" method of soft soap manufacture was used—*i.e.*, the fatty acid stock was cut and boiled in hot caustic, no salting out being required and "fitting" being eliminated. Mixtures were made beginning with pure caustic potash and substituting until pure caustic soda was used. Only a limited number of oils were used, an effort being made to obtain merely a relationship between the products using potash and soda.

The formulæ studied, the yields and the cost of materials used in each formula are classified in the accompanyng table. In many instances large repeat batches were made to check up the results. Where sodium entirely replaced potassium, as in I, J, K, L, and M, three and four runs were made; in all such check experiments no differences were noticed in yield or quantity of product. The limited number of oils used does not indicate that other olein stock could not be substituted for those used in the above formulæ. The proportions may vary for different stocks, but a little experimentation will yield formulæ from which satisfactory soft soaps can be made.

Wherever caustic soda has been substituted in part for potash the yield of soft soap of a definite consistency from a given stock decreases in proportion as the caustic soda is substituted; not alone, because a lesser weight of caustic soda than potash is absorbed, but hydration of the resulting soap is reduced. However, the slight increase in yield with potash is offset by the higher cost of this chemical, the cost per pound of sodium soaps being considerably less.

DATA ON THE PREPARATION OF SOFT SOAPS.

Formula.	Oil Stock: Pounds.					Alkali: Pounds.			Water	Gross Yield	Net Yield	Materials. Cost per Lb. Dollars.	Clouding Temperature. Degrees F.	Time before Apparent Hardening.

Discussion of Results.

The products produced according to formulæ I, J, and K, wherein no potash was used, dissolve very readily, lather instantly into hard, soft, hot, or cold water, and yet do not contain as much water as the pure potash formulæ A, B, and D, which were almost equal in value to the above-mentioned sodium soaps. Due to a lack of sufficient lye, formulæ C and E produce greasy soaps. A mixture of rosin with olein stock with a decreased amount of water gave a soap that was too soft and thin. Even the introduction of some caustic soda to increase the hardness did not help, although it did increase the yield, but also the cost of materials per pound of product.

The introduction of tallow into the stock and elimination of all the potash, gave a product that was too hard. Omitting the tallow from this formula gave the best soaps yet made. Changing the composition of the oils and adding sodium carbonate for "fitting" did not change the results, although the substitution of the cheaper corn oil for the more expensive soya bean oil reduces the costs. The products of formulæ I, J, and K, after many weeks of standing showed only a faint trace of a film on the surface, but no separation or change of consistency.

The use of single oil stocks with rosin and caustic soda, as in formulæ L and M, showed that although the consistency was fair when first made, the product lost some of its water on ageing and got too hard. Mixed oils seem to be essential for a good quality soap. Rosin is also essential, since its omission in formula N produced a soap that was not transparent, too hard on ageing for a soft soap, in addition to high cost.

Green soap, soap liniment, and other pharmaceuticals calling for potash soaps were made from the transparent soaps produced from formulæ I, J, and K, and were equal in all

respects to those made from the pure potash formula soaps A, B, and D.

Since a high-grade, clear, transparent, all-year non-figging soft soap can be made by the use of mixed olein stock, rosin and caustic soda in the total absence of potassium compounds, it is safe to assume that all other grades of soft soaps wherein figging and turbidity are not detrimental properties can be made without the use of potassium compounds in any form.

SILLIMANITE.

A HIGH-GRADE REFRACTORY MATERIAL.

CRYSTALLINE anhydrous aluminium silicate occurs in rocks in three forms, as sillimanite or fibrolite, as andalusite, and as cyanite. These three minerals, although identical chemically, have quite distinct physical properties. Sillimanite is much the most stable of the three, and the others may be converted into this form by heating to above 1,320° C.; it may be produced artificially by fusing together silica and alumina in the correct proportions or by other methods.

Massive Deposit Discovered in India.

Sillimanite is found widely distributed in gneisses and crystalline schists and in the detrital rocks derived from these; less often it occurs in zones of contact metamorphism, and still more rarely in granites. It is especially characteristic of the khondalite gneiss of India. In most cases the mineral is disseminated in grains or aggregates of fibres throughout the rock, the massive variety being extremely scarce. Recently, however, the occurrence in India of massive sillimanite has been brought to the notice of the Imperial Institute, and reference is made to the matter in the current issue of the *Bulletin* of the Institute. The mineral is stated to occur near Nongmaweit in the Khasia Hills of Assam, in the form of boulders. Details are at present lacking, but if the experimental work now being carried out proves successful and the difficulties of transport (which are very great in this mountainous tract) can be overcome, an attempt will be made to develop the deposit and place the sillimanite on the market as a high-grade refractory material.

Sillimanite has many valuable properties which render it suitable for use as a refractory material, amongst which are strength and toughness, high melting-point (about 1,810° C.) and stability up to that temperature, low co-efficient of expansion, low electrical conductivity, freedom from volume changes, neutral reaction, and resistivity to corrosive slags and to oxidising and reducing conditions.

This suggested use of sillimanite seems to arise naturally out of its synthetic development in furnace linings and pots used in glass-making, where it is formed by the action of fluxes, derived from the glass or present in the hot gases, on the aluminous materials of which these linings, etc., are made. Under these conditions a layer of sillimanite is produced, which acts as a protective coating and prevents the molten glass from coming into direct contact with the clay body of the tank or pot. It is obvious, therefore, that from a theoretical point of view a refractory material composed wholly or mainly of sillimanite would be ideal for use in glass manufacture.

Artificial Sillimanites.

In practice, however, the use of sillimanite as a refractory material is still in the experimental stage; and in spite of the desirable qualities mentioned above, it is not yet commercially available owing to the scarcity of the natural mineral and the expense involved in producing it artificially. Fused artificial sillimanite has been produced by the Malinite process of smelting aluminous rocks or minerals with a reducing agent. Experiments have also been carried out with mixtures resembling sillimanite in composition by the American Refractories Company in conjunction with the Mellon Institute, and it is said that the production of such refractory materials in quantity has already commenced. Published results, however, refer to tests performed on bricks containing a much higher percentage of alumina than does sillimanite, but it is stated that the composition of the material used will eventually approximate as closely to that of sillimanite as possible.

A process has been patented in America for the manufacture of refractory bricks from a mixture of artificial sillimanite and of finely ground natural zirconia, the amount of the latter varying from 5 to 75 per cent. Though the first cost of sillimanite refractories may be higher than that of less refractory materials, it is probable that eventually it will be found that their greater durability will more than compensate for the difference.

BRITISH INDUSTRIES FAIR, 1924.

PROGRESS IN ORGANISATION AND PUBLICITY CAMPAIGN.

THE announcement some time ago by the Department of Overseas Trade of the alteration of date in the holding of the annual British Industries Fair for 1924 promises to be thoroughly justified by the results. For the past nine years the Fair has been held regularly during the later half of February, occasionally running on into the first week of March. The next, the tenth Fair, will be held two months later, from April 28 to May 9, and the Birmingham Section, instead of being concurrent with or overlapping the London Section (the White City, Shepherd's Bush, April 28—May 9, 1923) as has been the case in previous years, will follow, opening on May 12 and closing on May 23. Before coming to a decision on this question of date, the Department gave the fullest consideration to the views expressed by the exhibitors in the various sections. It is obvious that the holding of an exhibition on the scale of the British Empire Exhibition outweighs all normal considerations, and that the Department was fully justified in its decision to depart from the usual date.

It appeared possible, however, that this radical change in the policy of the Fair, which had hitherto ante-dated Leipzig by a week to ten days, might have adversely affected the representative character of the exhibits. It is therefore reassuring to find that the Department has received substantial support for its point of view in the form of an increased number of applications as compared with an equivalent stage of the organisation a year ago.

Growth of the B.I.F. from Its Inception in 1914.

It is now nine years since the first British Industries Fair was organised with the limited purpose of promoting the manufacture in the United Kingdom of articles previously imported from abroad. The cutting off of certain imports caused by the war had revealed deficiencies which were seriously handicapping home industries. This situation was promptly dealt with by the Commercial Intelligence Branch of the Board of Trade (converted in 1917 into the Department of Overseas Trade), who organised a series of conferences known as Exchange Meetings where British manufacturers might inspect samples, obtain particulars of the goods affected, and meet interested buyers. It became evident in 1915 that having stimulated the production of these various lines the Government must go a step further and help to provide a market where the goods could be shown to the Dominions and neutral nations; hence the first British Industries Fair.

Imperial Significance of the Fair.

The fact that the Fair has been held annually since that date is ample evidence of its utility both to the exhibitor and the buyer. In the meanwhile it has far outstripped its original limited purpose, and has taken its place as a great annual event in the British commercial calendar. In addition the widening Imperial aspect of the Fair has in the last few years been appealing with increasing force to the manufacturer as well as to the buyer from the Dominions. For several years individual Dominion firms have participated, and an official Indian exhibit has been included. Last year the Dominion interest was reinforced by a combined exhibit organised by the Canadian Chamber of Commerce in London, with the most successful results.

Interesting the Overseas Buyer.

The world-wide propaganda campaign conducted on behalf of the Fair during the past four years by the Department of Overseas Trade is cumulative in its effects, and will be enormously reinforced next year by the co-operative publicity arranged between the Department and the authorities of the British Empire Exhibition. The main drive for securing the attendance of the overseas buyer is made through a series of "follow-up" letters sent direct to approximately 50,000 selected firms. These firms are known to be interested in one or several of the trades included within the scope of the Fair. The letters, which are four in number, are already

in process of issue to buyers in the more distant markets. This personal campaign is supported by display advertisements in the British export press, in trade journals circulating overseas, and in the home press having direct interest in the Fair. The general campaign will be further reinforced for next year by the fact that much of the British Empire Exhibition literature, which will be broadcasted in enormous quantities, will carry references to the holding of the Fair.

The opportunity for the overseas visitor will next year be exceptional. His visit to England will be at a time when the country is at its most beautiful and when the English climate is normally at its best. He will be able to make his survey of the goods of Britain's most enterprising manufacturers at the Fair at the White City, London, and at Birmingham, and then see at his leisure the wonders of the British Empire Exhibition, the greatest exhibition ever held, where he can review the output in art, science, industry and raw materials of the whole British Empire. The fact that admission to the Fair buildings is limited by personal invitation to the *bona fide* trade buyer contributes to the desirable end that the Fair shall be a business market for business men.

The Scope of the Exhibits.

The 1924 Fair will have the usual schedule of trade exhibits, including: Glassware; earthenware; stoneware; scientific and optical instruments; photographic and cinematographic requisites; chemicals, light and heavy; domestic chemical products; drugs and druggists' sundries; perfumery, and dyes, at London. The Birmingham exhibits, which are organised by the Birmingham Municipality and Chamber of Commerce, with the support and under the auspices of the Board of Trade, will include: Paints, colours and varnishes; metals of all descriptions; and brewing and distilling plant.

RIPARIAN OWNERS AND RIVER POLLUTION.

THE CHEMIST IN RECENT WATER-RIGHT CASES.

IN the course of a paper on "Some Aspects of Water-Right Cases" read before the Manchester Section of the Institute of Chemistry on Wednesday, October 24, Mr. S. E. Melling, F.I.C., outlined his experience consequent upon the claims of certain riparian owners. In the first place he stressed the importance of the clean water problem to the full development of the textile and other industries, and compared present-day conditions with those which led to the passing of the Rivers Pollution Prevention Act of 1876. Distinction was drawn between the scope and powers of this Act and the common law as affecting riparian owners, and attention was directed to the part played in the prevention of abuse of the rivers of the industrial North by the several Joint Rivers Authorities.

As specific instances of water-right contentions, involving technical evidence, Mr. Melling reviewed two recent Chancery Court cases upon which important judgments had been delivered. In *Hulley v. Silversprings Company*, the plaintiff as riparian owner established that the defendants, in carrying on their bleaching and dyeing business, had so interfered with the character of the water as to entitle him to an injunction, despite the plea of prescriptive right set up by the defendants. Dealing with the position brought about by the relevant facts, one or two points of considerable interest were noted. In the first place, defendants had no right to discharge their effluent at a spot some 130 yards nearer to the plaintiff's boundary unless they could show that such a change could not possibly affect the plaintiff. The onus of so doing rested on the defendants and they had not discharged it. The evidence showed that in the above distance sedimentation and the natural self-purifying agencies would have materially improved the polluting effluent carried down to the plaintiff's land. Secondly, no prescriptive right to pollute could follow, even if all other difficulties had been removed; and, thirdly, the prescriptive easement claimed absolutely violated the provisions of the Rivers Pollution Prevention Act.

The Question of Water Sampling.

In the more recent case, the *Calico Printers' Association v. J. Makin and Son*, the issue was as to whether the defendants, a firm of paper-makers, had, since the date upon which undisputed pollution had ceased, by reason of the discharge of their effluent into the river about a quarter of a mile above the plaintiffs' intake invaded the riparian rights of the plaintiffs. This case, said Mr. Melling, was a little unusual in that the effluent was of such a quality as to satisfy all due requirements of the Rivers Pollution Prevention Act, the "foul, noxious, and polluting matter" complained of being essentially salts contributing to hardness, mainly calcium chloride. The onus of proof was on the plaintiffs in respect of (1) a sensibly increased impurity at their intake in comparison with the condition at the defendants intake and that (2) such increase was caused or contributed to by the defendants' effluent. The learned Judge interpreted "sensibly" as "something more than an increase capable of being detected by a meticulous analysis" but which is "capable of being detected in the purposes, be they domestic, agricultural or industrial, from which the water is used." The character of the river both in volume and quality, its temporary retardation of flow by up-stream riparian owners, the nature and amount of defendants' effluent, and so forth, were all common ground, so that the factors of dilution and diffusion became all-important.

In giving judgment in defendants' favour it was held, *inter alia*, to be quite unsafe to deduce any conclusions from the analysis of isolated samples taken at each intake simultaneously or after an interval, unless calculated with reference to the time that must elapse before the water at the upper point reaches the lower point. In other words, nothing short of a continuous and contemporaneous sampling over a reasonable period could satisfactorily determine the relative conditions at the two critical points. Details were given of the method by which the plaintiffs' suggestion as to unequal diffusion or short-circuiting of the saline matters in the effluent were negatived, and, in conclusion, the author stressed the importance of collecting all the physical, chemical, and engineering data which might have some bearing, however little, on cases of the type he had described.

THE NORWEGIAN ALUMINIUM INDUSTRY.

WIDE VARIETY OF ARTICLES MADE.

THE manufacture of aluminium goods has of recent years become an industry of considerable importance in Norway. There are several firms engaged in the production of a steadily increasing range of articles, the high quality of which has been widely acknowledged. One of the most important works of this kind, states the *Anglo-Norwegian Trade Journal*, is that belonging to A/S Nordisk Aluminiumindustri at Holmestrand. This company, which has its sales office at Lokkeveien 9, Christiania, was formed in 1917, and is closely connected with Aktieselskapet Norsk Aluminium Company, who are makers of the metal. The aluminium articles manufactured by A/S Nordisk Aluminiumindustri may be classified under the following main heads: Plates, kitchen utensils, dairy equipment, brewery vats and containers for the chemical industry. The company are manufacturers of large containers and tanks of almost any size and shape for breweries, canning factories, margarine factories, mineral water factories, and for such chemical industries as nitric acid works, explosives works, dye works, rubber, soap, and glycerine works. Castings in aluminium and alloys are carried out according to models or specifications. In addition to the foregoing a great variety of articles, many of which have hitherto chiefly been made in other metals or in wood, glass, etc., are now made by the company in aluminium or suitable aluminium alloys. Especially may be mentioned aluminium conductors for electricity, the company having supplied cables of that material for several Norwegian power transmission lines.

Aluminium from Norwegian Clay.

Professor Harold Pedersen, who has for a number of years been engaged in investigating the possibility of producing aluminium oxide from Norwegian clay, in a recent lecture before the Chemical Society at Trondhjem, stated that he had succeeded in solving this problem with the co-operation of the Hoyangfaldene aluminium works. Owing to the present unfavourable times it had, however, been found impracticable to construct the necessary works. The Norwegian aluminium works have a capacity of about 20,000 tons annually and are at present dependent on the import of 40,000 tons aluminium oxide which is at present produced only from bauxite, found chiefly in France, U.S.A., and South America. It would, therefore, be of great national importance if the necessary aluminium oxide could be produced in Norway. Owing to the potassium content of the Norwegian clay it is estimated that with a production of 20,000 tons of aluminium 16,000 tons of sulphate of potassium could be obtained annually, thus paying for part of the running costs.

CHEMICAL SOCIETIES' CONJOINT DINNER.

OPPORTUNITIES FOR CO-OPERATION.

At the Hotel Victoria, London, on Wednesday, October 31, a dinner was held under the auspices of the Chemical Society, the Institute of Chemistry, and the Society of Chemical Industry, at which Sir William Pope, K.B.E., F.R.S., presided. The dinner was intended to be something in the nature of an informal gathering of members of the three bodies, and there were nearly 200 present, including a large number of ladies. Among the company were Lord Wargrave, P.C., Lord Exmouth, Dr. E. F. Armstrong, Mr. A. Chaston Chapman, Mr. J. L. Baker, Professor J. C. Philip, Dr. W. R. Ormandy, Mr. E. V. Evans, Mr. G. Keville Davis, Dr. B. Dyer, Dr. C. H. Herty, Dr. J. P. Longstaff, Dr. S. E. Carr, Dr. Monier-Williams, Dr. E. Mond, Dr. R. S. Morrell, Mr. F. H. Carr, Dr. S. Miall, Dr. E. K. Ridcal, Sir Robert Robertson, Mr. J. Ronca, Dr. R. Seligman, Mr. W. J. U. Woolcock, and Dr. T. M. Lowry.

After the loyal toasts, Lord Wargrave, proposing the toast of "Chemistry and the Nation" referred to the remarkable things done by chemists during the war. A new chapter of the requirements and wants of the nations lay before use, and he ventured to hope that the great experience which had been gained by the chemical manufacturers during the war period was not going to be lost, but that we should see security was given to it to enable chemists further to develop the discoveries which they then made.

Sir William Pope, replying to the toast, said that during the war we heard a great deal of the importance of chemistry to the nation, but he was afraid that feeling on the matter of the importance of chemistry to the nation is becoming more and more feeble, and that we are dropping back into the old situation of letting things run on and trusting to luck that they will right themselves when the proper moment comes.

The Federal Council and Its Activities.

Mr. W. J. U. Woolcock, C.B.E., proposing "Our Chemical Organisations," said that chemical science and technology in this country was very well served with Associations. He was not quite sure whether some of these societies might not be able, in the interests of economy and effort and in the interest of efficiency, to find some form of combination, some form, perhaps, even of loose linking up. A considerable amount of co-operation and linking up had indeed taken place. Recently there had been arranged as between the American Chemical Society and our own Chemical Society co-operation in producing the *Journal of Physical Chemistry*, which was all to the good, and was an instance of co-operation of the learned bodies. If to-day was the day of anything, it was the day of co-operation and co-operative effort. There was one body to which he wished specially to refer, the Federal Council, and to suggest two things. He did not himself think that as far as the Federal Council is concerned that it was its business to act independently. He did not detect on that Council a desire to usurp the position of any of the other bodies, but he did think there was room in the Federal Council to act, perhaps in two ways. The first was that the Federal Council might quite easily be a forum, and ideas with regard to progress among the various societies could be offered to the Federal Council for their consideration to reject or accept. There was also a thing the Federal Council had set out to do but had not yet accomplished, although be believed it would ultimately be accomplished—viz., the idea of having a central home for chemical organisations. Ultimately, perhaps, that would be the first great achievement of the Federal Council.

Professor W. P. Wynne, F.R.S., acknowledging the toast, said that when considering the various chemical organisations it was impossible not to be struck by one fact, that only two of them possessed homes of their own. One of them was the Institute of Chemistry. The other was the Chemical Society, which however, was merely a tenant in its own house, and in that house accommodation was severely restricted. The accommodation is so small that the use of the library is very difficult, and they had been told that within the next twelve months they would not be able to find room for their books in the library, which was supported by various chemical associations, and was the most important chemical library in London and therefore in this country. We had been told that the progress of the nation during the last century was due to the efforts and work of engineers. No one would deny that the work of the engineers had been magnificent; but how could the engineer have carried out this work without the assistance of the chemist. It seemed to him that what was required at the present time, is a campaign of publicity.

The final toast of the evening was "The Universities." Dr. E. F. Armstrong, F.R.S., proposing this, said this was a joint meeting of a number of the chemical societies, and what he wanted to suggest was that they should have more faith in themselves and in those whom they chose as their leaders. To the Universities he said that if they were going to do anything for the industry of chemistry they must turn out students who, above all, possessed the hall-mark of personality.

LEGAL INTELLIGENCE.

FAILURE OF DYESTUFFS MANUFACTURERS.

J. B. and W. R. Sharp, Ltd.

A largely attended meeting of the creditors of J. B. and W. R. Sharp, Ltd., Lumb Works, Edenfield, Lancashire, was held on November 1 at the Cannon Street Hotel, London, E.C. The chair was occupied by Sir William McClintock, of 71, Queen Street, E.C., who had been appointed to act as the liquidator in the voluntary liquidation of the company. The statement of affairs presented showed unsecured liabilities of £48,443., and total assets of £42,839., from which had to be deducted £2,025. for preferential claims and £9,559. in respect of liabilities incurred by the receiver. The net assets available for the debenture holders therefore totalled £31,255. There were first debentures held by the bank totalling £6,000., and those would be paid in full. The amount available to meet the second debenture holders was £25,255., whilst the claims totalled £38,684. The deficiency as regarded the second debenture holders was £13,429. There was nothing available for the third debenture holders, and as regarded the creditors there was a deficiency of £48,443.

The original capital of the company was £25,000., divided into 5,000 preference shares carrying interest at the rate of 7 per cent. per annum, and 19,000 ordinary shares and 1,000 deferred shares. The latter shares had since been converted into ordinary shares. On June 21, 1922, the company passed a resolution increasing the capital from £25,000. to £70,000. by the creation of a further 45,000 ordinary shares. At that time the company's financial position was not wholly satisfactory, and the resolution for the increase of the capital had never been acted on. The company, having regard to the small amount of shares subscribed for in cash, entered on a very ambitious programme, which they were able to carry through to some extent with the assistance and approval of the Board of Trade. Facilities were also granted by the bank. The company applied under the State Assistance to the Dye Industry Order for a £12,000. loan in April, 1920. They also received a free grant from the Government of £8,000. In December, 1920, the Government loan was increased to £17,000. and the grant to £10,000. With regard to the loan, £16,250. had actually been received, although the total due to the Board of Trade was £19,086. in respect of which second debentures for £17,000. were held.

The Chairman then presented a statement showing how the deficiency had arisen. The directors had hoped that it would be possible for the company to tide over the acute depression in trade, but he was appointed as the receiver for all the debenture holders on December 11, 1922.

A creditor stated that in January last a balance-sheet of the company was seen in Manchester which showed about 15s. in the £ for the unsecured creditors. He asked how that 15s. had disappeared, and the present deficiency taken its place.

The Chairman said that in the balance-sheet referred to the machinery, etc., was taken down at the figure at which it appeared in the books. The machinery, etc., had cost the company £98,000., but it was quite unlikely that anyone would ever be found who would give such a figure for it.

Mr. Stephens, of Messrs. W. J. Bush and Co., Ltd., asked what the Chairman proposed to do—shut down and sell off, or continue trading.

The Chairman: Mr. J. B. Sharp is still sanguine and thinks he can get someone with finance to come in and buy the assets at a price. Frankly, however, the best I shall get for them will not, in my judgment, be sufficient to fully discharge the claims of the debenture holders in full.

Mr. Stephens: How long would you trade before you put the business up for sale?

The Chairman: It will be put up at once.

After a short discussion a resolution was unanimously passed confirming the voluntary liquidation of the company, with the Chairman as liquidator, and an informal committee was appointed consisting of the representatives of the British Dyestuffs Corporation and Phineas Drake and Co., and Mr. A. Livesey.

MANUFACTURING CHEMISTS' LIQUIDATION.

Preston, Hull and Co., Ltd.

The statement of affairs issued by the Official Receiver in the matter of the above-named company, of 112, High Holborn, W.C., shows as regards creditors liabilities expected to rank for dividend £7,444. 12s. 3d., and net assets £356. 1s. 2d. As regards contributories the paid-up capital was £11,503., and the total deficiency amounted to £18,591. 11s. 1d. The company was registered on January 14, 1920, with a nominal capital of £12,500., and was formed, *inter alia*, to acquire as a going concern the business of manufacturing chemists and druggists carried on by Colvin Preston and Lucile Preston, his wife, at Holborn House, 112, High Holborn, W.C., under the style of the "Coal By-Products Company," since the year 1916, also all trade marks, the several processes for the manufacture of "Spots" and "Fumo Taracine," plant, machinery, office furniture, etc., and the benefit of a tenancy agreement relating to premises in High Holborn. The purchase price payable under the agreement was £6,000.

The purchase price was fixed without any independent valuation by Colvin Preston, who has admitted that no profits had been made prior to the registration of the company. Branches were opened by the company at Manchester, Birmingham, and Newcastle, in conjunction with C. P. Preston Co., Ltd. (also promoted by Colvin Preston). In each case the branches proved to be a failure and were closed down in 1922. The failure of the company was attributed by Colvin Preston to (*a*) inability to obtain supplies of benzol for its manufactures; (*b*) the depression generally in the motor trade, which caused heavy losses from bad debts incurred; and (*c*) insufficient capital to advertise the manufactures.

THE INDIAN INDIGO CROP.

FIRST FORECAST FOR 1923-1924.

The following forecast is based on reports received by the Department of Statistics, India, from the undermentioned six provinces, which contain practically the whole area under indigo in British India.

The total area sown is estimated at 163,700 acres, which is 28 per cent. below the corresponding estimate of last year. As compared with the final estimate (296,800 acres) of last year the present estimate shows a decrease of 133,100 acres or 45 per cent. The total yield of dye is at present estimated at 30,400cwt. as against 39,900cwt., the revised estimate at this time last year, or a decrease of 24 per cent. As compared with the final estimate (54,600cwt.) of last year, the present estimate shows a decrease of 44 per cent. Seasonal conditions have not been quite favourable, and the present condition of the crop is, on the whole, reported to be fair.

The detailed figures for the provinces are given below:—

Provinces.	Area (Acres).		Yield (Cwts.).		Yield Per Acre (Lbs.).	
	1923–24	1922–23	1923–24	1922–23	1923–24	1922–23
Madras	64,700	102,600	14,000	22,000(*a*)	24	24
United Provinces.	20,800	35,000	2,300	4,200	12	13
Bihar and Orissa.	24,800	35,200	3,800	4,300	17	14
Punjab	45,900	37,500	9,300	7,600	23	23
Bengal.....	1,300	7,300	100	200(*a*)	9	3
Bombay and Sind (including Indian States)...	6,200	9,300	900	1,600	16	19
Total	163,700	226,900	30,400	39,900(*a*)	21	20

OFF-PEAK ELECTRICAL POWER.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—A very important central station in Belgium, wishing to dispose of 5,000 to 10,000kw. of off-peak power during an 8-hour night shift, has requested me to find employment for this intermittent surplus power. Perhaps you will be kind enough to place my problem before your readers. I shall be very glad to receive any suggestions they may be obliging enough to offer. It seems to me that the difficulty in finding uses for such power is sufficiently great and of such general interest as to warrant thorough discussion.—

Yours, etc.,

Ivar J. Moltkehansen.

15, Rue Bréderode,
Brussels, Belgium,
November 2, 1923.

FIRE RISKS IN PIGMENT GRINDING.

STUDIES ON PRUSSIAN BLUE.

PRUSSIAN blue is liable to take fire in grinding, especially when it is being milled in an edge-runner with chrome yellow in the production of chrome green. Although the usual way of making chrome green is to precipitate the two colours together, it is often found necessary to adjust the shade subsequently to an exact standard by dry blending, and unless great care is taken combustion is liable to occur.

E. Renkwitz has investigated the safety limits of temperature of such a mixture, and designed an apparatus for measuring the temperature at which ignition occurs. This is 234° C. for pure Prussian blue, but lower for impure products. The presence of ferrous sulphate, for instance, has a marked lowering effect on the temperature of ignition. A mixture of 80 per cent. of lead chromate and 20 per cent. of dry technical Prussian blue decomposes explosively at 238° C.; a mixture of 92 per cent. of lead chromate and 8 per cent. of Prussian blue burns slowly at 270° C., and a mixture of 96 per cent. of chromate and 4 per cent. of Prussian blue does not burn at 280° C., although the Prussian blue is completely decomposed at this temperature with evolution of ammonia.

It is found that the addition of a small quantity of petroleum has a pronounced effect in reducing the inflammability. For example, a chrome green which alone ignited at 238° C. ignited at 246° C. when mixed with 2 per cent. of petrolatum. To avoid accidents in practice the edge-runner should not be too heavy, and the addition of 2 per cent. of petrolatum is recommended; this also has the effect of greatly facilitating the mixing and grinding. The addition of inert material such as barytes naturally has the effect of reducing the risk of firing almost to vanishing point, so that this trouble does not occur in the dry blending of Brunswick greens.—*Oil, Paint, and Drug Reporter.*

SULPHURIC-ACID TANK EXPLOSION.

FATALITY AT STOCKWITH CHEMICAL WORKS.

THE adjourned inquiry was held on Tuesday concerning the death of George Henry Carr (45), a workman employed at the works of Messrs. Morris and Co. (Stockwith), Limited, on the Trent bank at West Stockwith. It was stated at the opening of the inquiry that Carr was on an acid tank wagon with a naked light in the act of examining the valve, when an explosion occurred and he was instantly killed.

Henry Kellington, a foreman at the works, said he was inspecting the cleaning of the acid tanks which were on railway wagons, and which, owing to the conditions of trade, had not been in use since April, 1921. He understood the lid of the tank had been off half-an-hour when deceased asked him to inspect the tanks they had dealt with, and requested a fellow workman to give him a lamp so that he could see into the tank and examine the valve. Witness turned to inspect other tanks, when he heard the explosion. It was the first time he had ever heard of an explosion of an acid tank.

The Coroner (Mr. E. S. Spencer): Do you always have naked lights to examine the tanks?—Not always, but it was dark under the shed.

Edwin Rufus Hunt said he had been working with the deceased loosening the valves of the empty sulphuric acid tanks. They had completed two of them, and were engaged on the third. He had been working over 20 years on this job. They adopted precisely the same method with all the tanks, and used a little paraffin waste round the spindle which operated the valves. When this waste was lighted it blazed up above the manhole, and the waste loosened the spindle which operated the valve. The manhole lid had been off half an hour. Deceased asked witness to pass him a light. He handed him an open paraffin lamp, and the explosion took place just as deceased got hold of it

The Coroner: Have you ever been warned there might be explosive gas in the tank?—No. Never.

Is it possible to get the spindle loose without burning paraffin waste round it?—It is the method they always adopted.

John Robert Tomlinson, chemist at the works, said these tanks were used to contain sulphuric acid, which was not an explosive acid. Questioned, he said sulphuric acid of itself did not give off an explosive gas, and at full strength it had no effect on iron, but weak sulphuric acid was affected by iron, and generated hydrogen, which was highly explosive when mixed with air. As the tank had been empty so long, the strength of the sulphuric acid it contained would gradually weaken, and hydrogen might be generated.

The Coroner asked the works manager if they took any precautions to ascertain if any dangerous gases were present. Mr. Jones (works manager): We had no reason to suspect explosive gases.

The Inspector of Explosives (Mr. Warren): I entirely disagree with you. They ought to have apprehended danger. The Coroner returned a verdict that the deceased was killed by the accidental explosion of gas inside the tank.

Mr. Dalton Holmes, a director, said he would like to say how greatly the company regretted the accident, and on their behalf to express their deep sympathy with the bereaved.

ELECTROMETRIC METHODS IN ANALYSIS.

PAPER BY PROFESSOR TREADWELL, OF ZURICH.

A JOINT meeting of the Manchester Sections of the Society of Chemical Industry, the Society of Dyers and Colourists, the Institute of Chemistry, and the Manchester Literary and Philosophical Society was held at the Textile Institute, Manchester, on November 2. There were about 300 representatives of the various societies present. Dr. Levinstein, extended a very hearty welcome to their distinguished visitor, Professor W. D. Treadwell, Ph.D., Professor of Analytical Chemistry at the Eidgenössische Technische Hochschule, Zurich. Mr. William Marshall, J.P., F.I.C., Chairman of the Manchester Section of the Society of Dyers and Colourists, then took the chair, and in also extending a welcome to Professor Treadwell stated that this was the first time that gentleman had been to England, and, as Manchester societies, they were very highly honoured indeed in having him come among them. Professor Treadwell and his father had both worked indefatigably in the cause of chemical analysis, and had done, he thought, more than any other two chemists to place analytical chemistry in the high position it holds to-day. Professor Treadwell had broken new ground, and was in the forefront of those who were successfully applying the laws of physical chemistry to analytical purposes.

Professor Treadwell then read his paper, entitled "Electrometric Methods in Analytical Chemistry." He stated that in volumetric analysis the endpoint of a titration may be indicated very accurately by electric methods, either by measurement of potential or of conductivity. In potentiometric titrations a suitable electrode is used as an indicator, the endpoint being marked by a sudden change of potential. In conductivity titrations the endpoint of a chemical reaction is recognised by a sudden change in the conductivity of the solution.

These methods were first used in chemical research about thirty years ago, in a form, however, which proved to be too complicated for technical chemical analysis. During the last few years a rapid development of electro-titrations has been brought about, consisting mainly in the application of the above-mentioned electric indicators to all kinds of chemical titrations. Professor Treadwell described the simplification which had been devised in the necessary equipment, and these were such as would allow the use of these methods, even in the most primitive technical laboratory. The wiring devices for the different methods were explained by a number of diagrams. The applications of various titration-electrodes were illustrated by numerous examples taken from different branches of technical analysis.

The lecturer indicated the lines along which further systematic study of the behaviour of titration electrodes was required. In numerous cases the phenomena of activity await explanation. In spite of the very considerable literature on surface reaction, an exact knowledge of these phenomena, based on the electrostatic attraction of the effective atoms and molecules has hardly begun to be obtained. Much work is now being devoted to these problems, and progress may be expected in the near future, which will certainly also help to extend the possibilities of electrotitrations. Electrometric methods are predestined to be carried out in the form of microtitrations. It would be interesting to try them also with molten electrolytes. Finally, electrometric methods are of value, as they constitute the most reliable means for the scientific criticism of our common titrations.

A very exhaustive discussion then took place, to which Professor Treadwell replied in detail.

NOTES ON THE ITALIAN CHEMICAL INDUSTRY.

(From Our Own Correspondent).

Genoa, October 31.

Payment for Overtime Work.—A new agreement between the Federazione delle Associazioni Industriali Chimici and the Confederazioni delle Corporazioni Sindacali, has been concluded at Rome. By this agreement overtime work will be paid for on week days, with a twenty per cent. increase on the normal rate for the first two hours; twenty-five per cent. for the next three hours, and fifty per cent. for the following hours. On general holidays such overtime will be paid for with an increase twenty per cent. above the nominal rate for the first two hours, forty per cent. for the next three hours, and eighty per cent. for the following hours. If overtime work is done during the night (week days or holidays) it is remunerated as follows:—Twenty-five per cent. above the standard pay for the first two hours, fifty per cent. for the next three hours, and one hundred per cent. for the following hours. The hours from 8 p.m. to 6 a.m. are to be considered as night hours from October 1 to March 31, and from 9 p.m. to 5 a.m. from April 1 to September 30. The above agreement is to be valid for the whole of Italy.

The Citric Acid Industry.—The Italian citric acid industry unlike that of citrate of lime, has never been subjected to Government control. Until quite recently Italy consumed citric acid produced wholly by foreign firms, supplied with Italian citrate of lime. At the present day there are only two citric acid works in Italy, one of which, the Società Goldenberg, was founded in 1909 at Palermo. This firm had originally a German directorate and was financed by German capitalists In 1916, however, after working at a loss for some years, it came under Italian control, and is to-day on a firm financial basis, having increased its capital and accumulated substantial reserves. The second citric acid producing concern was established in Messina in 1919 under the name of Industria Siciliana di Acido Citrico, with a capital of 4,250,000 lire.

Overseas Chemical Trade.—During the first six months of this year Italy imported 984 tons of caustic soda from Great Britain, 5,423 tons from France, 3,127 tons from Spain, 1,740 tons from the United States, and 391 tons from other countries. She also imported from France 7,693 tons of phosphatic fertilisers; 830 tons from Germany; 1,246 tons from Luxemburg, and 139 tons from other countries. The exports of sulphur reached during the above period a total of 121,630 tons, of which 33,514 tons went to Great Britain, 21,581 tons to France, 15,409 tons to Greece, 7,090 tons to South Africa, 5,280 tons to Sweden, 5,869 tons to British India, 4,221 tons to Spain, 3,576 tons to Portugal, 3,605 tons to Austria, 3,167 tons to Germany, etc.

Production Statistics.—Italian production of metallurgical coke reached 34,022 tons in 1921, against 95,725 tons in 1920, 447,387 tons in 1917, 453,000 tons in 1914, and 396,560 tons in 1910. Production of coal in Italy reached 197,920 tons in 1922, against 114,236 tons in 1921, and 151,862 tons in 1920; whereas the 1922 production of lignite was 704,600 tons, against 1,026,035 tons in 1921, and 1,571,735 tons in 1920. The Italian production of sulphuric acid of 50° Baumé reaches about half a million tons per year.

Company News.—At an extraordinary meeting of shareholders at Genoa it was decided to liquidate the firm "La Tannica," owing to bad business. This firm was founded originally with a capital of half a million lire. There has been established at Milan, with a capital of half a million lire the firm Società Italiana Kerament for the production and sale of the product "Kerament" (the property of the Kerament Werke G.m.b.H. of Breslau Gerbovitz), for Italy and the Italian Colonies. The firm Prima Fabbrica Italiana di Lithopone Gelpi e Consonno, of Milan, at an extraordinary meeting decided to increase its capital from one million to two million lire. With a capital of two million lire there has been founded at Bologna the firm Ditta Antonio Bonora-Successori, for the manufacture and sale of fertilisers both natural and artificial. Another fertiliser-manufacturing firm Conti e Amati, has been established at Milan with a capital of 200,000 lire. The Stabilimento Minerario del Siele of Leghorn, is to increase its capital of 1,056,000 lire, by bringing the nominal value of the 400 lire shares to 500 lire. At Naples, the shareholders of the firm Caolino di Conza decided, at a recent meeting, to increase the capital from 100,000 to 400,000 lire. At Fiume, the Società Anonima Raffineria di Olii Minerali has decided to raise its capital of seven million lire to fifteen million lire by the issue of new shares. The Milan firm Società Generale Italiana del Tetrafosfato has decided to reduce its capital from 450,000 to 135,000 lire, and the value of the individual ordinary shares from 100 to 30 lire.

State of the Chemical Market.—The market remains fairly active. There is a good demand for caustic soda, anhydrous sulphate of soda, potassium nitrate, nitrite of soda, sulphuric acid, nitric acid, chlorate of potash, etc. Almost complete absence of business with Germany is now to be noted. During the month there was a slight demand for acetates, especially for sodium acetate, for bichromate of soda and potash, and for carbonate of potash. The amount of coal-tar products on the market was limited, but sufficient to meet a demand which did not obtain large proportions.

The consumption of mineral superphosphates is increasing, and the home works are kept fully occupied. The demand for bone superphosphate is also good, and in the season just closed about forty per cent. more superphosphate was consumed than in the 1922 fertiliser season. Several purchases of ammonium sulphate were made abroad, and have led to a decided reduction in prices during the past month. While England is offering the fertiliser at about £15. 10s. c.i.f. Genoa, better offers are coming in from Austria and Belgium. At the beginning of the month a reduction in Chilean nitrate of soda was hoped for, and this kept the market rather inactive. For sulphate of copper the market is not very active.

In shellac the "leaf" quality was scarce, whereas the "Angelos" quality was quite unobtainable. Regular deliveries of these materials are only expected after December 15. The Italian market resents keenly the effects of the increases that took place at Calcutta. Offers for shellac are also received from Germany at fairly low prices. The September rains have bettered the prospects of the olive oil harvest, but the market conditions have remained firm.

SOUTH WALES NOTES.

(Specially Contributed.)

The tinplate industry remains very steady and employment is regular. Orders have been received for small parcels in greater number, and at many of the establishments work is assured for the next five months. The locomotive men and firemen gave in their 28 days' notice on Monday last, but this action was taken without permission of their Union. Orders are expected from America for a large canning company, who are pressing for early delivery. The patent fuel trade remains rather quiet, makers being unwilling to reduce quotations. The export inquiry is good, and supplies are going chiefly to Egypt, France, Italy, and Spain. The coke ovens are being well utilised, large consignments of coke going to France, Germany, and Java. The residuals are selling well and the outlook is encouraging. The Blaenavon Co., Ltd., have decided to put into operation another blast-furnace. Galvanised sheet business is not so active, and although quotations are being upheld in most cases there is an inclination on the part of sellers to make concessions, as some works are not too well off for orders.

Among the imports during the week were 23cwt. graphite, 114 tons zinc dross from New York, 362cwt. phosphorus from Montreal to Cardiff; 250 tons phosphate, 300 tons basic slag from Ghent, 61 tons ferro silicon, 21 tons calcium carbide, from Antwerp to Newport; 698 tons iron pyrites from Pomaron, 14 tons magnesite from Hamburg, 29 tons calcium carbide from Amsterdam, 5 tons red lead from Genoa, 11 tons copper ore from Amsterdam, 49 tons ferro silicon from Fredrikstad to Swansea. Among the exports were 200 gallons benzol to Ramelton from Cardiff; 30 tons mineral pitch and 5½ tons sulphite of iron to Hennebont, 1 ton painters' colours, 2 tons lubricating oil, 1 ton various chemicals to Buenos Ayres, 5 tons zinc chloride, 1 ton copper sulphate to Bombay from Newport

Japanese Railway Losses.—According to a statement issued by Mr. Okada, Chief of the Kobe Railway Bureau, who has visited the district devastated by the earthquake, the damage sustained by the Japanese railways amounts to ninety-five million yen (about £9,500,000).

ITEMS OF INTEREST.

British Coal Output.—During the week ended October 27, 5,673,500 tons of coal were raised from the mines of Great Britain, as against 5,678,600 tons in the previous week, and 5,388,300 tons in the corresponding week last year.

Physical Society.—It was announced at a Council meeting held on October 26, that Mr. F. E. Smith had found it necessary to resign his position as Hon. Secretary of the Physical Society, and that Professor A. O. Rankine had been elected to the position.

Unemployment Statistics.—The number of persons on October 29, 1923, recorded on the live registers of the Employment Exchanges in Great Britain was 1,256,000. This was 6,563 more than in the preceding week, and 229,878 less than the figure recorded on January 1, 1923.

Cement Industry Developments.—In connection with the rumours prevailing during the past week that the control of the Associated Portland Cement Manufacturers, Ltd., has passed into the hands of another financial group, an official denial has been published by the secretary of the former company.

Safeguarding Act Complaints.—The Board of Trade have received formal notices of complaint under Part I. of the Act that rongalite, sodium formaldehyde sulphoxylate, and zinc formaldehyde sulphoxylate have been improperly included in the lists of articles chargeable with duty under the above Section.

Internal Transport in the Empire Exhibition.—Three types of mechanical transport will be available next April when the British Empire Exhibition opens at Wembley —a "never-stop" railway, the first to be installed in this country on more than an experimental scale, a "road-rail" system and a fleet of electric cars.

Progress in Insulin Research.—Experiments conducted on rabbits and described in the *Journal of Physiology* show that if alcohol be added in small quantities, insulin-containing fluid may be administered direct by the mouth and yet exert its full physiological effect. Without alcohol the insulin is destroyed by the gastric juice.

Italian Market for Paraffin Wax. — Paraffin wax probably finds the readiest market of all petroleum products in Italy, states an American Consular Report. Italy's per capita consumption of paraffin is the highest in the world. The normal import requirements are somewhat above 20,000 tons annually, of which about 75 per cent. comes from the United States.

Trade Inquiry from Holland.—A firm of wholesale mermerchants importing, on a commission basis, at The Hague desire the representation in the Netherlands of British manufacturers of basic slag, sulphate of ammonia, superphosphate, etc. Further information can be obtained on application to the Department of Overseas Trade, 35, Old Queen Street, S.W. 1, quoting Reference 485.

Casein Manufacture in Finland.—A product the manufacture of which has been introduced into Finland of late years and which has prospects of becoming an important article of export is casein. Taking into consideration the highly developed state of the dairying industry in Finland, it ought not to be difficult, states a report in the Board of Trade *Journal*, to organise quite an important trade in this commodity. Part of the casein produced is utilised at Tammerfors, in a factory which manufactures combs and other articles in imitation bone, whilst the remainder is exported.

Dyestuffs Licences in October. — The total number of applications for licences under the Dyestuffs (Import Regulation) Act, 1920, received during October was 520, of which 428 were from merchants or importers. To these should be added the 40 cases outstanding on October 1, making a total for the month of 560. These were dealt with as follows: Granted, 423 (of which 381 were dealt with within seven days of receipt). Referred to British makers of similar products, 75 (of which 63 were dealt with within seven days of receipt). Referred to Reparation supplies available, 53 (all dealt with within two days of receipt). Cancelled, 1. Outstanding on October 31, 8. Of the total of 560 applications received, 498, or 89 per cent., were dealt with within seven days of receipt.

Personal.—The Council of the Institution of Civil Engineers have awarded a "Watt" gold medal to Mr. T. E. Houghton for his paper entitled "Evaporation by the Vapour Compression Method." Mr. Houghton is on the engineering staff of the United Alkali Company.

The Trade Mark "Solignum."—The Dorset Farmers, Ltd., consented, in the Chancery Division on Tuesday, to a perpetual injunction restraining them from passing off as Solignum any article not manufactured by Major and Co., Ltd., the patentees of Solignum, a wood preservative.

New Tees-side Copper Works.—The Rio Tinto Company, Ltd., has obtained a large area of land on the south side of the River Tees, in the neighbourhood of the Cargo Fleet iron and steel works, where new works are to be erected for the manufacture of copper and dealing with by-products.

Rhodesian Mineral Output. — The British South Africa Company announces the following mineral output from Southern Rhodesia during the month of September: Gold, 57,144oz.; silver, 13,335oz.; coal, 58,624 tons; chrome ore, 4,548 tons; copper, 240 tons; asbestos, 2,062 tons; arsenic, 27 tons; mica, 7 tons.

Grain Warehouse Explosion. — Three men were burned and otherwise injured by an explosion which occurred in a grain warehouse at King's Dock, Liverpool, on Saturday last. The cause of the explosion is believed to be spontaneous combustion among the dust which was being cleared from the bearings of the elevators.

Chilean Package Regulations.—A recent Law provides that no sack of produce to be carried on the shoulders (man-handled) in Chile may have a weight greater than 80 kilogs. This applies to imported produce, but goods may be sent to Chile in sacks of a greater weight provided that the produce is re-sacked after arrival if it is to be man-handled.

Perkin Medallist.—Dr. F. M. Becket, metallurgist and director of the Union Carbide and Carbon Research Laboratories, Inc., has been elected to receive the 1923 Perkin Medal. The award will be made at the January, 1924, meeting of the American Section of the Society of Chemical Industry. His most noteworthy achievement was the discovery and development of the process for reducing ores by silicon, which is ranked with the aluminothermic process of reduction of Goldschmidt.

The Royal Institution. — At a general meeting of the Royal Institution, held on Monday, the thanks of the members were returned to Mr. F. Coston Taylor for his donation of 100 guineas to the Research Fund, and to Mr. Robert Mond for his gift of busts and medallions of Dr. Ludwig Mond, Cannizzaro, Liebig, Berzelius, and others, statuette of Sir James Dewar, and many portraits and photographs. Mr. H. A. Gwynne, Professor J. C. McLennan, and Colonel H. G. Wait were elected members.

Tariff Notes.—The Governor of Nigeria has decided to reduce the export duties on palm kernels from 40s. to 22s. 6d., palm oil from 60s. to 40s., and ground nuts from 20s. to 10s.—A duty of £1. per ton has been imposed upon copra exported from the Gilbert and Ellice Islands Colony.—Until December 31, the prohibition on the exportation of basic slag from France is reimposed.—Potassium permanganate (B.P. crystals) have been brought under the operation of the Australian Customs Tariff (Industries Preservation) Act when imported from Germany.—The Polish excise duties on 100 per cent. alcohol have been further increased.

University News. — The late Mr. William Prescott, of Liverpool, who died on October 26, has made provision in his will for the establishment and endowment of a chair at the University of Liverpool. The executors are empowered to offer the University up to £20,000, for the founding of a chair of agriculture or of some cognate subject, such as agricultural chemistry, the study of crops, or kindred lines of investigation bearing on the industry.—The Lancashire County Council have renewed their annual grant of £2,000. to the Manchester University. Simon-Carves, Ltd., have renewed the offer of an Industrial Research Scholarship, and the cholarship for the present year has been awarded to M. D. Pearson, B.Sc. Brunner, Mond and Co., Ltd., have given £150. for the assistance of research in the Metallurgical Department. The following awards have been made: Osborne Reynolds Fellowship: F. D. Reynolds, M.Sc. (for a second year). Elected Research Studentship: Bernard Cavanagh. Degree of Ph.D.: Burrows Moore, M.Sc.Tech. (in Technological Chemistry).

Oil Evaporation from Tanks. — The evaporation of oil from storage tanks, in the tests of the U.S. Bureau of Mines, was 1 to 1½ per cent. less when the tanks were painted white than when painted red and 2½ per cent. less than when painted black. The loss was lowest with tinplate and aluminium paint, but as neither is durable for outside work, the search for a satisfactory oil-saving paint continues.

Scientific Novelties Exhibition. — The Scientific Novelties Exhibition held in London last year was so successful that it has been decided to repeat the experiment. It will be held at King's College from December 29 to January 9, between 2 and 9 p.m. Many eminent scientists have promised to give short lectures with illustrations. The proceeds will be given to King Edward's Hospital Fund for London.

Royal Society Awards.—The following awards have been made by the President and Council: The Copley Medal to Professor H. Lamb, F.R.S., for his researches in mathematical physics; the Davy Medal to Professor H. B. Baker, F.R.S., for his researches on the complete drying of gases and liquids; the Hughes Medal to Professor R. A. Millikan for his determination of the electronic charge and of other physical constants.

Technical Staff Councils.—The Society of Technical Engineers, which, from its foundation, has claimed for the technical and administrative staffs in the engineering industries the position of a third party in industry, is extending its activities by promoting the formation of staff councils. The staff councils suggested will have no official association with the society, but will, by independent action, seek to forward the same objects as the society.

Australian Copper Mine Fails.—The Wallaroo and Moonta Mining and Smelting Company, whose copper mines have been working since 1860, is to be wound up. The production in September involved a loss of £18. a ton, and the estimated cost of continuing operations is £5,000. a month. The Government has offered support, provided that the outlook is satisfactory, but the report of the company's experts has discouraged the directors from seeking assistance.

Chemical Manufacturer's Affairs.—The first meeting of the creditors of John L. Stansfield, Waterfoot, Bacup, Lancashire, was held on November 1 at Manchester. The statement of affairs showed liabilities of £1,607. and there was a deficiency of £1,598. The Official Receiver said that a receiving order was made against debtor in the Salford Court in 1909, when a dividend of 1s. in the £. was paid on liabilities of £482., but debtor had not applied for his discharge under those proceedings. The matter was left with the Official Receiver as trustee of the estate.

Transmission of Heat Through Steel Pipes.—In a study of transmission of heat through steel pipes, being conducted at the Pittsburgh and Minneapolis stations of the United States Bureau of Mines, work on several sizes of steel pipes, calorised and plain, has been completed. It has been found that steel pipes offer a higher resistance to the transmission of heat after calorising than before. Under the conditions of the test but slight effect was noticed on the calorised pipe, while the plain steel pipe oxidised quite readily.—*Colliery Guardian.*

Possible Anglo-Swiss-American Chemical Entente.—According to a statement in *Chemical and Metallurgical Engineering* (New York), a chemical entente embracing portions of the industry in the United States, Great Britain, and Switzerland is believed to be an early probability. The step, it is said, is being taken to meet the "economic accord" being perfected between the German and French industry, which is likely to be extended to include Italy and Czecho-Slovakia. The recent agreement between American, Swiss, and British indigo producers is looked upon as the first step in the formation of the chemical entente.

Obituary.—The death is announced from Berlin of Professor Carl Harries, Ph.D., of the Technical High School at Charlottenburg. From 1904 to 1916 Dr. Harries, who was born at Luckenwalde, Prussia, in 1866, occupied the Chair of Chemistry at Kiel University. He was an accomplished organic chemist and was probably best known for his investigation on the effect of ozone on unsaturated organic compounds. This work led up to the elucidation of the structure of the rubber molecule by the study of the decomposition products of the rubber ozonides. Dr. Harries worked also on the synthesis of rubber, and elaborated the method of polymerising isoprene by means of metallic sodium.

COMING EVENTS.

Institute of Metals (Scottish Section).—Meeting, **Monday, November 12,** at **7.30 p.m.**, at 39, Elmbank Crescent, Glasgow. Paper: "Nickel Alloys," by D. Turner.—**(Birmingham Section):** Meeting, **Tuesday, November 13,** at **7 p.m.**, at the Chamber of Commerce, New Street. Paper: "X-Rays and Crystal Structure," by Dr. H. B. Keene.—**(N.-E. Coast Section):** Meeting, **Tuesday, November 13,** at **7.30 p.m.**, at the Armstrong College, Newcastle-on-Tyne. Paper: "General Scientific Brass Foundry Work," by Dr. P. Longmuir. — **(Swansea Section):** Meeting, **Friday, November 16,** at **7.15 p.m.**, at University College, Singleton Park. Paper: "The Density of Alloys," by Professor Thomas Turner.

Institution of Petroleum Technologists. — Meeting, **Tuesday, November 13,** at **5.30 p.m.**, at the Royal Society of Arts, John Street, Adelphi, W.C. 2. Paper by A. Millar.

Hull Chemical and Engineering Society. — Meeting, **Tuesday, November 13,** at **7.45 p.m.**, at the Photographic Society's Rooms, Grey Street. Paper: "Heating Mediums, Past and Present," by E. G. T. Hill.

Institute of Chemistry (Leeds Section).—Annual meeting. **Wednesday, November 14,** at **7 p.m.**, at the Queen's Hotel. Chairman's address by Wm. Mc. D. Mackey.

Institution of Chemical Engineers.—Meeting, **Wednesday, November 14,** at **7.30 p.m.**, at the Engineers' Club, Coventry Street, London, W. 1. Papers: "A Study of the Conditions of Constant Rate of Flow in Filter Presses," by M. B. Donald and R. D. Hunneman; "A Study of the Absorption Tower," by M. B. Donald and C. W. Tyson.

Society of Dyers and Colourists (West Riding Section).—Meeting, **Thursday, November 15.** Paper: "The Romance of Science," by Professor E. C. C. Baly.—**(Manchester Section):** Meeting, **Friday, November 16.** Paper: "Investigations into the Changes which Occur in Cotton Fabrics During Calendering and Beetling," by J. Huebner and V. Malwin.

Institution of the Rubber Industry.—Annual meeting and dinner, **Friday, November 16,** at the Hotel Victoria, London.

Institute of Chemistry (Glasgow Section).—Discussion, **Friday, November 16,** at the Royal Technical College.—**(South Wales Section):** Annual general meeting, **Friday, November 16,** to be followed by dinner.

Society of Chemical Industry (Chemical Engineering Group).—Meeting, **Friday, November 16,** at **8 p.m.**, at the Chemical Industry Club, 2, Whitehall Court, London, S.W. 1. Paper: "A New Source of Potash and Its Industrial Exploitation," by Professor J. W. Hinchley.—**(South Wales Section):** Meeting, **Friday, November 16,** at **7.15 p.m.**, in the Technical College, Mount Pleasant, Swansea. Paper by E. A. Tyler.

Institution of the Rubber Industry.—Meeting, **Monday, November 19,** at **7.30 p.m.**, at the Midland Hotel, Manchester. Paper: "Costing in the Rubber Industry as an Essential Factor to Successful Production," by C. A. Fryer.

Society of Dyers and Colourists (Midlands Section).—Meeting, **Tuesday, November 20,** at Leicester. Paper: "Bleaching with Hydrogen Peroxide," by I. E. Weber.

Society of Glass Technology. — Meeting, **Wednesday, November 21,** at the University, Leeds.

Society of Dyers and Colourists (London Section).—Meeting, **Thursday, November 22,** at **7 p.m.**, at the Dyers' Hall, Dowgate Hill, E.C. 3. Paper: "Macbeth Artificial Daylight, and the Fade-ometer," by A. D. Lang.

Society of Chemical Industry (Glasgow Section).—Meeting, **Friday, November 23,** at **7.15 p.m.**, at 39, Elmbank Crescent. Paper: "Artificial Resins: Their Preparations and Uses," by Dr. H. Hepworth.—**(Manchester Section):** Annual dinner, **Friday, November 23,** at **7.30 p.m.**, at the Queen's Hotel.

West of Scotland Iron and Steel Institute.—Meeting, **Friday, November 23,** at **7 p.m.**, at the Royal Technical College, George Street, Glasgow. Paper: "Effects of Time and Temperature on High Speed and Similar Steels," by W. E. Woodward.

Institute of Chemistry (Bristol Section).—Meeting, **Saturday, November 24,** at Exeter. Papers by A. Marsden and F. Southerden

REPORTS OF COMPANIES.

Amalgamated Zinc (De Bavay's) Company, Ltd.

The report for the half-year ended June 30 states that after transferring £6,796. to reserve for depreciation the gross profit was £26,885. (against £28,264. for the first half of 1922). The net profit was £26,732., which, added to the balance brought forward made available £65,810. From this dividends Nos. 32 and 33 were paid, leaving £15,810. to be carried forward. There was received £5,763. from dividends on shares of other companies, and since the close of the period an additional £12,000. in respect of the holding of ordinary shares in the Electrolytic Zinc Company of Australasia and also further dividends totalling £7,718. from Minerals Separation and De Bavay's Processes Australia Proprietary shares.

Langdale's Chemical Manure Company, Ltd.

Profit for year to September 30 last, £5,532.; add reserves transferred to profit and loss account, £10,170.; total, £15,702.; deduct debit balance brought in, £15,592.; credit balance carried forward, £110. Competition by Continental makers has been most severe during past year, states the report, and the quantity of foreign superphosphate sold to United Kingdom below cost of manufacture to home producer has considerably increased. The company has been enabled, however, to dispose of a larger output of sulphuric acid and fertilisers from its works than last year.

Santiago Nitrate Company, Ltd.

The directors announce a gross profit of £20,019. for the year ended June 30. After deducting stoppage expenses, London charges, and a provision for income tax, there remains a net sum of £12,692. (against £12,333. for the preceding year), which is added to £9,504. from the last accounts. A dividend of 7½ per cent., less tax, is now proposed (the same), and the balance of £10,196. is carried forward. The company's quota for the current nitrate year having been sold, the oficina remains closed, but it is proposed to resume working operations early next year.

Benzol and By-Products, Ltd.

The board has decided upon adoption of September 30 as being the most convenient date to terminate the company's financial period. It is believed that this will enable convention of the annual ordinary general meeting of the company in January of each year. At the next meeting (which is accordingly intended to be held in January, 1924) there will therefore be presented the accounts as from April 1, 1922, to September 30, 1923. Payment of fixed dividends, which it has been decided to distribute, will be made in each year on April 1 and October 1. Subject to audit, any adjustments and taxation reserves, the net profit is estimated at about £48,000., whilst cash and investments in British Government securities are more than doubled in comparison with those set forth in the last accounts. With regard to the future outlook, trading shows satisfactory progressive increase, and forward sales contracts extending to a considerable period of 1924 have been effected upon terms profitable to the company.

DIVIDENDS.

Fullers' Earth Union, Ltd.—Interim dividend of 11 per cent. per annum, less tax, on the preferred ordinary shares, payable on November 15. A year ago a dividend of 10 per cent. per annum was declared.

North Broken Hill Co., Ltd.—Dividend of 2s. per share, less tax, payable on December 12. This dividend will be paid on the increased number of shares in the company so that the amount of the dividend will be £70,000.

Castner-Kellner Alkali Company, Ltd.—Final dividend of 12 per cent., payable December 5, making 20 per cent. for year to September 30. For the preceding year the dividend was the same.

Ropp Tin, Ltd.—Interim dividend at the rate of 15 per cent., less tax, payable on November 22. The interim dividend for the preceding year was 10 per cent.

Santa Catalina Nitrate Company, Ltd. — Directors recommend final dividend of 10 per cent. (2s. per share), less tax, making 15 per cent. for year.

Joseph Nathan and Co., Ltd.—The directors do not propose to pay any dividend on the eight per cent. preferred ordinary shares for the year ended September 30 last. They anticipate that the interim dividend on the seven per cent. preference shares due on January 1 next will be paid.

NEW COMPANIES.

White Island (N.Z.) Sulphur and Fertiliser Company, Ltd.—Capital £100,000. Office: 638, Salisbury House, E.C.

Armourite (Laboratories), Ltd.—Private company. Capital £100., 1s. shares. Soap-powder manufacturers, etc. Office: 26, Stanley Road, East Sheen, S.W.

Bertram Thomas and Co., Ltd.—Private company. Capital £2,500., £1. shares (2,000 8 per cent. cumulative preference). Importers and merchants of paints, etc. Office: 28-29, Brooke Street, Holborn, E.C.

Byerley and Gut, Ltd.—Private company. Capital £2,500. Manufacturers of and dealers in artificial silk, etc. Address: 128, Fellows Road, N.W. 3.

Carlton Bleaching and Dyeing Company (1923), Ltd.—Private company. Capital £15,000. Office: Armitage Chambers, Victoria Street, Nottingham.

Eclipse Oil Company, Ltd.—Private company. Capital £3,000., £1. shares (1,000 7½ per cent. cumulative preference). Manufacturers and vendors of oils, colours, and paints, etc. Office: 458, Commercial Road, Portsmouth.

Fine Chemicals, Ltd.—Private company. Capital £4,000. Manufacturers of and dealers in resins, shellac, etc. Office: Calrow's Works, Bury, Lancs.

Pyorrhosal, Ltd.—Private company. Capital £5,000. Experimental and pharmaceutical chemists, etc. Office: 346, Strand, W.C.

"Statu" Manufacturing Company, Ltd.—Private company. Capital £3,000. Manufacturers of wax products, etc. Office: Phoenix Works, 2A, Bunyan Road, Bedford.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(Specially Contributed.)

There is very little change to record in the condition of the industries in the district, and there is still no increase in the production of hematite pig-iron. It is interesting to note that at a conference of local authorities held here on Saturday last to discuss unemployment schemes Mr. Watson Smith, the manager of the Whitehaven Colliery Company, spoke regarding the scale on which the development of the undertaking is to take place. Mr. Smith deplored the fact that it should be necessary to obtain so much coke from the East Coast, and pointed out that as long as this continued the district is at a disadvantage. He reiterated the fact mentioned in these notes sometime ago that the Whitehaven collieries are capable of producing 3,000,000 tons of coal as against the 500,000 tons being raised annually at the present time, and said that he looked forward in two years time to the company's employing 4,000 additional workers. The point as to the need for a larger output of local coke of a quality approximating to that of the East Coast was driven home by Mr. Danks, the manager of the Whitehaven Hematite Iron and Steel Company, who said that if they could eliminate the phosphorus from the Cumberland coke the smelters of iron on the North East Coast would be able to use it in larger quantities. The hope of the Whitehaven Colliery Company is, of course, that by taking selected coal from the Bannock Bands, a seam that has not hitherto been worked on a large scale, it may be found possible to produce coke with which special qualities of hematite pig-iron may be smelted.

Insulin Production.—Reuter's Indianapolis correspondent says that insulin is now being produced at Indianapolis in quantities sufficient to meet the world's needs at a price intended to make it available to the poorest sufferers.

FERTILISER NEWS.

Nitrate of Soda.—Exports of this fertiliser from Chile during October totalled 136,000 tons, of which 85,000 tons was intended for Europe, 39,000 tons for America, and 12,000 tons for Japan and other countries. The estimated production of 163,000 tons, which will probably be found to be too high, thus increases stocks in Chile to about 954,000 tons as at October 31 last. Compared with a year ago, shipments have considerably declined, and yet the visible supply at the end of last month, 405,000 tons, was larger than at the corresponding date in 1922, by some 60,000 tons. It is estimated that the visible supply for the United States and all other countries excluding Europe and Egypt, amounted on October 31, to 98,000 tons, so that the total supply in sight on that date, was under 1½ million tons—a lower figure than at the same date in 1913. Sales by the Producers' Association during the month, reaching some 60,000 tons, increased the total sales for delivery over the present fertiliser year to about 1,300,000, as compared with 950,000 tons twelve months ago. In view of this, it is not anticipated that there will be much further purchasing on f.o.b. account until the end of the year. C.i.f. cargoes have been neglected on this side, and owing to lack of inquiry amongst consumers on the Continent, the market has been very quiet over the month. Labour trouble in Chile, which is considerably disorganising the production and shipment of nitrate from Chile, is not the only difficulty with which producers of nitrate are faced at the present time. Apart from the necessity for improved methods of production, the question of transport is engaging attention. The application by the Nitrate Railways Co., Ltd.—an English concern operating about 400 miles of line in Chile—for the renewal of certain concessions in connection with their lines in the northern nitrate areas has been turned down by the Chilean Government. The company had offered to spend over £1,000,000. in raising the daily carrying capacity, and to cope with the heavier demands of the nitrate industry; but in view of this rejection, the money has been utilised elsewhere. What effect this decision will have upon the nitrate industry itself it is impossible to say. The first concession expires in 1936, when a stretch of railway between Iquique and La Noria, 42 miles, will pass into the possession of the Government.

Sulphate of Ammonia.—Users of fertilisers in this country appear to be holding back their orders indefinitely—particularly in the case of the nitrogenous fertilisers. Very little nitrate of soda is being purchased in this country for use as a fertiliser, and the demand for sulphate of ammonia is likewise very depressed at the moment. The latter fertiliser, nevertheless, is much the cheaper, and is certain to meet with a revival in demand as the season for application approaches. The rise of 2s. 6d. per ton at the beginning of the present month has not provoked any wider inquiry, and it almost seems that the £14. 10s. per ton price might have been maintained until the turn of the year without any serious loss. The stimulating effect on buying, of one fairly large rise might have proved to be much more effectual than the graduated schedule of price increases now in operation. The supply of sulphate is well maintained, and the export trade continues to be a valuable outlet for the producers in view of the quiet domestic demand. News from the United States indicates that the market for sulphate in America is anything but stable. Prices have already been reduced considerably, and "resales" are being effected at prices below the lowered quotations. As yet, there is said to be little export demand, the main reason being the high price in comparison with the British material. Were it not for the duty on imported sulphate, it would be profitable to export British material to the States at the present time; in fact, some Canadian material has been imported and sold at a price which competed strongly with offers by brokers for domestic requirements. The outlook is perhaps best summed up in the report that certain large consumers who contracted for their annual requirements last spring, have offered this material for resale at the actual cost price, believing that to make fresh purchases in the open market would ultimately result in a saving.

Carbon Dioxide in Butter-making.—A more durable butter is being produced in Holland by churning in an atmosphere of carbon dioxide. The air is easily withdrawn from the churn and replaced with the heavier gas, and the portion of this worked into the butter remains a long time with ordinary handling, thus keeping out the oxygen to which natural deterioration is chiefly due.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

British Magnesite Calcining Company, Ltd., London, S.W.—Registered October 19, mort., to Barclays Bank, Ltd., securing all moneys due or to become due to the Bank.

Greenhill and Sons, Ltd., London, E.C., celluloid manufacturers.—Registered October 20, £50,000. debs.

Landore Zinc Works, Ltd.—Registered October 19, £20,000. deb., to J. R. Down, Penybryn, Sketty.

Spencer (George) Moulton and Co., Ltd., London, S.W., indiarubber manufacturers.—Registered October 10, mort., securing £5,856. and further advances, to Halifax Permanent Benefit Building Society.

Taylors' Drug Company, Ltd., Leeds. — Registered October 22, £1,000. mort., to J. H. Armitage, Hookholm Park, View Crescent, Roundhay, and ano.

SATISFACTIONS.

British Cyanides Company, Ltd., London, E.C.—Satisfaction registered October 18, £25,000., registered July 7, 1914.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Alby United Carbide Factories, Ltd., London, E.C.—R. H. Hoare ceased to act as receiver June 20, 1923.

Bodelva China Clay Company, Ltd., St. Austell.—F. W. Heape, Cotton Exchange Buildings, Liverpool, appointed receiver October 17.

Industrial Soap Company, Ltd.—Resolved October 6: That the company be voluntarily wound up. F. Binns, 35, Westgate, Huddersfield, chartered accountant, liquidator.

Phosaline, Ltd.—Resolved October 15: That the company be voluntarily wound up. T. R. Gleaves, Wardwick, Derby, liquidator.

Seven Spas Soap Proprietary Company, Ltd., London, W.—Resolved September 13, confirmed October 16: That the company be voluntarily wound up. H. B. Everett, 3-7, Southampton Street, London, chartered accountant, liquidator.

BANKRUPTCY INFORMATION.

Rowley, Albt. J., late Crown Works, Brentford, paint and varnish manufacturers. 1st and final dividend, 8½d., at O.R.'s, 29, Russell Square, W.C., November 2.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Brough, A., and Co. (Archibald Brough and Geo. Hy. Brough), Macclesfield Road and Standard Dyeworks, Leek, silk dyers. September 29. Debts by A. Brough, who continues. (October 26.)

Universal Dye Works (Herbert Moore and Thos. Wm. Bare), Coombe Street, Coventry, dyers. October 13. Debts by H. Moore. (October 23.)

COUNTY COURTS JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Devon Cleansers, Ltd., 1, Guildhall Chambers, Exeter; cleansing-powder manufacturers; £18. 16s. 6d. September 27.

Fenwick Luke, 111, Grace Street, Newcastle-on-Tyne; enamel manufacturer; £10. 14s. 6d. September 19.

Phosaline, Ltd., 4, Richmond Road, Derby; manufacturing chemists; £11. 1s. 4d. September 28.

Remington J. Stewart, The Homestead, Grange-o-Sands; analytical chemist; £22. 13s. October 1.

Stansfield, J. L., 26, Burnley Road, Bacup; chemical manufacturer; £21. 14s. 2d. September 26.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 22 to 27 (inclusive).

Analysis of Coal. Alexander, R. 26,866.
Dyes. Baddiley, J.; British Dyestuffs Corporation, Ltd.; and Tatum, W. W. 26,485, 26,724, and 26,725.
Treating Waste Water of Chemical Factories. Benoit, A. L. 26,761.
Devulcanising Caoutchouc. Benson, M. 26,313.
Dyestuffs for Wool. Bloxam, A. G. (*Akt.-Ges. für Anilin-Fabrikation*). 26,476.
Plating Metal with Chromium and Nickel. Cam, F. 26,949.
Ink. Came R. R. 26,472.
Roasting Ores. Compagnie des Métaux Overpelt-Lommel Soc. Anon. 26,872.
Separating Liquids of Different Specific Gravities. Comyn, B. D. 26,508
Dyeing. Escaich, A.; and Worms, J.P. 26,353.
Hydroxylated Aliphatic Arsinic Acids. Etablissements Poulenc Frères; and Oechslin, C. 26,617 and 26,618.
Pump for Bitumen, Tar, Etc. Harding, S.M.; and Lockley, W. H. 26,668.
Production of Compressed Gas by Electrolysis. Hausmeister, P. 26,388.
Phosphoric Acid from Phosphates. Henkel, F. 26,557.
Neutral Sulphate of Ammonia. Henshaw, S.; Stonier, S.; and Talk o' th' Hill Colliery Co., Ltd. 26,526.
Settling or Precipitation Tanks. Hunter, S. 26,948.
Coking Retort Ovens. Koppers Co. 26,623.
Hampers for Acid Carboys. Leigh, R. 26,680.
Diacyl Derivatives of Diphenylisatine. Morton, A. Home-. (*Hoffmann-La Roche and Co., Akt.-Ges.*). 26,703.
Rotary Driers. Nicholson, T. 26,917.
Cements. Patrouilleau, L. G. 26,578.
Explosives. A. C. Scott. 26,938.
Utilisation of Waste Lime from Chemical Works. Smith, E. 26,899.
Derivatives of Naphthaquinone. Soc. Anon. des Matières Colorantes et Produits Chimiques de Saint-Denis; Lantz, R.; and Wahl, A. 26,612.
Formol. Soc. des Etablissements Barbet. 26,749.
Low-temperature Gravity Retorts. Struben, A. M. A. 26,753.
Recovery of Nitrogen from Molasses. Syndicat d'Etudes Chimiques. 26,700.
Conversion of heavy Hydro-carbons. Synthol, Ltd. 26,554.
Recovery of Oxalates. Wade, H. (*Fraymouth and Bhopal Produce Trust, Ltd.*). 26,736.
Centrifugal Separators. C. S. Watson. 26,342.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1*s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.*

1922.

Colloidal Dispersions. Hinchley, J. W.; and Plauson's (Parent Co.), Ltd. 10,567. **205,220**
Condensation Products of the Anthraquinone Series. Bloxam, A. G. (*Soc. of Chemical Industry in Basle*). 13,571. **205,525**
Mixing, Emulsifying, and Like Machines. Seaman, C. J.; and Brinjes and Goodwin, Ltd. 19,412. **205,548**
Aluminium Chloride and Alumina. Mond, A. L. (*Chemische Fabrik Griesheim-Elektron*). 19,700. **205,563**
Calcium-carbide Cakes. Them, H.; and Carbic, Ltd. 20,060. **205,589**
Cleansing Compositions. Golding, H. D.; and United Alkali Co., Ltd. 20,730. **205,599**
Enzymes. Ward Baking Co. 26,751. **186,924**
Mixing the Ingredients in the Manufacture of Soap. Burrows, E. A. 27,539. **205,672**
Reverberatory Furnace. Sklenar, W. F.; and British Reverberatory Furnaces, Ltd. 30,649 **205,715**

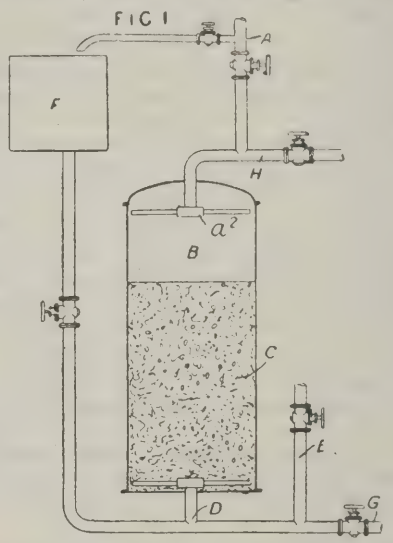
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Water-Softening. T. P. Hilditch, Grappenhall, Cheshire; and H. J. Wheaton, and J. Crosfield and Sons, Ltd., Warrington, Lancashire. British Patent **203,497**, of 1922.

In a process for regenerating base-exchanging compounds used for softening water, the regenerating solution is divided into, and employed in, portions, the preliminary portion or portions being solution which has been partly exhausted in a previous regeneration, and the final portion consisting of fresh unused solution, which after use is carried off and employed as the first portion in a subsequent regeneration. Fig. 1 shows one form of apparatus for carrying out the process, the water to be softened being admitted from the pipe A and distributor a_2 to the vessel B, and being discharged from the pipes D, E after passage through the

FIG 1



base-exchanging compound C. When regeneration becomes necessary, partially exhausted salt solution contained in the tank F is passed upwardly through the mass C, displacing water to waste through the pipe H. A fresh salt solution is now prepared in the tank F and is run into the vessel B, displacing the first portion to waste. Finally the partially exhausted solution is forced back to the tank F for re-use, by the pressure of untreated water, and the mass C is washed until water flowing to waste through the pipe G is free of salt, when the apparatus is again ready for softening purposes. Two tanks F, one for partially exhausted solution, and one for fresh salt solution, may be employed, and when the solution is to be further subdivided, additional tanks F may be provided. Specifications 4188/13, 120,293, and 120,294 are referred to.

Fluxes. T. Yamanouchi, Tokyo. British Patent **203,397**, of 1922.

Fluxes for use in galvanising sheet iron comprise ammonium chloride to which is added 2-3 per cent. of a mixture of strontium or strontium compounds, sulphur and carbonates or sulphur compounds or sulphur and sulphur compounds, chlorides, and bismuth or bismuth compounds. The following proportions by weight are used: strontium or its compounds 70-125, sulphur 60-125, sulphur compounds or carbonates 10-20, chlorides 5, bismuth or its compounds 20-30. In one example the mixture consists of the following parts by weight: strontium chloride 100, sodium sulphide 10, sodium chloride 5, and bismuth sulphide 20.

Titanium Oxide and Sulphate. C. Weizmann and J. Blumenfeld, London. British Patent **203,352**, of 1922.

To obtain titanium compounds free from iron, an ore such as ilmenite is heated to 150-180° C. with sulphuric acid of 70-90 per cent. strength. The solid product is leached with a limited quantity of water in presence of a reducing agent, preferably spongy iron, most of the iron sulphate being left in the solid form. The water is added little by little at a temperature not above 50° C. The reduction is completed when a brown-violet colouration shows the presence of

titanous salts. The solution is then treated to hydrolyse the titanium sulphate in any known way, and the first washings of the precipitated hydroxide are effected with water acidulated with sulphuric acid and containing a titanous salt so as to avoid any oxidation of ferrous salts which would injure the colour of the product. The precipitate is calcined under oxidising conditions, for instance by blowing air through the container or through the material during calcination, or, according to the Provisional Specification, by calcining in the presence of sulphuric acid, the object being to prevent any reduction owing to organic matter that might be present. The ferrous sulphate left with the undissolved residue of the ore is recovered by solution and crystallisation, and may be treated to recover the sulphuric acid. According to the Provisional Specification the solution of titanium sulphate is protected from oxidation during hydrolysis, by means of a film of oil, vaseline or the like.

Purifying Mineral Oils. H. M. Ridge and W. R. Hodgkinson, London. British Patent **203,354**, of 1922.

Oils, etc., are desulphurised or otherwise purified by bringing the liquid or vapour into intimate contact with material consisting of, carrying, or containing both one or more of the metals copper, zinc, cadmium, or iron, and one or more of an oxide, halide or oxyhalide of the metal or metals. In an example, 12lb. of copper turnings or filings are heated in air until partially coated with oxide or oxides, and then agitated with 100lb. of shale oil of high sulphur content. The oil is separated by filtration. In a second example, oil is filtered through a hot mixture of copper, copper oxides, and cuprous chloride obtained by heating granulated copper oxide with 10 per cent. of salammoniac and 5 per cent. of a paraffin lubricating oil. Pumice, bauxite, or similar carrier may be coated, impregnated, or mixed with the purifying agent. The Provisional Specifications also state that materials of a porous nature, such as manganese dioxide, magnesium carbonate or silicate, iron oxide or silicate, and coarse copper oxide can be used as carriers for copper or an oxide of copper, and that copper can be used in conjunction with its sub-chloride, sub-bromide, or sub-iodide.

Mineral Sodium Carbonate. R. H. D. Blattner, London. (L. Grouchkine, Alexandria.) British Patent, **203,271**, of 1923.

Pure soda ash, caustic-soda lye, and carbonic acid suitable for liquefaction are produced from mineral sodium carbonate such as natron or trona. The mineral is heated with a metallic oxide such as ferric oxide adapted to remove carbon dioxide, and the carbon dioxide evolved is led into a concentrated solution of another portion of the mineral. The bicarbonate which is precipitated is dried by waste heat, and calcined to give soda ash and carbon dioxide. Metallic oxide for reuse and caustic-soda lye are obtained by lixiviation of the mass resulting from the heat treatment.

Reducing Organic Compounds. D. G. Murdoch, Beckton, London; and W. L. Galbraith, Gas Light and Coke Company, Westminster. British Patent, **203,059**, of 1922.

The reduction of water-insoluble organic compounds such as nitro- and azo-derivatives by means of an amalgam of an alkali or like metal is effected in the presence of an aqueous reagent to react with the amalgam, and a stable water miscible solvent for the organic compound which will separate from the aqueous caustic alkaline solution produced; suitable solvents are water-soluble cyclic bases containing nitrogen in the ring, such as pyridine (including commercial pyridine bases) and piperidine; quinoline is, however, unsuitable. The reduction may be carried out by agitating the amalgam with the other reaction components or by passing the latter as a thin film or layer over the surface of the amalgam, which may also be in motion; it may be controlled by varying the amount of water in the mixture or by using dilute alcohol in place of water or by varying the temperature; the reaction may also be expedited by adding more water, or separating off some of the aqueous alkaline liquor and adding more water, during the reaction. When the reduction products are insoluble in alkali the latter may be readily recovered, the reaction being conveniently carried out in conjunction with one of the known processes for the electrolytic production of halogen and caustic alkali from alkali halide in a mercury cathode cell. If the alkali metal of the amalgam is not completely utilised, the latter may be passed through an ordinary water chamber before returning to the cell. Two suitable forms of apparatus are described. (For illustration, see the *Chemical Trade Journal and Chemical Engineer*, September 7, 1923, p. 288.) Examples are given, using pyridine as the water-miscible solvent, of the reduction of (1) *o*-nitroanisole to azo-anisole and anisidine in the apparatus of Fig. 1; (2) azo-anisole to hydrazo-anisole and anisidine, and nitrobenzene to hydrazobenzene and azobenzene, together with a little aniline, in the apparatus shown in Fig. 2. Specifications 3,099/96 and 200,167 are referred to.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

White Lead. G. F. Lloyd, Brighton, Victoria; F. B. Clapp and F. H. Campbell, both in Melbourne; all in Australia. British Patent, **203,301**. Convention date, August 30, 1922.

Basic lead acetate is prepared by treating litharge with acetic acid with or without sodium acetate or with an acetate such as sodium acetate and dilute sulphuric acid, the strength of the acetic acid being from 4½ to 60 per cent. and the proportions from 16 to 22 absolute acetic acid per 100 parts of litharge, the product containing from 10 to 73 per cent. of water at a temperature not exceeding 60° C. The basic acetate solution prepared as above is treated with a mixture of sodium or potassium or ammonium carbonate and bicarbonate, the carbonate being wholly in solution and the bicarbonate preferably partly in suspension, partly in solution, and partly added dry after the addition of the dissolved and suspended carbonates, and the operation being effected in the case of ammonium carbonates under a slight pressure of carbonic acid. The proportion of the carbonates used is from one-fifth to two-fifths parts of the mixed carbonates to one part of litharge contained in the basic acetate, and the proportion of bicarbonate to carbonate employed may be 60 to 75 parts bicarbonate to 40 to 25 parts carbonate. The white lead precipitate is separated, and washed with water or with normal or basic lead acetate in dilute solution for the purpose of removing any alkali carbonates adsorbed in the precipitate, and finally washed with water. Specifications 223/76, 9122/87, 6633/91, 13886/96, and 9638/12 are referred to.

White Lead. M. Rascher and R. Plaueln, Offenbach-on Main, Germany. British Patent **203,340**. Convention date, September 2, 1922.

White lead is produced by precipitating basic lead acetate solution in the presence of metallic lead, carbon, and moist compressed air, by means of carbonic acid. An apparatus shown comprises a cylindrical chamber having an internal concentric perforated cylinder. In the space between the walls is placed a mixture of lead and carbon. The solution of basic lead acetate is agitated by a stirrer, which, however, is not essential. Compressed moist air and carbonic acid are injected through pipes. The separated white lead is washed and dried at 90° C., or may be ground with oil while wet.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—Conditions in this market are about the same, with prices showing but very little difference, and business still slow and limited in volume. Surprise has been expressed that prices have not advanced here like they have in the pharmaceutical section, but it must be borne in mind that in this market the majority of the products are made here and are also obtainable from sources outside Germany, whereas many of the fine chemicals are only obtainable from Germany. **Acetic Acid,** 80% technical, £46.; 80% pure, £47. 10s. to £48.; 98% glacial, £60. in casks and £72. in glass demijohns, ex wharf London; dealers' prices are about the same, with business rather on the slow side. **Acetone,** British Government specification, about £124. per ton, in drums; the spot position keeps very steady at about this level; business quiet. **Alum,** lump, £10. to £10. 5s. per ton, in casks; dealers continue to offer Continental material at about these figures, with the demand small. **Arsenic,** Cornish white powdered, about £65. to £66. per ton, f.o.b. London; inquiry from America has been good, and reliable opinion favours much higher prices in the near future. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; dealers continue to quote at about this figure, but there is no great demand at present. **Bleaching Powder,** 35—37%, £10. to £10. 5s. per ton; the spot demand remains quiet, with dealers' prices unchanged. **Barium Chloride,** 98—100%, about £14. 15s. to £15. per ton; prices seem very steady at these rates, and may show an advance before long. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P., crystals, about 1s. 4d. per lb., less 5%; the spot position remains dull and weak. **Cream of Tartar,** 99—100%, about 85s. per cwt.; dealers are offering at about this figure, and some business has been done; the market is steady. **Epsom Salts,** commercial, crystals, £4. 10s. to £4. 15s. per ton, in bags; prices are being well maintained here, despite the lack of business. **Formaldehyde,** 40% volume, about £62. to £63. per ton; business remains slow, with plenty of offers on the market; prices are varying. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; there is little doing here so far as merchants are concerned. **Lead Acetate,** brown, about £41. 10s. to £42.; white, £42. to £43. per ton; supplies seem very limited, and fresh imports must be at higher levels. **Litharge,** imported, about £35. 10s. per ton; dealers are quoting at about this figure, with business slow. **Lithopone,** 30% Continental red seal, about £22. 10s. to £23. per ton; prices on spot are fully maintained, and may advance in view of the position on the Continent. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; spot supplies are offering, but there is only a limited demand; prices are steady. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at about these rates. **Oxalic Acid,** 5¾d. to 6d. per lb.; this article remains in very small request, and prices are none too steady. **Carbonate of Potash,** 90—92%, about £26.; 96—98%, about £27. 10s. per ton; sales on spot seem very few, and prices, although they have been on the decline lately, are still unsteady. **Chlorate of Potash,** crystals and granular, 2¾d. to 3d. per lb.; dealers continue to quote at these figures, with inquiry small. **Caustic Potash,** 88—92% solid, about £31. per ton; the spot position seems rather unsteady, with offers varying, one or two being under the figure quoted. **Permanganate of Potash,** commercial quality, about 9d. per lb.; at the rate quoted this market is rather easy, and the little business passing is generally on a slightly easier basis. **Prussiate of Potash,** yellow, about 10½d. per lb.; a further slight reduction in dealers' prices is recorded, with business still dragging. **Sulphate of Potash,** £11. per ton, ex ship; the market price shows no change on the week. **Mercury,** about £10. and upwards per bottle of 75—76lb., net; there has been an improvement in demand, and prices are much steadier. **Red Lead,** imported, about £35. 10s. per ton; imported material is offered by dealers at about this figure. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £43.; fine white crystals, £25. to £26. per ton; dealers holding stocks of imported material continue to quote at these figures, but business is still slow and small. **Saltcake,** home trade, about £4. 10s. per ton; export quotations are slightly dearer; material offering is limited. **Acetate of Soda,** about £24. 15s. per ton, on spot; dealers' offers are at this level, with business quiet. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers continue to quote at these prices, with the demand slow. British makers' prices to home consumers on contract are unchanged at 70—72%, £17. 17s. 6d., and 76—77% £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers' prices, to home trade only, are level at this rate, packages free, carriage paid to destination. **Bichromate of Soda,** home trade, 4½d. per lb.; British makers' prices are maintained at this old level; their prices for export are slightly dearer. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; prices quoted by British makers are unchanged. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in free bags, carriage paid to destination; this price is quoted by British makers for home trade only; dealers are offering ex stores and wharf at competitive rates. **Hyposulphite of Soda,** pea crystals, £14. 10s. per ton, in 1cwt. kegs; commercial quality, about £10. per ton, in casks; prices are very steady as far as dealers are concerned, and may advance. **Nitrate of Soda,** 96%, £13. 5s. per ton; the position shows no change, with the market quite steady. **Nitrite of Soda,** 100%, about £26. per ton; a slight reduction in price is recorded here. **Prussiate of Soda,** about 5½d. per lb.; dealers offering British material are quoting steadily at this level, but do not seem to be doing any good business. **Sodium Sulphide,** 60—62%, solid, about £14.; ditto, broken, about £15. per ton; dealers are finding hardly any inquiry, but continue to quote at unchanged prices. **Tin Crystals,** about 1s. 3d. per lb.; a reduction in price is recorded here. **Tartaric Acid,** B.P., crystals, about 1s. 1½d. per lb., less 5%; spot supplies are available, and at the price quoted the market is still very weak. **White Lead,** imported, about £42. per ton; imported material is offered by dealers in the region of this figure, with not much business doing. **Zinc Oxide,** B.P., £52. 10s.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers continue to quote at these prices.

Pharmaceutical Chemicals. — Many items in this market show further considerable advances in spot values. Business has been very active in these materials, and supplies are in some instances now difficult to locate. Offers from Germany are now very limited and at exceedingly high prices. Under these conditions, it seems that an acute shortage is to be experienced, and that abnormally high prices will rule. **Acetanilid,** crystals and powder, 2s. 3d. to 2s. 6d. per lb.; there has been plenty of inquiry for the limited stocks available; prices show a further advance. **Acetyl-Salicylic Acid,** B.P., 3s. 6d. to 3s. 9d. per lb.; the few parcels offering on spot have been eagerly sought after, and sold at high prices; fresh imports are doubtful, and any arrivals must be at or above the rates quoted here. **Benzoic Acid,** about 3s. 3d. per lb, nominal; it is estimated that any imports could not be sold below this level. **Diethylbarbituric Acid,** B.P. (barbi-

tone), about 18s. to 19s. per lb.; dealers are quoting at about these levels, but there is no great demand. **Salicylic Acid,** B.P., 2s. 4d. to 2s. 6d. per lb.; there has been plenty of business here, and it may now be difficult to obtain spot supplies at the lower rate quoted. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; spot offers are still made by some dealers at these prices; demand slow. **Amidopyrin,** about 15s. per lb.; dealers' prices are at about this rate, with not much business on the market. **Ammonium Bromide,** B.P., 8d. to 8¼d. per lb.; this market continues to improve, and further advances in spot values are looked for. **Benzonaphthol,** about 5s. per lb.; this market remains dull, with quoted values unchanged. **Betanaphthol,** resublimed, 2s. per lb.; although there has been but little doing here, prices are firmer. **Benzaldehyde 03,** about 3s. per lb.; the spot quotation is unchanged, with the market dull. **Calcium Lactate,** 1s. 10d. to 2s. per lb.; spot offers are made at these prices, with the market hardening. **Chloral Hydrate,** duty paid, 4s. 3d. to 4s. 4d. per lb.; there seems to be very little available on spot, and prices are very firm, and may advance. **Creosote,** B.P., about 2s. 6d. per lb.; dealers continue to offer spot supplies at this unchanged rate; business quiet. **Creosote Carbonate,** nominal; this material is not quoted on spot; it appears that supplies are not available. **Guaiacol Carbonate,** about 13s. to 13s. 6d. per lb.; a further advance in spot prices is recorded, with the market active and holding very firm. **Hexamine,** 4s. 3d. per lb.; spot offers are firm at this advanced price, and there is a distinct tendency to further movement to higher rates. **Hydroquinone,** 4s. 6d. per lb.; there has been eager inquiry for any spot lots available at the old prices of about 3s. 6d. per lb., but offers at this level are now off the market, and the higher price is now general. **Methyl Salicylate,** about 2s. 10d. to 3s. per lb.; this market shows further arvances in spot prices, and it is doubtful if any supplies are still offering at the lower rate quoted. **Methyl Sulphonal,** about 25s. per lb.; last week the quoted rate was about 15s. 6d. per lb., but the few lots offering were quickly snapped up, and, owing to the big jumps in Continental offerings, fresh imports cannot be offered much below the figure quoted. **Paraformaldehyde,** about 3s. 9d. per lb.; spot holders continue to quote at about this figure, with not much inquiry on the market. **Paraldehyde,** about 1s. 6d. per lb.; the firmer tone in this market reported last week is fully maintained. **Phenacetin,** 6s. 9d. to 7s. 6d. per lb.; offers on spot are very irregular, and are varying to the extent given; a fair volume of inquiry has been dealt with; the tendency seems to be for a movement to the higher rate quoted. **Phenazone,** 8s. 6d. per lb.; there is very little offering on spot below this figure, and a further advance in spot values is not unlikely. **Phenolphthalein,** about 8s. per lb.; this is about the price that would be asked for any fresh imports; spot supplies are difficult to locate. **Potassium Bromide,** B.P., crystals and granulated, about 7½d. per lb.; a further improvement in the spot position is recorded, with a good volume of business on the market. **Potassium Permanganate,** B.P., 9½d. per lb.; this seems to be about the cheapest offer now being made on spot; supplies here seem limited. **Potassium Sulphoguaiacolate,** nominal; dealers are not quoting; fresh imports are doubtful for the time being. **Resorcin,** about 6s. per lb.; the spot market is firmer, with plenty of inquiry for stocks available. **Salol,** about 4s. per lb.; at the advanced rate quoted last week, this item stands firm on spot, and may go still dearer. **Sodium Benzoate,** 2s. 9d. per lb.; it is estimated that this would be about the price for fresh importations on the present Continental quotation. **Sodium Bromide,** B.P., crystals and granular, about 8d. per lb.; there is very little available on spot below this figure, and the tone of the market is healthy, and may advance further. **Sodium Diethylbarbiturate,** 18s. to 18s. 6d. per lb.; dealers are quoting at about these figures, with not much doing at present. **Sodium Salicylate,** B.P., crystals, fully 3s.; powder, fully 2s. 10d. per lb.; sales on spot have been brisk during the week, with the tone of the market good; Continental offerings are restricted and dear. **Sulphonal,** about 25s. per lb.; an advance of 10s. per lb. is recorded here, and the question of further supplies from the Continent is a doubtful matter. **Terpin Hydrate,** about 1s. 9d. per lb.; spot supplies continue to be offered by dealers at this unchanged level. **Thymol,** nominal; not being quoted, but prices would be a good deal dearer than the last quotation at about 15s. per lb.

Coal-tar Products, Intermediates, Etc.—Business remains on the slow and small side in these products, and prices, although showing no material change, are in many cases unsteady, and tend to decline. **Aniline Salt,** about 9½d. per lb., casks free; prices are firmer here, and British makers' prices are somewhat dearer. **Aniline Oil,** 9d. to 9½d. per lb., drums free; prices are fully maintained at these levels, and tend to advance. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; the market seems steady, but has again been quiet. **Benzol,** about 1s. 3½d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; prices quoted are about the same, with business small. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; business is still lacking in volume; prices quoted are about the same. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; the demand from dealers remains small; their quotations are unchanged. **Naphtha,** about 1s. 2d. per gallon; this market at the recently reduced price remains dull, and is still rather unsteady. **Solvent Naphtha,** 90/160, about 1s. 3d. per gallon, drums extra; at the figure given the position is weak, and any business would be generally on a lower level. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; prices as quoted are weak, with the market dull. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; this market keeps steady, but has again been quiet. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; quoted prices are maintained on a steady market. **Creosote Oil,** about 9¼d. per gallon, f.o.b.; the position is fairly steady, but business is far from good. **Carbolic Acid,** crystals, about 1s. 1½d. per lb.; some limited business has been done, but there is a want of confidence in this article. **Naphthalene,** about £19. per ton; the lower prices quoted here have not brought any improvement in demand; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; tablets and candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; dealers continue to quote at this figure, with business quiet. **Pyridine,** fully 22s. per gallon; the spot position is exceedingly firm at this level, and tends to go still higher. **Hexamethylene,** 3s. 9d. per gallon; this is about the lowest price quoted by dealers for spot supplies. **Pure Methyl Alcohol,** about £90. per ton, in drums, ex wharf London; dealers are finding fair business, and their prices are being well maintained. **Pitch,** about 140s. per ton, f.o.b. East Coast; the position is quite satisfactory, with prices firm and tending to go higher; inquiry is good.

ITALIAN CHEMICAL MARKET.

Genoa, Oct. 31.

Quotations during October were as follows, prices being per 100kilos. at Milan, unless otherwise stated:— **Caustic Soda,** 70—72%, Italian, 180 lire; American, 76—78%, 200 lire; English, 185 lire; French, 175 lire. **Carbonate of Soda,** 98—100%, Italian, 85 lire (Genoa); English, 86 lire (Genoa); American, 86 lire (Genoa); demand is good. **Soda Crystals,** steady at 40 lire. **Alum,** crystals, fell from 87 to 85 lire; in smaller request. **Bicarbonate of Soda,** powder, kegs, fell from 180 to 175 lire (Genoa). **Bichromate of Soda,** 445 lire (Genoa). **Bichromate of Potash,** crystals, 590 lire. **Borax Crystals,** 99%, in kegs, fell from 400 to 380 lire. **Carbonate of Ammonia,** lump, 430 lire; powder, 370 lire; in fair request. **Carbonate of Magnesia,** pure, 430 lire; in steady demand. **Chlorate of Potash,** crystals, in strong demand at 310 lire. **Acetone,** pure, 98—99%, rose from 1,250 to 1,300 lire. **Glacial Acetic Acid,** 99%, in fair request at 1,200 lire. **Boric Acid,** crystals, in fair demand at 800 lire. **Lactic Acid,** 80%, in fair request at 300 lire. **Bisulphite of Soda,** crystals, 360 lire. **Formaldehyde,** 40%, rose from 725 to 750 lire; in better demand. **Phosphate of Soda,** steady at 160 lire. **Hyposulphite of Soda,** crystals, 130 lire. **Metabisulphite of Potash,** steady at 400 lire. **Nitrite of Soda,** 96—98%, rose from 295 to 300 lire. **Permanganate of Potash,** crystals, good demand at 800 lire. **Sulphate of Alumina,** crystals, 18%, rose from 100 to 110 lire; in good call. **Sulphate of Zinc,** in little request at 180 lire. **Citric Acid,** crystals, in fair demand at 1,900 lire. **Sulphate of Iron,** slow at 50 lire. **Hydrofluoric Acid,** 50%, in fair demand at 600 lire. **Oxalic Acid,** crystals, in very good demand, rose from 610 to 660 lire. **Tartaric Acid,** crystals, 1,350 lire. **Chloride of Ammonia,** lump, 98—100%, in little demand at 600 lire (Milan); powder, 95—96%, in good call, rose from 280 to 315 lire (Genoa). **Chloride of Calcium,** 75—80%, fell from 70 to 65 lire. **Bleaching Powder,** French, 110-115%, 90 lire; electrolytic, 100 lire. **Cream of Tartar,** 98—99%, powder, well treated at 930 lire. **Yellow Prussiate of Potash,** crystals, in fair call at 2,000 lire. **Yellow Prussiate of Soda,** crystals, at 1,400 lire. **Silicate of Soda,** crystals, 85 lire; in good call. **Silicate of Soda,** Italian, 38—45%, 65 lire; English, 140° Tw., 100 lire. **Sulphate of Soda,** crystals, 43 to 45 lire; very

good demand; powder, 65 lire. **Sulphate of Magnesia**, crystals, 48 lire; in little request. **Chloride of Magnesia**, solid, remained at 70 lire; in fair demand. **Hydrochloric Acid**, 20 –21° Bé., fell from 25 to 15 lire. **Sulphuric Acid**, 50° Bé., fell from 20 to 19 lire; 66° Bé., remained at 45 lire. **Nitric Acid**, 36° Bé., remained at 155 lire; 42° Bé., remained at 190 lire. **Benzaldehyde**, remained at 3,500 lire. **Tannic Acid**, 80%, remained at 2,000 lire. **Aluminium Acetate**, quiet at 162 lire. **Lead Acetate**, brown, 560 lire; white, 575 lire. **Betanaphthol**, in better demand at 2,800 lire. **Barium Peroxide**, remained at 1,000 lire. **Sodium Peroxide**, in fair request at 1,800 lire. **Red Prussiate of Potash**, not much doing at 3,150 lire. **Caustic Potash**, 88—92%, 380 lire. **Tartar Emetic**, powder, 1,200 lire. **Mineral Superphosphate** remained at 27 lire. **Bone Superphosphate**, in good demand at 52 lire. **Basic Slag**, 16—18%, in little call at 34 lire. **Nitrate of Soda**, 15—16%, in little call at 136 lire. **Nitrate of Ammonia**, in good demand, rose from 115 to 125 lire. **Nitrate of Lime**, 12—13%, in fair request at 110 lire. **Sulphate of Ammonia**, 20—21%, quotations fell from 170 to 165 lire through smaller demand. **Sulphate of Copper**, 98—99%, Italian, rose from 225 to 228 lire; foreign rose from 226 to 230 lire. **Chloride of Potash**, quiet at 75 lire. **Sulphate of Potash**, little business at 85 lire. **Calcium Cyanamide**, 15—16%, in little call at 98 lire. **Sulphur**, refined, in blocks, rose from 53 to 54 lire (Catania, Sicily), 70 lire (Milan). **Sulphur**, sublimed, rose from 70 to 71 lire (Catania, Sicily), 87 lire (Genoa). **Crude Tartar** fell from 280 to 273 lire.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £61. 5s. to £61. 7s. 6d., cash; £61. 15s. to £61. 17s. 6d., three months; electrolytic, £64. 10s. to £65. **Tin**: Standard, £216. to £216. 5s., cash; £215. 15s. to £216., three months; Straits, £216. 15s.; English, £216. 15s. **Lead**, soft foreign, £29. 15s., prompt; English, £32.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter**, prompt, £32. 12s. 6d.; hard, £27. 10s. **Antimony**, English regulus, 99%, £35. 5s. to £35. 10s.; special brands, £41. 10s. to £42. **Aluminium**, 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 15s. to £10. **Bismuth**, 10s. **Platinum**, £26. 10s. per oz.; scrap, £24. 10s. **Wolfram**, spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. The demand for **Zinc Dust** has increased, and the higher grades are in short supply; there is no Australian offering, all supplies having been cleared; prices as a whole are unchanged, with a firm tendency: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand for heavy chemicals continues fairly steady both on home and export account, but business is only on the small side for spot and near requirements. Values all round still rule in buyers' favour, with one or two exceptions. Quotations for alkali products are fairly well maintained at recent rates, and there are no changes to record. **Bleaching Powder**, softwood casks, remains quiet at £11. 5s., on rails makers' works. **Glauber's Salts** are easy at 70s. per ton, carriage paid. **Chlorate of Potash**, lower at 2¾d. per lb.; **Soda** at 2¾d. **Bichromates** are unaltered. Roasted **Saltcake** weak at £4. 10s., carriage paid, but there is only small inquiry. Imported crude **Sulphur**, easier at £5. 5s. on rails. There is no improvement to report in **Copper Sulphate**, and quotations remain nominal at £25. to £25. 10s., f.o.b. **Phosphate of Soda** remains steady at £14. per ton. **Hyposulphite of Soda**, commercial, £9. 10s.; and concentrated **Sulphide**, £14. per ton, carriage paid. **Nitrite of Soda**, firm at £26. 10s., ex store. White powdered **Arsenic** is again higher on the week, and Cornish make firmly held at £68., carriage paid, with supplies scarce. Yellow **Prussiate of Potash**, lower at 10½d. per lb.; **Soda**, firmer at 5¾d. **Carbonate** and **Caustic Potash** are unchanged at recent rates. **Acetic Acid** and **Acetate of Soda** are moving off fairly well, but quotations are easy. **Acetone**, quiet at £124. Miscible **Wood Naphtha**, 6s. per gallon, carriage paid. **Lead Salts** continue firm: White **Acetate** £42., brown £45.; and **Lead Nitrate**, £43., carriage paid. **Litharge**, British, is dearer at £45. per ton. **Barium Chloride**, steady at £14. 10s. per ton. There is a fair inquiry for **Tin**, **Zinc**, and **Ammonia Salts**, and values are maintained. **Oxalic Acid**, quiet at 5¾d. per lb. Green **Copperas** is in fair request, but price unchanged. **Permanganate of Potash**, B.P. quality, 9½d. per lb., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

There was fair activity in **Tinplates**, and business was done on the firm basis of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** met with a steady demand on the basis of £19. 2s. 6d. per ton. **Copper** evinced a better tone at £60. 12s. 6d. per ton cash, and £61. 2s. 6d. three months. **Tin** quotations were irregular, and some buying took place at £208. 2s. 6d. per ton cash; three months, £207. 2s. 6d. **Lead**, firm at £29. 17s. 6d. per ton prompt, and £28. 7s. 6d. three months; English, £32. 10s. **Spelter**, very firm at £33. 2s. 6d. per ton prompt, and £32. 17s. 6d. forward. **Zinc Sheets** in fair demand at £39. 2s. 6d. per ton, f.o.r. at makers' works. **Sulphate of Copper**, slow at £25. 17s. 6d. per ton, in casks, less 5%, f.o.b. **Sulphate of Ammonia**, rather quiet at £14. 15s. per ton, delivered. **Nitrate of Soda** quiet, but steady at £13. 12s. 6d. per ton. **Bone Meal** rather slow, with Indian, prompt, £9. 2s. 6d. per ton. **Rape Oil** very quiet, with prompt refined at £2. 6s. 3d. per cwt. **Cod Oil** steady; Newfoundland, prompt, £2. 5s. 3d.; and English, £1. 15s. 6d. per cwt., net, in barrels. **Coconut Oil**, very steady, with Ceylon at £2. 4s. 3d. per cwt., ex ship. **Linseed Oil** quiet, but steady at £2. 5s. 3d. per cwt. for raw, and £2. 7s. 3d. boiled, net, in barrels. **Cottonseed Oil** in fair demand, with common edible at £2. 2s. 9d., and deodorised £2. 5s. 9d. per cwt., net. **Castor Oil** firm, with limited demand at £2. 18s. 6d., down to £2. 12s. 6d. per cwt., net, in barrels. **Palm Oil** in fair demand, with prices firm; Lagos, £36. 15s. 6d.; softs, £35. 17s. 6d.; mediums, £36. 7s. 6d.; and hards, £36. 12s. 6d. per ton. **Olive Oil** quiet at £65. 17s. 6d. per ton for Spanish, ex ship. **Turpentine** firm, with American, prompt, at £3. 14s. 3d. per cwt. **Oxalic Acid** quiet at 6¼d. per lb. put on rails. **Arsenic** very quiet, with white powdered at £60. 12s. 6d. per ton. **Copperas** in better call at £2. 2s. 6d. per ton, delivered London or equal. **Pitch** rather easier at £6. 17s. 6d. per ton, delivered docks. **Benzol** maintained good demand at 1s. 4½d. per gallon, f.o.r. **Creosote** in strong demand at 8¾d. per gallon. **Sulphuric Acid** in good demand at late quotations. **Coal** had a steadier tendency; best Admiralty smokeless £1. 7s. 6d., seconds £1. 6s.; ordinaries, £1. 5s. 6d.; Monmouthshire black vein, £1. 6s. 6d., all per ton, f.o.b. **Anthracite** in active demand, and well booked forward; best large £2. 6s., seconds £1. 15s.; Paris and French nuts, £2. 17s. 6d. per ton, f.o.b. **Cokes** very steady, with export £2. 2s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks at ovens. **Patent Fuel** prices firm from £1. 9s. to £1. 12s.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for the heavier chemicals for use in the home trade continue to be made steadily and on a very fair scale. **Bleaching Powder** has moved steadily on home-trade account, and has been shipped more largely to overseas ports; it is £11. 5s. per ton for spot; for contracts special prices are quoted, according to requirements. **Chloride of Calcium** has again been quiet, and is £5. 12s 6d. per ton. **Caustic Soda** has been rather more in demand for home-trade uses, and has been shipped freely on export account; it is £19. 7s. 6d. per ton for spot of 76%, special terms being quoted for export lots, according to requirements. **Bicarbonate of Soda** has been in good request on U.A. account, and has had a fairly active shipment for foreign ports; it is £10. 10s. per ton, carriage paid, to users in the home trade. **Soda Crystals** continue to sell with some freedom for use in the United Kingdom; they are £5. 5s. per ton to home-trade buyers; business in the export branch has been quiet. **Nitrate of Soda** has had a moderate inquiry, and is £13. 5s. to £13. 10s. per ton. **Borax** has been in very fair request; commercial grades are—crystals £25. per ton, powdered £26.; higher grades—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has had a somewhat better inquiry; it is £4. 10s. to £5. per ton for the home trade, and £5. to £6. per ton for export. **Bichromate of Soda** has been in very fair demand, and is 4¾d. per lb., c.i.f. to stated ports. **Ammonia Alkali** has had a rather free sale on home-trade account, and has had a fairly brisk shipment; it is £7. 10s. per ton, f.o.r. at works, for spot; for contracts special prices

are being quoted, according to requirements; for export, £8. per ton is quoted as a normal price, varying according to destination. **Hyposulphite of Soda** continues in fair demand; it is £10. per ton in 2cwt. bags for commercial, and £15. to £15. 10s. per ton for photographic. **Sulphide of Soda** has been very quiet; it is £14. 10s. to £15. per ton for solid, and £8. 15s. to £9. per ton for crystals. **Chlorate of Soda** has been but little in request, and is 3d. per lb. **Phosphate of Soda** has been inactive, and is £15. to £15. 10s. per ton. **Prussiate of Soda** has had a limited inquiry, and is 6d. per lb. **Yellow Prussiate of Potash** has had a rather slow sale, and is 11½d. to 1/- per lb. **Red Prussiate** has been but little called for, and is 3s. per lb. **Carbonate of Potash** has sold more readily, and is £25. to £30. per ton. **Nitrate of Potash** has been steadily called for, and is £29. to £30. per ton. **Chlorate of Potash** has been more in request, and is 3½d. to 4d. per lb. **Caustic Potash** continues to meet with a very fair inquiry, and is £29. to £30. per ton. **Permanganate of Potash** has had a steady sale, and is 9d. to 9½d. per lb. **Bichromate of Potash** has sold rather more freely, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in quietly steady demand; first quality is £60., and second quality £57. per ton. **Sulphate of Ammonia** has had a moderate inquiry on home-trade account, but has had a heavy shipment to overseas ports; neutral of 25¾% is £14. 15s. per ton, and ordinary of 25¼% £13. 12s. per ton for November, for the home trade. **Carbonate of Ammonia** has had a fairly free sale, and is 4d. per lb. **Muriate of Ammonia** has been in slightly better request, and is £32. per ton. **Magnesia** has been steadily called for; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been rather more inquired for; prices are £11. per ton for use in the U.K., and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been in moderate demand, and is £8. to £11. per ton, according to quality. **Sulphur** has had a steady and very fair inquiry; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s. per ton, and American £5. 10s. per ton. **Tartaric Acid** continues quiet, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has had a fairly free sale, and is £4. 10s. per cwt. **Boric Acid** has been steadily called for; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. to £60. per ton. **Citric Acid** has again moved but slowly, and the price has shown an easing tendency; it is 1s. 5½d. per lb. **Oxalic Acid** has been quiet, and is 6d. per lb. **White Acetate of Lead** has been in moderate demand; it is £42. to £42. 10s. per ton. **Sulphate of Copper** has had a limited inquiry for use in the U.K., and has been quiet in the export branch; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been more in demand; white powdered is £63. to £65. per ton; supplies of Cornish have become very light.

WEST OF SCOTLAND CHEMICALS. Wednesday.

The steady day-to-day demand for chemicals on home-trade account continues at previous levels, but export inquiry is still limited. The position is quiet, however, improvement depending upon a revival in the chemical-consuming industries. Prices are about the same, with some shading in certain lines. Sulphate of copper is inclined to be easier. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, unchanged at £67. per ton on spot; an improving market. **Barium Chloride,** £14. 10s. per ton; at this price the market remains steady. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £26. 15s. per ton, less 5%, at Liverpool; a rather neglected market, with price reduced. **Cream of Tartar,** £4. 2s. 6d. per cwt. for 99% at Glasgow; quotation shaded, and inquiry small. **Lead Acetate,** white, £41. 10s. per ton on spot; brown, more inquiry at £44. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. 1d. per lb.; at this reduced price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 11s. 6d. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 10s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid,** 1s. 1½d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending November 3.

AMMONIA (ANHYDROUS)—
Rouen, 54 cylds.

BARIUM SULPHATE (BLANC FIXE)—
Hamburg, 34 cks.

BARYTES—
Antwerp, 20 bgs.
Hamburg, 24 cks.

BORATE OF LIME—
Los Angeles, 4,735 bgs.

CASEIN—
Rouen, 50 bgs.

CHEMICALS (*otherwise undescribed*)
Hamburg, 314 pkgs.

GELATINE—
Hamburg, 9 cs.

GLUE—
Antwerp, 90 bls.

MANGANESE—
Hamburg, 9 cs.

OXIDE (*otherwise undescribed*)—
Malaga, 4 brls.

POTASSIUM SALTS (*otherwise undescribed*)—
Antwerp, 800 bgs.

RED LEAD—
Genoa, 48 cks.

SALT—
Hamburg, 3,390 bgs., 100 t.

SOAP—
Norfolk (Va.), 975 brls.

SODIUM ACETATE—
Rouen, 50 bgs.

TALLOW—
Wellington, 63 cks.

TANNING MATERIALS—
Chestnut Extract
Leghorn, 100 brls.

TURPENTINE—
Gothenburg, 2 cs.

WHITE LEAD—
Antwerp, 11 brls.
Hamburg, 38 cks.

GOOLE.

Week ending November 3.

DEXTRINE—
Amsterdam, 150 bgs.

GLUE AND SIZE—
Antwerp, 40 bgs.
Boulogne, 5 cks.

LITHOPONE—
Antwerp, 8 cks.
Rotterdam, 20 cks.

RED LEAD—
Copenhagen, 1 ck.

SULPHUR—
Antwerp, 33 cs.

WHITE LEAD—
Antwerp, 12 brls., 87 pkgs.

GRANGEMOUTH.

Week ending November 3.

ALUMINIUM SULPHATE—
Rotterdam, 585 bgs.

BONE PHOSPHATE—
Rotterdam, 704 bgs.

CALCIUM CARBIDE—
Christiania and Drammen, 1,700 drms.

CREAM OF TARTAR—
Rotterdam, 30 cks.

GLYCERINE—
Rotterdam, 7 pkgs.

GUANO—
Faroe Islands, 629 bgs.

LITHOPONE—
Rotterdam, 40 cks.

MANGANESE DIOXIDE—
Rotterdam, 10 cks.

TALLOW—
Christiania & Drammen, 60 brls.

ZINC OXIDE—
Rotterdam, 50 cks.

GRIMSBY.

Week ending November 3.

ACETIC ACID—
Rotterdam, 5 cks.

CALCIUM CARBIDE—
Rotterdam, 1,400 drms.

IRON OXIDE—
Antwerp, 1 ck.

KAINIT—
Antwerp, 101 t.

PHOSPHATE OF LIME—
Antwerp, 2,000 bgs.

HULL.

Week ending November 3.

BORIC ACID—
Dunkirk, 25 t. 1 c.

GOLD CHLORIDE—
Rosario, 1 cs. (pt.), £10.

HYDROCHLORIC ACID—
Bangkok, 1 c., £10.; Callao, 3 c., £9.; Colombo, 10 c., £19.; Pt. Swettenham, 3 c., £10.; St. Kitts, 1 t., £23.; St. Lucia, 4 c., £5.; Trinidad, 1 t. 10 c., £33.

HYDROFLUORIC ACID—
Calcutta, 1 cs. (pt.), £30.; Callao, 1 cs. (pt.), £8.; Hong Kong, 2 cs., £16.; Pt. Elizabeth, 1 cs., £10.

HYDROGEN PEROXIDE—
East London, 10 cs., £21.

HYPOPHOSPHITES (*otherwise undescribed*)—
Sydney, 1 cs. (pt.), £8.

HYPOPHOSPHOROUS ACID—
Paris, 1 pkg., £18.

IODIDES (*otherwise undescribed*)—
Amoy, 1 cs. (pt.), £51.; Calcutta, 1 cs., £56.; Penang, 1 cs., £74.; Toronto, 1 cs. (pt.), £17.

IODINE—
Barbados, 1 cs., £7.; Brussels, 1 cs. (F.), £407.; Calcutta, 1 ck. (pt.), £26.; Florence, 1 cs., £103.; Paris (F.), 20 kgs., £1,695.

IODINE (RESUBLIMED)—
Sydney, 1 cs., £121.

IRON AMMONIUM CITRATE—
Durban, 2 cs., £14.
Sydney, 1 cs., £13.
Toronto, 1 cs., £15.

IRON SULPHATE—
Cape Town, 5 kgs., £6.

LACTIC ACID—
Calcutta, 6 cks., £33.

LEAD ACETATE—
Calcutta, 10 kgs., £21.

LEAD ARSENATE—
Pt. Elizabeth, 6 crts., £40.

LEAD PEROXIDE—
Antwerp, 19 cks., £90.

MAGNESIA—
Christchurch, 10 cs., £24.
Dunedin, 10 cs., £24.
Sydney, 10 cs., £24.
Vigo, 14 cks., £33.

MAGNESIUM CARBONATE—
East London, 1 kg., £16.; Lyttleton, 2 cs., £7.; San Fernando, 4 cs., £7.; Sydney, 1 cs., £11.; Wellington, 5 cs., £17.

MAGNESIUM CHLORIDE—
Saigon, 25 cs., £21.

MAGNESIUM CITRATE—
Barcelona, 10 cs., £150.

MAGNESIUM CITRATE—
Demerara, 1 cs., £7.

MAGNESIUM HYDRATE—
Switzerland (F.), 4 cs., £23.

MAGNESIUM SULPHATE—
Basrah, 5 c., £5. ; Beira, 4 c., £5. ; Canton, 10 c., £7. ; Durban, 6 c., £8. ; East London, 12 c., £18. ; Malta, 3 c., £5. ; Sydney, 5 c., £6. ; Trinidad, 1 t., £14. ; Wellington, 10 kgs., 1 t. 1 c., £50. ; Woodstock, 1 t., £11.

MANGANESE HYPOPHOSPHITE—
Melbourne, 1 cs. (pt.), £10.

MERCURY SUBCHLORIDE—
Calcutta, 5 cs. (pt.), £13.
Coconada, 1 cs., £22.

METHYL SALICYLATE—
Durban, 1 cs., £9.
Wellington, 1 cs., £9.

NICKEL SALTS (*otherwise undes.*)—
Sydney, 1 ck., 2 pkgs. (pt.), £18.

NITRIC ACID—
Callao, 2 c., £16.
Colombo, 1 c., £5.

PHOSPHOCITRIC ACID—
Bangkok, 1 c., £8.
Delagoa Bay, 5 c., £28.

PHOSPHORUS—
Kuala Lumpur, 2 cs., £21.

POTASSIUM BICHROMATE—
Kuala Lumpur, 5 kgs., £20.

POTASSIUM BROMIDE—
Durban, 3 cs., £16.
Trinidad, 1 cs., £6.

POTASSIUM CARBONATE—
Rio de Janeiro, 3 cks., £11.

POTASSIUM CITRATE—
Brisbane, 1 cs., £14. ; Durban, 2 cs., £19. ; Melbourne, 2 cs., £23.

POTASSIUM CYANIDE—
Christchurch, 1 cs. (pt.) £17.
Rangoon, 1 cs., £15.

POTASSIUM IODIDE—
Brussels, 6 cs., £81. ; Calcutta, 1 ck. (pt.), £88. ; Durban, 4 cs. (pt.), £182. ; Florence, 2 cs., £129. ; Genoa, 13 cs., £803. ; Naples, 1 cs., £86. ; Pt. Elizabeth, 2 cs., £175. ; Rangoon, 2 cs., £175. ; Rio de Janeiro, 4 cs., £363. ; Trinidad, 1 cs., £88.

POTASSIUM METABISULPHITE
Brisbane, 1 kg., £6.

POTASSIUM PERMANGANATE—
Buenos Ayres, 1 cs. (pt.), £5. ; Durban, 1 cs., £7. ; Melbourne, 5 drms. (F.), £18. ; Wellington, 2 drms. (F.), £9.

POTASSIUM PRUSSIATE—
Kobe, 19 cks.,. £501.
Trinidad, 2 kgs., £8.

POTASSIUM SALTS (*otherwise undescribed*)—
Montreal, 40 cs., £346.
Sydney, 1 cs., £12.
Toronto, 8 cks., £46.

POTASSIUM SULPHATE—
Demerara, 30 pkgs., £37.

PRUSSIAN BLUE—
Amsterdam, 2 cks., £127.

PYROGALLIC ACID—
Melbourne, 1 cs., £12.
Paris (F.), 13 cs., £146.

ROCHELLE SALTS—
Durban, 4 kgs., £9.

SALAMMONIAC—
Auckland, 2 kgs., £6.
Shanghai, 3 cs., £8.

SALICYLATES (*otherwise undes.*)—
Buenos Ayres, 1 cs. (pt.), £5. ; Montreal, 2 cs. (pt.), £17. ; New York, 1 cs. (pt.), £9. ; Shanghai, 1 cs. (pt.), £5.

SALICYLIC ACID—
Adelaide, 2 cs., £26.
Singapore, 1 cs., £13.

SALTPETRE—
Adelaide, 1 t. 3 c., £42. ; Christchurch, 10 c., £20. ; East London, 4 c., £10. ; Townsville, 10 c. (F.), £14. ; Zwolle, 1 t., £42.

SHEEP DIP—
Durban, 3 t. 7 c., £239.
San Fernando, 1 c., £2.

SILVER NITRATE—
Alexandria, 2 cs., £89. ; Danzig, 2 cs., £350. ; Durban, 1 cs., £25. ; Hong Kong, 1 cs., £56. ; Rangoon, 1 cs. (pt.), £6.

SODA CRYSTALS—
Lisbon, 1 t. 5 c., £13.

SODIUM ARSENITE—
Durban, 4 t. 9 c., £308.
Pt. Elizabeth, 2 c., £7.

SODIUM BENZOATE—
Calcutta (F.), 1 c., £11. ; Madras, 9 c., £117. ; Paris, 4 c., £55. ; Sydney, 1 c., £6.

SODIUM BICARBONATE—
Bilbao, 5 c., £19. ; Calcutta, 2 c., £6. ; Delagoa Bay, 7 c., £9. ; Durban, 11 c., £22. ; East London, 4 c., £5. ; Florence, 5 c., £10. ; Piraeus, 5 c., £6. ; Pt. Elizabeth, 4 c., £6. ; Singapore, 10 c., £15. ; Toronto, 5 c., £12.

SODIUM BISULPHITE—
Penang, 2 t. 3 c., £43.

SODIUM CARBONATE—
Shanghai, 1 t. 2 c., £13.

SODIUM CITRATE—
Melbourne, 1 c., £6.
Montreal, 3 t. 13 c., £715.

SODIUM CYANIDE—
Cape Town, 5 cs., £27.

SODIUM HYDROSULPHITE—
Pondicherry, 2 t., £300.

SODIUM HYPOPHOSPHITE—
Boston, 3 t. 12 c., £1,002.
Paris, 1 c., £15.

SODIUM HYPOSULPHITE—
Wellington, 1 t., £14.

SODIUM IODIDE—
Florence, 4 c., £393. ; Genoa, 1 cs., £39. ; Naples, 1 c., £59.

SODIUM PHOSPHATE—
Vloardingen, 1 t. 3 c., £26.

SODIUM SALICYLATE—
Durban, 4 cs., 1 cs. (pt.), £64.
Trinidad, 1 cs., £14.

SODIUM SULPHATE—
Demerara, 20 kgs., £7.

SODIUM SULPHIDE—
Auckland, 10 t., £165.
Lyttleton, 25 t. 3 c., £350.

SODIUM SULPHITE—
Penang, 2 t. 15 c., £68.
Singapore, 7 c., £27.

SODIUM SULPHITE (ANHYDROUS)—
Penang, 13 c., £17.

SODIUM TARTRATE—
Sydney, 10 c., £38.

SPENT OXIDE—
Naarden, 180 t., £386.

SULPHUR—
Colombo (F.), 1 t., £14.

SULPHURIC ACID—
Berbice, 2 t. 10 c., £50. ; Callao, 2 c., £5. ; Penang, 1 c., £10. ; Pt. Swettenham, 2 c., £10. ; Rotterdam, 2 t., £36. ; Sekondi, 1 t. 7 c., £29. ; St. Vincent, 10 c., £10. ; Trinidad, 2 t. 10 c., £50.

SUPERPHOSPHATE—
Channel Islands, 70 t., £196.

TARTARIC ACID—
Brisbane, 1 t. 10 c., £180. ; Calcutta, 11 c., £73. ; Cape Town, 2 c., £11. ; Christchurch, 2 c., £14. ; Durban, 2 c., £15. ; East London, 1 c., £8. ; Fremantle, 2 c., £17. ; Kuala Lumpur, 2 c., £12. ; Melbourne, 11 t., £1,499. ; Montreal, 1 t. 5 c., £173. ; Mossel Bay (F.), 1 c., £9. ; Paris, 2 t., £240. ; Penang, 1 c., £6. ; Pt. Elizabeth (F.), 3 c., £29. ; Sydney, 1 t., £120. ; Toronto, 4 t. 6 c., £600.

TIN OXIDE—
Dunkirk, 10 cks., £227.
Sydney, 1 cs., £59.

ZINC OXIDE—
Aden, 16 kgs., £12. ; Barcelona, 10 cks., £46. ; Calcutta, 5 kgs., £14. ; Copenhagen, 80 cks,. £150. ; Christiania, 4 bgs., £16. ; Kuala Lumpur, 1 ck., £8. ; Madras, 45 kgs., £107. ; Pt. Elizabeth, 2 cks., £5.

Week ending November 3.

ANTIMONY REGULUS—
Sydney, 2 t.

BEESWAX—
Sydney, 1 c.

DEXTRINE—
Suez, 1 t.

FULLER'S EARTH—
Antwerp, 10 t. ; Bordeaux, 5 t. ; New York, 35 t. ; Paris, 6 t. ; Rotterdam, 50 t.

GLUE, SIZE, AND GELATINE—
Barbados, 1 c. ; Brisbane, 2 c. ; Brussels, 1 t. 2 c. ; Calcutta, 7 t. 2 c. ; Channel Islands, 1 c. ; Demerara, 1 c. ; Dunedin, 6 c. ; Durban, 1 c. ; East London, 3 c. ; Fiji Islands, 1 c. ; Kobe, 5 t. ; Karachi, 6 c. ; Melbourne, 1 t. 11 c. ; Montreal, 1 t. ; New York, 1 t. ; Paris, 5 t. ; Pt. Elizabeth, 1 t. 2 c. ; Pt. Swettenham, 1 c. ; Rangoon, 4 c. ; Riga, 3 t. ; Rotterdam, 5 c. ; St. Johns (B.C.), 10 t. ; San Francisco, 10 c. ; Singapore, 1 c. ; Sydney, 1 t. 2 c. ; Tientsin, 9 c. ; Toronto, 17 t. ; Vancouver, 12 t. ; Victoria, 2 c. ; Wanganui, 1 c. ; Wellington, 1 c. ; Yokohama, 5 t.

LEAD ASHES—
Hamburg, 24 t.

MINERAL WAX—
Antwerp, 16 c. ; Gothenburg, 2 t. 10 c. ; Melbourne, 10 t. ; Naples, 1 t.

PARAFFIN WAX—
Durban, 11 c.

PLUMBAGO—
Madras, 10 c. ; Santos, 1 t. 4 c.

QUININE—
Calcutta, 6,419 oz. ; Durban, 312 oz. ; Montreal, 41 oz. ; Perth, 66 oz. ; Piraeus, 4,800 oz. ; Sourabaya, 35 oz. ; Sydney, 2,000 oz. ; Trinidad, 420 oz.

ROSIN—
Pt. Elizabeth, 2 t. 11 c.
Rio de Janeiro, 3 c.

SALT—
Copenhagen, 11 c. ; Cuba, 4 c. ; Durban, 3 t. 3 c. ; Fiji Islands, 15 t. ; Fremantle, 1 t. 9 c. ; Gibraltar, 1 c. ; Hawkes Bay, 20 t. ; Hong Kong, 2 c. ; Jamaica, 1 c. ; Madras, 9 c. ; Paris, 1 c. ; Singapore, 16 c. ; Yokohama, 16 c.

SOAP—
Accra, 13 c. ; Adelaide, 3 c. ; Aden, 2 c. ; Antwerp, 1 c. ; Auckland, 2 c. ; Azores, 2 c. ; Bangkok, 2 t. 7 c. ; Barbados, 1 c. ; Barcelona, 3 c. ; Basrah, 1 c. ; Bathurst, 18 c. ; Beira, 2 c. ; Bombay, 1 t. 19 c. ; Brisbane, 3 c. ; Brussels, 3 c. ; Calcutta, 13 c. ; Dar-es-Salaam, 1 c. ; Delagoa Bay, 1 c. ; Demerara, 1 c. ; Durban, 1 c. ; Hong Kong, 5 c. ; Irish Free State, 6 c. ; Italy, 10 c. ; Jamaica, 1 c. ; Karachi, 8 c. ; Madras, 8 c. ; Malta, 10 c. ; Matadia, 1 c. ; Melbourne, 1 c. ; Monte Video, 4 c. ; New York, 1 t. 8 c. ; Montreal, 6 t. 13 c. ; Napier, 1 c. ; Penang, 4 c. ; Perth, 2 c. ; Pt. NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE ARSENIC MARKET.

THE arsenic market, which attracted so much attention last spring, is again the scene of interesting developments. In the years prior to 1914 price fluctuations of any magnitude were rare in this market. The production of white arsenic before the war was about 10,000 tons per annum, and the price ranged between £9. and £11. per ton. The disturbing element which has caused arsenic prices to soar, and frantic efforts to be made to increase production, has been, of course, the recognition of the unrivalled insecticidal value of calcium arsenate as a weapon for combatting the boll weevil in the world's cotton-growing areas. During the early part of the year something approaching an arsenic panic developed. American buyers, in their frantic efforts to secure possession of supplies of arsenic, caused the market value of the oxide to rise from about £30 to £75 per ton in a very few weeks. World stocks proved inadequate to meet the demands of the cotton growers, and comprehensive schemes were proposed to produce arsenic in the United States, directly from arsenical ores. Under the stimulus of the increased demand, and in spite of the depression in the copper industry, which normally produces large quantities of arsenic as a by-product, the world's production is now over double the pre-war figure. At the commencement of the present cotton-growing season very considerable stocks of arsenate were held by American dealers, but the boll weevil failed to come up to expectations, and prices of white arsenic fell from a level of about £75. per ton to just over £57. per ton. Within the past three weeks, however, the old enemy of the cotton grower has again resumed his activities; the demand for arsenic is, consequently, approaching its last season's level, and prices are again in the neighbourhood of £70. per ton. These fluctuations are causing considerable concern to dealers throughout the world, and the question whether it is not possible to stabilise the arsenic market is being asked. An American contemporary suggests that this can only be done by the discovery of a new extensive and permanent outlet for arsenic; in other words, that a new use for the product be found. Whilst the varying demand for insecticidal purposes controls the market it is difficult to see how stability in arsenic prices can be attained. It is true some quite new large-scale use for arsenic compounds may ultimately be discovered, but the probabilities are not great.

THE STATE OF TRADE.

On the evidence furnished by the statistics given in the October Board of Trade Returns, trade appears to be improving. The value of imports rose to £99,915,000. during the month, compared with £83,266,000. in September. British exports also increased in value, almost reaching the total for May, previously the highest point in 1923. Including re-exports, the total value of exports reached £82,470,000., against £71,947,000. in the previous month. Imports, it will be noticed, rose more rapidly than exports, thus increasing the "adverse" trade balance. From the standpoint of British industry it is gratifying to see that the chief increase in imports is due to raw materials, the values being £30,879,000. for October, compared with £23,579,000. for September. Added to this is the fact that exports of British manufactures rose from £48,937,000 in September to £53,882,000. in the following month, of which increase iron and steel manufactures and cotton manufactures each accounted for over £1,000,000. In chemicals a larger volume of trade is recorded, exports expanding from £2,342,000. to £2,573,000., and imports from £1,024,000. to £1,246,000. Turning to the trade figures for the ten months ending October 31, due allowance must be made for the change in the status of Ireland, while the scale of values is also a factor which affects comparison with last year, though not to the same extent as in the previous years. As compared with the corresponding period of last year, there is a total expansion to note in the value of imports of £74,000,000., and in exports of £54,000,000. Even when all allowance is made, however, it is not a good point that so much of the increase in imports for the 10 months should have been connected with foodstuffs and manufactured articles, and that out of the total expansion in exports so large a proportion should have been under the head of raw materials.

A CODE OF ETHICS FOR CHEMISTS.

It may be remembered that during the present year an American Institute of Chemistry, modelled closely on the lines of the British Institute, came into being. This body has already secured a membership which, both as regards numbers and the enthusiasm of the individual members, makes its eventual growth to a very powerful organisation practically assured. Chemists on this side of the Atlantic—who, of course, wish the new Institute every success—are, naturally, greatly interested in its activities. A matter that at the present moment is occupying the minds of the members of the American Institute is the advisability and practicability of drawing up a wide code of ethics to regulate the conduct of professional chemists. The idea of a code of ethics is not new in America. Seven years ago the American Chemical Society drew up such a code, consisting of twelve clauses, but after full discussion by the Council the proposal was abandoned. Again, the American Gas Products Association—an organisation mainly concerned with the marketing of compressed gases—has recently adopted a code of ethics as standards of correct practice in the conduct of the business of its members. This latter code, consisting of seven articles, divided into sixty-two clauses, is a veritable encyclopædia of the moral and civic virtues. We do not know what will happen if a member fails to live up to any clause, but of this we are quite confident—that if only one half of the good resolutions are given general effect, the age of the Millenium in the business world will be very near. We might just cite one clause as an example: "We shall be accurate in our printed or oral word, whether they be in letter, advertising, part of a sales talk, or in general conversation with customers or others. Accuracy is not only the absence of actual misstatement, but also the absence of any facts which will prevent the hearer or reader making a correct deduction." The American Institute of Chemistry is, however, apparently to be satisfied with a code consisting of fifty clauses only, under the four divisions of the chemist's relation to the public, to clients and employers, to employees, and to other chemists, respectively. The various clauses, which range from general injunctions, such as "The chemist should participate in clean politics, and should strive to be a force to assist in the cleansing of politics," to exact rules of etiquette, such as "He should not seek or solicit a position occupied by another chemist," are, however, quite as comprehensive in scope as those of the Gas Products Association referred to above. We do not wish it to be inferred for one moment that we are in any way deprecating the value of the ideals that the Institute places before its members, but we do think it somewhat futile to draw up a long list of moral injunctions, the majority of which cannot, by any stretch of the imagination, be enforced by the Institute. A simple code of professional etiquette, that can be enforced, would seem to be of far more immediate practical value.

THE TURNING POINT.

The utmost credit must be extended to the Premier for his courage in submitting the vital question of protection for our industries to the decision of the country at such an early date. A general election must cause a certain amount of dislocation in the business of the trading community, but we are convinced that Mr. Baldwin has acted wisely in not postponing his appeal to the country until next year. The decision of the electorate on December 6 next may prove to be the most fateful one in the industrial history of the country. If, as we hope and believe, a strong Conservative Government is returned to power, relief for our struggling industries will be immediately forthcoming. We made clear our own attitude on these all-important matters some weeks ago. We are convinced that a modification in our fiscal policy must be made if our unemployment problem is to be solved and large numbers of our manufacturers to be saved from ruin. This modification can only consist in a general but systematically compiled tariff on imports, with a preferential treatment for our Empire co-partners.

FIREPROOFING AND FIRE-EXTINGUISHING AGENTS.

A SUMMARY OF MODERN DEVELOPMENTS.

By "Investigator."

THE principles underlying the protective action of fireproofing agents or "antipyrenes"—first recognised by Gay Lussac—are firstly, the dilution of the combustible vapours, so as to render them practically non-inflammable; and secondly, the formation of an indestructible surface-coating. Little difficulty is experienced in effectively fireproofing such materials as unexposed timber, but the case is very different with fabrics which have to withstand laundering. A case in point, which has been the subject of close study, is the proofing of flannelette. Here the protection afforded must not only withstand the rigours of the wash-board, but the proofed fabric must not be tendered nor exercise any injurious action on the skin.

As was stated at the recent Aeronautical Congress, a pressing problem, and one beset with many difficulties, which is now receiving attention, is the fireproofing of the doped fabric structures composing the wings of aeroplanes. For a successful solution, the proofing would require to be not only highly efficacious and able to withstand weathering without deterioration, but it must also not tender unduly the linen fabric nor "weight" it appreciably.

In the field of fire-extinction, much attention is being paid to the use of foam-producing compositions, particularly in the case of oil-fires. Oil refineries are now equipped with large installations based on this principle, an equipment, the need for which will be realised, when it is stated that, during the decade 1908—1918, nearly 13 million barrels of oil were destroyed by oil-fires in the United States alone. Out of a total of 500 of these conflagrations, more than 300 were caused by lightning. Carbon tetrachloride is now extensively used for extinguishing oil and electrical fires, but according to a recent American Governmental report, its haphazard use, particularly in confined spaces, is attended with some danger owing to the toxic nature of its decomposition products.

The Use of Ammonium Compounds.

Ammonium phosphate $(NH_4)_2HPO_4$, is endowed with both the desiderata of an efficient fireproofing agent, it readily liberates ammonia, a gas of low inflammability, and leaves a fusible residue of metaphosphoric acid. Its high solubility, however, precludes its successful use in materials which have to withstand laundering and weathering. Combustible materials coated with the phosphate, char in contact with a flame and glow only with great difficulty. For this reason, matches are impregnated with it to produce non-glowing match-ends. In order to proof wood, ammonium phosphate may be used in conjunction with boric acid, a solution, suitable for treating wood by immersion, containing 100 grammes of the former and 10 grammes of the latter per litre. It is claimed that wood, so impregnated, can be worked like the untreated material without detriment to the tools, and that it will not injure paint, varnish, nails or screws.

In the manufacturing of fire-resistant varnishes, the addition of 5 per cent. of ammonium phosphate is recommended, as this proportion will not render the film opaque. Owing to its solubility, however, higher proportions are readily dissolved out on exposure. For the prevention of smouldering, vegetable fibres, such as kapok, may be impregnated with 2 per cent. solutions of ammonium phosphate or borate, or with a 6 per cent. solution of microcosmic salt (*Brit. Pat.*, 130,662, of 1919). On heating, the latter fuses and evolves ammonia leaving a coating of fire-resistant sodium metaphosphate.

Ammonium phosphate $(NH_4)_2HPO_4$, is endowed with both proofing solutions, but owing to its property of sublimation from heated materials, fusible non-volatile substances, such as borax and boric acid, are usually added to assist its protective action. For instance, Gleichmar's solution consists of 133 grammes of ammonium chloride, 33 grammes of borax, and 17 grammes of salt per litre. The tendency of this solution to deteriorate fabrics, through its acid properties, cannot easily be countered by the presence of alkaline compounds, owing to the decomposition of the chloride set up by the latter. For proofing fabrics, a mixture of ammonium chloride, ammonium phosphate and alum, in the proportions 2 : 1 : 1, has been suggested, dilute acetic acid being added to avoid attack on the dye (*Brit. Pat.*, 113,162, of 1917). Such a mixture, consisting as it does, of three acid substances, would almost certainly tender the fabric. Ammonium bromide is claimed to be a more effective protection from ignition than the chloride (*Ger. Pat.*, 355,107, of 1918).

Ammonium sulphate is seldom used alone because of its acid reaction. On this account, the Hall Lumber Company combines its use with that of an alkaline-reacting salt such as trisodium phosphate (*U.S. Pat.*, 1,080,966, of 1913). Borax may also be used in conjunction with the sulphate.

Compounds of Boric Acid.

Owing to the facility with which metallic borates fuse to form glass-like sealing films, stable under heat, these compounds find extensive use in fireproofing media. A notable example is zinc borate, a substance which has received close attention at the hands of the United States Government research departments. Thus, together with the corresponding lead compound, its use in fire-resistant paints has been covered by patents, which have been dedicated to the public. (*U.S. Pats.*, 1,265,549, of 1918 and 1,216,729, of 1917). For fireproofing fibrous material with lead borate, the material is first saturated with a solution of a borate, dried, and the insoluble lead compound precipitated by treatment with a soluble lead salt. Impregnation with zinc borate by a similar process is recommended by the U.S. Forest Products Laboratory as being particularly suitable for imparting incombustibility to roofing shingles. In this case, the shingles are impregnated with borax, dried until the moisture content does not exceed 10 per cent. Then follows the injection of zinc chloride, when the insoluble borate remains in the pores.

Complex borates, which should have the advantage of lower melting-points than the simpler constituent compounds, have also found application. Thus, for fireproofing aircraft linen, the double zinc-sodium borate, prepared by mixing boiling solutions of zinc-ammonium sulphate and borax, has been suggested (*Brit. Pat.*, 120,421, of 1917). The material is applied in a gelatin medium containing borax and ammonium chloride. A similar medium is that of Flatters, who proposes, for this purpose, a complex composition consisting substantially of magnesium and sodium borates suspended in a colloidal mixture of soap, glycerol, glue, and gelatin (*Brit. Pat.*, 120,465, of 1918).

In many fireproofing compositions, boric acid is added to the borax both to enhance the fusibility and to neutralise the alkalinity of the borax. A mixture of borax, trisodium phosphate and potassium carbonate has been suggested for the dual purpose of fireproofing and fire-extinguishing. On account of their solubility, however, the use of the alkali borates is much restricted.

Fireproofing with Water Glass.

On account of its glass-like nature and stability at high temperatures, water glass enters into the composition of many fireproofing media. Wood may be painted with water glass alone, or with a hot mixture of sodium silicate, glue and Spanish white (chalk). For textiles, silica may be deposited by after-treatment with dilute hydrochloric acid, followed by washing and heating, but this treatment imparts harshness to the fabric. A rubber emulsion, containing water glass, borax and a metal powder, has been suggested for water-proofing and fire-proofing fine fabrics such as lace (*Brit. Pat.*, 160,627, of 1920).

The adhesive properties of sodium silicate are turned to advantage both in coating materials with solid fireproofing compositions and in the formation of fireproof masses containing steel wool, silicate cotton (slag wool) or asbestos. Thus a fireproof coating for wood is made by treating solid sodium silicate (350 parts), and asbestos powder (350 parts) with boiling water (1,000 parts); or the wood is first treated with a mixture of equal parts of magnesium silicate, sodium phosphate and borax, and subsequently finished with water glass (*French Pat.*, 472,172, of 1914).

Resort is frequently had to treatment with calcium compounds in order to impart water-resistance. Thus, a cement, for converting sheets of paper into fireproof pasteboard, consists of potash water glass (5-10 per cent. free alkali) mixed with chalk (*Ger. Pat.*, 298,129, of 1916). Fireproof masses may be made by moulding a mixture of slag wool, filler and water glass, followed by treatment with a solution of calcium chloride, while the structural material "Uralite" is made by spraying asbestos with a mixture of water glass and sodium bicarbonate.

Magnesium Compounds.

Magnesium ammonium phosphate, which decomposes on heating into magnesium pyrophosphate and ammonia, has been patented by the Du Pont Company of America for reducing the inflammability of cellulose-ester and oil-varnish films. In the latter case, the boiled linseed oil is incorporated with about one-third its weight of the phosphate (*U.S. Pat.*, 1,316,881, of 1919).

For fireproofing and preserving wood, the material may be impregnated with a solution of the double ammonium magnesium sulphate or with cuprammonium sulphate. In order to lower the melting-point of the magnesium sulphate, sodium or potassium sulphates may be added, preferably in quantity to form the eutectic mixture—that is, the mixture with the lowest melting-point (*Ger. Pat.*, 306,600, of 1914).

Calcium sulphate or barium carbonate may be deposited in the body of the wood, the former by impregnation with ferrous sulphate followed by treatment with calcium chloride, the latter by treatment with a solution of barium sulphide and subsequent injection of gaseous carbon dioxide (*U.S. Pat.*, 1,346,287, of 1920).

Compounds of Zinc and Aluminium.

In addition to the borate of zinc, described above, the chloride is used to impart fire-resistance as well as immunity from destructive organisms, to wood. To counteract acidity, the chloride may be dissolved in ammonia and the excess neutralised with boric or phosphoric acid. Zincate solutions (2 per cent. zinc), stabilised by the addition of ammonium salts, have also been proposed, while the American Pyrene Company have patented a mixture of zinc phosphate and an ammoniacal solution of zinc chloride (*U.S. Pats.*, 1,318,524, of 1919, and 1,261,736, of 1918).

Alum has been used for fireproofing textiles, in combination with lime, or with the sulphates of ammonium, sodium or potassium. In order to impregnate fabrics with adherent hydrated alumina, they are soaked in a solution of sodium aluminate (Sp. Gr. 1.13), treated with carbon dioxide at 105° C. under a slight pressure, then washed and dried; or the aluminate may be decomposed by treatment with sodium bicarbonate. Another method is to moisten the alum-impregnated material with bicarbonate, and then to treat with steam or with carbon dioxide at 100° C.

To reduce the inflammability of paper, a paste of sodium aluminium carbonate may be incorporated with the pulp (*Brit. Pat.*, 23,421, of 1914). With a view to suppressing the tendency of such proofed materials to smoulder at the edges, they may be treated with a colloidal solution of sulphur, prepared from sulphuretted hydrogen and sulphurous acid. Solutions of sulphur in volatile organic solvents are also applicable (*Brit. Pat.*, 130,743, of 1918). According to W. H. Perkin, rubberised fabrics, as used for tyres, may be rendered non-inflammable by the addition of hydrated alumina alone or mixed with asbestos (*Brit. Pat.*, 125,622, of 1916).

A complex composition consisting of manganous chloride (33), orthophosphoric acid (20), magnesium carbonate (12), boric acid (10), ammonium chloride (25), and water (1,000 parts), will fireproof wood when this is boiled for 8 hours with the medium.

Use of Tin and Antimony Compounds.

The highly combustible nature of certain fabrics like flannelette and muslin, led to an exhaustive study of the problem of reducing their inflammability. This work culminated in the process due to W. H. Perkin, patented in 1902, according to which the fabric is impregnated with hydrated stannic oxide. Described briefly, the fabric is soaked in a solution of sodium stannate, $Na_2SnO_3.3H_2O$, ("preparing salt"), of specific gravity 1.225 at 15° C., squeezed and passed over drying drums. A solution of ammonium sulphate (Sp. Gr. 1.075) is then applied and the resulting sodium sulphate removed by washing. Material treated in this way has its dyeing properties unaltered, and is without deleterious action on the skin. With tin at £200 per ton, the cost of fireproofing "Nonflam" flannelette works out at about one penny per yard, according to the inventor's statement (8th Inter. Congr. App. Chem., New York, 1912). In a modification of this process, after impregnation with sodium stannate, the fabric is treated with a titanium-salt solution, followed by fixing with sodium silicate.

A drawback in the use of oxides is their tendency to act as combustion catalysts by surface action and thus to promote glowing, in presence of combustible vapour. Such an effect is especially noticeable where the fabric is painted, varnished or doped, and may, under favourable circumstances, lead to the ignition of any gaseous decomposition products.

Within the last few years numerous patents have been granted to Arent, to cover the use of antimony and bismuth trichlorides for fireproofing. These chlorides will dissolve in many organic solvents such as carbon tetrachloride, carbon bisulphide, amyl acetate or benzol and are hydrolysed by water to form insoluble basic compounds. They can also be incorporated with organic wood-preserving and waterproofing materials.

A suitable medium for both reducing the inflammability of and creosoting timber, consists of a solution of antimony trichloride dissolved in creosote (2lb. $SbCl_3$ per gallon). Tar and asphalts may be incorporated with about one-fifth their weight of the chloride. (*Brit. Pat.*, 146,099, of 1920). A fire-resisting varnish is composed of a drying oil and a solution of antimony chloride in one of the volatile solvents already mentioned. To fireproof fabrics, they are treated with a solution of the trichloride in carbon bisulphide or carbon tetrachloride, the solvent evaporated, and the chloride hydrolysed by exposure to steam or water. Waterproofing agents, such as rubber, may also be added to the antimony solution (*Brit. Pat.*, 132,813, of 1919) In the preparation of non-flaming plastic masses from cellulose derivatives, such as the nitrate, the material may be dissolved in amyl acetate containing antimony chloride (*Brit. Pat.*, 138,641, of 1920).

Compounds of Tungsten and Zirconium.

Sodium tungstate is much used both by itself and in conjunction with other fire-retarding compounds. In some experiments on its protective action recorded by Sibley (*J. Ind. Eng. Chem.*, No. 8, 1921), impregnation of cotton fabrics with a three per cent. solution was found to be equally as efficacious as treatment with a more concentrated solution. For the protection of tulle, muslin and other delicate fabrics, impregnation with a solution containing 10 grammes tungstate, 125 grammes ammonium phosphate and 7 grammes boric acid per litre, has been proposed. This solution is added to the finishing medium (gum, starch or dextrin), in the proportion 1:4. Ammonium chloride, ammonium sulphate, and aluminium acetate may also be combined with sodium tungstate. A medium, particularly recommended for artificial silk, can be prepared by diluting a mixture of the following solutions: 100 parts aluminium acetate (Sp. Gr. 1.13), 10 parts acetic acid (Sp. Gr. 1.06), and 200 parts sodium tungstate (Sp. Gr. 1.40). Water-resistance can be imparted by using an excess of the acetate (*Brit. Pat.*, 175,746, of 1920).

According to Mond (*Brit. Pat.*, 4,457, of 1915), zirconium hydroxide may be applied to fabrics as a hydrogel, prepared by steeping in a solution of the aceto-nitrate containing magnesium sulphate, draining, heating to 65° C., and finally washing. One litre of the steeping medium should contain 200 grammes magnesium sulphate and 20 grammes of the aceto-nitrate, prepared by evaporating zirconium nitrate with acetic acid. To enhance the fire-retarding effect, the treated fabric may be allowed to absorb phosphoric acid. Another method is to impregnate the material with a solution of precipitated zirconium phosphate in concentrated oxalic acid.

Organic Fireproofing Agents.

As is to be expected, the principal members in this group are highly chlorinated or brominated substances, depending for their effect, on the evolution of non-inflammable vapours. One such composition consists of brominated coal tar, dissolved in pitch. Bromination is effected by treating the tar with half its weight of bromine, after which the product is dissolved in 20 parts of pitch and the mixture applied to the wood in the molten condition (*U.S. Pat.*, 1,194,558, of 1916). The chloro-naphthalenes have also been applied in reducing the inflammability of asphalt. According to another specification, fibrous material is impregnated with the sodium salt of a polychlorophenol or chloro-acid and the free phenol or acid then precipitated. These compounds decompose below 400° C. and may be used in conjunction with an inorganic fireproofing agent. Solutions of the sodium salts may also be utilised for putting out fires (*U.S. Pats.*, 1,085,783-4, of 1914).

Solutions of algin, or alginic acid have been suggested for fireproofing inflammable aircraft materials. This is a nitrogenous product obtained from certain species of seaweed, by extraction with sodium carbonate, precipitation with acid

and final purification by dialysis (*U.S. Pat.*, 1,321,708, of 1919).

Methods of Application and Testing.

In the fireproofing of wood, the methods of impregnation are closely similar to those used in applying wood preservatives.* The pressures applied will depend on the structure of the wood, as an excessive pressure will tend to crush the cells. Too high a temperature during drying may lead to brittleness. In order to assist penetration, an initial vacuum may be applied, followed by injection under about 170lb. pressure. In the application of water glass and its subsequent precipitation with hydrochloric acid, salt is left in the wood. To obviate this, it has been proposed to utilise pure silicic acid, prepared and impregnated by electro-osmotic methods (*Brit. Pat.*, 101,205, of 1917).

Many fibres, such as kapok, have cuticles which are penetrated with difficulty by soluble salts. To facilitate penetration in such cases, the material may be treated with alcohol or other volatile solvent, or with a dilute solution of hydrofluoric acid (2 parts of the commercial acid in 100 parts of water). Coating with metal by electro-deposition is suggested as a method of fireproofing aircraft linen without loss of tensile strength (*Brit. Pat.*, 149,745, of 1919).

For most practical purposes, the direct method of testing the efficacy of a fireproofing treatment—that is by applying a flame—should be sufficient. In certain cases, notably for aircraft fireproofing, some method of testing the comparative protective action is necessary. Very little information is available, however, with regard to the inflammability of fireproofed fabrics, although some results of comparative tests with unproofed materials have been made public (Aeronautical Advisory Committee Report, No. 573, of 1918). The three methods used for determining the ease of ignition of doped fabrics were as follow: An approximate ignition temperature determination by heating in a metal tube; determination of the size of celluloid cube necessary to cause ignition together with the rate of burning of the fabric; and determination of the proportion of alcohol in a carbon-tetrachloride-alcohol mixture, burning on a cylinder of plaster of Paris, necessary to ignite the fabric.

The Tendering Action of Fireproofing Agents.

Although fireproofing generally tends to weaken the fabric, the published quantitative information is very meagre. Sibley has determined the tensile strength of tyre duck fabrics after treatment, on a small scale, with seven different fireproofing media (*J. Ind. Eng. Chem.*, No. 8, 1921). Pieces of the fabric (1 inch by 6 inches) were boiled for 15 minutes in the solutions, then lightly wrung out, and allowed to dry in the air for 3 days so that they had the same water-content, all the experiments, as well as the control, being carried out simultaneously. The highest and lowest results (of three tests) for each medium are given below, the figures representing the breaking strength in lbs. per inch.

Treatment.	Heavy Fabric (36oz./sq. yd.).	Light Fabric (18½oz./sq. yd.).
Control (boiled 15 minutes in distilled water)	302 .. 286	212 .. 180
Boiled with saturated aluminium sulphate, $Al_2(SO_4)_3\ 18H_2O$, dried at 80° C., then treated with saturated sodium carbonate	—	—
Ammonium chloride 40, borax 10, salt 5, and water 300 parts	200 .. 184	185 .. 170
Borax 35, glucose 18, water 300 parts	164 .. 150	154 .. 144
Sodium-tungstate solution, 3½ per cent. $Na_2WO_4\ 2H_2O$	264 .. 222	210 .. 188
Borax 45, $MgSO_4$ 22½, water 300 parts	220 .. 200	178 .. 155
Control	333 .. 304	229 .. 212
NH_4Cl 15, $Na_2B_4O_7$ 3, H_3BO_3 6, water 300 parts	209 .. 200	215 .. 184
Sodium-tungstate solution, 15 per cent. $Na_2WO_4\ 2H_2O$	292 .. 238	230 .. 200

The sodium-tungstate solutions had the least weakening effect, while tests were impossible with the fabrics treated with aluminium sulphate followed by sodium carbonate, owing to their extremely deteriorated condition.

Tenacious Foam-forming Mixtures.

According to the investigations of the U.S. Bureau of Mines (Bulletin, No. 170), the most practicable method of dealing with oil-tank fires is to spread, on the surface of the oil, a thick, tenacious, foam, consisting of tough bubbles inflated with carbon dioxide. Such a foam is usually obtained by mixing a sodium-bicarbonate solution, containing a froth-stabiliser, with an acid salt. A highly-recommended mixture comprises a pair of liquids of the following composition:—

A. Aluminium sulphate 10, sulphuric acid (Sp. Gr. 1.71 at 15° C.) ½, water 100 parts.

B. Sodium bicarbonate 7½, ground glue 1¼, arsenious oxide 1/52, water 100 parts.

The proprietary extinguisher "Foamite" has a closely similar composition. Other stabilisers may replace glue, as for example, liquorice-root extract, saponins, soap bark, the phlobaphenes and sodium silicate. The cost of such an installation is estimated to be about 3 cents per barrel-capacity of the tanks protected. To increase the efficiency of the ordinary bicarbonate-acid extincteur, foam-forming compounds may be added to the alkali solution and carbon tetrachloride may be added to sulphuric acid of similar density.

Many carbonate and bicarbonate solutions containing water-soluble organic compounds have been patented. A few such mixtures are sodium bicarbonate with sodium lactate, potassium citrate or a phosphoprotein, potassium carbonate with glycerin or sodium lactate, and ammonium carbonate with glycerin (*U.S. Pats.*, 1,278,714-6, of 1918, 1,375,779, of 1921 and 1,306,707-9, of 1919). A very effective mixture consists of sodium sulphite and ammonium chloride in molecular proportions.

Carbon Tetrachloride as Fire-extinguishing Liquid.

Owing to the formation of a heavy, non-inflammable, vapour blanket in contact with a heated surface, carbon tetrachloride is extensively used for putting out small fires. When applied to electric-arc and similar fires, there is no danger of electric shock, but its general use in the absence of efficient ventilation is not without risk. Recent investigations by the American Bureau of Mines (Technical Paper, No. 248), have shown that toxic quantities of phosgene ($COCl_2$), chlorine and hydrochloric-acid gas result from its decomposition, in contact with heated iron or with a fire. In some experiments made by passing the tetrachloride mixed with air through a heated quartz tube at 600°-800° C., one-half was decomposed into toxic products. The addition of turpentine reduced the amount of free chlorine, but was without appreciable effect on the proportion of phosgene.

According to Henning (*J. Soc. Chem. Ind.*, No. 10, 1922), methyl bromide (B.P. 4.5° C.), does not give rise to dangerous decomposition products and would, moreover, be self-propelling and also very resistant to cold (freezing-point -84° C.). A host of mixtures of carbon tetrachloride with small quantities of other organic liquids have been recently patented, chiefly in America. In the majority of cases the object of these additions is to lower the freezing-point and saturated or chlorinated hydrocarbons, aromatic esters, aniline, acetophenone, anisol and propionic acid are some of the compounds recommended for this purpose. Inorganic fire-resisting materials have also been incorporated with chlor-hydrocarbons, while a recent specification proposes to combine the use of the latter with materials based on the "Foamite" principle (*Brit. Pat.*, 201,379, of 1922).

INDIGO SHORTAGE IN JAPAN.

CESSATION OF GERMAN DELIVERIES.

MORE than a thousand barrels of German indigo blue were lost in Tokio and Yokohama during the earthquake, states a Tokio correspondent of the *Oil, Paint, and Drug Reporter*. The shipment of German indigo, which was already irregular during all the first half of this year, had practically ceased in August. The Daido Indigo Corporation, which is an association of Japanese dye merchants acting as agent for German producers, gave notice just before the earthquake to its sub-agents, therefore, that when its stock in hand was exhausted it would have to wind up its affairs. The losses caused by the recent catastrophe, however, accentuated the Corporation's difficulties. This closing of German dye manufacturers' business in Japan, it is feared, will cause a great shortage in indigo blue in the season of larger consumption which will soon set in. In Osaka and Kobe merchants are trying to deal with the situation, and it is expected that the importation of indigo in the remaining part of the year will be considerable.

NEW COLOUR INTERMEDIATES AND BACTERICIDES.

CHEMICAL RESEARCH AT BIRMINGHAM UNIVERSITY.

SEVERAL interesting technical contributions relating to research work in the Chemistry Department of the University of Birmingham were made at the first meeting of the session of the Birmingham and Midland Section of the Society of Chemical Industry on Tuesday, November 6. The papers were by Professor Morgan, head of the Chemistry Department, in conjunction with colleagues and students. In the absence of Dr. E. B. Maxted (chairman), Dr. Parker presided, and announced that on December 15 a dinner would be held by the Midland Section of the Society of Chemical Industry in conjunction with the Institute of Chemistry at the Queen's Hotel, Birmingham.

The Amino-Acetophenones as Colour Intermediates.

In this paper by Professor G. T. Morgan and J. E. Moss, it was stated that at low temperatures nitration of acetophenone led to meta-nitro-acetophenone as the preponderant product, *ortho*-nitro-acetophenone being present as a by-product, the proportion of the latter increasing with rise of temperature. Even at the highest temperatures at which nitration occurs smoothly, however, meta-substitution predominates, although, owing to oxidation, a portion of the product now appears as meta-nitro-benzoic acid.

The two nitro-acetophenones when reduced gave the corresponding amino derivatives which were tested as dye-producing intermediates. When diazotised and coupled with β-naphthol-sulphonic acids the amino-acetophenones furnished monoazo dyes. Mordanting tests showed that azo dyes from ortho-amino-acetophenone did not behave as adjective colouring matters towards chromic and copper salts in spite of the contiguity of the carbonyl group to the hydroxy radicle. When, however, the acetyi group is replaced by carboxyl as in anthranilic acid, well-marked mordanting effects are obtained.

The negative result obtained with acetophenone-azo-β-naphthol dyes as regards mordanting throws considerable doubt on the validity of the hydrozy-azo constitution of these colouring matters, and affords support to the view that azo-β-naphthol dyes are really hydrazones of β-naphthoquinone-sulphonic acids. Moreover, this hypothesis furnishes a ready explanation of the mordanting effects obtained with the anthranilic acid azo dyes, which contain a lake-forming carboxyl radicle in close proximity to quinonoid oxygen.

Some Bactericidal Organo-Tellurium Derivatives.

In a paper entitled "Bactericidal Action of the Tellurium Derivatives of Aliphatic β-Diketones," by Professor G. T. Morgan, E. A. Cooper, and A. W. Burtt, it was stated that the tellurium β-diketones described in the preceding papers have been examined on micro-organisms with the following results:—

1. Tellurium dipropionyl-methane is the most active of the series, being bactericidal as regards *Bacillus Typhosus* in concentrations of the order of one in 40 millions.

2. The bactericidal power of these tellurium derivatives increases with the ascent in the homologous series of β-diketones.

3. Position isomerism plays an important part in determining bactericidal power, the orientation of alkyl groups affecting considerably the activity of the tellurium compound.

4. These tellurium compounds lose their strong bactericidal action in the presence of serum, but they retain their inhibitory power. Their germicidal action is, however, maintained in urine.

5. These compounds, and especially tellurium dipropionyl-methane and tellurium 3-methylpropionyl-acetone, offer promise of application as disinfectants in treatment of infective conditions of the urinary organs.

Condensation of Tellurium Tetrachloride with Diketones.

In a second paper entitled "The Interaction of Tellurium Tetrachloride and the Higher β-Diketones; Parts I., II., and III.," the authors, Professor G. T. Morgan, H. D. K. Drew, R. W. Thomason, and E. Holmes, said that although in the great majority of instances the metallic and metalloïdal derivatives of acetylacetone contain the organic group in the form of a univalent radicle, nevertheless in combination with selenium and tellurium the above-mentioned β-diketone furnishes bivalent radicles. The dichloro-tellurium derivative containing a bivalent radicle is readily reduced to tellurium acetylacetone, a bright yellow substance soluble in water and having outstanding germicidal properties.

On account of its singular chemical constitution and because of the bactericidal powers of tellurium acetylacetone, the condensation with tellurium tetrachloride has been extended to the homologues of acetylacetone. β-diketones containing normal branched chains give rise to dichloro-tellurium derivatives of the bivalent organic radicles. β-diketones containing alkyl substituents in the methylene group also yield these comparatively stable dichlorotellurium derivatives readily reducible to the active tellurium β-diketones. With branched chain β-diketones the tellurium tetrachloride condensation takes a different course, and the unstable tellurium derivatives contain only univalent radicles. The complex ketones diacetylacetone and dimethyl-dihydroresorcinol give rise to oxonium tellurichlorides. Ethyl acetoacetate gives rise only to an unstable tellurium derivative of a univalent radicle.

These experiments conducted over a wide range of β-diketones have thrown light on the chemical behaviour of these reactive substances, and have furnished a new group of tellurium derivatives having pronounced bactericidal and physiological action.

SOCIETY OF PUBLIC ANALYSTS.

AT the ordinary meeting held on Wednesday, November 7, Mr. P. A. Ellis Richards in the chair, a certificate was read for the first time in favour of R. C. Frederick and H. T. S. Britton. Certificates were read for the second time in favour of L. E. Campbell, J. T. Hannen, C. L. Hinton, D. W. Kent-Jones, T. W. A. Shaw, W. Hall Simmons, K. E. N. Williams, and P. N. Williams.

The Gold-Beater's Skin Test for Tannins.

In a paper on this subject by Phyllis H. Price, B.Sc., the author pointed out that as tanning consists in the fixation of the tannins by animal fibre, a reliable tannin test must demonstrate this specific property. Such a test was described from Dr. Nierenstein's laboratory by Miss E. Atkinson and Miss E. O. Hazleton (*Biochem. Journ.*, 1922, 16, 516). The method consists of the fixing of the tannin on gold-beater's skin, and consequently not stained. The author has further chloride, non-tannins not being fixed on the gold-beater's skin, and consequently not stained. The author has further developed the test and finds that it is possible to detect 0.00005 gramme of gallotannin in 1 c.c. of solution with the use of either ferrous sulphate, ferrous chloride, or amyl-nitrite fumes in place of ferric chloride. It was also noticed that on decolourisation with dilute hydrochloric acid, skins previously treated with pyrogallol tannins are completely decolourised, whereas those treated with catechol tannins have a reddish stain left on them. This is suggested as a test for phlobaphenes.

Determination of Nitrogen in Coal.

W. Donovan, M.Sc., in a paper on this subject, confirms the work of Fieldner and Taylor, Terres, Fleischer, and others who observed that the Dumas process as described in the report of the Research Committee of the Institute of Gas Engineers, and the Kjeldahl process, both gave low results, the former owing to incomplete combustion, the latter by loss of gaseous nitrogen. He points out that the Dumas process makes no provision for the complete removal of hydrocarbons. Concordant results are, however, obtained with the Dumas process (hydrocarbons having been completely removed) by the addition of a constant (0.2 per cent.) to the Kjeldahl figure, using mercury as a catalyst.

Colourimetric Estimation of Lead.

In a paper on "The Estimation of Lead in Potable Waters and in Urine," by John C. Thresh, M.D., D.Sc., F.I.C., it was stated that in estimating traces of lead in coloured moorland waters the influence of the colour is not always removed by making the standards with the same water diluted with distilled water. The presence of even one part of copper in 100 millions reduces the depth of the tint given by lead, and iron in solution also interferes with the colourimetric estimation of lead, and accounts for most of the discrepancies obtained with moorland waters. It is essential that the standard should have the same acidity and contain the same acid as the water or urine under examination. A sensitive method of testing for lead in urine was described.

A STUDY OF THE ABSORPTION TOWER.*

EFFECTS OF THE GAS VELOCITY.

By M. B. Donald and C. W. Tyson.†

IN the "sulphite" pulp industry, wood chips are cooked in a digester with sulphite liquor which consists of calcium and magnesium bisulphites together with free sulphurous acid, the best liquor being that which contains the most free acid.

In one system for preparing this liquor, milk of lime is converted into bisulphites in a plate absorption tower and then the additional SO_2 is added in a tile tower. It was with the object of determining the factors concerning the design of these towers that this research was carried out, and also to bring out, if possible, the factors underlying the general phenomenon of absorption of gases by liquids on a plant scale.

Previous Theoretical Work.

The first attempt to reduce industrial gas absorption to a quantitative basis was by Hurter (*J.S.C.I.*, Vol. 4, p. 639, and Vol. 6, p. 707), who, in 1885, showed that it depended mainly on the surface of contact between the liquid and the gas and divided the cases into three types:—

(1) The gas, divided into small bubbles, passes through a column of liquid.

(2) The liquid, divided into fine drops, falls through a column of gas.

(3) Solids, with extensive surfaces and interstices, are covered with the liquid, the gas filling the interstices.

In 1893 he put forward the idea (*J.S.C.I.*, Vol. 12, pp. 227, and 989) of rating absorption towers on the amount of contact surface which is available per unit volume of the gas for one second. This is independent of the form of the apparatus, and measures the amount of time which it allows for any molecule for traversing unit distance for the purpose of approaching the absorbing surface. The equation for counter-current transfer of material has been developed by W. K. Lewis (*J. Ind. Eng. Chem.*, Vol. 8, p. 825), and in its simplified form is as follows:—

$$\frac{W}{\theta} = \text{"ka"}\ V\ (\Delta p)_{ave},$$

where

$\frac{W}{\theta}$ = weight of substance transferred per minute.

A = area of "wetted" surface exposed to the gas.

k = proportionality constant.

$(\Delta p)_{ave}$ = average effective pressure tending to drive the gas into solution.

Since in most cases, such as spray chambers, for instance, it is difficult to measure the value of A accurately, the following equation is the more general form:—

$$\frac{W}{\theta} = \text{"ka"}\ V\ (\Delta p)_{ave},$$

where

V = volume of tower.

a = area of "wetted" surface per unit volume of tower.

On the assumption that the carrier gas has only a small percentage of absorbable gas, and that this follow Henry's law over the range dealt with, the average driving pressure can be shown to be the logarithmic mean of the driving pressure at the top and bottom of the tower.

F. G. Donnan (*J.S.C.I.*, Vol. 39, p. 236 T) in a similar theoretical discussion points out further assumptions made in deriving these equations, and claims that the absorption efficiency depends on:—1. High interfacial area. 2. High relative motion of gas and liquor within limits. 3. High degree of turbulent motion. 4. Sufficient rate of flooding to secure maximum drip effect.

As regards the expression $(\Delta p)_{ave}$, Partington and Parker (1919) and Thomas (*J.S.C.I.*, Vol. 41, p. 34 T) assume that the rate of absorption is proportional to the concentration of unabsorbed gas in the gas phase, and also that equilibrium is attained. In 1920 Donnan and Masson (*loc. cit.*) deduced that the rate of absorption was proportional to a concentration potential—*i.e.*, the difference in concentration of the gas in the solvent and its concentration in the inert carrier.

The view held by W. K. Lewis and his co-workers is that the potential should be a pressure one—*i.e.*, the difference between the partial pressure of the gas in the inert carrier gas and its partial pressure over the solvent. In the case of gases obeying Henry's law, such as oxygen and nitrogen in water, these two forms are identical, but in the case of sulphur dioxide dissolving in water both forms cannot be right.

W. G. Whitman and J. L. Keats (*J. Ind. Eng. Chem.*, Vol. 14, p. 186), from data on air conditioning apparatus, show that the effect of air velocity is small if air carries particles of water along with it, so that the relative velocity of the air with regard to the water is practically zero. Due to the fact that humidifaction and dehumidifaction of air gave different values for "ka," they brought forward the two-film theory, in which they recognised the existence of both a gas and a liquid film at the interfacial surface, each of which exerted a separate effect on the diffusion of the gas or vapour. Recent work has shown that by using solutions of glycerine and water the absorption is inversely proportional to the viscosity of the liquid.

F. Exner showed in 1876 that the rate of diffusion of a gas through a liquid film in still air is proportional to $\beta/\sqrt{d}$, where β = absorption coefficient of the gas and d = density of the gas.

Objects of the Present Investigation.

Gases, such as hydrochloric acid, which form maximum boiling-point mixtures, and consequently give fogs, require special treatment, and will not be considered: also cases in which a chemical reaction takes place, such as carbon dioxide in sodium-carbonate solution. The effect of velocity of the gas on the rate of absorption of the gas depends upon its degree of agitation, and hence would give better results for turbulent flow than for viscous or straight line flow.

Van Arsdel (*Chem. and Met. Eng.*, Vol. 29, p. 66 (1923)) suggests that the rate of absorption is only dependent on the velocity of the gas up to a certain critical "flow ratio" (*i.e.*, volume gas/volume liquid) and above that critical value on the velocity of the liquid. The amount of liquid used in these experiments was such as to ensure the flow ratio being below the critical value. Also from heat transfer experiments it appears that the effect of a gas impinging on a surface, such as a metal tube in an air heater, is about three times as great as when the gas flows parallel to it.

The value of the proportionality constant "k" therefore depends on the absorption coefficient, the density of the gas, and, also, some function of the relative velocity between the gas and the liquid. The following experimental data were determined in order to discover some facts concerning the effect of gas velocity.

Experimental Details.

A tower (made entirely of lead with flanged top and bottom which could be bolted down when the tower had been packed) was set up. The internal diameter of the tower was 8in., and the height from the bottom to the water inlet was 30in.

The SO_2 concentration of inlet and exit gases was determined by an Orsat, and the exit liquor concentration by titration with standard iodine in potassium iodide.

The vapour pressure of SO_2 over solutions of sulphurous acid was determined from the data given by T. H. Sims, and the partial pressure of the SO_2 in the gas from the barometric pressure and its concentrations, as determined in the Orsat. The dry SO_2 gas containing about 8 per cent. SO_2 was tapped off the main gas line where it was under pressure and measured by a $\frac{3}{4}$in. orifice in a 2in. pipe. The static pressure and temperature were measured after the orifice. The gas was then passed through a $\frac{1}{4}$in. lead coil in a barrel of water so that it could be brought to a constant temperature. The temperature, pressure, and analysis were taken about a foot from the inlet into the tower.

The water rate was kept constant at 45 c.c./min. when the ring spray was used, and increased to 85 c.c./min. when the spiral spray. It was fed into a 50-litre bottle from the city water supply at the same rate at which it flowed from the spray. The total head of water above the spray was 10ft. 6in., and the amount sprayed was controlled by adjusting a screw clamp near the tower.

Efficiency of Ring and Spiral Sprays.

The ring was of 6oz. $\frac{1}{4}$in. soft lead tubing, made so that the end of the tube was burnt on to the inlet pipe and thus formed a complete circle. The spray was pierced with small holes so that the water was sprayed horizontally against the walls of the tower. The rate was adjusted so that the

---

* Paper (slightly abridged) read before the Institution of Chemical Engineers on Wednesday, Nov. 14. The original paper contains five diagrams.

† Work done in partial fulfilment of the requirements for the degree of M.Sc. in Chemical Engineering Practice at the Massachusetts Institute of Technology.

walls had a continuous stream of water flowing down them, and it was found that by spraying the water on to a strip of paper instead of the bare lead a much better distribution was obtained. The wetted surface in this case was 5.23 sq. ft., and the free volume in the tower was 0.873 cub. ft.

A graph was plotted showing the values "ka" obtained by varying the velocity and temperature. The velocity was expressed relative to the tower, as it was almost impossible to get more than a rough estimation of the velocity of the gas *relative* to the liquor. The graphs both at 60° F. and 100° F. were straight lines.

The effect of varying the temperature and keeping the gas velocity constant was also graphically plotted. If the value of "ka" is corrected according to Exner's results it gives almost a horizontal line. As SO_2 does not follow Henry's law exactly at low partial pressures, the values for the absorption coefficient were taken for a partial pressure of 60mm. mercury when making the correction.

In order to decrease the effective area of the tower and thus give a greater relative velocity between the gas and liquid, a closed cylinder 27in. high and 6in. diameter, provided with four 2in. legs, was lowered into the tower and secured so that it was exactly in the centre. The slope of the linear graph obtained is very much less than that for those of lower velocities. This indicates that increase in velocity of the gas increases the rate of solution up to a point where one obtains a maximum effect.

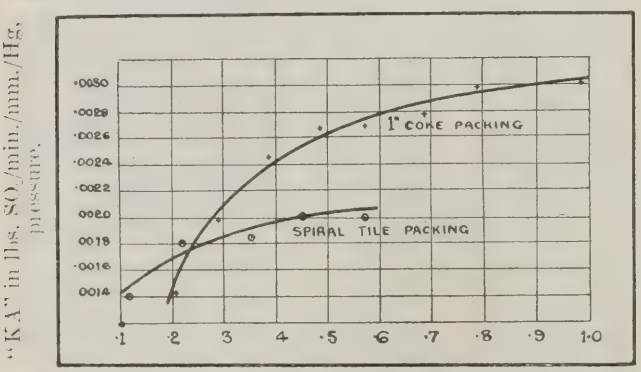
The ring spray was now replaced by a similar piece of lead pipe made into a spiral with the inside end joined on to the inlet pipe, as before, in order to ensure a fairly uniform delivery through all the holes. These holes were drilled facing downwards, and were 0.039in. diameter, about ¼in. apart, and 158 in all. This gave a wetted surface of approximately 3.62 sq. ft., and a free volume of 0.873 cub. ft.

Although the wetted surface by the spray method is smaller than that obtained by allowing the water to flow down the sides of the tower, yet it gave a very much better coefficient. This is probably due to the fact that the gas produces a greater effect by impinging on a surface instead of merely brushing past it.

Spiral Tiles and Coke Packing.

The spiral tiles used were 3in. spiral brick tiles, and the tower was packed with eight layers of four tiles each, staggered so that the gas could not go up through them. Three lead discs, 3in. diameter, were used as baffles at various points in the centre of the tower, which space would otherwise have been an unrestricted channel for the gas. When the tiles were taken out they were found to be wet all over, indicating efficient distribution by the spiral spray. The wetted area in this case was 14.2 sq. ft. and the free volume in the tower 0.546 cub. ft.

The tower was now filled for 26in. with 21lb. of 1in. diameter coke which had been previously used in towers for drying the sulphur dioxide and was fairly carefully graded. The coke was well washed with water and left in an atmosphere of SO_2 overnight before the runs were made. This gave a wetted area of 39.6 sq. ft. and a free volume of 0.329 cub. ft.



Velocity of Gas Relative to the Tower in Feet Per Second.

The results for the spiral tiles and the coke are shown in the accompanying diagram, the velocity of the gas relative to the tower being determined from the ratio of "free" volume to total volume. The curves obtained confirm some previous results by M. S. Salomon and W. S. Brackett, who worked on a similar tower filled with 3in. tiles, and with a concentration of SO_2 in the gas about 18 per cent., and showed that the velocity of the gas produced a maximum effect at about 12ft. per second.

Conclusions.

The effect of velocity of a gas giving a maximum value when impinging on a surface appears to be analogous to the operation of a sling psychrometer where, in order to get the wet bulb temperature of the air, the rate of evaporation of water from the wet bulb is kept constant by rotating the thermometer through the air above a certain definite speed.

It is also shown by the fact that the rate of solution of a salt in water is affected only by the velocity of the solution past it up to a maximum value, after which increased stirring produces no effect. Further experiments on the effect of gas velocity are required before it can be expressed as a mathematical function in the absorption-tower equation. They would probably take the form of varying the concentration of the absorbable gas, and also by substituting another gas, such as ammonia, etc., for the sulphur dioxide.

THE PREVENTION OF METAL CORROSION.

RIVAL PROCESSES TO PAINTING.

ON interesting lecture on "Corrosion" was given by Dr. U. R. Evans, of Cambridge, to the Oil and Colour Chemists Association on Thursday, November 8. Dr. Evans spoke not so much about corrosion from the point of view of the use of protective paints as from the point of view of other methods for preventing corrosion which, in a way, might have the effect of producing rivals to the use of protective paints. At the same time, he pointed out the disadvantages of some of these rival methods.

Plated Surfaces Must Be Covered Completely.

Whatever means was adopted for covering up a surface for this purpose, said Dr. Evans, it was most important that it should be completely covered, and the problem was to cover the inaccessible crannies and cracks. Generally speaking, it was more satisfactory to have a covering surface like a paint which was viscous at the time of application and gradually dried, than it was to use another metal in the form of a plating, for example, which solidified immediately after application. Another point in favour of paint was that even if a small portion of the surface was not actually covered, it was possible that no harm would result from corrosion, because supposing the part not covered was a "cranny" or slight crevice, the paint had actually covered the cathode and so prevented the formation of an electrical couple. On the other hand, if the covering material were nickel, the position of affairs would be far worse than if the nickel was not there at all, because the nickel itself would cause corrosion, and an electrical couple would be set up. It was for this reason that, for some purposes, it seemed to him a little doubtful whether the use of covering metals is quite as beneficial as is sometimes thought.

Corrosion of the Protecting Metal.

Another point against metallic coating to prevent corrosion was that the coatings themselves were by no means incorrodible. He (Dr. Evans) had exposed a large number of metals to atmospheres containing considerable amounts of such substances as hydrogen chloride, sulphur dioxide and ammonia, and in the presence of these gases, which occurred in industrial areas, the metals were attacked very quickly. In the presence of damp air only, the amount of corrosion was very slight indeed—almost negligible, in fact—but in the presence of these other substances, the rate of attack was very rapid. Of the different types of polluting agent in regard to metals, he had found that hydrogen chloride was the most fatal to zinc and aluminium, ammonia was the most fatal to copper and copper alloys, and sulphur dioxide was the most fatal to iron and nickel.

Electrical Conductivity of a Paint Film.

Regarding the types of covering with which paint chemists were most concerned, Dr. Evans said it seemed to him that mechanical rather than chemical considerations were of first importance. The first functions of a pigment are as a support for the vehicle, but there was no doubt that in many cases the pigment had a very specific action on the course of the corrosion. It had been shown, for instance, that

carbonaceous pigments tended rather to promote rusting, whereas certain basic and also chromate pigments tended to keep the iron passive, and to stop the corrosion of iron and steel. The action of the carbonaceous pigments was probably due to their setting up electro-chemical action where they came in contact with the iron. While he did not suggest that the electrical conductivity of the paint film is an absolute index of its value from the point of view of corrosion, yet he thought the determination of the conductivity would always be of interest, because if the conductivity were found to be very low, it would show, at any rate, that the film was continuous and that there was not much likelihood of electro-chemical action being set up.

Corrosion-resisting Alloys.

Another method of dealing with corrosion, which was a rival to painting, was the use of the new corrosion-resisting alloys which are supposed in many cases to need no paint. These could be divided into two classes—first, those metals which had low heats of oxidation, such as gold, silver, platinum, etc., which were too expensive to be considered for industrial purposes; and secondly, those metals which had high heats of oxidation, such as aluminium, tantalum, and many of the alloys containing chromium, of which stainless steel is only one. A great deal of research was going on in this connection, and, said Dr. Evans, we are likely to have much more reliable materials of this nature than have hitherto been provided. At the same time, he did not anticipate that these materials would compete very seriously with protective paints, and at any rate there would always be a wide field for the application of the latter.

In the course of a short discussion, the President (Dr. J. Newton Friend), speaking of the possibility of the pigment being electro-chemically active, said it must be remembered that, broadly speaking, there are two classes of pigment, the inert pigment and the fairly-soluble pigment, such as chromates and carbonates. So far as the former were concerned, if they were mixed with linseed oil they had an absorbed layer which tended to prevent any electro-chemical action, but in the case of other pigments, if the pigment dissolved in water then it could pass through the linseed oil film in the form of solution and so attack the iron. Worse than that was that a pigment dissolving became smaller and left mechanical holes in the linseed oil film, and thus the pigment tended to promote corrosion in two ways. He had found that whilst the addition of 5 per cent. of beeswax or paraffin wax was an advantage in the case of materials exposed to the air, it was not an advantage in the case of steel which was submerged.

SICILY AS A CHEMICAL PRODUCER.

THE ISLAND'S CONTRIBUTION TO THE WORLD'S REQUIREMENTS.

IT is well-known that the island of Sicily is one of the world's largest producers of essential oils of the citrus fruit. Messina is the chief mart for this industry, and there has been established in this town a well equipped analytical and consulting chemical laboratory, directed and staffed by English chemists. So many diverse samples pass through this laboratory that the chemists have gained unique experience of Sicilian products. We are indebted to two of the chemists of the Messina laboratory for the following general account of the Sicilian chemical industry.

Essential Oils of the Citrus Fruits.

It is estimated that at present there are about eight million lemon trees in the island, each tree, during an average season, producing about 800 lemons. The trees blossom in February, and during the maturing of the fruits during the long hot summer, it is necessary to use very elaborate means of irrigation, which in itself is quite an industry, and calls for power in all forms, from oxen and donkeys, to wind and electricity. The fruit ripens about November, and harvest extends over three months, according to the situation of the plantation. The same general remarks apply to the other citrus trees, such as sweet and bitter orange trees, tangerine trees, and bergamot trees in Calabria, except that all these ripen rather earlier, with a shorter harvest period. All these fruits are cultivated for export as such, and also for the production of the oil from the rinds and the acid from the juice. Bergamots, however, are cultivated solely for oil and acid, as the fruit itself is not edible. For export, great care is taken that only the best and soundest fruits are shipped. The rejected fruits are used for local consumption, and oil production.

It is estimated that at the present time half the total fruit production is exported as such, and the remainder converted into oil, and citric acid. During the last three years, Messina alone has exported an average of 1,320,000 English pounds net, of various oils. The U.S.A. are the largest importers, taking about 40 per cent. of this quantity, with England next with 25 per cent.

The different products prepared from the various citrus trees are:

Lemon oil, sold in practically every country of the world for use as a cheap and pleasant flavour in confectionery, and for the preparation of soft drinks.

Lemon juice, supplied to the various Governments for use in the navies as an antiscorbutic, also to various cordial makers.

Orange oil, sold for same purpose as lemon oil. It also appears in several pharmacopeias as a flavouring and tonic.

Mandarine oil, used in perfumery and for flavouring.

Concentrated lemon juice, used in several dyeing operations.

Citrate of lime, for manufacturing citric acid.

The Two Extraction Processes.

There are two general methods for the extraction of the oil from the skins of the various fruit. These are: (1) the sponge process; and (2) the machine process. Both processes aim at rupturing the oil sacs in the skins of the fruit and so liberating the oil. The oldest and most efficient method, although very costly, is that of the sponge. In this process, the fruit is chopped in halves, and from each half, the fruit or pulp is removed by means of a special spoon. Each half skin is then taken and pressed against a damp sponge of special fine texture. The oil sacs are broken, and the oil ejected on to the sponge where it is absorbed. The work is done by young men, and a good workman can press about 600 half skins per hour with a yield of about three fluid ounces of oil. If the fruits are ripe and the skins softer, as many as 1,000 halves can be pressed per hour with an average yield of five fluid ounces.

When one considers that the average production of lemon oil alone is about 800,000 English pounds, the extent of the industry can be appreciated if only in consideration of the stupendous number of lemons worked.

In the machine process, the whole fruits are put into a machine, where by a rotary or jigging motion they are passed over a kind of grater, thus rupturing the cells. Only a little oil is produced this way, and the product is by far inferior to that produced by the sponge method. Most of the citrus oils consist of terpenes, with other constituents present in small proportions, but which lend the various oils their characteristic odours and flavours.

Valuation of the Products.

Lemon oil contains from 3 to 5.50 per cent. oxygenated products, chiefly the aldehyde citral, and the remainder are terpenes. The citral content serves as a valuation of the oil, high citral oil being much more in demand than a low one. The B.P. has fixed 4 per cent. citral as a standard, but the citral contents vary greatly according to the district of production. The N. coast plantations produce a very poor oil, whilst a N.E. coast oil is invariably high in citral. Again, the citral varies according to the season, and a great amount of experimental work has yet to be done to decide which are the determining factors to account for the great differences.

In the case of orange and mandarine oils the flavouring matter is methyl anthranilate, and the valuation usually depends on the optical rotation before and after distillation of the oil. By this method it is easy to detect an admixture of 5 per cent. lemon oil—which, being much cheaper, is the common adulterant.

Lemons are pressed at all stages of maturity, as even when a lemon is ripe, the skin is sufficiently tough to withstand the pressure of the sponges without breaking. With oranges and mandarines, however, the case is different, as the skins of the ripe fruits break and no oil is obtained. These fruits must be pressed when green.

Concentration of the Oils a Modern Development.

All the oils are exported in tinned-iron, or tinned-copper containers, sealed under solder seals to exclude air. The oils are apt to oxidise very quickly when in contact with air and light, with the production of carvone and its allied bodies. As the oils present rather a large bulk for exportation, the business of concentrating the various oils has been developed lately. This is accomplished by distilling off the terpenes in high vacuum at low temperature. By this means the oils remaining in the stills contain all the main flavouring matters. A fairly good concentrated lemon oil contains upwards of 50 per cent. citral, and this concentrated oil is finding increasing favour in the mineral water business owing to its complete solubility in low-grade alcohol. Orange oil is concentrated down to about 5 per cent. of its original bulk, and is used for mineral waters, cordials, etc. Bergamot oil is reduced to about half its bulk, and is used in perfumery.

Calcium Citrate and Citric Acid.

In each extraction process there remains the pulp. In case of lemons this pulp is pressed, and the juice worked up to produce calcium citrate. In the other cases, such as oranges, this pulp is usually thrown away as, since the fruit is pressed when green, the juice contains gummy matter, and only small proportions of citric acid, which it does not pay to extract. The juice from the presses is run into large wooden tanks or coppers and brought to boiling-point, either by direct heat or steam coils. A juice so pressed gives about 6oz. to the gallon of citric acid, and some producers concentrate this in copper containers when it becomes dark brown and then contains 60-70oz. to the gallon. Milk of lime is added until the liquor is nearly neutral, the temperature being maintained as near boiling as possible. The approaching end-point is seen in the darkening of the juice due to formation of calcium pectate. The reaction is completed by adding a slight excess of calcium carbonate. The whole procedure is essentially crude and primitive, the average Sicilian maker usually working as taught by his father years ago. Very few, indeed, make use of the help of such simple tests as litmus or other test papers.

The calcium citrate settles out during the neutralisation and is then collected, pressed, and dried on iron trays in hot rooms. When dry it is a sandy coloured product, in lumps that are easily powdered. An average analysis shows that the final product contains 63 per cent. citric acid as calcium citrate, about 3 per cent. calcium carbonate, the rest consisting of fibrous pieces of lemon skin, etc.

The whole of calcium citrate produced must be sold to the Italian Government, who hold a monopoly of it,* and fix the price every November. The Italian Government themselves are therefore the only exporters of the product. The chief buying countries are the U.S.A., France, England, and Germany. We might add here that Sicily has the largest citric acid factory in the world located at Palermo, and we can say that the product is a very fine one indeed.

The Tartaric Products Industry.

The next great Sicilian industry is the wine industry, with its by-products of tartaric acid materials. Sicilian wines are amongst the strongest produced, as in a normal year it is possible to get wines of 14-15 per cent. alcohol by volume. A good percentage of these wines find their way to France, where they are used to strengthen weaker wines. In 1920 Sicily produced about 150 million gallons of wine, this being about eleven per cent. of the total Italian production for that year.

The wine lees deposited from the wine during and after fermentation is a valuable source of tartaric acid. The first solid that separates is the lees, which on analysis show 28-32 per cent. potassium bitartrate and 8-14 per cent. of calcium tartrate. After fermentation is completed and the wine settled clear from the lees, it is decanted into barrels and stored in cool cellars, to season it. During this seasoning process, which might extend over several years, argols, an impure bitartrate of potassium, separate out in a crystalline form.

These two products are practically our only source of tartaric acid, and are bought and sold on their content of potassium and calcium tartrates. The whole of this trade and industry is thus entirely controlled by analysts' reports and certificates. The crude material is bought for the manufacture of pure potassium bitartrate and tartaric acid, and is usually bought by citric acid manufacturers as the plants used for both acids are practically identical.

The Sulphur Industry.

Of course, the richest mineral deposits in Sicily are those of sulphur. This industry gives employment to about 100,000 men. The deposits are located in the centre of the island in the districts of Caltanisett and Girgenti, dry, arid, bare zones. The sulphur is found mixed with calcium sulphate and carbonate, and the actual amount of available sulphur in the rock worked varies from 15 to 40 per cent.

The method of extraction is by the calcarone or Gill kiln process, in which the sulphur rock is ignited, and the heat of combustion melts the sulphur from the surrounding pieces of rock. The average working losses are about 15 per cent. of the total sulphur. The Texas Gulf (Frasch) process has been tried on a small scale, but it has been found that when Sicilian rock is treated with super-heated water, the whole mass fuses without any actual separation of sulphur. Some attempts have also been made to use the flotation process, but with little success.

The average production of sulphur during the last few years has been round about 220,000 tons. Large quantities are used in Italy as a dressing for vines in conjunction with lime and copper sulphate. The present stock of refined sulphur in the island is about 275,000 tons, but now that Sicily has a working agreement with the Texas sulphur people, it is expected that all this will be sold in the course of a year, and that the production for 1924 will be augmented to 300,000 tons.

Liquorice Extract and Its Adulteration.

Amongst the minor industries that call for chemical attention is that of liquorice-extract manufacture. This industry is located chiefly in Catania and Palermo. The root of *Glycyrrhiza glabra* is extracted with boiling water, and the resulting extract evaporated down to the required consistency. An average analysis of the dried root is:—Water, 11.40 per cent.; soluble, 29.50 per cent.; and insoluble, 59.10 per cent. An average percentage analysis of the extract is:—Water, 12-18 per cent.; soluble in water, 55-70 per cent.; sugars, 10-12 per cent.; starches and gums, 20-30 per cent.; glycyrrhizine, 9-12 per cent.; and ash, or mineral matter, 6-8 per cent.

The very nature of the extract makes it an attractive proposition for the adulterator, and we know that such things as Indian figs, or prickly pears, carob beans, or locust beans, and different starches are boiled with the root to put up the extract. During the last few months another root has been employed in the boiling. This root is called locally Masticogni, and is of same family as liquorice, but is coarser and bigger. It has recently been reported from Sardinia that five people have been fatally poisoned by eating the root.

We were very fortunate in finding means of detecting the presence of this root very early. We found that a liquorice extract containing this root showed small crystals under the microscope, and these crystals were shaped like the compass needle—long, acicular, having the middle much broader than the ends.

The Indian fig extract can be detected by the presence of calcium-oxalate crystals, and the locust bean extract is detected by an excess of sugars. The different starches are detected by their granular formation. With a fair experience and an intelligible interpretation of analytical data, the chemist gets a fair idea as to the actual purity and composition of the juice. The juice is usually marketed in blocks of 7lb. or 2cwt., hence the trade name of block juice. A fair quantity is sent out in the form of sticks, but not so much as the block form. The general use for the blocks is for a certain class of beer, for manufacturing of sweetmeats, and for the manufacture of a certain class of smoking and chewing tobacco.

Crystal Structure of Beryllium Acetate.—In a paper which Sir William Bragg and Professor G. T. Morgan delivered to the Royal Society last night (Thursday, November 15), the authors stated that basic beryllium acetate has been shown by X-ray analysis to be a highly co-ordinated compound. The molecule is a perfect tetrahedron, having an oxygen at the centre, a beryllium atom at each corner, and an acetyl group associated with each edge. The crystalline structure is the same as that of diamond. The propionate forms a monoclinic crystal with a symmetry much less than that of the acetate.

PLATINUM IN MODERN INDUSTRY.

THE CARE OF LABORATORY APPARATUS.

SOME interesting data on platinum are given in a booklet of Baker and Company, Inc., platinum refiners and workers of Newark, New Jersey. The first reference in European literature to the metal subsequently given the name of platinum is in the book of Julius Scaliger, *Exercitationes Exotericae de Subtilitate*, published about 1600, in which he speaks of an infusible metal found in the mines of Mexico and Darien (Panama). The metal is first mentioned by name in Don Antonio de Ulloa's account of his travels to South America with a French astronomical mission, printed about 1748. The Spanish gave it the name "platina del Pinto," or "little silver of the river Pinto." It appears that the aborigines of the region had become fairly skilled in the manufacture of simple platinum ornaments, for many have been found in ancient graves, some even composed of a double layer of gold and platinum.

Discovery and Early Work on Platinum.

To the early Spanish gold seekers, platinum was a nuisance, and soon became a danger, for on account of its great density it could be used to counterfeit gold by covering it with a thin layer of the precious yellow metal. For this reason the Spanish Government took all possible precautions to prevent its exportation. The Spaniards did, however, make ornaments, etc., out of platinum, and a small amount was taken to England in 1742 by Charles Wood, who probably obtained it in Jamaica. The properties of the new metal were described before the London Royal Society in 1751 by Sir William Watson and Dr. William Brownrigg. This excited great interest, and gave rise to much study of the properties of platinum by all scientists who were able to obtain specimens. Scheffer presented a fairly full discussion to the Stockholm Royal Academy, and in 1755 Dr. William Lewis, before the London Royal Society, described in detail the occurrence of the ore, its solution and purification, the properties of the pure metal, and even of a few of its alloys.

The desirability of platinum dishes for chemical analysis was early recognised. The next important historical step was the manufacture of malleable platinum ingots by hammering white hot platinum sponge in a metal or clay mould. This seems to have been done independently by Knight of England and Chabaneau in France. Up till then platinum had been fused with a more volatile metal, such as arsenic or bismuth, which was subsequently driven off by baking or cupellation.

About 1819, heavy white metal grains of platinum were noticed with the washings from the gold mines in the Ural Mountains, and three years later rich deposits were found. In 1828 Russia began coining platinum money, but this was discontinued in 1845 because of the fluctuations in the value of platinum.

The modern method of melting platinum with the oxy-hydrogen flame was introduced by Dr. Robert Hare of Philadelphia, the inventor of the blowpipe itself, in the first decade of the last century, and in 1859 Debray and Deville in France introduced the use of a hollowed lime crucible and cover for the fusion of platinum.

Occurrence and Nature of Platiniferous Minerals.

Contrary to popular impression, platinum and its associated metals are widely distributed, although thus far they have been found in paying quantities in but few localities. Alluvial deposits have provided nearly all the platinum in use, though in a few localities it has been reported as found in quartz veins. Over ninety per cent. of the world's platinum has come from the Ural Mountains. Next to Russia, Colombia in South America is the biggest source. Owing to the dislocation in the Russian industry since 1917 Colombia has been the world's greatest producer (see the *Chemical Trade Journal and Chemical Engineer*, July 20, 1923, page 70). Traces of platinum, more or less promising have been found in California, Oregon, Alaska, Tasmania, Dutch East Indies, and Papua.

Crude platinum is usually found in the form of rounded or flattened grains or "sand," occasionally in irregular lumps of the size of peas; large nuggets are very rare—the largest as yet found weighing twenty-one pounds. The ore has a metallic lustre and is distinguished by its steel-grey colour, shining light grey streak when rubbed on a hard white surface, high specific gravity (16 to 19), malleability, infusibility in the hottest blast furnaces, and insolubility in any single acid.

Platinum ore is a complex body consisting of the metal in combination with varying proportions of the other members of the platinum group, such as iridium, rhodium, palladium, ruthenium and osmium, together with from four to twenty per cent. of iron. In alluvial deposits the ore is generally associated with iridosmine (a native alloy of iridium and osmium possessing a degree of hardness superior to that of hard-tempered steel), magnetic iron sand, chromite, garnet, epidote, and often with zircon, serpentine, ilmenite, peridot, quartz, diamond and chrysolite. In Russia the platinum-bearing sand is found at depths of between six and forty feet, the "reef" averaging less than a foot in depth, resting directly on serpentine bed-rock.

Total World Production.

It has been estimated that the production of platinum up to the present has totalled about 4,000,000 troy ounces, to which can be added about 400,000 ounces of the other metals of the platinum group. About one million ounces is probably in dental use, the same amount in chemical apparatus, about half a million ounces each in electrical instruments and jewellery, and about 400,000 ounces is in use as catalyst material. The metal used in dentistry disappears from commerce in appreciable amount with the burial of the human body.

Properties of the Platinum-group Metals.

Platinum itself is tin-white in colour, very ductile and malleable. It takes a very high, permanent polish. It is practically unoxidisable and unattacked by acids other than aqua regia. It can be oxidised by prolonged heating in oxygen, and is attacked by sulphuric acid at 250° C. It is obtainable in the form of "platinum sponge," which is finely-divided metallic platinum, and "platinum black," which has the power of absorbing very much larger quantities of hydrogen than the metallic form, though not so much as palladium.

Osmium was discovered by Smithson Tennant in 1804. It is found in platinum ores, and together with iridium is osmiridium. It has the highest specific gravity of any known material. It is the least volatile of the group, and has the highest melting point; but easily oxidises and passes off as the tetroxide, which is very poisonous. Crystalline osmium is not attacked by aqua regia, but the amorphous variety is soluble in it, and more readily in fuming nitric acid.

Iridium is one of the most useful of the group, for it is used to alloy with pure platinum to give it the hardness necessary for many technical applications. It also was discovered by Tennant in 1804. It is white, steel-like in appearance, and malleable at a white heat. Metallic iridium is not attacked by aqua regia unless alloyed with a considerable proportion of platinum. Rhodium is a hard, white metal, ductile and malleable at a red heat. It was discovered by Wollaston in 1803, and received its name from the distinctive colour of its salts. It is practically insoluble in aqua regia, but is attacked by chlorine and sulphur. It has a very important technical application in the Le Chatelier thermocouple.

Palladium, also, was discovered by Wollaston in 1803. It is silvery in appearance, and of about the same hardness as platinum, and ductile. It oxidises if heated to redness in air, but the oxide is again reduced at a higher temperature. It boils and volatilises as a greenish vapour at about 2,000° C. At ordinary temperatures it does not oxidise in air. It is easily soluble in aqua regia, concentrated nitric acid, and not so readily in other acids. The most interesting physical property of palladium is its great ability to occlude hydrogen, for, if heated in this gas, it can absorb over 800 times its own volume, and retains the hydrogen unless heated again in a vacuum. Ruthenium was discovered in 1845 by Claus, who made a very careful and detailed study of the Ural platinum ore. It is a white metal having a higher melting-point than any of the six with the exception of osmium, which it resembles in the formation of a volatile, poisonous tetroxide.

Adverse Effects of Iridium in Platinum Laboratory Ware.

Pure platinum being a very soft metal, it is generally necessary to alloy it with a small percentage of iridium, to render the various articles made from it of commercial service. Platinum with high percentages (*i.e.*, more than 10 per cent.) of iridium is attacked only slightly by chemical reagents, including aqua regia. In spite of this, it has been recommended for the past twenty-five years that platinum

ware, especially crucibles, which are frequently exposed to high temperatures, should have only a very small iridium content. The 1911 Report of the Committee of the American Chemical Society on the Quality of Platinum Laboratory Utensils, and the reports of the Bureau of Standards in 1915 and 1916, fully confirm the correctness of this opinion. Experiments at the Bureau of Standards have shown that platinum containing appreciable amounts of iridium begins to show serious loss in weight on heating to 900° C., and that this loss increases rapidly with the temperature. It was recommended therefore that the platinum used in crucible ware should show an E.M.F. against pure platinum of less than 1 millivolt at 110° C. (*i.e.*, should contain less than 0.3 per cent. iridium).

The Shimer Combustion Apparatus.

Among platinum articles of interest to chemists is the Shimer combustion apparatus. This apparatus, designed for the rapid determination of carbon in iron and steel, is in general applicable to the same class of chemical operations as the more costly platinum combustion tube, and the cumbersome and inefficient combustion furnace. It offers the advantages of neatness, reduction in the number of parts to be handled, diminished consumption of gas and time to effect combustions, and increased ease and accuracy of manipulation. It is indispensable when a large number of carbon determinations have to be made, and equally useful for determining combined water, carbonic acid, and for general ignition work in atmospheres of hydrogen, nitrogen, or other gases

The apparatus was patented in 1900 and 1901. It comprises a special form of platinum crucible having a water-jacketed top; water-jacketed tapered copper stopper and a rubber gasket sealing the joint between crucible and stopper. The necessary inlet and outlet tubes for flow of gases and cooling water are attached to both crucible and stopper. This construction and arrangement of parts permit heating the lower part of the crucible to the full temperature of a blast lamp without injury to the rubber gasket or security of the seal.

Platinum gauze and perforated sheet electrodes offer many advantages over the solid form. Great uniformity in current density is obtained; freer escape of disengaged gases; uniform deposit of metal entirely surrounding the solid portions of the submerged electrode, reducing losses from peeling and larger working current density, thus reducing time required for separation. Modern platinum electrodes are made without the use of rivets or gold solder, all joints and seams are welded.

Precautions in Working with Platinum Apparatus.

It is important to remember that, although platinum is not oxidised in the air at any temperature, nor attacked by any single acid, yet there are many substances that attack and combine with it at comparatively low temperature. The caustic alkalies, the alkaline earths, nitrates and cyanides, and especially the hydroxides of barium and lithium, attack platinum at a red heat, although the alkaline carbonates have no effect at the highest temperatures. Phosphorus and arsenic attack platinum when heated with it; therefore phosphates and arsenates, etc., should not be ignited in their filter paper in the crucible. Silicon, which may be formed by the reducing action of carbon on silica, causes brittleness. Contact with compounds of easily-reducible metals like lead is dangerous at high temperatures, because low-fusing platinum alloys are readily formed. Do not put platinum in the inner cone of the Bunsen flame; the carbon in this cone reacts with the platinum to form a carbide which causes brittleness and general deterioration.

The Cleaning of Platinum Utensils.

Every careful analyst of necessity uses clean utensils. The habit of cleaning and polishing platinum ware immediately after using is easily formed, and repays the user with increased confidence in his work, as well as with the prolonged life of the article. The loosening effect of the Bunsen flame upon the surface of platinum exposed to its action produces the familiar grey appearance which cannot be removed except by burnishing. Rubbing the surface of platinum with moist sea sand (round grains only), applied with the finger, serves to remove most impurities and to polish the metal, without material loss in weight.

Fusing bisulphate of potash or borax in the vessel and then boiling in water and polishing as above with sand is recommended by Gmelin. When it is desired to clean the outer surface of vessels in this manner, they must be placed in dishes of sufficient size to allow the fused flux to envelop completely the article to be cleaned

Sodium amalgam possesses the property of wetting platinum without amalgamating with it, even when other metals are purposely added to the amalgam. This substance, is, therefore, useful for effecting a quick and thorough cleansing of platinum. The amalgam is gently rubbed upon the metal with a cloth and then moistened with water, which oxidises the sodium and leaves the mercury free to alloy with foreign metals. The mercury is then wiped off and the article cleaned and polished with sand, as above described.

If the existence of a base metal alloyed with the platinum is suspected, immerse the article in question first in boiling hydrochloric acid for a few minutes; then, after thoroughly rinsing with clean water, in boiling nitric acid free from chlorine. If the article is unaffected in weight or appearance, and the acid baths fail to give reaction for base metals, the absence of such is assured.

AMERICAN NON-FERROUS METALLURGY.

A BRITISH METALLURGIST'S IMPRESSIONS.

IN the early part of this year, Dr. Walter Rosenhain, F.R.S. (of the National Physical Laboratory), visited America, primarily for the purpose of delivering a series of lectures on metallurgy. During his visit he had opportunity of seeing something of American science and industry in the North-Eastern States, and, in a lecture which he delivered to the London Section of the Institute of Metals, on Thursday, November 8, he gave some of his impressions of American practice in non-ferrous metallurgy.

He referred first to the electrolytic refining of copper as carried out by the great Anaconda Copper Co., at their works at Raritan (Perth Amboy). The crude copper reached the electrolytic plant in the form of anode plates. The refining was carried out in an enormous number of cells, operating simultaneously, large numbers being connected in series, and groups of them in parallel. The copper was dealt with on an immense scale, and the sheds in which the process was carried out covered literally acres. After being refined in this way the copper was retained in the form of cathode plates, which were stripped, and, as far as the greater part of them were concerned, were re-melted in furnaces.

Recovery of the By-products from Copper Plants.

An interesting feature of the process was the recovery of by-products from the resultant sludge, which included selenium and tellurium, gold, silver, platinum, iridium, and molybdenum, which were in turn carefully separated and refined. The copper was re-melted in furnaces in 300-ton lots, the selenium and tellurium handled in hundredweight lots, silver in pounds, gold in ounces, and platinum, iridium, and molybdenum in milligrammes. Dr. Rosenhain believed that the recovery of the by-products had a good deal to do with the commercial success of the whole operation.

The casting of the copper was done mechanically, the moulds being placed on a rotating table and brought under the pouring spout of the furnace. It was interesting to notice that the firing of the furnace was done by a single oil burner, which was sufficient to maintain the necessary temperature—viz., about 1,200° C. On re-melting, the copper contained a certain amount of sulphur; this was got rid of by oxidation, followed by a poling process.

Discussing the moulding arrangements, Dr. Rosenhain pointed out that the moulds for casting the copper were themselves made of copper, and he had been told that the ingots were not so sound when cast in other kinds of moulds. He personally was inclined to doubt that, and thought it was rather a case of "nothing like leather."

Quality a Secondary Consideration in American Practice.

The brass industry in America was centred mainly around Waterbury, Connecticut, apparently, because English brass makers had settled there originally. Actually, however, the brass industry was showing a tendency to migrate westward into more favourable surroundings. He had visited four large works near Waterbury, owned by the American Brass Co., the Scoville Co., the Bridgeport Brass Co., and the Chase Co., which, between them, turned out a volume of metal astonishing to our ideas. Quality, unfortunately, seemed to be rather a secondary consideration, since the

demand for quality did not exist. The Americans, when buying, say, a motor car, did not want one to last a lifetime, because in a few years it would be out-of-date, and would be replaced, so that it did not matter whether it was worn out at that time or not.

Wide Use of the Electric Furnace.

In describing the methods by which the exact proportions of the various metals were weighed and tipped into skips travelling along a roller path, and how the operations were checked by balances along the roller path, the lecturer said that the methods employed were so accurate that in these works they did not hesitate to make alloys containing aluminium alongside ordinary brass, although the brass founder hated aluminium as a poison in brass, because it tended to render his castings and ingots porous. The most striking feature was the extensive use of the electric melting furnace, in spite of the fact that the electricity had to be generated from coal or oil. The reason was that the slightly higher cost of energy was counterbalanced by uniformity of working and product, and diminution in the loss of metal by volatilisation, through the complete avoidance of over-heating. The type of furnace used largely was the Ajax-Wyatt, which was rapidly ousting all others from the brass foundry, but it was not used for high-copper alloys. One man looked after two of the Ajax-Wyatt furnaces and poured the metal into the moulds at perfectly regular intervals. The furnaces, however, had to be worked day and night, in order that they should not get cold, but this disadvantage did not appear to weigh heavily under American conditions.

The Aluminium and Nickel Industries.

Other metals dealt with were aluminium and nickel, and the lecturer referred to the great development of the aluminium industry in America, particularly at Cleveland, in the hands of the Aluminium Co. of America, under the scientific guidance of Dr. Zay Jeffries. He also pointed out that aluminium bronzes had been developed commercially, and were widely used. The nickel industry had suffered a very marked depression as the result of armament reductions, but, in spite of this, a remarkable new rolling mill for dealing with nickel had been installed at the Huntington (West Virginia) plant of the International Nickel Co. This was entirely electrically driven and controlled, the whole plant being operated by two men from a bridge overlooking the mill, by means of electric switches. This mill had been installed in an endeavour to counteract the devastating effect of the slump, and Dr. Rosenhain considered it very likely that it would succeed.

Neglect of Pure Scientific Research in Metallurgy.

The lecturer concluded with a reference to the general relation of science to the non-ferrous industries. His impression was that these industries were very ready to avail themselves of scientific methods and appliances—more so than is the case here—but that, on the other hand, America looked to England for metallurgical research and did not contribute adequately to the advancement of the science. As an example of their readiness to apply scientific knowledge in a practical manner, he mentioned that at the works of the American Brass Co., Hilger's spectrograph was used for the spectroscopic analysis of metals and alloys by means of the ultra-violet spectrum, whilst this instrument was also used with success at the Bureau of Standards, Washington. As regards real scientific research on metals, however, there appeared to be a lack of leadership and initiative, and it was admitted by Americans to be unfortunate and unsatisfactory that American metallurgy, both ferrous and non-ferrous, should look to this country for stimulus and guidance. Dr. Rosenhain commented on the deplorably low salaries paid to research workers there, however, which had resulted in trained men being attracted to industry, where they could command higher salaries. There was a very large turnover in the staff at the Bureau of Standards, and soon after the war whole divisions of that institution were entirely depleted of their staffs, owing to the rapid growth of industry. Many of the men in the colleges were booked up two years before the end of their curriculum, which would be a very refreshing state of affairs if it existed here. On the whole, while British non-ferrous industries had much to learn from America in regard to the application of scientific methods and results, labour-saving devices and organisation on a large scale, America showed decidedly less regard for the last refinements of high-quality materials, and did not sufficiently encourage or provide for the wider aspects of metallurgical research.

OUR BOOKSHELF.

Varnishes and Their Components. Robert Selby Morrell, M.A., Ph.D., F.I.C. Publishers: Oxford University Press (Frowde, Hodder and Stoughton); 25s. net.

We commenced to review this work with great expectations, and the further we got into the volume the more justification we found for these expectations, until, staid technologists as we are, we very soon became enthusiastic, above all things at the wonderfully skilful way the author blends very high chemical attainment with great experience in varnish technology. The contents of books of this type too frequently alternate between wordy theory and masses of brief recipes, or, at the most, scanty paragraphs which make them little better than workshop manuals. Dr. Morrell keeps the chemistry of the subject "going" all the way through, and he does this so well that it can never be abstruse or burdensome, even to readers of limited chemical knowledge. The author never fails to convince on the ever-present connection between chemical composition and properties. A very outstanding feature is the modernity of the work; there is an "up-to-the-moment-of-writing" flavour about theory, materials, and effects. Chapter 2 on "Catalytic Oxidation of Oils by Driers" is both concise and sound. The treatment of linseed oil and all the drying and semi-drying oils is much better than can be found elsewhere. Varnish resins, both natural and synthetic, provide a fund of information of the most practical nature conceivable. Bituminous substances are discussed with a wealth of essential detail. Varnish solvents, many of them new, or at any rate very modern, such as dekaline, tetraline, etc., are admirably treated from all points of view. The matter written at considerable length upon the properties and defects of varnishes is a feature which a less able author might well have shrunk from attempting. Spirit varnishes, followed by insulating varnishes and general analysis, complete about the most valuable "up-to-the-minute" technical book of this character available.

Kelly's Directory of the Chemical Industries, 1923. Kelly's Directories, Ltd., 186, Strand, London, W.C. 2; price, 30s.

The title of this old-established directory might legitimately have been extended or modified in order to do more justice to its comprehensive range of contents. Every druggist, drysalter, and manufacturing chemist in the British Isles is included, so far as we can judge, as well of course as the large and more exactly defined chemical manufacturers, and all appear both in local areas as well as under proper classified sections. To illustrate the value of an up-to-date directory, it is estimated that alterations in revising the previous edition amount to 41 per cent .of the total. The concluding section of the volume gives an excellent list of proprietary brands and articles together with makers' names and addresses.

Van Nostrand's Chemical Annual (1922). John C. Olsen (Editor). London: Constable and Co., Ltd.; 21s.

The fifth issue of this annual is of the usual marked accuracy. Many new compounds have been included, and many recent data added. About 46 new tables of wide general utility have been included. It would be difficult to discover any reference detail of the type that chemists want at their finger-ends every day which is not to be found in this very efficient handbook.

Blasting With High Explosives. W. Gerard Boulton. Sir Isaac Pitman and Sons, Ltd.; 5s. net.

A small book written largely with the object of showing the advantages and economy of high explosives over gunpowder in general operations, and also, of course, giving details of their relative value and mode of employment to the best advantage. Quarry owners, mineral proprietors, salvagers, and even farmers are types whom it should interest.

Oil Analysis, a Short Handbook of. Augustus H. Gill. London: J. B. Lippincott Company.

This, the revised 10th edition, includes a section on the examination of motor gasoline and a description of the latest model MacMichael absolute viscometer. Tests, methods of analysis, and description of special oils and greases have been revised where necessity has arisen. In every way this concise manual has been brought up to date.

ITEMS OF INTEREST.

Soap Works Destroyed by Fire.—Dixon's Soap Works, Rochdale, were completely destroyed by fire on Friday evening last. The damage is estimated at over £30,000.

Nobel Prize Awards. — The Nobel Chemistry Prize for 1923 has been awarded to Professor Pregl, of Jugo-Slavia, for his work in connection with micro-analysis. The physics prize has been awarded to Dr. Millikan, of California.

Proposed Coconut Product Factory in British Guiana. - The British Guiana Farmers' Conference has decided to ask the Government to establish a factory in Georgetown where full use could be made of the products and by-products of the coconut

Personal.—Mr. C. E. Gardner, chairman of Wm. Gardner and Sons (Gloucester), Ltd., was, on Friday last, unanimously elected Mayor of Gloucester for the ensuing year.—Mr. R. B. Pilcher, of the Institute of Chemistry, has been elected Treasurer of the Chartered Institute of Secretaries for the coming year.

Fuel Economy Progress.—We are informed by Meldrums, Ltd., of Timperley, that during October they have received orders for forced-draught furnaces for 16 boilers, mechanical stokers for five boilers, also seven refuse destructors, a steam disinfector, and a gas washer-scrubber to deal with 22 million cub. ft. per 24 hours.

Change of Address.—Owing to the large expansion of the merchant and export business of Chance and Hunt, Ltd., they have found it necessary to remove the London offices to more commodious premises at 5 and 7, St. Helen's Place, London, E.C. 3. Telegrams: "Amonicid Stock, London." Telephone: Avenue 8863 (5 lines).

Proprietary Medicines in South Africa.—By a South African Government Notice issued on September 29, the following articles, among others, are wholly exempted from the stamping requirements applicable to "patent or proprietary medicines": Carbolic oil, castor oil, cod liver oil, Epsom salts, glycerine, medicinal paraffin, and zinc ointment.

Business Notice.—Mr. J. E. Hewlett, Mr. T. Martin, Mr. A. Reid, and Mr. T. Tayler have been appointed directors of the Anchor Chemical Company, Ltd., of Clayton, Manchester. The founder of the business, Councillor T. R. Hewlett, J.P., will continue to act as chairman of the company, whilst he and Mr. T. Harry Hewlett will be the managing directors.

Patent Office in Japan.—Owing to the recent earthquake and fire in Tokio, the whole of the registers and almost the whole of the documents in the Patent Office were destroyed. The Japanese Consulate in London has asked the Institute of Patentees to make public the fact that the Institute have at their offices in Great Russell Street a copy of the laws and regulations promulgated with a view to avoiding any possible detriment or inconvenience to parties who may be concerned.

Artificial Wool Patent Litigation.—Artificial silk yarn composed of filaments inflated with air, and which appears to have tubes or bubbles inside the individual filaments, is sometimes referred to as "artificial wool." Patents purporting to protect such product have been taken out by the Frenchmen, Messrs. Drut and Rousset. Messrs. Courtaulds, Ltd., it is reported, have instructed their solicitors to take proceedings for revocation of these patents on the ground, *inter alia*, that this inflated yarn is nearly as old as the ordinary yarn with solid fibres.

Indian Groundnut and Sesamum Crops. — According to reports prepared by the Indian Department of Statistics, the total area of groundnut sown in the present season in the provinces of Madras, Burma, and Bombay is estimated at 1,687,000 acres, as against 1,855,000 acres (revised) at this time last year, or a decrease of 9 per cent. The sesamum forecast is based on reports from provinces, which contain on an average 99.6 per cent. of the total area under sesamum in British India. The returns in this forecast exclude estimates for the "mixed" crop of the United Provinces and for the late crops of Bengal and Madras. The total area so far reported for the present season is 3,016,000 acres, as against 3,432,000 acres reported at this time last year, or a decrease of 12 per cent.

Dr. Muspratt's Estate.—The net estate of the late Dr. Edmund Knowles Muspratt, of Seaforth Hall, Seaforth, Liverpool, president of the United Alkali Company, Ltd., and who died on September 1 last, amounted to £434,842. 15s. 1d.

Ship Fumigation Fatalities.—During fumigation of the French steamer Caroline in Havana Harbour five seamen were asphyxiated by hydrocyanic-acid gas, and seven others are reported to be dying. The gas percolated through loose plates into the engine-room.

American Indigo Prices for 1924. — E. I. du Pont de Nemours and Co. have announced contract prices on indigo 20 per cent. paste for 1924 delivery on the basis of 25 cents per lb., carload lots, f.o.b. shipping point, freight allowed. The new price is 1 cent. below the prevailing spot quotation.

Grant for Insulin Research Work.—The University of Alberta has received a grant of £2,000. from the Carnegie Foundation for research work. The grant is made with the particular purpose of enabling a continuation of the investigations of Dr. Collip, who was associated with Dr. Banting in the discovery of insulin.

Model Sugar Factory for Trinidad.—The Governing Body of the Imperial College of Tropical Agriculture are establishing and equipping at St. Augustine, Trinidad, a model sugar factory, towards which the British sugar machinery manufacturers are contributing plant to the value of £20,000. It is expected that the factory will be completed next year.

Reparation Dyestuffs Deliveries.—Representatives of the German dyestuffs industry have signed an agreement with delegates of the Inter-Allied High Commission by the terms of which the manufacturers pledge themselves to resume regular reparation deliveries in conformity with the manner prescribed by the High Commission. They also agree to Customs control over the despatch of goods from the factories.

British Order for Oil Tanks.—The Admiralty have placed a repeat order with the Tees-side Bridge and Engineering Works, Middlesbrough, for 12 oil tanks, with a capacity of 3,000,000 gallons each, to be erected abroad. The order is to be completed by May, 1925. The whole of the steel plate and sections required for the tanks will be manufactured on Tees-side, and will thus provide a great deal of employment.

Tariff Changes. — New regulations governing the manufacture and sale of pharmaceutical specialities in Spain are to be drawn up, and to come into operation on January 1 next. In the meantime, as from November 1, the importation of foreign pharmaceutical specialities is to be permitted only under special orders or authorisation from the Spanish Direction General of Health. The dumping duty on caustic soda originated in or exported from the United Kingdom is applied on its importation into the Commonwealth of Australia. The duty is applied to all such caustic soda entered for home consumption on and after August 4, 1922.

The British Empire Exhibition.—Elaborate arrangements are being made for organised parties to visit the British Exhibition at Wembley next year. The railway companies will run special excursions to London at reduced rates from all the principal stations in the country, and special reduced rates of admission are being given by the exhibition authorities for organised parties booked before March 1, 1924. It is also announced that the various sections of the gas industry have combined, and have taken a space of 12,500ft. in the Palace of Industry. Mr. D. Milne Watson, governor of the Gas Light and Coke Company, Ltd., is chairman of the British Empire Gas Exhibition.

The Van der Waai Equation.—Dr. J. H. Jeans, secretary of the Royal Society, who delivered the Van der Waals Memorial Lecture before the Chemical Society on Thursday, November 8, gave an interesting discussion of the Van der Waal Equation. He pointed out that the a and b of Van der Waals admit of exact interpretation in terms of the physical conception of to-day. His b arises from what may be called the quantum forces—the perfectly unyielding restraints which bind the electrons to definite orbits within the atom—while his a arises from the ordinary electric fields of force. It is the b of Van der Waals which saves us from immediate annihilation through positive and negative charges rushing together to their mutual destruction, just as it is his a which saves us from rapid disintegration.

COMING EVENTS.

Institution of the Rubber Industry.—Annual meeting and dinner, **Friday, November 16,** at the Hotel Victoria, London.

Institute of Chemistry (Glasgow Section).—Discussion, **Friday, November 16,** at the Royal Technical College.—**(South Wales Section):** Annual general meeting, **Friday, November 16,** to be followed by dinner.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, November 16.** Paper: "Investigations into the Changes which Occur in Cotton Fabrics During Calendering and Beetling," by J. Huebner and V. Malwin.

Institute of Metals (Swansea Section).—Meeting, **Friday November 16,** at **7.15 p.m.,** at University College, Singleton Park. Paper: "The Density of Alloys," by Professor Thomas Turner.

Society of Chemical Industry (Chemical Engineering Group).—Meeting, **Friday, November 16,** at **8 p.m.,** at the Chemical Industry Club, 2, Whitehall Court, London, S.W. 1. Paper: "A New Source of Potash and Its Industrial Exploitation," by Professor J. W. Hinchley.—**(South Wales Section):** Meeting, **Friday, November 16,** at **7.15 p.m.,** in the Technical College, Mount Pleasant, Swansea. Paper by E. A. Tyler.

Institution of the Rubber Industry. — Meeting, **Monday, November 19,** at **7.30 p.m.,** at the Midland Hotel, Manchester. Paper: "Costing in the Rubber Industry as an Essential Factor to Successful Production," by C. A. Fryer.

Society of Dyers and Colourists (Midlands Section).—Meeting, **Tuesday, November 20,** at Leicester. Paper: "Bleaching with Hydrogen Peroxide," by I. E. Weber.

Institution of Civil Engineers. — Meeting, **Tuesday, November 20,** at **6 p.m.,** at Great George Street, Westminster,S.W. 1. Paper: "The Tides from an Engineer's Standpoint," by E. W. Hollingworth.

Society of Glass Technology. — Meeting, **Wednesday, November 21,** at the University, Leeds.

Institute of Chemistry (London Section).—Annual general meeting, **Thursday, November 21,** at **7.45 p.m.,** at 30, Russell Square, W.C. 1. Discussion: "The Relationship Between Employers, Works Chemists, and Consultants," to be opened by Dr. W. R. Ormandy.

Society of Dyers and Colourists (London Section).—Meeting, **Thursday, November 22,** at **7 p.m.,** at the Dyers' Hall, Dowgate Hill, E.C. 3. Paper: "Macbeth Artificial Daylight, and the Fade-ometer," by A. D. Lang.

Society of Chemical Industry (Glasgow Section).—Meeting, **Friday, November 23,** at **7.15 p.m.,** at 39, Elmbank Crescent. Paper: "Artificial Resins: Their Preparations and Uses," by Dr. H. Hepworth.—**(Manchester Section):** Annual dinner, **Friday, November 23,** at **7.30 p.m.,** at the Queen's Hotel.

West of Scotland Iron and Steel Institute. — Meeting, **Friday, November 23,** at **7 p.m.,** at the Royal Technical College, George Street, Glasgow. Paper: "Effects of Time and Temperature on High Speed and Similar Steels," by W. E. Woodward.

Institute of Chemistry (Bristol Section).—Meeting, **Saturday, November 24,** at Exeter. Papers by A. Marsden and F. Southerden.

Faraday Society.—Meeting, **Monday, November 26,** at **3 p.m.,** at the Institution of Electrical Engineers, Victoria Embankment. Discussion: "Electrode Reactions and Equilibria."

Society of Dyers and Colourists (Leeds Junion Branch).—Meeting, **Monday, November 26.** Paper: "Works Filtration," by Dr. Forster.—**(West Riding Section):** Meeting, **Thursday, November 29.** Paper: "The British Dye Industry," by Dr. H. Levinstein.—**(Midlands Section):** Meeting, **Thursday, November 29,** at Nottingham. Paper: "Bleaching with Hydrogen Peroxide," by I. E. Weber.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, November 27,** at **7.45 p.m.,** at the Hull Photographic Society's Rooms, Grey Street. Paper: "Recent Advances in Colloid Chemistry," by A. V. Slater.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, November 30,** at **7 p.m.,** at 36, George Street,

BRITISH OVERSEAS CHEMICAL TRADE.

OCTOBER IMPORTS AND EXPORTS.

ACCORDING to the Board of Trade returns, trade in chemical and allied products during October increased in value, both on import and export account, as compared with the previous month. Imports were valued at £1,245,916., against £1,023,552. in September, and £966,212. in October, 1922. Exports amounted to £2,572,881., against £2,341,761. in September, and £1,590,287. a year ago. The quantity figures of imports and exports of selected products are given in the table below :—

IMPORTS—Increases on September Quantities.

		1923. October.	September.
Acetic acid (including acetic anhydride)	tons	537	475
Boron minerals	,,	1,757	259
Calcium chloride	cwts.	87,509	65,526
Dyeing extracts	,,	9,457	8,610
Manganese ore	tons	76,336	36,709
Mercury	lb.	179,779	44,459
Nickel oxide	cwts.	6,656	1,500
Potassium c'p'ds (except nitrate)	,,	325,474	251,714
Pyrites	tons	28,273	15,260
Rosin	cwts.	131,226	123,307
Sodium nitrate	,,	109,142	91,408
Sodium c'p'ds (except nitrate)	,,	24,462	16,661
Turpentine	,,	100,686	49,203
White lead	,,	10,561	7,574
Decreases on September Quantities.			
Barytes, ground	cwts.	49,135	52,900
Bleaching materials	,,	2,285	3,907
Borax	,,	2,555	3,878
Cream of tartar	,,	2,871	2,912
Glycerine, crude and distilled	,,	3,524	6,902
Gums and resins (except rosin)	,,	16,868	19,761
Indigo, natural	,,	—	74
Paraffin wax	,,	64,578	66,034
Petroleum, crude mineral	galls.	31,907,825	35,995,347
Phosphate of lime	tons	21,181	32,373
Potassium nitrate	cwts.	12,352	27,119
Sulphur	tons	7,982	9,861
Tanning extracts	cwts.	70,933	90,299
Tartaric acid (including tartrates not elsewhere specified)	,,	60	915
Zinc oxide	tons	451	522

EXPORTS—Increases on September Quantities.

Ammonium sulphate	tons	26,587	23,858
Barytes, ground	cwts.	8,148	2,735
Benzol and toluol	galls.	424,599	142,603
Bleaching powder	cwts.	31,918	28,028
Carbolic acid	,,	15,694	12,656
Caustic soda	,,	145,967	116,180
Cement	tons	77,938	48,454
Copper sulphate	,,	340	116
Disinfectants, insecticides, etc.	cwts.	48,279	43,273
Dyes, coal-tar	,,	16,224	14,313
Glue and size	,,	16,128	11,534
Glycerine, distilled	,,	9,653	8,195
Naphtha, coal-tar	galls.	29,456	14,583
Naphthalene	cwts.	21,314	18,122
Pitch, coal-tar	tons	36,208	8,695
Potassium chromate and bichromate	cwts.	3,815	3,604
Potassium compounds (except chromate and bichromate)	,,	5,545	4,053
Salt (other than table)	tons	34,050	30,287
Sodium sulphate	cwts.	187,031	157,456
Tar, coal	tons	770	452
Tar oil, creosote, etc.	galls.	7,250,372	4,580,427
Tartaric acid (including tartrates not elsewhere specified)	cwts.	2,422	2,003
Decreases on September Quantities.			
Ammonium chloride	tons	266	402
Paraffin wax	cwts.	17,448	20,567
Sodium carbonate	,,	375,804	473,801
Sulphuric acid	,,	2,707	2,983
White lead	,,	15,988	16,944
Zinc oxide	tons	240	247

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN OCTOBER.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of October, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the returns.

FERTILISER NEWS.

Nitrate of Soda.—One of the questions at present occupying the attention of the Chilean nitrate producers is that of extending the scheme of propaganda entered on by the Producers Association. The lack of such propaganda, or the inefficient use made of the funds allotted for that purpose, was the occasion of an attack made by the chairman of a nitrate company at a recent meeting. It is generally considered, therefore, that the consumption of Chilean nitrate could be greatly increased if more propaganda on a commercial basis were conducted. At the present time, the Association is said to spend approximately £200,000. per annum in this way, towards which the producers subscribe £160,000. and the Chilean Government £40,000. The principal expenditure is incurred in connection with the United States and Canada, France, Belgium, and Holland, the United Kingdom and Spain, a committee in London, it is stated, being responsible for the distribution of the money. In view of the re-opening of this question, delegates of the Nitrate Committee in London, and the United States are now in Chile, and consultations are taking place in Valparaiso with the idea of giving fresh impetus to propaganda. South Africa and New Zealand, countries which have not hitherto taken much nitrate, are to be attempted, and negotiations are proceeding to that end. While the nitrate interests have not lost their faith in a renewed steady demand for nitrate, they are concerned about the difficulties of increasing production. Efforts are being made to ensure a supply of satisfactory labour against the time when more oficinas will be working, but as the Chilean workman progresses, his desire for a higher status increases proportionately as his knowledge of the huge profits which have been made, increases. In this connection, it is refreshing to read the remarks by the chairman of the Santiago Nitrate Company at the annual meeting on Tuesday, abstracted on page 588 of this issue.

Sulphate of Ammonia. — The export market for this product, contrary to the domestic trade, continues to be very active, and the October shipments, as given in the Board of Trade returns, show a very high tonnage taken by overseas customers. During the month, 26,587 tons were shipped, against 23,858 tons in September, and 9,659 tons in October of last year, when, however, the demand from Japan was entirely lacking. Signs of the dislocation in that country consequent upon the earthquake are evident in the reduced export figure for October, much of the material destined for that country—probably contract purchases—having been diverted to other parts. Japan was our best customer in September, taking 9,571 tons, but in October, only 3,646 tons were despatched, and it is probable that the current month will see a further diminution. In October, however, Spain and the Canaries hold first place with 6,499 tons for the month, compared with 5,821 tons in September, and 4,221 tons last year. That country has been a much better buyer this year than was the case in 1922, in no small part due to the lack of offers from America at a price able to compete with the low figure demanded by British producers. Spain's imports of sulphate from the United Kingdom during the 10 months of this year are more than double the tonnage for the corresponding period of 1922. A revival in shipments to the Dutch East Indies is recorded, 4,305 tons in October against 700 tons in September. Here again, last year's total is added to considerably in 1923. The demand from France is maintained at 3,359 tons, nearly 400 tons short of the September figure. Since January 1, 24,570 tons have been imported by France from this country, a very satisfactory total considering the distribution of reparation sulphate obtained from Germany, and the increasing home production. Yet another market which indicates the difficult position of American exporters is the West Indies. Previously, supplies had been furnished mainly from the United States, but it is found cheaper to purchase the British product in spite of the freight charges. Imports from the U.K. therefore, reached 1,094 tons against 132 tons in October, 1922, bringing the total for 1923 up to 8,925 tons. Italy accounted for a greatly increased quantity, taking 949 tons compared with 75 tons in September. Other countries, not separately specified in the returns, took 6,735 tons against 3,284 tons in September and 1,431 tons in October last year. Export figures for the ten months show 211,593 tons for 1923, and 113,280 tons for 1922, Japan accounting for almost 50,000 tons of the increase, and Spain, over 33,000 tons.

Other Fertilisers.—Basic slag and superphosphate are attracting some attention, and the former is in rather better demand on home account. The state of trade in the latter industry is, however, far from good, and imported material is constantly coming in and underselling the British product. In spite of the present situation, the statistics issued by the Board of Trade indicate only the exports of this commodity, so that it is difficult to estimate the real danger, not to the superphosphate industry alone, but to the sulphuric acid industry which is also working very much under capacity. Exports during October amounted to 815 tons, against 421 tons in September, making a total for 1923 (ten months) of 9,296 tons, compared with 4,939 tons for the same period in 1922. When it is remembered that the exports in 1913 amounted to 63,500 tons, and in 1912, 88,890 tons, the extent of the depression may better be realised. In basic slag, of course, the position is rather different, changes in the manufacture of iron and steel accounting for the small exportation as compared with pre-war figures. Exports during October increased to 1,826 tons, making the 10 months figure some 19,344 tons, against 6,183 tons in 1922. This threefold increase is mainly due to the great activity in the iron and steel industries during the first half of this year. Pre-war statistics show that in 1913, 165,100 tons were exported, and 49,313 tons imported, so that post-war imports have increased somewhat to meet the agricultural demand in this country. During the ten months ended October 31, 1923, 76,544 tons of slag were imported, comparing with 57,751 tons in the previous year. Imports of phosphate rock were much lower in October than in September, but compound manures, including guano, bone meal, etc., have been exported in greater quantity this year than in 1922.

Synthetic Nitrates in New Zealand.—Steps are being taken by a group of New Zealand capitalists to investigate the commercial practicability of fixing atmospheric nitrogen. It is proposed to establish works at a suitable site at Bowen Falls, West Coast. The proposed works are to be modelled on those of Germany engaged in the manufacture of nitrates from atmospheric nitrogen. The venture is receiving the full consideration of the Government, in whom the sole rights of the use of water for such purposes is vested. It is reported that the capital required for the works is already assured.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Bedford Chemical Company (1922), Ltd.—Registered October 26, deb., to Lloyds Bank, Ltd., securing all moneys due or to become due to the bank.

Bigsbys (Mitcham), Ltd., ink and varnish manufacturers. —Registered October 19, £4,000. deb., to T. O. King, 55, Manor Park, Lee.

Dodgson White, Ltd., London, S.E., manufacturers of anti-fouling paint, etc.—Registered October 23, £500. debs.

Northampton Glue Company, Ltd.—Registered October 24, £8,000. (not ex.) deb., to Westminster Bank, Ltd.

Standard Brick and Terra Cotta Company, Ltd., Buckley (Ches.).—Registered October 18, £5,000. deb., to Branch Nominees, Ltd., 15, Bishopsgate, London, E.C.

Wood Distillation (England), Ltd., Coleford.—Registered October 26, £9,600. deb., to E. B. Richardson, Potto Hall, Northallerton.

Wray's Drug Company, Ltd., London, W.C.—Registered October 25, £400. deb., to Mrs. O. H. Keen, 10, Ruskin Mansions, Queen's Club, London, W.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Lambeth Glass Works, Ltd., London, E.C.—Resolved October 24: That the company be voluntarily wound up. C. A. Low, Broad Street-ho., London, E.C., liquidator.

London Dye Manufacturing Company, Ltd.—W. G. Wilson ceased to act as receiver October 24.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Reid and Robertson (Alex. Reid and Wm. Robertson), 68, Hydepark Street, Glasgow, sheep dip manufacturers. October 31. Debts by A. Reid, who continues. (November 2.)

REPORTS OF COMPANIES.

Santiago Nitrate Company, Ltd.

The annual meeting was held in London on Tuesday last, Mr. Edward Eyre (the chairman) presiding. The Chairman, in moving the adoption of the report and accounts, dealt with the Chilean labour question as follows:—It would appear that to satisfy the world's supply for next year the output will have to be materially increased. To what extent this is possible depends on the not over-abundant labour available, and on its disposition to render steady, continuous, and efficient service.

In this connection I referred last year to the steps that were being taken to improve the conditions of the workmen. All these, however, deal exclusively with the physical welfare of the labourer and are undoubtedly laudable, but if it is hoped that through those means alone a better understanding between the employer and employed in the nitrate—or, for that matter, in any other—industry is to be looked for, disappointment, I fear, awaits us. Employers of labour on the pampas should encourage and assist the moral well-being of their employés, appealing to the Chilean traditional religious feeling, if for no other reason than that of self-interest.

Wall Paper Manufacturers, Ltd.

The report for the year ending August 31 last states that the profit, after making a reserve for corporation profits tax, is £635,681., to which has to be added £114,696. brought from last year's account, and that, after payment of interest upon debenture stock and interim dividends to preference and ordinary shareholders, and income tax, the amount available for further appropriation is £621,173. The directors paid a final dividend on the preference shares on October 31 and they now propose a final dividend on the ordinary shares at 6 per cent., making, with the interim dividend already paid, 10 per cent. for the year; to pay a dividend on the deferred shares for the year at 10 per cent., to transfer £100,000. to reserve fund, leaving £223,088. to be carried forward. The profit of £635,681. compares with £701,595. a year ago and with a loss of £878,600. for 1920-21. The dividend of 10 per cent. on the ordinary shares repeats last year's figure, but the deferred distribution of 10 per cent. compares with 5 per cent. for 1921-22. The allocation to reserve is unaltered, whilst the carry-forward exceeds that of last year by £108,388.

Amelia Nitrate Company, Ltd.

For the year to June 30 last gross trading profits £3,647., plus income on investments, over-provision of income-tax, and transfer fees £42,428., and £3,712. brought in, making £49,787. Administration expenses, interest, stoppage expenses, loss in exchange, and loss on realisation of old nitrate stocks totalled £41,037., leaving £8,750. After payment of preference dividend, there remains £5,750., which directors propose to carry forward. Report adds trading profit resulted entirely from iodine, but greater part of old expensive nitrate stocks has during year been realised (though at a loss), while balance of these stocks brought into new year will, on realisation, show a reasonable profit. The company restarted production in June last, and with this resumption of activities it hopes to have safely overcome past nitrate crisis, and the consequent prolonged and costly stoppage. It is proposed to subdivide the ordinary £10. shares into shares of £1. each, and resolutions will be submitted.

Weardale Lead Company, Ltd.

The report for the 12 months ended September 30 states that 2,906 tons of dressed lead ore and 7,178 tons of fluor spar have been produced. This compares with 2,420 tons and 6,741 tons respectively in the previous year. The profit, including income from investments, is £14,802. After providing for income tax, etc., and bringing into account the balance brought forward, less £362. as shown in the appropriation account, the total amount to be dealt with is £14,875. Out of this sum an interim dividend of 6d. per share has been paid, amounting to £2,447., leaving a credit balance of £12,427. The directors recommend a final dividend of 1s. 6d. per share (making, with the interim dividend already paid, 10 per cent. for the 12 months), which will absorb £7,343., leaving to carry forward £5,083.

Cellulose Holdings and Investment Company, Ltd.

The report from May 4, 1922, the date of incorporation, to June 30, 1923, discloses a net profit for the period, after meeting expenses, interest on debenture stock, making provision for taxation and debenture stockholders' participation in profits, of £4,359. Preliminary, formation and new issue expenses amounting to £3,825. have been written off, leaving a balance of £534. to be carried forward. In order to assist in providing the funds required to enable the company to subscribe for an additional £400,000. first mortgage debenture stock of the British Cellulose and Chemical Manufacturing Company, Limited, a further amount of £250,000. participating first mortgage debenture stock has been issued, together with an additional 62,500 ordinary shares of the company.

Lawes' Chemical Manure Company, Ltd.

Directors' report for the year ended June 30 states that the fall in prices, to which attention was drawn in the last report, has continued. There has been a serious falling off in the consumption of fertilisers and other articles manufactured by the company, which has caused a material reduction in the volume of sales as compared with previous years. Foreign competition in the company's main product, assisted by continued depreciated Continental exchanges, was felt with increased severity during the year. The directors regret that, in spite of every effort on their part, the heavy loss of £22,294. has to be reported. They recommend that £19,511. be written off the contingent fund created as a reserve during good years, thereby closing that account. The balance of £2,782. to be carried forward.

Santa Catalina Nitrate Company, Ltd.

The report for the year ended June 30 states that profit and loss account shows a gross profit of £21,742. After deducting London expenses, £1,737., and charging stoppage of works expenses £4,423., starting-up expenses £1,224. and repairs £3,145., there remains £11,211., to which has to be added the balance brought forward, £722., making a total of £11,934. Deducting interim dividend of 5 per cent. (1s. per share) paid in June last, £3,950., leaves to be dealt with £7,984. Directors propose payment, on November 23 next, of a further dividend of 10 per cent., making, with the interim dividend, 15 per cent. for the year, carrying forward the balance of £84. Manufacture of nitrate was resumed on March 1 last.

Lagunas Nitrate Syndicate, Ltd.

Report for the 12 months ended June 30 last shows a gross profit of £50,130., from which have been deducted London expenses, income tax, corporation profits tax, and provision for North Lagunas stoppage expenses, £17,151.; debenture interest, £10,482.; leaving a balance of £22,496., which has been transferred to the sinking fund in accordance with the resolution of the debenture-holders of December 14, 1914. Oficina North Lagunas has not yet been re-opened, but it is probable that working operations will be resumed in the course of next year.

Liverpool Nitrate Company, Ltd.

Profits for the year ended June 30 were £41,009., and £17,221. was brought forward. Expenses in connection with the increase of capital absorbed £6,454., and a final dividend of 2s. per share is proposed, making 3s. per share for the twelve months, and carrying forward £15,895. Shareholders are offered the remaining 57,725 shares at 50s. per share.

DIVIDENDS.

Aluminium Corporation, Ltd.—Dividend 7 per cent., less tax on preference stock and shares for year, carrying £6,696. forward.

London Nitrate Co., Ltd.—Final dividend of 1s. 6d. per share, making 2s. 6d. per share, free of tax, for the year. A sum of £30,000. is transferred to reserve for redemption of debentures.

Mount Lyell Mining and Railway Co., Ltd.—After allowing for dividend tax and income taxes £21,031., depreciation £50,712., and mine prospecting £4,120., operations for year to September 30 last resulted in net profit of £151,002. Dividend No. 31 of 1s. per share, less tax.

Amalgamated Zinc (De Bavay's) Co., Ltd.—A dividend of 1s. per share, less tax, will be paid on December 5 to members on the London register on November 20.

"Sanitas" Co., Ltd.—Interim dividend at rate of 9 per cent. per annum on preference, payable December 1.

LEGAL INTELLIGENCE.

ASSESSMENT OF DAMAGES IN RAINHAM EXPLOSION CASE.

Belvedere Fish Guano Company, Ltd. *v.* Rainham Chemical Works.

The explosion at the Rainham Chemical Works in 1916 was the subject of proceedings before Mr. G. A. Scott, High Court Official Referee, who, on November 8, was asked to assess damages claimed by the Belvedere Fish Guano Company, Ltd., for injury to their buildings and plant by the explosion. The defendants, on land adjacent to the plaintiffs' works at Rainham, carried on the business of manufacturing picric acid from dinitrophenol. This being a dangerous explosive, by arrangement with the Ministry of Munitions, it was agreed that the manufacture should be carried on at the contractor's risk. In 1916 a violent explosion occurred, by reason of which the plaintiffs' premises and plant suffered considerable damage. The explosion, plaintiffs alleged, was caused by the defendants' negligence in storing too large a quantity of nitrate of soda, picric acid, and other explosives in proximity to plaintiffs' works, and an action was brought against them in the King's Bench Division in 1917, when Mr. Justice Scrutton found for the plaintiffs. The defendants appealed, and the Court of Appeal confirmed the judgment of the Court below, as did also the House of Lords, before whom the case was then taken, and the case now came before the Official Referee for assessment of the amount of damage sustained by the plaintiffs.

The Referee, in giving judgment, said he was of opinion that plaintiffs had not suffered any general damage by the shutting down of their works, but by law he had to give some damage, and he assessed the amount at £128., and the damage to property at £1,872. There would therefore be judgment for the plaintiffs for £2,000., with costs.

SULPHATE OF AMMONIA SALES DISPUTE.

British Sulphate of Ammonia Federation, Ltd. *v.* The South Metrofolitan Gas Company

This action, which has reference to the proper method of keeping accounts under a pooling and equalisation scheme, again came before Mr. Justice Greer on Monday last.

Mr. Le Quesne, for the plaintiffs, said that on October 31 Mr. Wright partially opened the case (*C.T.J. and C.E.*, November 2, 1923, page 525), and on the application of the parties, it was allowed to stand till that day. In the interval, the parties and their accountants had met, and plaintiffs had supplied full accounts; but the time had not been sufficient to enable the accountants to master them. He was not surprised at this, as the accounts were very voluminous and complicated. In these circumstances he was instructed to apply for a further adjournment.

Mr. Wylie, for the defendant, supported the application, stating that his accountants had found considerable difficulty, in the time at their disposal, in dealing with the accounts which had been placed before them. He hoped, if a further adjournment were granted, the result would be that the Court would not be further troubled with the case.

His Lordship, in ordering the case to stand over until November 29, said he trusted this adjournment would result in the parties arriving at a settlement, as the case was eminently one which ought to be amicably settled.

PURIFICATION OF OIL-CONTAMINATED WATER.

THE "VICKCEN" CENTRIFUGAL OIL SEPARATOR.

SEVERAL interesting devices have been evolved recently for enabling ships to comply with the "Oil in Navigable Waters" Act. Oil-bearing steamers frequently fill their old tanks with salt water after the oil in the tank has been either expended or discharged. When these tanks are again pumped out the water pumped from the tank is necessarily contaminated with a certain proportion of oil. Oil is also inevitably present in the bilges of such ships, and under the "Oil in Navigable Waters" Act it is an offence to pump this contaminated water into harbours or docks on account of the pollution caused. The devices which have been evolved have in mind principally the discharge of oil-free water into the harbour. There is, however, another and extremely important aspect of this operation. The oil as recovered from these devices still contains a proportion of water and dirt, rendering it, as a rule, unfit for actual use as a fuel without further treatment.

There has, however, been put on the market recently an entirely British-made centrifugal oil purifier, by means of which machine it is possible to purify rapidly and efficiently this recovered oil. This new machine is known as the Vickcen Oil Purifier, and is handled by Messrs. British Separators Limited, of 161, Queen's Road, Peckham, who are associated with Vickers Limited. The machines, it is claimed, will run for hours with practically no attention whatever, and a special interest attaches to them in that they enable compliance with the "Oil in Navigable Waters" Act to become in some cases a commercial advantage due to the rapid and efficient recovery of oil in an entirely fit state for use.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

The outlook is distinctly better in nearly every direction. The chief feature is the improvement that is taking place in the hematite pig-iron and steel industries in this district and also in the Furness area. There is no doubt whatever that within a comparatively short period there will be considerably more employment for the steel rail mills at Workington. There will be more work for them this year than was anticipated, and it is believed that by the end of January they will be rolling three weeks in four. The hematite pig-iron trade, quite apart from the consideration that so much of the iron will be reserved for local consumption, is exhibiting no small signs of improvement. This week, for instance, consumers are buying forward, a thing they have not done anytime previously this year. The advance in price is itself a proof of the larger demand. Ordinary iron is now £5. 5s. per ton at works, and it would not be surprising were a further rise to take place. A furnace at Workington is ready to be relighted, and it is expected that one or two more furnaces may be put into blast. This activity, of course, means greater pressure upon the collieries and the coking plants. Already the coke ovens are so busy that they are absorbing nearly all the small coal that is being raised. It looks as if when iron smelters get all the furnaces blowing that they have in blast in normal periods, they will be unable to obtain from the coking plants here the whole of the coke they require. It is true that the ovens are not working at the moment at the maximum capacity, but however much more production may be increased it will not be quite sufficient to meet needs. East Coast coke supplies this week, it is to be noted, have risen to 10,000 tons. Little coke can be spared for the Continent, and makers command 35s. per ton. Of the residuals sulphate of ammonia is slow and is being stocked.

SOUTH WALES NOTES.

(Specially Contributed.)

During the week further orders have been received, and the tinplate trade is steadily expanding. The patent-fuel business is fairly active with firm quotations, owing to the high prices of binding materials. Cokes are in much better demand, and stocks at the ovens are rapidly diminishing. By-products have a strong market, especially in benzol, and the tar residuals. Sulphate of ammonia has moved slowly, but as stocks are very low, no curtailment in output is expected. The nickel factories are in full operation, and the demand for the metal is well maintained. By-products also are selling promptly. Sulphuric acid makers report a steady and even slightly increasing trade. The spelter trade is brisk, the demand from the galvanised sheet manufacturers having increased on account of the pressing call for corrugated sheets in the Far East.

The shipping returns for the week show 4 tons magnesite from Drammen, 8 tons calcium carbide from Kragero, 20 tons nitrate of soda from Christiania, 25 tons calcium carbide, and 50½ tons nitrate of soda from Sarpsborg to Swansea; 838cwt. calcium carbide from Sarpsborg, 1,005cwt. red arsenic from Antwerp, 103cwt. iron oxide from Malaga, 21 tons white arsenic from Antwerp to Cardiff; 21 tons ferro silicon to Newport.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained.

France.

An agent established in Paris is desirous of obtaining the representation of British manufacturers for the sale in France of petroleum products, rubber chemicals and raw materials, industrial chemicals, glues, gums, etc. (Ref. No. 510.)

Greece.

The acting British Consul-General at Salonica reports that a quantity of tar or suitable composition for road-making will shortly be required by the Municipal Council of Salonica. (Ref. D.O.T. 11729/F.E./M.C./2.)

Netherlands.

An agent in Amsterdam desires to secure the sole representation, on a commission basis, for the Netherlands of British manufacturers of tinplates. (Ref. No. 511.)

Norway.

A firm of agents in Christiania are desirous of securing the representation in Norway of British exporters of raw materials for margarine factories (such as oleo oil, etc.). (Ref. No. 513.)

Portugal.

A British firm of good standing in Oporto wish to get into touch with firms dealing in lubricating oils, with a view to securing their representation. (Ref. No. 516.)

Denmark.

Tenders are being invited in Copenhagen for the supply and erection of a tar-distilling plant. Tenders are to be presented by November 20. A copy of the specification and conditions of tender are available for inspection. (Ref. D.O.T. 8211/C.C./2.)

China.

The Shanghai Branch of an old-established British firm of manufacturers of pharmaceutical preparations, infant and invalids' foods, and druggists' sundries, wishes to secure the representation in China of well-established British manufacturers of perfumery, etc. (Ref. No. 521.)

India and the Far East.

A gentleman with experience in export trade to the Far East is shortly visiting India, Burma, Straits Settlements, Hong Kong, and Japan, and is desirous of acting as representative for British firms dealing in paints and varnishes, bag blue, soaps, perfumery, and patent medicines. (Ref. 522.)

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," November 17, 1888.)

The Salt Trade in Parliament.—Sir G. Campbell asked the President of the Board of Trade whether Her Majesty's Government had considered and taken the advice of their law officers on the question whether combinations of capitalists to establish monopolies, and raise the price of salt and other articles by means of rings and trusts, were offences against the law of conspiracy, or against the laws making penal proceedings in restraint of trade in salt or other articles of consumption; and, if so, whether measures would be taken to protect the public against the salt and other rings now being formed? Sir M. Hicks-Beach: The Government have no information before them which would justify them in taking the course which the hon. member's question suggests. Sir G. Campbell said that he would take an opportunity of calling the attention of the House to that subject. Mr. Bradlaugh said that in the law reports there was a decided case of a conviction in regard to raising the price of salt. Sir M. Hicks-Beach: That may be so, but we have no information before us that would justify us in referring this matter to the law officers of the Crown for their consideration. Every case must be dealt with on its own grounds. Mr. Bradlaugh asked whether the right. hon. gentleman was aware that one of the promoters of the combination wrote to the *Times* stating that one of its objects was to obtain a more remunerative price for salt? Sir M. Hicks-Beach: That may be so.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

October 29 to November 3 (inclusive).

Organic Compounds of Mercury. Albert, A. 27,376.
Rubber Sheets from Latex. Anode Rubber Co., Ltd. 27,464 and 27,465.
Rubber Latex. Bostock, N. S. 27,010, 27,011, and 27,012.
Triarylguanidines and Their Use in Vulcanisation of Rubber. British Dyestuffs Corporation, Ltd.; Cronshaw, C. J. T.; and Naunton, W. J. S. 27,462.
Diarylguanidines. British Dyestuffs Corporation, Ltd.; Cronshaw, C. J. T.; Naunton, W. J. S. and Green, S. J. 27,463.
Activation and Synthesis of Gases. Buckley, J. W.; and Metropolitan-Vickers Electrical Co., Ltd. 27,181.
Anti-corrosion Medium. Butler, E.; and Soar, T. L. 27,040.
Treating Crude Oxide and Carbonate of Zinc. Chance and Hunt, Ltd.; Gidden, W. T.; and Ragg, W. G. 27,048.
Disintegrating and Dehydrating Feat. Clewlow, C. W. G. 27,552.
Fractional Distillation. Dorman, Long, and Co., Ltd.; Lowe, H. M.; and Roelofson, J. A. 27,679.
Drying Copra. Elsworth, O. 27,339.
Acid Azo-dyestuffs. Farbwerke vorm. Meister, Lucius, and Brüning. 27,219.
Esters. Hefti, F.; and Schilt, W. 27,272.
Insecticides and Fungicides. Howles, F.; and McDougall and Yalding, Ltd. 27,588.
Fuel. Illingworth Carbonisation Co., Ltd.; and Illingworth, S. R. 27,047.
Azo-dyestuffs. Imray, O. Y. (*Soc. of Chemical Industry in Basle*). 27,069.
Dyeing of Leather. Lamb, M. C. 27,429.
Regeneration of Base Exchanging Bodies. Lassen, S. V. H.; and United Water Softeners, Ltd. 27,312.
Temperature-control Valves. Maclaren R. 27,242.
Synthetic *l*-cocaine. Merck, F.; Merck, K.; Merck, L.; Merck, W.; Merck, W. E.; Maeder, H.; and Wolfes, O. 27,340.
Leaching Copper. Metals Production, Ltd. 27,345.
Ammonium Sulphate. Nicholson, T. 27,648.
Condensation Products from Formaldehyde and Urea. Pollak, F. 27,613.
Retorts for Carbonisation of Solid Fuels. Queneau, A. L. J. 27,348.
Insecticide. Ralph, J. W. 27,559.
Oxides of Nitrogen. Ramsay, H. G. A. 27,052.
Acridinium Compounds. Ransford, R. B. (*Cassella and Co.*). 27,233.
Artificial Cotton. Rosenthall, F. A.; and Stevenson, W. J. 27,502.
Composition for removing Rust. Siegel, H. 27,131.
Solation of Gelatinising Organic Colloids. Waele, A. de. 27,071.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

1922.

Purification of Cracked Hydrocarbon Spirit. Remfry, F. G. P. 20,151. **205,868**
Electrode Structure. Scott, J. P. 20,350. **205,883**
Electrolytic Cells. Scott, J. P. 20,352. **205,884**
Grinding-machines. Marks, E. C. R. (*Bock Bearing Co.*). 20,355. **205,885**
Viscose. Dreyfus, H. 20,557. **205,898**
Alkali Salts. Plauson's (Parent Co.), Ltd. (*Plauson, Dr. H.*). 24,748. **205,955**
Chlorination of Methane. Holzverkohlungs-Industrie Akt.-Ges. 27,107. **195,345**
Thermometers. Sugden, T. 31,910. **206,028**

1923.

Fire-extinguishing Medium. Pyrene Co., Ltd. (*Pyrene Manufacturing Co.*). 331. **206,045**
p-phenetol-carbamide. Sonn, Dr. A. 7,507. **206,083**
Evaporating Water from Semi-liquid Substances. Trocknungs-Anlagen-Ges. 9,532. **197,656**

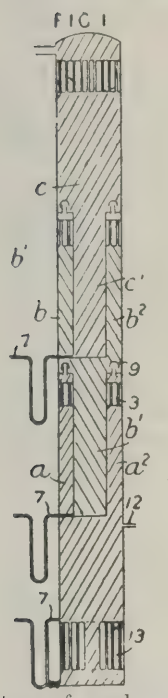
COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Perylene Vat Dye. Pereira, H. 25,665. **206,133**
3,10 Perylene Quinone. Pereira, H. 25,666. **206,134**
Naphthaquinone Derivatives. Soc. Anon. des Matières Colorantes et Produits Chimiques de Saint-Denis; Wahl, A.; and Lantz, R. 26,037. **206,142**
Substituted Products of an Aliphatic Arsinic Acid. Etablissements Poulenc Frères; and Oechslin, C. 26,163. **206,143**
Reverberatory Furnaces. Heimsoth and Vollmer Ges. 26,171. **206,144**
New Derivatives of Naphthaquinone. Soc. Anon. des Matières Colorantes et Produits Chimiques de Saint-Denis; Wahl, A.; and Lantz, R. 26,612. **206,150**
Hydroxylated Aliphatic Arsinic Acids. Etablissements Poulenc Frères; and Oechslin, C. 26,617.
Formol. Soc. des Etablissements Barbet. 26,749. **206,158**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Fractionating Liquids. A. L. Bloomfield, Buckhurst Hill, Essex; and A. Boake, Roberts and Co., Ltd., London. British Patent **203,506,** of 1922.



An apparatus for separating by fractional distillation three or more volatile components of a liquid mixture comprises a series of superposed fractionating-units each having a lower boiling or analysing-portion and an upper rectifying-portion arranged so that the rectifying-portion of one unit forms the heating-means for the analysing-portion of the unit next above. An apparatus to separate three components and discharge them in liquid form comprises three units *a*, *b*, *c*, Fig. 1. The rectifying-portion a^2 of the unit *a* surrounds the analysing-portion *b'* of the unit unit *b*, and the rectifying-portion b^2 of the *b*, and the rectifying-portion b^2 of unit unit *c*. The mixture to be separated is supplied to the lower unit *a* through an inlet 12 either in the form of pre-heated liquid or as vapour. The unit is heated by a heater 13 which may receive the vapours of the highest-boiling component or may be heated by steam, etc. The highest-boiling component is withdrawn by pipe 7 from the base of the lower unit, and the vapours of the other components pass through opening 9 fitted with capped tubes or with ball or check valves into the middle of the second unit *b*, from the base of which a second component is withdrawn. The remaining vapours pass into the middle of the third unit *c*. Heating or cooling devices 3 may be arranged at the top of each unit to regulate the temperature gradient throughout the column.

Benzanthrone Dyestuffs. J. Y. Johnson, London. (Badische Anilin and Soda Fabrik, Ludwigshafen-on-Rhine, Germany.) British Patent **203,533,** of 1922.

Condensation products, which are probably 2:2'-dibenzanthronyl compounds, are prepared by heating benzanthrone or its derivatives with alkaline condensing-agents under more moderate conditions than those yielding dibenzanthrone dyes; any dye simultaneously produced is removed by means of alkaline hydrosulphite. These condensation products are converted into dibenzanthrone dyes by heating, with or without alkaline, acid, or oxidising condensing-agents; if free halogens or sulphuric acid are used as condensing-agents, the resulting dyes contain halogen or sulphonic groups; strongly oxidising condensing-agents produce oxidised dibenzanthrones.

Thioindigoid Vat Dyestuffs. S. Sokal, London. (Kalle and Co., Akt.-Ges., Biebrich-on-Rhine, Germany.) British Patent, **202,734,** of 1922.

By heating with acid condensing agents, naphthalene-dithioglycollic acids or their derivatives are converted into naphthalene-di (oxythiophenes); by oxidation or by condensation with cyclic *o*-diketones or derivatives thereof, for instance, isatin, naphthisatin, diketodihydrothionaphthenes, or their α-derivatives, or acenaphthenequinone, the oxythionaphthenes yield thioindigoid dyestuffs dyeing cotton in green, violet, brown, olive, etc., shades from the hydrosulphite vat; the mixed dyestuffs may also be prepared in one operation by treating a mixture of a naphthalene-dithioglycollic acid and the *o*-diketone with chlorsulphonic acid. Naphthalene-dithioglycollic acids are obtained from the corresponding disulphonic acids by conversion into chlorides with phosphorus pentachloride, reduction, and condensation with chloracetic acid.

Aryl Phosphates. A. G. Bloxam, London. (Chemische Fabrik Griesheim Elektron, Frankfurt-on-Main, Germany.) British Patent **203,820,** of 1922.

Aryl esters of phosphoric acid are prepared by treating an aromatic hydroxyl compound, whether carbocyclic or heterocyclic, or a substitution product thereof, with a phosphorus oxyhalide in the presence of an alkaline earth metal, magnesium or aluminium, or a halogen compound of such metal or of a metal of the chromium or iron group. Mixtures of the aromatic hydroxyl compounds may be employed; and indifferent solvents or diluting agents, such as benzene, toluene, or chloro-benzene, may be present. The products are useful as softening agents in the cellulose and other industries. The preparation is described of triphenyl phosphate from phenol and phosphorus oxychloride in the presence of aluminium chloride, *p*-cresyl phosphate from *p*-cresol and phosphorus oxychloride in the presence of magnesium filings and several others. Phosphorus oxybromide may replace the phosphorus oxychloride; and chlorophenols, nitrophenols, α-naphthol, dioxynaphthalenes and oxyquinolines, may be used as starting materials.

Sodium Silicate. W. Clayton, Liverpool; and H. W. Richards, Wallasey, Cheshire. British Patent **203,749,** of 1922.

Sodium-silicate solution is evaporated by spraying into heated air. The solution may be of 100° Tw., and may contain 2.1 parts by weight of silica to 1 part by weight of Na_2O. The spraying may be effected with the liquid at 45° C. by means of an air pressure of 65lb. per sq. in. Beneath the jet of liquid is a high velocity air jet at right angles to the liquid jet as in milk spraying, a pressure of 150lb. per sq. in. being suitable. Instead of an air jet superheated steam or flue gases may be employed, or a fine spray may be produced by other means, such as a whirling jet. The spray may be directed into the top of a chamber in which the air is at 110° C. at the top and 75-85° C. at the outlet at the bottom. Potassium silicate may be added to the sodium silicate to reduce the viscosity.

Formamide. J. Y. Johnson, London. (Badische Anilin and Soda Fabrik, Ludwigshafen-on-Rhine, Germany.) British Patent **203,812,** of 1922.

Formamide is obtained by the interaction of carbon monoxide and ammonia under a pressure of not less than 20 atmospheres and at a temperature exceeding 100° C. Catalysts, such as pumice, clay, earthenware, alumina, metals, especially copper, or water may be used. In the presence of larger proportions of water, ammonium formate or a mixture thereof with formamide is produced. The reaction is effected in an autoclave capable of withstanding high pressures and not made of iron or tin. The process may be operated in a continuous manner, and diluent gases, such as hydrogen or nitrogen, may be employed. Examples of the process are given.

Soya-Bean Adhesives. O. Johnson, San Diego, California, U.S.A. British Patent, **203,969,** of 1922.

Soya beans or the seeds of other leguminous plants are soaked in water to produce a pulpy mass which is ground, boiled and filtered. The filtrate is treated as by centrifuging to extract oil, and is then curdled. The curd is preferably washed with sodium-arsenate solution to remove acid, and is finally dried and ground. The product may be mixed with materials such as hydrated lime, sodium fluoride, and water to produce an adhesive; it may also be used as a base for sizes, calcimines, and paints. The step of filtering the boiled pulp may be omitted.

Sulphur Dioxide from Metallurgical Gases. A. E. White, London. (American Smelting and Refining Company, New York, U.S.A.) British Patent **203,722,** of 1922.

Substantially pure sulphur dioxide, in solution or as a gas and of predetermined strength, is obtained from intermittently supplied metallurgical gases by passing the cooled scrubbed gases in counter-current with water or a solution of sulphur dioxide prepared at a previous stage in the process. A suitable plant is illustrated and described.

Production of Insulin. F. V. Feeny, London. (F. G. Banting, J. B. Collip, C. H. Best, Toronto, Ontario, Canada.) British Patent **203,778,** of 1922.

A pancreas extract to be injected intravenously or subcutaneously in the treatment of diabetes is obtained from fresh glands by extracting them with a solvent, such as alcohol, which inhibits the action of enzymes on the active substance or hormone and then removing toxic impurities by precipitation. According to an example fresh ox pancreas is minced, mixed with alcohol, and the mixture strained and filtered. The filtrate is treated with more alcohol to precipitate proteins, and the solution is distilled under vacuum to remove the alcohol. The concentrated solution so obtained is extracted with ether to remove lipoid sub-

stances, and, after elimination of the ether, alcohol is again added, and the mixture agitated and centrifuged, whereby "salted-out" saline impurities and more proteins are separated and removed. Additional volumes of 95 per cent. alcohol are added to precipitate further impurities and the filteral solution distilled to remove the alcohol. The hormone so obtained is dissolved in distilled water and the solution is standardised by concentration, sterilised by filtration, and a small quantity of a preservative such as tri-cresol is added.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Iron-Free Alumina Salts. Chemische Fabrik Griesheim Elektron, Frankfort-on-Main, Germany. British Patent, **203,706.** Convention date, September 8, 1922.

Aluminium is separated from ferruginous solutions by precipitation as aluminium-alkali fluoride by adding to the solution hydrofluoric acid and an alkali salt or a fluoride and a mineral acid such as hydrochloric or sulphuric acid under such conditions that the iron is not precipitated. To ensure that the precipitate shall be free from iron either a small excess of unprecipitated aluminium salt is left in solution, or the solution is treated before the precipitation, so as to reduce the iron to the ferrous condition, for instance by passing sulphuretted hydrogen through the solution.

Electrolytic Zinc Production. Electrolytic Zinc Company of Australasia, Ltd., Melbourne, Australia. British Patent, **202,299.** Convention date, August 8, 1922.

In the recovery of zinc from ores or metallurgical products, the residue after leaching the roasted material with spent electrolyte, is mixed with strong sulphuric acid in a rotating drum or other apparatus, and is preferably formed into nodules. It is then dried and heated in a shaft or other furnace to which gases containing sulphur dioxide, such as roaster gases, are supplied. The furnace temperature is sufficient to decompose iron sulphate, but not zinc sulphate. The product is then leached with part of the solution obtained in the previous leaching, and the resulting solution is added to the main circuit. The gases leaving the furnace are conducted to a plant for the recovery and production of sulphuric acid. The product of the first leaching is classified into slimes and coarse material, the former of which is thickened and decanted and the residue filtered for the acid treatment. The coarse material is treated by flotation, and the tailings filtered and added to the slime residue, the concentrates being roasted for production of the gases used in the furnace treatment and the calcines returned to the initial leaching-vats. The liquid products of both leachings are agitated with limestone to precipitate iron and silica, and are filtered before return to the cells. Chlorides may be added to precipitate silver, if sufficient chloride is not present in the leaching-solution.

Furfural. Quaker Oats Company, Chicago, U.S.A. (Assignees of C. S. Miner and H. J. Brownlee.) British Patent **203,691.** Convention date, September 7, 1922.

Furfural is prepared by mixing the raw material, such as oat, rice, or cottonseed hulls, corn cobs, etc., with sufficient liquid, preferably containing acid, to damp the mass and subjecting the mixture to the continuous action of steam to remove the furfural as formed. In an example a mixture of oat hulls, about 25 per cent. by weight of water and rather less than 2 per cent. of sulphuric acid, is charged into a jacketed digester, which is then continuously revolved and heated. Steam is then passed into the digester through a plurality of jets with the valve closed until a pressure of 60 pounds is attained, when the valve is opened and the supply steam adjusted to maintain the pressure within the digester. The steam and furfural pass into the condenser and thence to a receiver. The distillate is neutralised, preferably with slaked lime, and is distilled to obtain the furfural.

Electrolytic Production of Alkali Bichromates. A. J. B. Jouve, A. Helbronner, and Soc. Hydro-Electrique and Métallurgique du Palais, all in Paris. British Patent, **203,709.** Convention date, November 23, 1921. Addition to 177,174.

In the electrolysis of an alkali-carbonate solution with an anode of a chromium alloy, such as ferrochrome, according to the parent Specification, the electrolysis is continued after the complete conversion of the carbonate into chromate, in order to form bichromate. Concentrated solutions are preferably employed so that the resulting bichromate solution is near the crystallising point. A current density of some hundreds of ampères per square metre is employed so as to heat the electrolyte. The electrolysis may be carried out in a series of baths between which the electrolyte circulates. The cathodes may be of lead. Iron oxide is removed from time to time by agitation and filtration of the liquid or by centrifugal separation. Neutral chromate may be obtained from the bichromate solution so prepared by adding excess of alkali carbonate.

NEW COMPANIES.

Alexander Cross and Sons (London), Ltd.—Private company. Capital £50,000., £10. shares. Chemical manufacturers, dealers in fertilisers and feeding stuffs. Office: 81, Gracechurch Street, London, E.C.

Deptford Glass Works, Ltd.—Private company. Capital £1,000. Solicitor: T. H. Goodwin, 14-15, Coleman Street, London, E.C.

John Quilliam and Co. (1923), Ltd.—Private company. Capital £5,000. Manufacturing and wholesale chemists, and medical plaster manufacturers. Office: Canterbury Works, Victoria Bridge, Manchester.

Nugget Polish Company of Ireland, Ltd.—Private company. Capital £50,000., in £1. shares. Blacking and polish manufacturers, etc. Office: 23-24, Lower Bridge Street, Dublin

Super-Centrifugal Engineers, Ltd. — Private company. Capital £100. Agents in the U.K. for the patented machines and processes of the Sharples Specialty Company of New York. Office: Imperial House, Kingsway, W.C.

Lennox Chemicals, Ltd.—Private company. Capital £2,000. General manufacturing chemists, etc. Office: 19, Upper Ormond Quay, Dublin.

PUBLICATIONS RECEIVED.

Methods of Analysis of Coal.—Interim Report of the Fuel Research Board of the Department of Scientific and Industrial Research (Physical and Chemical Survey of the National Coal Resources, No. 2). London: H.M. Stationery Office; price 1s. 6d. net.

Scouring: Oil Extraction and Degreasing.—Booklets from R. W. Greeff and Co., Ltd., descriptive of the products of the Weston Chemical Company, Ltd.

Haughton Patent Metallic Packing.—We are in receipt of two highly attractive blotters from Messrs. Haughton's Patent Metallic Packing Company.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals. — The demand for heavy chemicals continues limited in volume, with the tone of the market fairly steady, and showing but little change during the past week. **Acetic Acid,** 80% technical, £46.; 80% pure, £47. 10s. to £48.; 98% glacial, £60. in casks and £72. in glass demijohns, ex wharf London; prices are being kept fairly steady, but business has again been slow. **Acetone,** British Government specification, about £124. per ton, in drums; this market remains steady, with business limited. **Alum,** lump, £10. to £10. 10s. per ton, in casks; dealers' prices are unaltered; business slow. **Arsenic,** Cornish white powdered,

about £65. per ton, f.o.r. Cornwall; inquiry for export to America continues strong, and, with supplies available rather restricted, it is expected that there will be further advances before long. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; matters are rather dull here; dealers' prices are about the same. **Bleaching Powder,** 35—37%, £10. to £10. 5s. per ton; dealers are offering Continental material at about these rates, but are not finding much demand. **Barium Chloride,** 98—100%, £14. 10s. to £15. per ton; some slightly cheaper offers are being made by importers; market still dull. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P., crystals, about 1s. 5d. per lb., less 5%; this market shows improvement, and conditions are much firmer. **Cream of Tartar,** 99—100%, about 85s. per cwt., in ton lots; dealers are doing a limited business at about this figure. **Epsom Salts,** commercial quality, £4. 10s. to £4. 15s. per ton; dealers are quoting at about these figures, but appear to be doing very little business. **Formaldehyde,** 40% volume, about £62. to £63. per ton; although there has been but little business doing, the spot position is very steady, and tends to harden on account of the Continental position. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers' quotations show no change; business dull. **Lead Acetate,** brown, £41. to £43.; white, £42. to £43. per ton; as expected, prices are dearer here, and stand very firm; supplies short. **Litharge,** imported, about £35. 10s. per ton; importers are doing a little business at about this figure. **Lithopone,** 30% Continental red seal, about £22. 10s. to £23. per ton; a fair volume of business continues here, and prices are well maintained. **Ammonium Chloride,** grey galvanising, £30. 10s. to £31. per ton; dealers holding spot stocks of Continental material are fully maintaining their prices; any movement is likely to be to higher values. **Nickel Sulphate,** home trade single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these unchanged rates. **Oxalic Acid,** 5¾d. to 6d. per lb.; quoted here at these figures, with the market dull and not at all steady. **Carbonate of Potash,** 90—92%, about £25.; 96—98%, about £26. 10s. to £27.; dealers are offering at cheaper rates, but there is still little doing. **Chlorate of Potash,** crystals and granular, 2¾d. to 3d. per lb.; these prices are mentioned by dealers, but little inquiry is on the market. **Caustic Potash,** 88—92% solid, about £31. per ton; spot stocks are available, with not much demand at present; Continental offerings are unsteady, but may harden. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers find it difficult to realise this figure in actual business. **Prussiate of Potash,** yellow, about 10¼d. per lb.; last week's cheaper price is still being quoted by agents for British material; business remains slow. **Sulphate of Potash,** £11. per ton, ex ship; the position is as last reported. **Mercury,** about £10. per ton; during the past week business has been fair, and prices on spot are being maintained. **Red Lead,** imported, about £35. 10s. per ton; dealers quoting on spot at about this figure, with business slow. **Salammoniac,** dog-tooth crystals, about £50.; medium, £42. to £45.; fine white, about £26. per ton, in casks; dealers holding spot stocks are rather firmer in their offerings, and there is a slight tendency towards higher values. **Saltcake,** home trade, about £4. 10s. per ton; for export quotations are slightly dearer; there is little material available up to the end of the year. **Acetate of Soda,** about £24. 15s. per ton; dealers have a few small spot parcels offering at about this figure. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers' quotations are unchanged at these levels, with business still small. British makers' prices to domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; and 76—77%, £19. 7s. 6d. per ton, in drums free, carriage paid to any station in Great Britain; their prices for export vary according to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags free; British makers continue to quote at this level for home trade only, carriage paid. **Bichromate of Soda,** home trade, 4½d. per lb.; British makers' prices are steady at this rate; export prices are slightly dearer. **Cyanide of Soda,** export, about 8d. to 8½d. per lb.; British material is quoted at about these figures. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in free bags, carriage paid to any station in Great Britain; British makers offering at this price for home trade only; dealers are quoting at competitive rates. **Hyposulphite of Soda,** pea crystals, £14. 10s. to £15. per ton, in 1cwt. kegs; commercial quality, about £10. per ton, in casks; the tone here is good, and spot values tend to harden; Continental offerings are dearer. **Nitrate of Soda,** 96%, £13. 5s. per ton; this item keeps very steady, with quoted values unchanged. **Nitrite of Soda,** 100%, about £26. 10s. per ton; the slight reduction in prices recorded last week has been followed by a full recovery. **Prussiate of Soda,** about 5½d. per lb.; dealers offering British material at about this figure find business very slow and limited. **Sodium Sulphide,** 60—62%, solid, about £14.; ditto, broken, about £15. per ton, in drums; dealers are offering imported material at about these rates, but are not meeting with much demand. **Tin Crystals,** about 1s. 3½d. per lb.; quoted rates are a little better here, with the market steady. **Tartaric Acid,** B.P., crystals, about 1s. 1¾d. per lb., less 5%; although there is still but little demand for this product, the position seems to be steadier. **White Lead,** imported, about £42. to £43. per ton; dealers continue to offer Continental material at about this rate; demand slow. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers quote at about these rates, f.o.r. works.

Pharmaceutical Chemicals.—The firmer tone, accompanied by considerably higher levels in value, continues in this market, and any further movement is likely to be to still higher rates. Business has been brisk in many items, and in a number of products spot supplies are very limited, with fresh imports rather doubtful. **Acetanilid,** crystals and powder, about 2s. 3d. per lb.; the higher rate quoted last week is well maintained, and there has been good inquiry. **Acetyl-Salicylic Acid,** B.P., about 3s. 9d. per lb.; after the very considerable advances in prices, this market is again at higher values; the demand has been active, and supplies seem limited. **Benzoic Acid,** B.P., about 4s. 3d. per lb.; importers are quoting at about this figure to arrive. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; this market remains quiet, with values about the same. **Salicylic Acid,** B.P., 2s. 4d. to 2s. 6d. per lb.; at these rates the spot position is well maintained, with inquiry active. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; with not much business doing, this item keeps quite steady. **Amidopyrin,** about 15s. per lb.; very little inquiry has been on the market; quoted values unchanged. **Ammonium Bromide,** B.P., 8d. to 8¼d. per lb.; the recently improved position is maintained here, and business has been good. **Benzonaphthol,** about 5s. per lb.; nominal; the market has again been idle. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; spot holders have put their prices up to this level, but it is doubtful if business has been done on this basis. **Benzaldehyde 03,** about 3s. per lb.; prices quoted on spot are steady, with market quiet. **Calcium Lactate,** about 2s. per lb.; prices are slightly dearer this week, and are likely to hold firm. **Chloral Hydrate,** duty paid, about 4s. 3d. per lb.; some fair business has been done in small lots at about this figure; the position is firm. **Creosote,** B.P., about 2s. 6d. per lb.; the tone of the spot position is well maintained, although there has not been much business about. **Creosote Carbonate,** nominal; there are still no quotations being made. **Guaiacol Carbonate,** about 13s. per lb.; the higher price level quoted last week is well maintained, and inquiry has been good. **Hexamine,** about 4s. 3d. per lb.; there is very little material offered on spot below this level; higher rates are expected for fresh imports. **Hydroquinone,** about 4s. per lb.; spot quotations are varying here, but the figure mentioned is about the average offer. **Methyl Salicylate,** 2s. 10d. to 3s. per lb.; the spot market is fully maintained at the higher rates recorded last week; business good. **Methyl Sulphonal,** about 25s. per lb.; there is no doubt that the price of this article has advanced considerably, but it is doubtful whether

the price quoted as mentioned here is obtained for actual business. **Paraformaldehyde,** about 3s. 9d. per lb.; the quoted price for spot supplies is steadily maintained at this level, with business slow. **Paraldehyde,** about 1s. 7d. to 1s. 8d. per lb.; dealers are quoting at higher rates this week, with the market firm. **Phenacetin,** about 7s. 6d. per lb.; this market is still rather irregular on quotation, but seems to be gradually firming up to this figure. **Phenazone,** 8s. 6d. per lb.; dealers holding spot stocks are not accepting much less than their quoted rate as given here. **Phenolphthalein,** about 8s. per lb.; very few dealers seem to be in a position to quote this material. **Potassium Bromide,** B.P., crystals and granular, about 7½d. per lb.; business has been active again in this product both for home and export; prices are being well maintained, and tend to move higher. **Potassium Permanganate,** B.P., about 9½d. per lb.; importers are quoting in this region, but business is slow; prices are not likely to decline. **Potassium Sulphoguaiacolate,** about 7s. per lb.; some dealers mention this as their selling price; not much interest shown at present. **Resorcin,** about 6s. per lb.; the better tone here is maintained, and some business has been done. **Salol,** about 4s. per lb.; there has been no further advance in spot values; inquiry good, with market very steady. **Sodium Benzoate,** about 2s. 9d. per lb.; dealers are quoting at unchanged rates on the week. **Sodium Bromide,** B.P., crystals and granular, about 8d. per lb.; there has been plenty of inquiry here, and the market as quoted is healthy. **Sodium Diethylbarbiturate,** 18s. per lb.; little inquiry has been received; dealers' offers are unchanged. **Sodium Salicylate,** B.P., crystals, 3s.; powder, 2s. 10d. per lb.; this market has again been active, with spot stocks now rather limited; prices as quoted appear quite firm, and, if anything, seem likely to move to higher levels. **Sulphonal,** about 20s. per lb.; last week this market was irregular, and the few spot holders put their prices up considerably until they could form their opinion of the position; quotations at their present level are likely to hold firm. **Terpin Hydrate,** about 1s. 9d. per lb.; dealers' prices are steadily maintained at this figure, with business rather slow.

Coal-tar Products, Intermediates, Etc.—The volume of business continues small, with prices in the majority of cases unchanged. The market is rather unsteady, however, and in some lines may decline a little. **Aniline Salt,** about 9½d. per lb., casks free; prices are firmer here, and British makers' prices are somewhat dearer. **Aniline Oil,** 9d. to 9½d. per lb., drums free; prices are fully maintained at these levels, and tend to advance. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; the market seems steady, but has again been quiet. **Benzol,** about 1s. 3½d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; prices quoted are about the same, with business small. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; business is still lacking in volume; prices quoted are about the same. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; the demand from dealers remains small; their quotations are unchanged. **Naphtha,** about 1s. 2d. per gallon; this market at the recently reduced price remains dull, and is still rather unsteady. **Solvent Naphtha,** 90/160, about 1s. 3d. per gallon, drums extra; at the figure given the position is weak, and any business would be generally on a lower level. **Heavy Solvent Naphtha,** 90/190, 1s. 3d. per gallon, drums extra; prices as quoted are weak, with the market dull. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; this market keeps steady, but has again been quiet. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; quoted prices are maintained on a steady market. **Creosote Oil,** about 9½d. per gallon, f.o.b.; the position is fairly steady, but business is far from good. **Carbolic Acid,** crystals, about 1s. 1½d. per lb.; some limited business has been done, but there is a want of confidence in this article. **Naphthalene,** about £19. per ton; the lower prices quoted here have not brought any improvement in demand; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; tablets and candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; dealers continue to quote at this figure, with business quiet. **Pyridine,** fully 22s. per gallon; the spot position is exceedingly firm at this level, and tends to go still higher. **Hexamethylene,** 3s. 9d. per gallon; this is about the lowest price quoted by dealers for spot supplies. **Pure Methyl Alcohol,** about £90. per ton, in drums, ex wharf London; dealers are finding fair business, and their prices are being well maintained. **Pitch,** about 140s. per ton, f.o.b. East Coast; the position is quite satisfactory, with prices firm and tending to go higher; inquiry is good.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £62. 12s. 6d. to £62. 15s., cash; £63. 5s. to £63. 7s. 6d., three months; electrolytic, £68. to £69. **Tin:** Standard, £200. 7s. 6d. to £220. 10s., cash; £220. 7s. 6d. to £220. 10s., three months; Straits, £221. 7s. 6d. to £20. 10s.; English, £221. 5s. **Lead,** soft foreign, £31., prompt; English, £32. 15s.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £33. 7s. 6d.; hard, £28. **Antimony,** English regulus, 99%, £35. 5s. to £35. 10s.; special brands, £42. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 15s. **Bismuth,** 10s. **Platinum,** £28. per oz.; scrap, £26. **Wolfram,** spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. The demand for **Zinc Dust** has increased, and the higher grades are in short supply; there is no Australian offering, all supplies having been cleared; prices as a whole are unchanged, with a firm tendency: Highest grade English, 93—95%, £48 per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

The home-trade demand for heavy chemicals remains on the dull side, and, with the continued decline in values, there is very little interest shown in forward business. Quotations for alkali products are unchanged, and so far prices have not been fixed for 1924 contracts. **Bleaching Powder,** dull at £11. 5s. per ton, softwoods, on rails makers' works. **Glauber's Salt,** easy at 70s. per ton, carriage paid. Roasted **Saltcake,** quiet at £4. 10s. in bulk, carriage paid. **Chlorates** are unchanged, **Potash** at 2¾d., and **Soda** 2⅝d., ex store Manchester. **Bichromates** are unaltered. Imported American **Sulphur,** firm at £5. 5s., free on rails. **Copper Sulphate** is only in small request for export, and quotations remain nominal at £25. to £25. 10s., f.o.b. Liverpool. **Phosphate of Soda,** steady at £14. 10s., ex store. Commercial **Hyposulphite of Soda,** dull at £9. 10s. on rails, in bags. **Nitrite of Soda** is in fair inquiry, and price firm at £26. 10s., ex store, basis 100%. Concentrated **Sulphide of Soda,** £14. per ton. White powdered **Arsenic** continues in strong demand, and price has further advanced to £69., carriage paid, for Cornish make. Yellow **Prussiate of Potash,** steady at 10¼d. to 10½d. per lb., carriage paid; **Soda,** 5¾d. per lb. **Carbonate and Caustic Potash** are only moving off slowly, and prices have a lower tendency. **Acetic Acid** and **Acetate of Soda** are maintained at recent rates. Grey and brown **Acetate of Lime** continue in short supply, and quotations are firm. **Acetone,** quiet at £124. per ton. Miscible **Wood Naphtha,** 6s. per gallon. **Lead Salts** are again higher, in sympathy with the firm position of lead, and stocks are low: White **Acetate** £43., brown £45.; and **Nitrate** £44., net., all carriage paid. The prices of lump **Salammoniac** have been reduced to 55s. and 52s. 6d. for first and seconds respectively. **Barium Chloride,** quiet at £14. 10s. to £15. per ton. Green **Copperas** is in good request, and prices are steadier. **Oxalic Acid,** slower sale at 5¾d. per lb., ex store. **Permanganate of Potash,** commercial, unchanged at 8½d., carriage paid. All **Tin, Zinc,** and **Ammonia Salts** are moving off satisfactorily, and values are fairly steady.

SWANSEA MARKET REPORT. Wednesday.

There is an improved tone in **Tinplates,** and quotations are firm on the basis of £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** are brisk at £19. 2s. 6d. per ton, f.o.b. **Copper** slightly dearer, for prompt £62. 12s. 6d. per ton, and three months £63. 2s. 6d. **Tin** in better supply, and easier at £215. 17s. 6d. per ton cash, and £215. 12s. 6d. three months. **Lead** dearer, and not freely offered for immediate delivery at £31. 2s. 6d. per ton, and forward at £30. 12s. 6d.; English, £32. 12s. 6d. **Spelter** cheaper, but steady at £33. 2s. 6d. per ton prompt, and £33. 7s. 6d. forward. **Zinc Sheets** in fair demand at £39. 12s. 6d. per ton, on rails at makers' works. **Sulphate of Copper,** dull at £25. 7s. 6d. per ton, less 5%, in casks, f.o.b. **Sulphate of Ammonia,** very steady home trade at £14. 15s. per ton. **Nitrate of Soda,** quiet at £13. 7s. 6d. per ton. **Bone Meal,** slow trade, with Indian, prompt, at £9. 2s. 6d. per ton. **Arsenic** is attracting more attention, Cornish supplies being short; white

powdered, £64. 7s. 6d. per ton. **Oxalic Acid,** quiet at 6¼d. per lb., f.o.r. **Sulphuric Acid** in good demand, with rates unchanged. **Copperas,** dull at £2. 3s. 6d. per ton, including delivery London or equal. **Pitch** in good inquiry, but quotations high, and very little business at £6. 17s. 6d. per ton. **Seed Oils** were firmly held, with raw **Linseed** at £2. 5s. 9d. per cwt., and boiled £2. 7s. 9d. **Cottonseed Oil,** common edible £2. 2s. 9d., and deodorised £2. 5s. 9d. per cwt. **Rape Oil** steady, with refined prompt at £2. 6s. 6d. per cwt., net, in barrels. **Cod Oil** quiet; Newfoundland prompt £2. 5s. 3d., and English £1. 15s. 3d. per cwt. **Coconut Oil,** firm at £2. 5s. 9d. per cwt. for Ceylon. **Castor Oil,** very firm at £2. 13s. 6d. to £2. 19s. 6d. per cwt., net, in barrels. **Palm Oil** firmly held; Lagos, £37. 7s. 6d. prompt, and £37. 2s. 6d. forward; softs, £37. 2s. 6d. prompt, £37. 5s. forward; mediums, £37. 7s. 6d. prompt, and £37. 5s. forward; hards, £37. 2s. 6d., all per ton at docks. **Olive Oil** steady, with prompt Spanish at £67. 12s. 6d. per ton. **Turpentine** firm, with prompt American at £3. 12s. 9d. per cwt. **Creosote,** in good demand at 8¾d. per gallon. **Coals** show a steadier tendency: Best Admiralty smokeless £1. 7s. 6d., seconds £1. 6s.; ordinaries, £1. 5s. 6d.; Monmouthshire black vein, £1. 6s. 6d., all per ton, f.o.b. **Anthracite** steady: Best large £2. 5s., seconds £1. 15s.; Paris and French nuts, £2. 17s. 6d. per ton, f.o.b. **Patent Fuel** prices firm from £1. 8s. 6d. to £1. 11s. 9d. per ton, f.o.b. **Cokes** firm; export, £2. 2s. 6d. per ton, f.o.b.; foundry, £1. 19s. 9d.; furnace, £1. 9s. 9d. per ton.

LIVERPOOL CHEMICAL MARKET. Wednesday.

A steady and very fair business in chemicals of the heavier class has been done with the buyers in the United Kingdom, the tendency being for sales to improve somewhat. In the export branch of the trade a good general shipment of chemicals has been made, but the aggregate volume of products shipped has not been so great as in recent preceding weeks. **Bleaching Powder** has been quiet in the home-trade department, but has been shipped rather freely; the price is £11. 5s. per ton for spot, special quotations being given for contracts, according to requirements. **Chloride of Calcium** has been more in demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has had a very fair inquiry on home-trade account, and has had a moderately active shipment for export; the price of spot, for home-trade use, is £19. 7s. 6d. per ton, special terms being quoted for contract lots, according to requirements. **Bicarbonate of Soda** has again been in good request for home-trade use, and has had a moderate shipment for foreign ports; the price is £10. 10s. per ton, carriage paid, to users in the U.K. **Soda Crystals** have had a steady inquiry for use in the U.K., and are £5. 5s. per ton to home-trade buyers, carriage paid; business in the export branch has been on a small scale. **Nitrate of Soda** continues to meet with a limited inquiry, and is £13. 5s. to £13. 10s. per ton. **Borax** has had a steady sale for home-trade use; commercial crystals are £25. per ton, and powdered £26.; higher grades are—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid in the U.K. **Saltcake** has been quieter, and is £4. 10s. to £5. per ton for the home trade, and £5. to £6. per ton for export. **Bichromate of Soda** has had a quietly steady sale, and is 4¾d. per lb., c.i.f., to stated ports. **Ammonia Alkali** has been in rather good demand for U.K. use and for export; it is £7. 10s. per ton for spot, f.o.r. at works; for contracts, special prices are being given, according to requirements; for export £8. per ton is quoted, varying according to destination. **Hyposulphite of Soda** has been steadily called for; it is £10. per ton, in 2cwt. bags, for commercial, and £15. per ton for photographic. **Sulphide of Soda** has had a limited inquiry; prices are £14. 10s. to £15. 10s. per ton for solid, and £8. 15s. to £9. per ton for crystals. **Chlorate of Soda** has again been but little in request, and is 3d. per lb. **Phosphate of Soda** has been inactive, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been quiet, and is 6d. per lb. **Yellow Prussiate** has been rather more in demand; the price has eased, and is 10½d. to 11d. per lb. **Red Prussiate** has had a quietly steady sale, and is 2s. 10d. to 3s. per lb. **Carbonate of Potash** has had a fair inquiry, and is £25. to £27. per ton. **Nitrate of Potash** has had a rather free demand, and is £29. to £30. per ton. **Chlorate of Potash** has had a fair inquiry, and is 3½d. to 4d. per lb. **Caustic Potash** has been steadily called for, and is £29. to £30. per ton. **Permanganate of Potash** has been more in demand, and is 9d. to 9½d. per lb. **Bichromate of Potash** has met with a steady inquiry, and is 5¾d. per lb., c.i.f. to usual ports **Salammoniac** has been in fair request; first quality is £60., and second quality £57. per ton. **Sulphate of Ammonia** has been but little in demand on home-trade account, and has had only a light shipment on export account; prices for November are: Neutral of 25¾% £14. 15s. per ton, and ordinary of 25¼% £13. 12s. per ton. **Carbonate of Ammonia** has been in rather good demand, and is 4d. per lb. **Muriate of Ammonia** has had a quietly steady sale, and is £32. per ton. **Magnesia** has sold with some freedom; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a steady inquiry, and is £11. per ton for home-trade use, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has again had a very moderate sale, and is £8. to £11. per ton, according to quality. **Sulphur** has sold more readily; flowers are £10. per ton, roll is £8. 10s. per ton, rock is £8. to £8. 10s. per ton, and American £5. 10s. per ton. **Tartaric Acid** has been in fair demand, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has again been steadily called for; the price has tended to ease, but may be given as £4. 10s. per cwt. **Boric Acid** has been rather more in request; commercial is £48. per ton, and powdered £51. per ton; B.P. grades are £54. and £60. per ton. **Citric Acid** has been but little in demand, and the price has further eased; it may be given as 1s. 4½d. to 1s. 5d per lb. **Oxalic Acid** has moved but slowly, and is 6d. per lb. **White Acetate of Lead** has been more in request, and is £42. to £43. per ton. **Sulphate of Copper** has been very quiet for use in the U.K. and for export; it is £25. 10s. to £26. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has had a very fair inquiry, and the price of white powdered has tended to harden; it may be given as £63. to £65. per ton.

WEST OF SCOTLAND CHEMICALS. Wednesday.

The steady day-to-day demand for chemicals on home-trade account continues, but export inquiry is still limited. The position is quiet, however, improvement depending upon a revival in the chemical-consuming industries. Prices are about the same, with a rising tendency in white acetate of lead. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, unchanged at £67. per ton on spot; an improving market. **Barium Chloride,** £14. 10s. per ton; at this price the market remains steady. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted at slightly below this figure. **Citric Acid,** 1s. 6d. per lb., less 5%; little business about at last week's quotation. **Copper Sulphate,** £26. 15s. per ton, less 5%, at Liverpool; a rather neglected market. **Cream of Tartar,** £4. 2s. 6d. per cwt. for 99% at Glasgow; quotation steady, and inquiry small. **Lead Acetate,** white, £42. 15s. per ton on spot; brown, more inquiry at £44. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. per lb.; at this reduced price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £60. and £57. per ton respectively; crystals £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 11s. 6d. per cwt., net; a better market, with quotation unaltered. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady. **Sodium Bicarbonate,** £9. 10s. per ton, in 2cwt. bags; £11. 10s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid,** 1s. 1¼d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

Sudan, 142 pkgs. ; Puerto Colombia, 4 bxs. ; Rotterdam, 111 cs. ; Rangoon, 1,732 pkgs. ; Salonika, 90 pkgs. ; Sabang, 28 bxs. ; Saltpond, 56 bxs. ; Samarinda, 200 bxs. ; Santa Cruz de la Palma, 16 cs. ; Saparoca, 75 bxs. ; Sierra Leone, 20 bxs. ; Serembau, 25 bxs. ; Sekondi, 3 bxs. ; Sourabaya, 43 bxs. ; Singapore, 516 bxs., 20 cs. ; St. Kitts, 110 cs. ; St. John's, N.F., 664 pkgs. ; St. Lucia, 65 cs. ; Shanghai, 1,000 bxs. ; Stockholm, 1,100 cs. ; Sydney, 1 cs., 80 drms. ; Tagoelandang, 25 bxs. ; Tamako, 25 bxs. ; Tandjong Pandan, 105 bxs. ; Tanga, 100 bxs. ; Taroena, 25 bxs. ; Teneriffe 211 bxs. ; Ternate, 476 bxs. ; Tetuan, 125 bxs. ; Timosa, 22 cs. ; Tolal, 125 bxs. ; Trinidad, 550 pkgs. ; Tuticorin, 200 cs. ; Valparaiso, 185 cs. ; Vatoeroesa, 100 bxs. ; Wellington, 189 cs. ; Winnebah, 124 bxs.

SODA CRYSTALS—
Buenos Ayres, 10 brls.; Ceuta, 25 bgs.; Colombo, 100 pkgs.; Durban, 20 pkgs.; Jersey, 70 pkgs.; Malta, 50 bgs.; Panama, 270 pkgs.; Penang, 30 pkgs.

SODA ASH—
Adelaide, 430 pkgs.; Antofagasta, 491 pkgs.; Arica, 20 pkgs.; Auckland, 20 pkgs.; Brisbane, 217 pkgs.; Buenos Ayres, 575 cks.; Calcutta, 5,000 pkgs.; Christiania, 600 pkgs.; Colombo, 800 pkgs.; Constantinople, 200 pkgs.; Copenhagen, 1,700 pkgs.; Drammen, 100 pks.; Durban, 200 pkgs.; Fremantle, 278 pkgs.; Hamburg, 6,500 pkgs.; Helsingfors, 300 pkgs.; Hobart, 27 pkgs.; Iquique, 200 pkgs.; Karachi, 5,180 bgs., 2,820 pkgs.; Kobe, 11,274 bgs., 11,571 pkgs.; Kotka, 1,300 pkgs.; Launceston, 236 bgs.; Madras, 44 pkgs. Malmo, 400 bgs.; Melbourne, 259 pkgs.; Medellin, 45 bgs.; Moji, 3,788 bgs.; Odense, 1,000 bgs.; Rotterdam, 5,000 bgs.; Samarang, 100 bgs.; Shanghai, 952 pkgs.; Sourabaya, 100 bgs.; Stockholm, 2,000 bgs.; Sydney, 118 bgs.; Tuticorin, 8 cks.; Volo, 80 pkgs.; Wiburg, 300 bgs.; Yokkaichi, 808 bgs.

SODIUM ARSENITE—
East London, 20 pkgs.

SODIUM BICARBONATE—
Adelaide, 18 pkgs.; Alexandria, 130 pkgs.; Aden, 20 pkgs.; Auckland, 40 pkgs.; Bari, 75 kgs.; Batavia, 40 pkgs.; Beyrout, 20 kgs.; Bourgas, 60 kgs., 122 pkgs.; Braila, 150 kgs.; Copenhagen, 12 pkgs.; Dalny, 112 pkgs.; Durban, 90 pkgs.; Genoa, 50 pkgs.; Karachi, 200 pkgs.; Kilindini, 10 kgs.; Kingston, Ja., 5 pkgs.; Leghorn, 130 pkgs.; Madras, 191 pkgs.; Malta, 30 bgs.; Manila, 280 kgs.; Melbourne, 20 kgs.; Montreal, 75 pkgs.; Naples, 125 kgs.; Newcastle, 112 bgs.; Para, 70 pkgs.; Penang, 30 pkgs.; Piraeus, 50 pkgs.; Pt. Sudan, 5 pkgs.; Pt. Swettenham, 20 pkgs.; Shanghai, 42 drms.; Sydney, 201 kgs.; Varna, 140 kgs.

SODIUM BISULPHITE—
Cochin, 20 drms.

SODIUM CYANIDE—
Cartagena, 65 cs.

SODIUM HYPOSULPHITE—
Sydney, 100 kgs., 40 cks.

SODIUM PRUSSIATE—
Kobe, 100 kgs.

SODIUM SILICATE—
Adelaide, 172 pkgs.; Auckland, 7 pkgs.; Bordeaux, 3 cks.; Buenos Ayres, 146 cks.; Cartagena, 50 cks.; Durban, 76 pkgs.; Kobe, 30 pkgs.; Fremantle, 28 dble. bgs.; Melbourne, 215 pkgs.; Montreal, 16 pkgs.; Monte Video, 60 cks.; Newcastle, 1 pkg.; Pt. Said, 40 pkgs.; Singapore, 3 cks.; Sydney, 32 cks.

SODIUM SULPHIDE—
East London, 6 pkgs.

STEARINE—
La Guaira, 20 bgs.

LONDON.

Week ending November 7.

ACETIC ACID—
Brisbane, 10 cs., £35.; Christchurch, 5 cs., £17.; Calcutta, 2 cs., £8.; Durban (F.), 3 cs., £10.; Malta (F.), 1 ck., £9.; Salonika (F.), 5 cs., £9.; Toronto, 2 cs., £8.; Wellington, 4 cs., £12.

ACETONE—
Antwerp (in transit) (F.), 33 drms., £1,067.

ACETYL SALICYLIC ACID—
Bombay, 5 cs. (pt.), £21.; Calcutta, 1 cs. (pt.), £11.; Iddo, 1 cs. (pt.), £11.; Sydney, 2 cs. (pt.), £19.

ALUM—
Bombay, 6 kgs., £8.

ALUMINIUM SULPHATE
Iddo, 4 cs., £15.

AMMONIA—
Accra, 25 cs., £48.; Belgian Congo, via Antwerp, 5 cs., £9.; Beira, 3 cs., £6.; Bombay, 15 cs., £27.; Calcutta, 10 cs., £18.; Durban, 35 cs., £57.; Irish Free State, 20 cs., £36.; Kilindini, 4 cs., £7.; Madras, 5 cs., £9.; Penang, 4 cs., £8.; Pt. Elizabeth, 8 cs., £15.; Pt. Harcourt, 5 cs., £9.; Sekondi, 9 cs., £16.; Singapore, 19 cs., £18.

AMMONIA (ANHYDROUS)—
Durban, 10 cs., £17.; Penang, 28 cylds., £175.; Pernambuco, 2 cylds., £13.; Pt. Sudan, 3 cylds., £17.

AMMONIUM BIFLUORIDE
Paris, 2 cks., £26.

AMMONIUM CARBONATE—
Bangkok, 7 c., £29.; Brussels, 1 t., £26.; Calcutta, 4 c., £18.; Chiclayi, 3 c., £8.; Copenhagen, 1 t., £28.; Dunkirk, 1 t. 19 c., £58.; Hamburg, 5 t., £118.; Hong Kong, 6 c., £17.; Kobe, 5 t., £126.; Menado, 3 c., £9.; Paris, 3 t. 16 c., £116.; Penang, 11 c., £28.; Pt. Elizabeth, 4 c., £8.; Singapore, 2 c., £6.

AMMONIUM CHLORIDE—
Calcutta, 3 kgs., £7.
Montreal, 2 t., £62.

AMMONIUM NITRATE—
Calicut, 20 t. 10 c., £502.

AMMONIUM PHOSPHATE—
East London, 1 ck., £7.

AMMONIUM SULPHATE—
Auckland, 25 t., £398.; Hong Kong, 10 t., £152.; Kobe, 100 t., £1,597.; Mauritius, 50 t., £700.; Piraeus, 300 t., £4,050.

ANTIMONY OXIDE—
Mollendo (F.), 1 ck., £10.

ANTIMONY SALT—
Genoa, 6 cks., £62.

ANTIMONY SULPHIDE—
Christiania, 1 ck., £18.; Copenhagen, 14 cks., £138.; Genoa, 7 cks., £162.; Hamburg, 2 cks., £29.; New York, 8 cks., £156.

ARSENIC—
Barcelona, 3 cks., £28.; East London, 2 drms., £7.; Riga (F.), 10 cks., £108.; San Paulo, 20 drms., £64.; Wanganui, 100 drms., £375.

BARIUM CHLORIDE—
San Paulo, 1 ck., £6.

BARIUM PEROXIDE—
Rotterdam, 30 drms., £450.

BASIC SLAG—
Channel Islands, 50 t., £131.

BISMUTH CARBONATE—
Bombay, 1 cs., £71.
Melbourne, 1 cs., £73.
Wellington, 2 cs., £142.

BISMUTH SALTS (*otherwise undes.*)
Auckland, 1 cs. (pt.), £34.; Bombay, 4 cs. (pt.), £5.; Karachi, 1 cs. (pt.), £16.

BISMUTH SUBNITRATE—
Bombay, 2 cs., £182.
Calcutta, 4 cs. (pt.), £30.
Madras, 3 cs. (pt.), £8.
Sydney, 1 cs., £98.

BISULPHITE OF LIME—
Dunedin, 15 cks., £70.

BITUMEN—
Calcutta, 34 pkgs. (pt.), £23.
Copenhagen, 19 brls., £26.

BLEACHING POWDER—
Bagdad, 4 cs. (pt.), £8.

BORAX—
East London, 1 c., £3.
Melbourne, 1 c., £9.

BORAX GLASS—
Sekondi, 15 c., £60.

BORIC ACID—
Calcutta, 10 c., £35.; Callao, 5 c., £17.; Dunedin, 2 c., £6.; Hamburg, 9 t. 17 c. (F.), £472.; Jamaica, 4 c., £12.; Karachi, 2 c., £7.; Singapore, 3 c., £10.

CALCIUM CARBIDE—
Accra (F.), 6 c., £5.; Accra, 10 c., £12.; Sekondi, 7 c., £6.

CALCIUM CARBONATE
Calcutta, 8 cks., £36.

CALCIUM CHLORIDE—
Adelaide, 9 pkgs., £12.
Bombay, 2 cs., £6.
Perth, 12 kgs., £13.
Pt. Sudan, 7 drms., £14.

CALCIUM HYPOPHOSPHITE—
Calcutta, 3 cs. (pt.), £14.

CALCIUM SULPHATE
Barcelona, 20 dks., £30.

CARBON TETRACHLORIDE
Calcutta, 3 cs., £13.
Fremantle, 5 cs., £70.

CAUSTIC SODA—
Rotterdam, 2 c., £6.

CHEMICALS (*otherwise undescribed*)
Adelaide, 10 cs., £106.; Auckland 17 pkgs. (pt.), £35.; Bangkok, 1 c., £7.; Beira, 20 pkgs., £71.; Bombay, 25 cs. (pt.), £79.; Brussels, 2 cs., £6.; Buenos Ayres, 82 cs. (pt.), £791.; Calcutta, 10 cs. (pt.), £55.; Callao, 20 pkgs., £49.; Cape Town, 6 pkgs., £12.; Colombo, 15 cs. (pt.), £66.; Colon, 10 cs. (pt.), £22.; Dar-es-Salaam, 6 cks., £8.; Delagoa Bay, 160 pkgs., £568.; Durban, 2 cs., 14 pkgs. (pt.), £13.; East London, 13 cs., £11.; Foochow, 4 pkgs., £6.; Gothenburg, 15 pkgs. (F.), £18.; Havana, 19 pkgs., £25.; Hong Kong, 4 cs., £5.; Irish Free State, 10 pkgs., £13.; Karachi, 14 pkgs. (pt.), £66.; Kilindini, 11 pkgs. (pt.), £16.; Kobe, 5 cs., £105.; Lisbon, 6 cs., £10.; Madras, 95 pkgs., £116.; Melbourne, 20 pkgs., £173.; Penang, 6 pkgs., £7.; Petrograd, 2 cs., £38.; Rio de Janeiro, 2 cks. (pt.), £8.; Rotterdam, 64 pkgs., £162.; Sekondi, 14 pkgs., £48.; Shanghai, 2 cs., £6.; Singapore, 11 pkgs., £84.; Smyrna, 4 cs. (pt.), £10.; Sydney, 29 pkgs. (pt.), £1,318.; Trichinopoly, 1 cs., £8.; Tulagi, 6 cs., £9.; Vera Cruz, 125 pkgs., £386.; Wellington, 5 cs., £7.; Yokohama, 1 cs., £26.

CITRATES (*otherwise undescribed*)—
Calcutta, 1 cs., £6.

CITRIC ACID—
Amsterdam, 10 c., £73.; Bangkok, 1 c., £6.; Calcutta, 5 c. (F.), £55.; Calcutta, 1 c., £10.; Colombo, 5 c., £35.; Copenhagen, 10 c. (F.), £210.; Hobart, 10 c., £83.; Melbourne, 5 c., £38.; Perth, 5 c., £35.; Rio de Janeiro, 5 c., £61.; Rotterdam, 10 c., £73.; Sydney, 2 t. 10 c., £364.; Yokohama, 3 t. 10 c., £509.

COAL TAR PRODUCTS—
Carbolic Acid
Bombay, 6 cs., £31.; Hong Kong, 1 cs., £11.; Pt. Swettenham, 1 cs., £5.

Naphthalene
Rotterdam, 1,000 bgs., £1,010.

Pitch
Alexandria, 350 pkgs., £139.; Cette (bulk), 1,050 t., £7,613.; Dunkirk (bulk), 250 t., £1,563.; Pt. Said, 160 brls., £180.; Rouen, 8 brls., £240.; Sydney, 25 brls., £74.

Pyridine
Helsingborg, 4 drms., £317.; Rotterdam, 17 drms., £962.; Stockholm, 7 drms., £620.

Tar
Durban, 25 cks., £64.; East London, 44 drms., £9.; Pt. Said, 60 drms., £104.; Singapore, 35 runlets, £154.

Xylol
Rotterdam, 6 drms., £80.

COBALT ACETATE—
Sydney, 1 cs., £25.

COPPER SULPHATE—
East London, 8 c., £12.

CREAM OF TARTAR—
Adelaide, 5 t., £423.; Channel Islands, 2 c. (F.), £9.; East London, 1 fc., £6.; Fremantle, 10 c, £52.; Hobart, 1 t., £87.; Hong Kong, 1 c. (F.), £5.; Karachi, 1 c. (F.), £6.; Launceston, 2½ t., £214.; Menado, 1 c. (F.), £6.; Mollendo, 1 c. (F.), £5.

DISINFECTANTS (*otherwise undes.*)
Acajutla, 9 c., £17.; Antigua, 4 c., £8.; Bagdad, 2 c., £7.; Bangkok, 5 c., £8.; Bonny, 9 c., £25.; Calabar, 1 t., £61.; Calcutta, 2 t. 3 c., £87.; Canton, 18 c., £23.; Cartagena, 1 c., £14.; Christchurch, 1 t. 7 c., £290.; Colombo, 1 t. 4 c., £98.; Cotonou, 3 c., £8.; Dunedin, 1 t. 16 c., £130.; Forcados, 19 c., £56.; Gisborne, 13 c., £40.; Hong Kong, 3 t. 6 c., £100.; Iddo, 1 t. 3 c., £35.; Irish Free State, 3 t. 8 c., £82.; Karachi, 6 c., £10.; Kilindini, 6 c., £20.; Las Palmas, 6 c., £16.; Penang, 14 c., £42.; Pt. Elizabeth, 5 c., £8.; Rangoon, 2 t. 15 c., £138.; Singapore, 5 c., £11.; Sydney, 1 t. 4 c., £58.

DYESTUFFS (ARTIFICIAL)—
Nigrosine
Brussels, 1 ck., £8.
Sydney, 3 pkgs., £11.
Unspecified
Bombay, 1 cs. (pt.), £11.; Boulogne, 4 cks., £100.; Montreal 1 cs. (pt.), £7.; Sydney, 8 pkgs., 1 cs. (pt.), £121.; Valencia, 8 kgs., £13.

ETHER—
Bombay, 2 cs., £9.

ETHYL CHLORIDE—
Pt. Swettenham, 1 cs. (pt.), £11.

FERTILISERS (*otherwise undes.*)—
Buenos Ayres, 2 t., £25.; Channel Islands, 6 t. 12 c., £77.; Ghent, 24 t. 10 c., £138.; New York, 5 t. 5 c., £136.

FORMALDEHYDE—
Calcutta, 2 cs., £9.; Irish Free State (F.), 1 brl., £17.; Wellington, 12 cks., £30.

GLYCERINE—
Bombay, 3 c., £26.; Canton, 1 c., £6.; Florence, 10 c., £42.; Melbourne, 2 c., £5.; Oporto, 1 t., £99.

GLYCEROPHOSPHATES (*otherwise undes.*)
Bombay, 1 cs. (pt.), £10.

HYDROCHLORIC ACID—
Lagos, 1 c., £7.

HYDROFLUORIC ACID—
Pt. Elizabeth, 1 cs., £13.

HYDROGEN PEROXIDE—
Pt. Said, 2 cs. (pt.), £10.

IODIDES (*otherwise undescribed*)—
Auckland, 1 cs. (pt.), £71.
Calcutta, 1 cs. (pt.), £9.

IODINE—
Rio de Janeiro, 1 cs. (pt.), £38.

IODINE (RESUBLIMED)—
Brussels, 4 cs. (pt.), £155.
Sydney, 1 cs. (pt.), £26.

IRON AMMONIUM CITRATE—
Bombay, 5 cs., £32.
Buenos Ayres, 4 cs., £23.

IRON IODIDE—
Rangoon, 1 cs. (pt.), £6.

IRON PERCHLORIDE—
Sydney, 10 cs., £11.

LEAD ARSENATE—
Cerro Azul, 100 drms., £481.
Pt. Swettenham, 5 cks., £28.

LEAD PEROXIDE—
Antwerp, 5 cks., £25.

MAGNESIA—
Auckland, 6 cs., £8.; Christchurch, 5 cs., £13.; San Juan del Sur, 1 cs., £9.; Switzerland, 3 cs., £7.; Sydney, 35 cs., £84.; Wellington, 4 cs., £9.

MAGNESIUM CARBONATE—
Melbourne, 10 cs., £23.; Rio de Janeiro, 5 cs., £28.; Sydney, 10 bgs., £29.

MAGNESIUM CITRATE—
Havre, 13 cs., £214.

MAGNESIUM SULPHATE—
Accra, 6 c., £11. ; Bahrein, 1 c., £5. ; Basreh, 4 c., £5. ; Bombay, 17 c., £26. ; Brisbane, 1 t. 15 c., £11. ; Calcutta, 10 c., £8. ; Colon, 8 c., £10. ; Lagos, 10 c., £12. ; Launceston, 1 t. 5 c., £28. ; Maryborough, 5 c., £6. ; Melbourne, 7 t. 9 c., £168. ; San Juan del Sur, 5 c., £7. ; Sydney, 1 t. 14 c., £39. ; Toronto, 10 c., £8.

MERCURIALS (*otherwise undes.*)—
Auckland, 1 cs. (pt.), £5.
Calcutta, 3 cs., £51.

MERCURY CHLORIDE—
Calcutta, 3 cs. (pt.), £6.

MERCURY OXIDE—
Rio de Janeiro, 1 cs. (pt.), £15.

MERCURY SUBCHLORIDE
Bombay, 2 cs., £26.

METHYL SALICYLATE—
Durban, 1 cs., £6.

NICKEL SALTS (*otherwise undes.*)
Durban, 14 pkgs. (pt.), £14.
Melbourne, 5 cs., £11.

PHOSPHORIC ACID—
Calcutta, 4 cs., £12.
Dunedin, 2 cs., £6.

POTASH (*otherwise undescribed*)—
Dunedin, 1 kgs., £22.

POTASSIUM BICARBONATE—
Sydney, 5 cs., £14.

POTASSIUM CARBONATE
Hong Kong, 5 cs., £18.
Sydney, 2 cs., £6.

POTASSIUM CHLORATE
Calcutta, 3 kgs., £6.

POTASSIUM CITRATE
Bombay, 2 cs., £21.

POTASSIUM IODIDE—
Brussels, 4 cs. (pt.), £129. ; Beira, 1 cs. (pt.), £11. ; Bombay, 2 cs., 4 cs. (pt.), £190. ; Calcutta, 3 cs., 3 cs. (pt.), £307. ; Cape Town, 1 cs. (pt.), £12. ; Karachi, 1 cs., £88. ; Kobe, 5 cs., £392. ; Madras, 3 cs. (pt.), £12. ; Melbourne, 1 cs., £90. ; Rio de Janeiro, 1 ck., 4 cs. £466. ; Singapore, 2 cs., £178. ; Sydney, 2 cs., 1 cs. (pt.), £186.

POTASSIUM METABISULPHITE
Melbourne, 20 cs., £63.

POTASSIUM SALTS (*otherwise undes.*)
Toronto, 2 cs., 7 cks., £38.

ROCHELLE SALTS—
Canton, 1 c., £13.

SALAMMONIAC—
Wellington, 2 cks., £27.

SALICYLATES (*otherwise undes.*)—
Sydney, 3 cs. (pt.), £27.

SALTCAKE—
Bilbao, 250 t., £1,406.

SALTPETRE—
Auckland, 2 t. 5 c., £82. ; Bahia, 2 t. 9 c., £98. ; Dunedin, 2 t. 5 c., £82. ; Wellington, 5 t., £204.

SHEEP DIP—
Durban, 1 t. 6 c., £38.
Irish Free State, 1 c., £8.

SILVER NITRATE—
Canton, 1 cs., £52.
Hong Kong, 3 cs., £238.

SILVER SALTS (*otherwise undes.*)
Melbourne, 1 cs., £65.

SODA CRYSTALS—
Karachi, 3 c., £19.

SODIUM ARSENITE—
Delagoa Bay, 2 t., £146.

SODIUM BENZOATE—
Kobe (F.), 1 t., £224.
Paris, 1 t., £259.

SODIUM BICARBONATE—
Calcutta, 6 c., £19. ; Fremantle, 10 c., £15. ; Hong Kong, 1 c., £5. ; Monte Video, 15 c., £40. ; Oruro, 10 c., £16. ; Rio de Janeiro, 2 t., £35. ; San Juan del Sur, 15 c., £24.

SODIUM BISULPHITE—
Auckland, 1 t., £20. ; Callao, 1 t. 19 c., £29. ; Cochin, 10 c., £19. Penang, 2 t. 10 c., £46.

SODIUM CARBONATE—
Christiania, 10 c. £8. ; Delagoa Bay 9 c., £17. ; Singapore, 2 c., £5.

SODIUM CARBONATE
Stockholm, 1 t., £13.
Yokohama, 9 c., £27.

SODIUM CITRATE
Bombay, 1 c., £9.

SODIUM HYDROSULPHITE
Calcutta, 10 c., £89.

SODIUM HYPOSULPHITE—
Basrah, 3 c., £5.
Colombo, 10 c., £9.

SODIUM IODIDE—
Brussels, 1 cs. (pt.), £24.

SODIUM PRUSSIATE
Mexico Bay, 1 t. 1 c., £58.

SODIUM SALICYLATE—
Irish Free State, 1 c., £11.
Pt. Swettenham, 1 cs., £7.

SODIUM SALTS (*otherwise undes.*)
Dunedin, 17 c., £40.

SODIUM SULPHATE
Demerara, 20 kgs., £10.

SODIUM SULPHIDE—
Montreal, 10 t. 17 c., £95. ; Perth, 1 t., £17. ; Rotterdam, 5 t. 3 c., £72.

SODIUM SULPHITE—
Antwerp, 10 c., £10.
Singapore, 6 c., £24.

SODIUM TARTRATE—
Calcutta, 1 c., £5.

SODIUM TUNGSTATE
Sydney, 1 c., £8.

SULPHUR—
Beira, 10 c., £9.
Irish Free State, 1 c., £8.

SULPHURIC ACID—
Aden, 6 c., £7. ; Bagdad, 1 c., £6. ; Beira, 1 t. 10 c., £24. ; Durban, 13 c., £35. ; Iddo, 1 t. 10 c., £95. ; Pernambuco, 10 t., £200. ; Pt. Sudan, 1 t. 5 c., £25. ; Pt. Swettenham, 2 t. 4 c., £89.

SUPERPHOSPHATE—
Channel Islands, 155 t., £122.

TARTARIC ACID—
Adelaide, 1 t., £120. ; Bombay, 2 c., £17. ; Buenos Ayres, 50 t., £5,563. ; Calcutta, 1 c., £32. ; Galatz, 1 t. (F.), £120. ; Karachi, 1 c., £8. ; Limon, 3 c. (F.), £24. ; Melbourne, 2 t., £240. ; Perth, 5 c., £30. ; Pt. Elizabeth, 1 c., £7. ; Sydney, 3 t., £360. ; Valparaiso, 1 t., £122. ; Yokohama, 12 t., £969.

TIN OXIDE—
Melbourne, 4 cks., £200.

TURPENTINE—
Cape Town, 2 drms., £7.

ZINC OXIDE—
Alexandria, 10 brls., £59. ; Boulogne, 2 cks., £10. ; Christiania, 80 cks., £161. ; Copenhagen, 220 cks., £665. ; East London, 10 kgs., £13. ; Medellin., 10 cks., £21. ; Paris, 80 cks. £330. ; Victoria, 10 cks., £17.

ZINC SULPHIDE—
Danzig, (F.), 1 ck., £8.

Week ending November 10.

CARNAUBA WAX—
Amsterdam, 1 t.

CERESINE WAX—
Irish Free State, 14 c.

COPPER RESIDUE—
Hamburg, 26 t.

DYESTUFFS (NATURAL)
Turmeric
Ghent, 2 c.

FULLER'S EARTH—

CURRENT TOPICS.

THE EXPORT TRADE IN SULPHATE.

TO those who have followed the figures relating to the export trade in sulphate of ammonia, as published in the monthly trade returns, the encouraging results given by the chairman of the British Sulphate of Ammonia Federation, in his speech on Friday last, will occasion no surprise. This fertiliser is one of the few British products which have more than held their own in the world's markets. The period reviewed by Mr. D. Milne Watson was the last fertiliser year—from June 1, 1922 to May 31, 1923— and during this period the production of sulphate in this country increased by 50 per cent. Exports showed a gain of 58 per cent., and home deliveries a rise of 3 per cent. on the previous year. In times of trade depression like those this country has been and is still passing through, figures such as quoted above are most stimulating. These gratifying results are attributed by the chairman to the improved quality of the product marketed by the Federation, which, is to be inferred from Friday's speech, amounts to about nine-tenths of the total British output. That 70 per cent. of the production is of neutral quality is a matter for congratulation, meaning as it does a further narrowing down of the margin of loss due to the rotting of bags in transit, together with greater ease of application of the fertiliser to the land. But is it justifiable to accord to this improvement in quality the entire credit for the increased export trade? Has not the absence of American competition been a contributory factor? Was the loss of Japan as a market during 1921 and 1922 due entirely to low quality of the British material? The great sulphate slump in America in 1920 resulted in the purchase by Japan at the end of that year of very large quantities at a comparatively low price, with the consequence that the market became greatly overstocked, and the progress of dispersion lasted nearly two years. In the meantime, the United States coal and railway strikes caused a considerable reduction in output, leaving the world's markets open to the British producers. Credit must be given, however, to the very efficient propaganda work undertaken by the Federation, which is, as Mr. Milne Watson pointed out, bearing fruit during the current year. Exports have been very satisfactory over the past six months, but the trend of prices has been downward—in fact, export quotations are in

many cases below the controlled home price, a state of affairs which must result, sooner or later, in a lowering of the latter figure.

THE NEW SOURCE OF POTASH.

New, cheap, and plentiful supplies of potassium compounds would seem to be assured if the preliminary work that has been carried out on the utilisation of the Italian mineral, leucite, affords any indication. Perhaps we are wrong in using the word "preliminary," for, as Professor Hinchley pointed out before the Chemical Engineering Group on Friday last, the mineral is already being exploited industrially in France, alum and sodium silicate being produced at costs remarkably low compared with the costs by the usual methods. The probability of alum at £4. per ton, and silicate of soda of 40° Bé. at £2. 9s. per ton, is certainly disconcerting to present British makers. It will be all to the good of both users and makers, however, if further experience proves that these low production costs can be maintained. There is evidently no danger of supplies of leucite failing for centuries, even if called upon to supply the whole of the world's demands for potash, and absolute independence of German supplies should be gained at last. That the Germans themselves realised the danger of the competition of leucite was illustrated clearly by the incident related by Professor Hinchley, to whom thanks are due for having brought so vividly the potentialities of leucite before the British chemical industry. To a mineral from which potassium salts can be produced so cheaply and which has such a high content of available potash, the freight difficulty is not serious, and production costs in this country should not be much higher than those in France. Dr. Voelcker's conclusions on the value of finely ground leucite as a fertiliser are especially interesting and rather unexpected, for work on other potash-containing minerals has not produced very encouraging results. The suitability of leucite as a raw material for chemical manufacture depends upon the non-gelatinous nature of the silica residue left after treatment with acids. Its value as a direct potash fertiliser is probably also bound up with this factor, but the exact connection is not clearly evident as yet.

THE GERMAN REPARATION DEFAULT.

Those who still believe in the honesty and sincerity of the German Government, and who ascribe the greater part of the troubles of present-day Europe to the wanton aggressiveness of French militarism, will have received something of a shock at the latest development in the German policy. The German Government has repudiated completely its agreement, made under the London Ultimatum of May, 1921, as to the 26 per cent. reparation levy on all imports of goods of German origin into Great Britain. This repudiation was made in an Ordinance dated November 15, a translation of which we print on another page. Hitherto, the British importer has paid the German exporter 74 per cent. of the invoice values of the goods shipped, the British Customs authorities retaining the remaining 26 per cent. The German exporter has then recovered his balance of payment from the German Government. The latter Government has now declared its intention of paying no more, and if the British Government continues to levy the duty, the whole of the amount will have to come out of the pocket of the British importer, as it is obvious that the German shipper will increase his prices to cover the losses occasioned by the default of his own Government. The question of the enforcement of the agreement upon the German Government is one too big to enter upon here, though the episode should prove illuminating to those who argue in favour of withdrawing force and leaving the payment of war reparations to the honour of the German people. Fortunately, the silver lining said to be possessed by every cloud is clearly revealed in this instance, for so far as British chemical manufacturers are concerned the further rise in price of German chemicals, which would seem to be an inevitable consequence of the action of the German Government, will act as a welcome measure of protection. As we pointed out a fortnight ago, general economic conditions in Germany have to a very large extent destroyed the formidable nature of her competition in the British chemical market, and German prices have in some instances risen above world prices. The additional difficulties now placed in the way of the German exporter will increase, temporarily at least, the opportunities possessed by the British manufacturer, who, we have every confidence, will take the fullest advantage of the new conditions.

EFFICIENCY IN DETAILS.

Few chemists and chemical engineers will be inclined to disagree with the contention of our contributor, Mr. C. Elliott, that too little attention is directed to the distribution part of the steam system in the average chemical works. Bare piping and leaking joints, inefficient steam traps and unsuitable valves very often represent a loss of heat or power which in the aggregate is very large. There exist, of course, many works where this state of affairs does not hold good, and where minute attention to detail has brought its reward in the shape of greatly increased efficiency. Most establishments of any magnitude have now realised the necessity of scientific supervision and instrumental control of the steam-producing units of their plants, but the equally valid argument in favour of an efficient distribution system has not been so generally recognised. Mr. Elliott's article, although dealing at some length with the less obvious aspects of boiler control, is especially valuable for the suggestions given on the erection and upkeep of the steam distribution system. Mr. Elliott is a chemical engineer who has had many years' experience in the erection and running of plant for the manufacture of fine chemicals, and all the suggestions he gives have had their value proved in actual practice. Thus, in the method of pipe fitting whereby the usual threaded pipes and T-pieces are replaced by flanged pipes and welded branches, the latter method has been demonstrated to be, in most cases, as cheap as, and much more efficient than, the former.

THE STEAM SYSTEM IN A CHEMICAL WORKS.

NEGLECTED DETAILS THAT REDUCE EFFICIENCY.

By C. Elliott, B.Sc., A.M.I.C.E.

In a chemical works more than any other class of industrial undertaking, successful operation depends very largely upon attention to detail. Whilst this is generally realised so far as the actual handling and working up of the chemical products themselves are concerned, it is surprising how many details on the engineering side of the business are given scant if any attention by the engineer or manager responsible. There seems often to be little appreciation that, though these details are individually small, yet collectively they may assume very considerable proportions and may cause considerable loss and trouble, misfortunes which might have been avoided by the exercise of a little more forethought and care.

Steam Raising and Steam Distribution.

The steam-raising plant is in many cases a very important, if not the most important, centre radiating heat and energy in all directions through suitable mains. The purpose of this article is to present the view that considering their mutual importance and interdependence, the boilers and steam mains form a complete system, every detail of which should receive careful attention and consideration. The duty of a steam system is to deliver to every part of the works where required, an adequate supply of steam at the lowest possible cost of production and maintenance, with the least capital expenditure and with the least possible loss of pressure. Boiler-houses equipped with modern labour-saving devices but with the boilers working inefficiently, and efficiently worked boilers coupled to badly designed and faulty mains should be incompatible. The steam system is too often regarded as a detail instead of a collection of many details, each capable to a varying extent of giving considerable trouble if neglected and each worthy of attention if maximum overall efficiency is desired. There is a considerable amount of truth in the paraphrase "look after the details and the works will look after itself."

Boiler-house Efficiency.

The management of a boiler house in a chemical works does not differ essentially from that in any other industrial establishment, yet it seems strange that in many cases it should be so neglected when so much attention is given to the possibilities of improving the qualities and yields of chemical products. There is some excuse where the demand for steam is small and irregular or when the cost of steam is only a small proportion of the total cost of production, but even then the possibility of effecting considerable saving by efficient methods should warrant a greater amount of interest. Even if it is too much to expect that continuous efforts be made to maintain maximum efficiency in these cases, yet it is not unreasonable to urge that even a small amount of forethought and care will make appreciable difference. Even in large plants where the cost of steam is an important factor in the total cost of production, considerable neglect is often evidenced not only in the actual running of the plant, but also in regard to such matters as insulation of naked pipes.

The subject of boiler efficiency and the methods of obtaining it have been exhaustively treated by many writers to whom it is a constant source of inspiration, but whether the many panaceas proposed have been given a fair trial and whether the disease will be ever thoroughly eradicated from our industrial system as a whole, and from chemical works in particular, is open to question. A full examination of and discussion on all the many points which arise in a consideration of the steam system is impossible in the course of one article, and attention will therefore be drawn to some salient features only, in the hope that other matters will suggest themselves.

Factors to be Considered in Buying Coal.

Fuel is of course the heaviest item of expenditure in a boiler-house, but coal—our fuel in this country—is too often purchased in the cheapest market possible quite irrespective of its calorific value and its general value for steam-raising purposes. The burning of raw coal is rather a failure on the part of modern science which has performed such marvels in other fields, but the buying of coal by weight instead of calorific value is surely adding insult to injury, and it should be considered a disgrace to burn it inefficiently. Unfortunately very few collieries will sell on a thermal basis, but this does not prevent the user from testing his coal and ascertaining how much real combustible and how much ash he is buying.

The calorific value of a coal, however, as determined by more or less elaborate methods does not give the true economic value, for there are other factors to be considered. To a considerable extent the economic value of a given coal varies with the type of boiler and the method of firing. Thus a Lancashire hand-fired boiler might not do so well as one fitted with a mechanical stoker, rocking grate and forced draught or as a water-tube boiler with a chain grate stoker. The amount of ash and its tendency to clinker also affect the efficiency, for the air spaces may get badly choked, the draught and therefore the combustion checked, while cleaning the fire may be frequent and in the case of bad clinkering very difficult. The amount of ashes and their disposal often present very expensive troubles, and the frequency with which the flues have to be cleaned is an important item. Transport and handling costs of one ton of a poor fuel are exactly the same as for a good fuel. Thus, if these items amount to x shillings per ton, then the charge per 1,000B.Th.U. is 33 per cent. higher with a 9,000B.Th.U. than a 12,000B.Th.U. coal. There is also the fact that in general the evaporative value of a coal does not vary proportionately with the calorific value determined in the laboratory, for poor coals usually give less efficient results than good ones. In many of the poorer grades of coal, the sulphur content is high and is the cause of corrosion. This point is often neglected, but it is worth while ascertaining the amount of sulphur in the coal. These and other matters should be considered in the purchase of coal, and it might be remembered that it is often possible to buy a superior coal at almost the same cost as a poorer one because of the absence of a calorific selling basis. Those who test their coal and know its true economic value are the wisest, others are only buying a black material.

Mechanical Stokers, A Word of Warning.

The installation of mechanical stokers and various furnaces does in many cases enable poor fuel to be used advantageously and good fuel to be burnt more efficiently, but unless such devices receive proper attention and skilled supervision, they may become little better than hand firing. When new or when kept in a good state of repair and particularly when they are used intelligently they are capable of very excellent work, but when neglected the results are often very bad. To take one point, the steam nozzles employed to give forced draught should be examined frequently since the holes are liable to erode and enlarge in course of time with consequent waste of steam. As a general rule such jets use 4 to 5 per cent. of the amount of steam generated by the boiler, but the consumption may reach alarming figures if the nozzles are in bad order. With some stokers the repair bill is heavy, a point that is often disregarded, but on the whole the success of any type of mechanical stoking depends in a very great degree on the user.

From a national point of view, the poorer the coal that can be used the better, for it reduces the consumption of the superior grades, leaving these latter available for more dignified and useful purposes and it checks the waste of our diminishing coal reserves. From a practical economic point of view, there is a limit where the cost of handling, cleaning, depreciation, etc., counterbalances the saving obtained by the purchase of an inferior coal.

Regular Feed-water Supply.

A boiler may be regarded as a chemical plant consisting of a continuous still working under pressure, the product being steam which should be as pure as possible, the impurity being water. For the successful working of a continuous still, it is essential that the conditions should be kept as constant as possible and in the case of a boiler the feed should be as regular and continuous as possible in order that a constant water level may be maintained. The feed to the boiler should be as hot as possible in order that fuel may be economised, and very considerable saving may be effected by the use of feed-water heaters and economisers. Further to economise fuel and also to prevent damage to the boilers, the feed should be as pure as possible since scaling lowers the transmission of heat and the plates may get overheated. The discharge from steam traps is too often allowed to run to waste but being hot, and, more especially, pure, should be returned to the boiler. Condenser water which is hot but not pure is often produced in large

quantities, and this can be used as " make up " to maintain a constant level in the hot well, as shown in Fig. I., which is

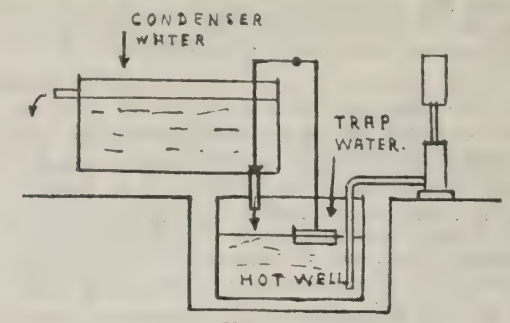

Fig. 1.

self-explanatory. The exhaust from steam engines would be valuable if it did not contain considerable amounts of oil, but it may occasionally be used after proper treatment which under certain circumstances may be worth while.

As already mentioned it is not proposed to discuss here all the many aspects of the working of boilers for maximum efficiency, but rather to point out that there are many factors and details which determine the overall and economic efficiency. Anyone who has been in charge of a boiler plant will appreciate that upkeep, depreciation, and repairs are considerable and that proper attention to all such matters is amply repaid by increased economy and safety and by reduced deterioration. The maintenance of a boiler in as clean a state as possible both externally and internally, the prevention of air, steam and heat leaks, the regularity of blowing off, the avoidance of careless slacking of ashes near the front end of a Lancashire and above the blow-cock, flue gas explosions and many other matters which will occur to the reader, are all comprised in the working of a boiler plant.

The Loss of Pressure in Steam Pipes.

Having discussed briefly some features in the boiler portion of the steam system, a few remarks will be made concerning that portion which completes the system—namely, the steam pipes. In the majority of cases the main steam pipes do receive a certain amount of care as they are usually of a permanent nature, but there are many exceptions and in the case of subsidiary lines neglect is the general rule.

The steam pipes should convey dry steam from the boilers to any point required with the minimum loss of pressure. This loss of pressure is due principally to three causes :—(1) Surface friction, which increases with the velocity of the steam ; (2) resistance due to change of direction of flow and irregular surfaces; and (3) condensation.

Concerning the first cause of loss, it is usual to consider an average velocity of 80 feet per second for ordinary low pressures decreasing to 60 feet per second for high pressures, 180 to 200lb. per sq. inch. Too high a velocity causes unnecessary frictional loss, but too low a speed causes excessive losses by radiation. Any saving in first cost due to the adoption of a high velocity and small pipes is lost by excessive friction. The second cause of loss can be minimised by careful design and the avoidance of sharp bends, elbows and so forth. The third cause can largely be counterbalanced by the insulation of all pipes, flanges, valves, steam traps and any other places where heat can escape. The amount of heat that can be lost through neglect in this respect is considerable. If the boilers are working at 60 per cent. efficiency using 12,000B.Th.U. coal and if the steam pressure is 150lb. per sq. in., one sq. foot of bare pipe will cause the burning of nearly 10cwt. of coal per year for no purpose.

In some works there are hundreds of square feet of bare surfaces, and in the aggregate the loss may be very considerable and in bad cases enormous. The writer believes in covering *every* place where there is heat leakage. Main steam pipes which would rarely be dismantled should receive permanent high-class insulation which is best supplied and applied by the makers, but purely temporary pipes, those which may be altered some time or other and many branch pipes, are just as well done by the works staff using a good insulating material which can be used over again and of which there is at least one excellent type. Neglect to insulate all bare pipes, etc., is a " penny wise pound foolish " policy.

The Use and Misuse of Superheated Steam.

In many cases superheated steam is very useful in preventing loss of pressure and in maintaining dry steam in long mains. With good practice, a continuous feed, and especially a constant water level and even firing, 98 per cent. of the " steam " from a boiler can be real steam and 2 per cent. water, but too often the amount of water is considerably greater. The water in the steam will be increasing continually the greater the distance the steam travels from the boiler, for no insulating material is perfect and condensation is always occurring. This water is usually removed by means of steam traps at suitable places, but the steam is not even then free from moisture. Superheated steam will ensure that dry steam is delivered to the mains and even a comparatively low superheat will be very useful in this respect, but loss of pressure is a matter that is often disregarded.

Although the superheating of steam has its uses in avoiding condensation, and in certain operations such as the distillation of glycerine, it should not be used to raise the temperature of steam to be used in closed steam coils and jackets of vessels when the pressure is not sufficiently high to give the desired temperature. Thus, suppose steam at 60lb. pressure and at 307° F. is not sufficient to distil a liquid with a boiling point of 320° F., and it is therefore superheated to 507° F. in the belief that since the temperature of the steam is now higher than the boiling-point of the liquid, distillation will proceed in a satisfactory manner. The distillation can be effected in this way, it is true, if economy is no object, but if economy is expected, then there is little appreciation of the properties of steam. In the case taken, for 1lb. of steam the latent heat plus the superheat is

$$898 + 0.48(507 - 307) = 994\text{B.Th.U.}$$

The temperature of this steam can only drop to, say, 327° F., somewhat higher than the temperature of the liquid, and therefore 1lb. gives up an amount of heat—

$$0.48(507 - 327) = 86.4\text{B.Th.U.}$$

No more heat can be given up, so it is impossible to extract the latent heat, and the steam leaves with an amount of heat—

$$994 - 86.4 = 907.6\text{B.Th.U.},$$

neglecting the heat of the water which is not available. The amount of heat usefully employed is therefore only about 8½ per cent. of what is available under other circumstances.

On the other hand, 1lb. of dry saturated steam at 122lb. pressure and at its normal temperature of 322° F. will give up its latent heat of 866B.Th.U.s, so that the steam consumption is one-tenth of that used in the first case. A case came under the writer's knowledge where two stills were worked using steam superheated in an independently-fired superheater, the saturated steam being supplied from a range of boilers working under a pressure which was too low for distillation purposes. By substituting a small vertical boiler at a higher pressure, one of the larger boilers was closed down. In other cases where this difficulty arises, it may be possible to reduce the boiling point of the liquid by applying vacuum or to use oil heating, and it is also possible to use superheated steam in the coils and to have an economical system by using the steam after it has left the still for other purposes, such as heating or boiling or even driving a steam engine.

Lay-out and Details of Mains.

The lay-out and design of steam mains and branch pipes are worthy of the greatest care, both for the sake of economy and of safety. Obviously, the main steam pipe should run so that the length of the individual branch pipes is a minimum and so that as far as possible each building supplied is independent of any other for its steam supply. It is also advisable to divide the main into sections by valves, as this not only facilitates repairs and alterations, but avoids having steam in the whole range unnecessarily. Steam pipes should slope in the same direction as the flow of the steam, a minimum gradient being 1 inch in 40 feet. Water cannot flow against the hurricane of steam moving at 40 to 50 miles an hour. If the steam main must rise as it gets further from the boilers, vertical lengths should be used to give this rise and care should be taken that a steam trap is installed at the lower end of each slope. Globe valves are commonly used in mains, but full-bore valves of the Hopkinson-Ferranti type are preferable, for they prevent the tortuous passage of steam which occurs in a globe valve and the loss of energy is negligible. If, however, globe valves are used they should be fixed with the spindle horizontal and not vertical, for if vertical the water can accumulate in the pipe up to the level of the valve seat unless a steam trap is put before the valve, a precaution which should be taken with all important valves no matter what the type

or position of the spindle. It is almost unnecessary to add that there is a wrong way and a right way for fixing a globe valve, that the screw spindle should be outside so that it can be seen and oiled and that renewable valve seats are a *sine qua non*.

Branch and Subsidiary Pipes.

Although a reasonable amount of care is probably taken with the steam mains, in the case of subsidiary pipes, the matter is frequently left to the discretion and care of the erector and very inefficient work is often the result. The steam mains would in most cases be of welded steel pipes made by a reputable firm, but branch pipes would be composed of pipe lengths and standard fittings, the chief advantage being that erection is facilitated since only straight pipes need be cut and occasionally bent, the fittings being supplied ready for use by the makers. On the other hand, the use of such fittings necessitates a large number of joints each of which is a potential leak, and stopping such leaks when they occur is often a trouble and entails either caulking, which spoils the thread, or remaking the joint, which entails dismantling. Rearrangement of plant or additions mean fresh connections to existing pipes and again dismantling to insert T's, valves, etc. It is also necessary to keep an adequate stock of standard fittings in the stores, and quite a considerable amount of money can be locked up in this way. Even if supplies are easily accessible from outside sources, the sudden exhaustion of simple fittings may mean the loss of valuable time while they are being obtained, and a fitter looking for another job or, more likely, "scowing."

An Improved Method of Pipe Fitting.

Le us consider in detail a pipe line with the usual standard fittings as shown in Fig. 2, which illustrates a subsidiary branch pipe for steam to the jackets of three vessels. A box for connecting the ends of two pipes involves 2 joints

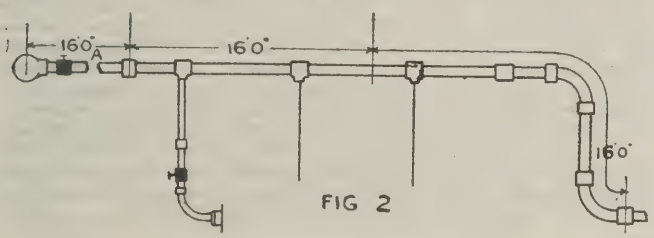

FIG 2

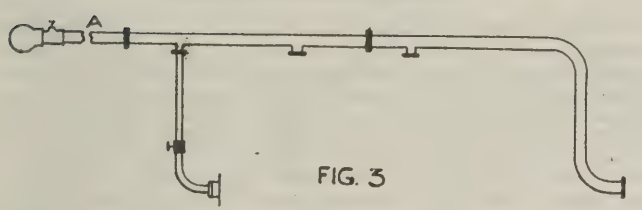

FIG. 3

and possibly 2 threads to screw on the pipe ends, a T means 3 joints and 3 threads, a bend 4 joints (two boxes are needed) and two threads, an elbow 2 joints and 2 threads, while a "longscrew" or "running joint" means one box, 2 threads and 2 joints. Longscrews are very apt to leak as there is no "vanishing" thread to enable the box to make a good joint and the locknut joint is often at fault. In Fig. 2 the total number of joints as shown is fifty, all of which may leak at some time or other. Many screwed joints will last for years without giving any trouble while some will leak very soon after they have been made, and unfortunately it is only after the pipes are connected up that the leaks show themselves.

The making of a good joint is so much at the mercy of the erector that there is no certainty that it is right. This is often not so much the fault of the erector as the difficulty often experienced of getting the she-thread started on to the he-thread due to the pipes not being in perfect alignment or to burrs on the thread, or again to faulty screwing of the pipe end. If through faulty work there is a dip in the pipes, water will collect there and the steam may hurl this along the pipe and probably provide another lot of joints to remake or repair. A pipe which is trying to look skywards is never a pleasant sight, though insulation covers up many such faults.

To insert a T in pipe A means cutting the pipe, inserting the T and also another running thread or longscrew fitting in order to connect up again. There is thus a further increase in the number of joints to 55. The insulation has to be removed and put back again (unless this is regarded as a detail and left undone), while "ten to one" some of the other joints in the pipeline are disturbed and leak sooner or later. Another way to insert the T would be to work back from long thread B which is, of course, worse, entailing more dismantling, remaking of joints, recovering with insulation and loss of time.

Threaded Joints Replaced by Flanged Joints.

If, however, threaded joints are avoided as far as possible for one-inch sizes and upwards and a welding plant and pipe bending machine are available or are purchased, an arrangement such as is shown in Fig. 3 is possible. Here are three lengths of pipe connected by flanges and with welded branches, the bends being eliminated by bending the pipe itself. The total number of joints in this case is 17 or a reduction of 66 per cent. on those in the alternative arrangement. To insert a T in A means taking down one length, uncovering the insulation at the desired spot only, welding in the branch and then slipping the pipe back again. Obviously time is saved and if still greater speed is required, a new pipe with a branch can be prepared and inserted in a very short space of time.

There is of course nothing new in this which is merely the application of everyday principles for the elimination of pipe joints, but in the writer's opinion and experience, there are many advantages. A flange that leaks is easily remade or may only need tightening up, whereas to tighten up a screw joint at one spot slackens another joint or joints somewhere else. With caulking the remedy is often worse than the disease. The preliminary measurements made by a fitter before an alteration, are exact with flanged joints since the flanges are visible, whereas mistakes are possible with threaded joints as the pipe ends are hidden.

Where the New System is Cheaper and Better.

Two flanges and bolts are dearer than one box (or socket), one or two of these being usually supplied (and charged for) with each pipe length to preserve the threads of the screwed ends. But taking a long view there is not so much in it as would appear at first sight. The flanges can be plain circles with a hole for the pipe and are therefore cheaper than the usual standard flanges which are screwed and have bosses. The pipes need no threads, simply plain ends and can be handled roughly as there are no threads to be damaged. There is always an allowance of about 4 per cent. on the net price of pipe lengths which have no sockets or threads. All the flanges can be drilled standard when they arrive, and each pipe length would have a flange added at one end when it is received. The cost of fittings such as T.s, bends, etc., are high compared with those made by welding and bending, especially in the larger sizes and there can be considerable saving in this way in addition to absence of leaks and ease of erection to say nothing of the reduction of the stocks of some fittings and the total elimination of others. For example a 3in. to 2in. T costing 11s. can be replaced by a flange and a small piece of pipe, probably otherwise waste, which would cost much less. When old pipes are taken down and cut to shorter lengths for another job, one end would be reserved for a branch in another pipe.

There are a great many other details which must be considered if the system is to be of service, such as the routine work in the welders' shop, special fittings, little "gadgets" to ensure speed and accuracy and so forth, but these cannot be entered into here. These will probably occur to the reader if he has been through the mill of apprenticeship in an engineering shop. The system is not a universal panacea and does not entirely replace screwed fittings, for it is not so useful for small pipes, although the writer has used welding in some cases for ¼in pipes, but bending in the cold and in the hot can be extensively employed. The idea has been successfully employed in some large plants, threaded joints being almost entirely excluded, not only for steam, but for compressed air, vacuum, and liquids. Carried to its logical conclusion welding plus bending means that only plain straight pipes and flanges need be bought, but it is probably better in most cases to run the two types of pipe lines together. To instal the system requires the co-operation of the foremen and fitters who have in a great measure to change their usual conception of pipe lines. Where very great speed is essential in erection work, say to meet a very urgent demand for a product, pipe

fittings are more suitable, but for ordinary work they can be largely cut out.

It might be mentioned incidentally that a portable welding plant is an exceedingly useful appliance in a chemical works and when the user gets accustomed to it, he wonders how he managed to do without it. For cutting girders, steel plates, repairing pin holes in coils and innumerable repair jobs it is a valuable and speedy aid.

The Importance of Steam Traps.

One of the chief causes of leaks is the presence of water in the steam pipes, and the resulting water-hammer effect set up may also be very dangerous. In view of their importance and utility steam traps are worthy of considerable care which they do not always receive. Expansion traps are useful under certain conditions, but for general purposes it is usually agreed that the float type is preferable. One finds that traps are very often too small for their work, that they and their drain pipes are not covered with insulating material, that they are rarely fitted with dirt interceptors and unfortunately they are in many cases only repaired when they are blowing through badly and sometimes not even then. A common omission is a valve between the steam main and the trap to allow of the latter being changed without closing down the main, while it is always advisable to let a trap blow through occasionally by using the attachment usually supplied. It is dangerous to have a defective steam trap on a main, while on coils and jackets it hinders the steam from doing useful work.

The value of the discharge from steam traps for boiler-feed purposes has already been mentioned, but it is not always recognised that when discharging there is a loss of water due to self-evaporation. Thus 1lb. of drain water under 160lb. pressure is at 370° F., and contains 163 units of heat more than it does at 212° F. When released from the trap, the pressure falls to atmospheric and the temperature to 212° F., resulting in the evaporation of 16 per cent. of the water. The addition of a few feet of pipe to the discharge enables this steam to be condensed, and this increases the amount of pure water for the boiler-feed.

A Plea for the Standardisation of Small Valves.

In a fairly large works, the number of valves can assume very great dimensions, but often very little attempt is made to see that they are all the same type. They are bought with no specification, just so many 1-inch valves and so forth, while only too often the pleadings of a traveller are so effective that an order is given on the strength of a few minutes conversation. On the arrival of the valves they go to the stores and are used in various places in the works. Their very existence is forgotten, and in a short time neither their source nor their good or bad qualities can be discovered. In the writer's opinion it is far better to obtain sample valves, several of each size, and thoroughly to test them in actual practice and after careful consideration of their relative merits in every way including cost, to adopt one type or a few types as standard. Even a good valve is not everlasting, but its life can be considerably longer if it has a renewable seat and if there are certain standards, the number of valves and seats kept in stock can be a minimum.

If, say, one type is adopted for high-pressure steam and another for low pressures, the latter can be a cheaper valve and, moreover, can be used for water, vacuum or compressed air. With the exception of the full-bore valves previously mentioned for use on steam mains, the writer has never found a satisfactory valve of this type for small sizes. Again, the thread of screw-ended valves never makes quite the same joint when it is used again; it gets slack and is apt to leak. In many cases it pays to have flanged valves, but as these are dear, a nipple and flange at each end is cheaper and satisfactory. A cemented joint can be used for the thread of the nipple in the valve and in the flange which, when set, is impregnable against leaks. The distance over all flanges can be kept exactly the same as the standard flanged valve of the same size.

There are a considerable number of other details about steam systems that can be standardised to great advantage, such as safety valves on low-pressure mains where the steam is supplied through reducing valves, the reducing valves themselves, pressure gauges, steam traps, etc., and in many cases these standard articles can be used on chemical plant, so that there is only one type of a fitting or valve in the whole works. It might be added that it is advisable to ascertain that the supply of the standard article is not likely to fail and that the articles as received are standardised in themselves.

Final General Considerations.

These considerations on the steam system could be expanded enormously, and there are many points that have been omitted altogether in the foregoing, but this article is intended to be mainly suggestive, for generally the prevailing circumstances must be considered and what is suitable for one works may not be satisfactory in another. Most of the points mentioned should be common knowledge, but are apparently forgotten or not fully appreciated in many cases. It is surprising how many firms know practically nothing about the cost of the steam that they are making, and how few realise what economies are possible in fuel and maintenance by a little forethought in the design and care in the supervision. The annoyance caused by small details can be vastly reduced by studying them in turn, and by standardising as far as possible both the methods employed and the articles themselves. It takes time and a certain amount of trouble to do so, but in the end there comes a smoothness of working and an overall economy which is a source of satisfaction. In a steam system, if the details are reduced to their "least common denominator" as it were, more attention can be devoted to the important matters of boiler efficiency, etc., by both manager and staff. If supervision is methodical, and of a routine kind, so much the better.

ITALIAN LEUCITE.

A PROMISING NEW RAW MATERIAL FOR CHEMICAL MANUFACTURE.

THE Chemical Engineering Group of the Society of Chemical Industry held its first meeting of the session at the Chemical Industry Club, London, on Friday, November 16. Mr. J. Arthur Reavell (Chairman of the Group) presided, and Professor J. W. Hinchley gave a talk on the possibilities of leucite, a material obtained from the lava deposits in Italy, as a source of potash. Professor Hinchley was only able to deal in a more or less cursory manner with the chemical aspects, but has promised a complete paper, dealing more in detail with these, and also with the chemical engineering side, at a later date. The importance of these deposits impressed itself very much upon those present, and Professor Hinchley referred to the subject as one in which the British public ought to take an interest.

A Ready Source of Potash.

Professor Hinchley said the total world output of potash was probably in the neighbourhood of one million metric tons per annum, and, having regard to the large proportion of this which was still produced by Germany, it was necessary that we should find as many other sources as possible. The igneous rocks of the earth's crust contained approximately 3 per cent. of potash, but unfortunately a large number are not very amenable to industrial application. In Italy, however, there is a source of potash, the mineral leucite, which is amenable and occurs in such quantities that the world's demands for many centuries can be met. Henry Washington has estimated that the lavas of Italy contain as much as 8,786 million metric tons of K_2O, a considerable proportion of which is capable of being utilised at a reasonable cost of production. Personally, Professor Hinchley believes that supplies to meet the world's demands for potash over a period of 500 years are at present available and visible in these lavas at a cost not greater than that of the potash obtained from the Stassfurt deposits.

Pure leucite contains 21.5 per cent. potash, 23.5 per cent. alumina, and 55 per cent. silica. The particular district of Italy with which Professor Hinchley dealt was the Rocca Monfina district, from which it will be easily possible, by means of a telpher system, to load ships at the coast, 12 miles away, so that the problem of shipping in 5,000-ton lots to this country will not be a difficult one. The mineral is crushed and is separated electro-magnetically at a very low cost. When crushed into a fine powder it is useful for many purposes. Dr. Voelcker, for instance, has been experimenting with it for a year or two as a fertiliser, and has found that powdered leucite is practically equivalent to soluble potash of the same composition for this purpose. Leucite, in a powdered form, is also useful for water softening, and it should be able to find a very large market.

Manufacture of Potash Alum from Leucite.

The exploitation of Italian leucite is due largely to an Italian, Baron Blanc, who, during the war, developed the potash industry in Italy, and the Societa Italiana Potassa is now in operation, the potash recovered being used in Italy very largely for agricultural purposes. One of the important features of granular leucite, is the fact that it can be dissolved in acids without obtaining the gelatinous silica which is the bugbear in dissolving ordinary silicates. Therefore, in any process of treating leucite on a commercial scale it must be handled in the granular form—and there is no difficulty about this,—leaving the powdered form available for agriculture. Probably the first process which could be applied commercially to leucite is the simple one of treating it with sulphuric acid, which has practically no vapour tension, and is easy to handle. By this means one obtains potash alum without any residue, and a plant for producing alum in this way is actually at work at Pierre Beniti, near Lyons, in France. From 4 tons of leucite it is possible to obtain 6 tons of alum, and Professor Hinchley understands that the cost of the production of alum in that particular plant is only 31 cents per kilo, or a little over £4. per ton. The sulphuric acid costs 18 cents per gallon in that district.

For the manufacture of the alum, a granular bed of leucite is placed in a suitable vessel, and treated with mother liquors from a previous operation, and these mother liquors are continually enriched with sulphuric acid whilst combination takes place. After two hours or so, the action becomes vigorous, and the whole of the potash has gone into solution, the bed of leucite remaining almost exactly the same volume as before, and consisting of a skeleton structure of silica. The temperature of the mother liquors rises to 90° C., and the volume of the charge can be so arranged that the liquor is saturated at about 70° to 80° C. The liquor is then withdrawn, and cooled down to 20° C., and the whole of the alum that has been formed by the attack of the acid is deposited as crystals. The amount of iron in the leucite is not very great, and it is possible to get very pure crystals of alum without resorting to any method of removing the iron.

Sodium Silicate from the Silica Residues.

Apparatus for the removal of the silica can be made in many different ways, and there is no difficulty in removing it by manual labour, but there is a simple method of removing such granular materials, which Professor Hinchley wondered was not used more in chemical works. This consists of an ordinary ejector connected to a steam pipe. The silica contains a large proportion of gangue, and it has been proposed to pass the material through rubber rollers, to dry it, and blow a current of air through it, and in that way the whole of the silica can be removed, leaving behind the larger particles of original gangue. The weight of silica which remains behind generally contains about 5 per cent. of gangue. The silica obtained has two molecules of water, after drying at 100°, and has interesting characteristics, the most important of which is that it is capable of being attacked at once by caustic soda or caustic potash, even when very dilute, with the formation of sodium silicate. The caustic soda is placed in a vessel provided with an agitator, and the silica is added slowly, while stirring. Since the action is exothermic, the temperature rises considerably, and there is no difficulty in producing a hot solution, which can be allowed to stand a short time for the separation of any gangue, if the crude silica residue has been used. This can be passed through a filter press, and an absolutely colourless, clear and transparent solution of sodium silicate is obtained, a very much purer material than that very often sent out. The cost of sodium silicate made at the Pierre Beniti works is 18 cents per kilo, or £2 9s. per ton, 40° Beaumé, 1.38 specific gravity.

Hydrochloric-acid Treatment a Pressing Chemical Engineering Problem.

The next process, which is not at work at the moment, but has been at work at Cengio, in Northern Savoy, is the hydrochloric-acid treatment, and on this point Professor Hinchley said that he looked upon treatment with hydrochloric acid as one of the problems that chemical engineers ought to get their noses down to. He did not know of a more wasteful method of handling hydrochloric acid and more unsatisfactory chemical engineering than can be found in our general methods of treatment with hydrochloric acid. At the same time, the problem is not a difficult one if we really make up our minds to solve it. The hydrochloric-acid process, which has been at work at Cengio, is due to Baron Blanc and Felix Jourdan, and by this process it has been possible to get practically pure potassium chloride, pure hydrated aluminium chloride, or, alternatively, hydrated aluminium oxide and silica. The plant consists of a short stoneware tower, in which the leucite is placed, and the solution is circulated continuously. As in the alum case, it is possible to work the process with mother liquors, so that, during the cooling stage, the temperature rises in the same way to 90° C., and, the whole of the potassium obtained by the action of the acid on the leucite could be crystallised out. The potassium chloride precipitated is generally yellowish in colour, but, by washing with washing waters from previous operations, it can be got as a white potassium chloride, as is the case at Pierre Beniti.

Hydrated Aluminium Chloride from Leucite.

The mother liquors contain iron, and it might be assumed that the liquor will get stronger, but Professor Hinchley said such was not the case. The first operation removed about the same amount of iron as was added by the addition of the leucite, and by care in this direction it is possible to use the method of passing the aluminium, before precipitation, through a bed of leucite, which is a cheap material, and in that way get rid of the iron entirely, and obtain a perfectly white precipitate of aluminium chloride. This aluminium chloride contains water, so that it cannot be used for the purposes where anhydrous aluminium chloride is required, but it can be used as a mordant. The material is pure, and it should be remembered that in its production no filter press has been used.

In treating one ton of leucite, 619,000 calories of heat are given out, and this has to be dissipated to a large extent, or it may be used for heating wash waters, but, in treating aluminium chloride, which requires heat, 139,000 calories are applied for the purpose.

Professor Hinchley believes that, once we get familiar with leucite, it will be applied in many processes not thought of to-day He himself could see the ammonia process actually being affected by the introduction of this material. For instance, after treating powdered leucite in an autoclave at about 200lb., and washing with caustic lime, 95 per cent. of the potash in the leucite is converted into caustic potash, and, after two treatments, a 12 per cent. solution of caustic potash is obtained, which, on evaporation, gives the caustic potash of commerce. This process is not at work on a commercial scale, to his knowledge. With regard to the handling of hydrochloric acid in these plants, he believed there was a new material made in this country which could replace earthenware for this type of plant. It was a rubber composition, and he hoped that when next he dealt with the subject he would get the person responsible for this material to read a paper on it before the Chemical Engineering Group.

Hydrochloric-acid Resisting Plant.

Dr. W. R. Ormandy said a material had been developed in Switzerland which had proved particularly useful in the conversion of wood cellulose into glucose by means of warm, fuming hydrochloric acid. This material would stand the action of concentrated fuming hydrochloric acid up to 60° C., and plant had been produced for using a saturated solution of hydrochloric acid in large quantities, the loss in each operation being under 7½ per cent., the whole of this loss being accounted for by the combination of the chlorine with certain by-products. If the people responsible for the operations in Italy could find a means for cheaply converting the hydrated aluminium chloride into anhydrous aluminium chloride, it would be of the greatest possible importance in relation to the refining and cracking of oils.

Dr. Voelcker on Leucite as a Fertiliser.

Dr. Voelcker said he did not hesitate to say that there is a big future for this new material He himself had been interested in it from the agricultural point of view. For a long time attempts had been made to ascertain where cheap supplies of soil-assimilable potash could be obtained from granites and other volcanic rocks, and agriculturists had endeavoured to find out whether there was any benefit in using these materials either finely ground, or after suitable treatment. Hitherto they had failed. He himself had tried many of these for many years at his own experimental place at Woburn, but had hitherto failed. He was inclined to believe, from his own experiments, that there would be considerable advantage in the use of certain silicates, because he had found a considerable benefit from the use of calcium silicate, and he had also found that the addition of burnt lime to the silica results, in many cases, in the partial

formation of silicates of lime in the soil, which is a material which possesses distinct fertilising value. He was now in his third year of his experiments with leucite. Comparative experiments with sulphate of potash were made on pot cultures of wheat and in the field with mangolds and potatoes. There was not very much difference in the results as between the two fertilisers. This year he had started a much wider series, and was enlisting the help of outside agriculturists for experiments on a field scale.

How the Germans Tried to Stop Developments.

Professor Hinchley, replying to the discussion, said he believed that the deposits in the Rocca Monfina district would last for 100 years, work as hard as we liked upon them. For many years before the war the Germans were watching these deposits very carefully, and the slightest move that took place towards their development they were prepared to checkmate. Baron Blanc sent samples of this material to a large firm in Germany who understood electro-magnetic separation, probably, as well as anybody in the world, and this firm reported that it was impossible to separate it electromagnetically. Fortunately, Baron Blanc did not believe them. If he had, nothing further would have been done, and the German potash syndicate would have been quite satisfied. The cost of the production of finely-comminuted leucite for agricultural purposes was half the cost of kainite or sylvinite.

INSTITUTION OF CHEMICAL ENGINEERS.

DISCUSSION ON THE ABSORPTION TOWER.

A MEETING of the Institution of Chemical Engineers was held at the Engineers' Club, Coventry Street, Piccadilly, W. 1, on Wednesday, November 14, Sir Arthur Duckham, the president, in the chair. Two papers were presented for discussion. These were: "A Study of the Absorption Tower," by M. B. Donald (Associate member) and C. W. Tyson; and "A Study of the Conditions of Constant Rate of Flow in Filter Presses," by M. B. Donald and R. D. Hunneman. The meeting was preceded by an informal dinner, attended by members and their friends.

The President said the Council of the Institution had not yet had an opportunity of completing arrangements for the future meetings, except, of course, that there would be a formal annual meeting next year.

Mr. Donald then read the paper on "A Study of the Absorption Tower." (See the *Chemical Trade Journal and Chemical Engineer*, November 17, p. 577).

Professor J. W. Hinchley (Hon. Secretary) asked Mr. Donald if he would say whether, in speaking of the velocity of gas relative to the tower in feet per second, he was taking into account the volume occupied by the spiral tiles and the coke packing. Mr. Donald replied that he was.

The President referred to the statement in the paper that the curves obtained confirmed some previous results by M. S. Salomon and W. S. Brackett, who worked on a similar tower filled with 3-in. tiles and with a concentration of SO_2 in the gas of about 18 per cent., and showed that the velocity of the gas produced a maximum effect at about 12ft. per second, and asked how far that figure could be taken with other gases. Did it vary considerably? If they were taking, say, CO_2 absorption, what was the variation, because that figure of 12ft. per second was a very useful one; it was useful technically, and was a very practical one to use.

Effect of Gas Velocity on the Partial Pressure.

Professor Williams said in the early part of the paper, Mr. Donald had drawn a distinction between Professor Donnan's results and his own, and had pointed out that there was a difference in concentration and a difference in partial pressure; but later on, in deriving his equations, he had said quite definitely that he had calculated his partial pressures on the assumption that Henry's law held over the range he was considering. He (Professor Williams) thought that was the whole point of disagreeing with Professor Donnan, that Henry's law did not hold with the conditions under which Mr. Donald was working. Then there was the point as to increase of "ka" with velocity. Again, if the velocity were increased, this would have an effect on the percentage of SO_2 in the exit gases, and Mr. Donald had not dealt with that. If the velocity were increased, the partial pressure of SO_2 with the exit gas would be considerably higher than with lower velocity. Therefore, they could not ascribe all the increase in the absorption coefficient to the increased velocity of the gas over the liquid. Then there was another point, with regard to the liquid film and the gaseous film. They had coke, spiral tube packing, and a plain water surface, and were comparing the coefficient of absorption in those three for given velocities of gas relative to the tower. It seemed to him that, by passing water over the three packings, they were bringing in another factor—namely, the effect of the surfaces over which the water was passing, on the turbulence of the liquid. He supposed that the same rate of water flow was used throughout.

Mr. Donald said it was, except in the case of the last of the three.

Professor Williams said that, even supposing that the rate of water flow was the same throughout, they would have very different liquid film conditions in passing over the three packings, and for that reason he did not think they could compare entirely the absorption coefficient against the velocity basis through the tower.

Mr. T. C. Finlayson asked whether Mr. Donald had, in his use of the word "absorption," differentiated between absorption in the sense of true solution, and absorption when chemical interaction took place between the gas and the liquid. The rates of solution of gases varied very considerably in different solvents, and therefore, with one solution they might have to allow longer time and different velocities of everything than if they were using another solution. Recently, some people in America who had been studying the absorption of gases in solution, had found that not only did the suitable velocity of the gas come in, but there was also a maximum or optimum value for the velocity of the solution through the gas. Taking a constant velocity of gas, they could then speed up the velocity of the solution, and obtain a maximum from the point of view of the velocity of the solution. He would like to know whether that also came into the fundamental study of the absorption tower.

Other Factors to be Considered.

Mr. Norman Swindin, speaking of the flow of gases in pipes and the heat transfer, said that the relation between the velocity of the turbulent flow and the streamline flow is 0.5. The relation between the average velocity and the film in turbulent flow is 0.84, which had resulted from the researches of Stamford. In recent work on heat transfer the same factors held good for the effect of the variation of temperature on the conductivity of heat, and velocity. Mr. Donald had mentioned only three factors affecting the rate of transfer across a tube, but there were a lot more—about 10. First, there were the gases, then the interface, then the film, another interface, the metal, another interface, film, another interface, and so on. All of them ought to be thoroughly studied before there was any attempt to give a formula, and then only for a pipe in which the heat could not flow laterally down the tube—a pipe made of glass or asbestos, or something of that sort, and not metal.

Mr. J. H. West said absorption towers could vary from a rain of drops of liquid down through the gas to bubbles of gas passing up through a solid column of liquid, and the packed tower was a sort of intermediate between the two. There was the possibility, where they had a rain of drops of liquid through a gas, that the outer surface of the spheres of liquid would become saturated with the gas, and the diffusion from the unsaturated middle of the drops—between the middle unsaturated part of the drops and the outside saturated surface of the drops—would be very much slower than the corresponding diffusion of the bubble of gas passing up through the liquid. As soon as the outside of the bubble became saturated, the diffusion through the middle would become very rapid. That, in the ordinary packed tower, might not be important, but it seemed to him to be a factor in the problem.

Relation of Vapour Pressure to Rate of Absorption.

Professor J. W. Hinchley said he would like to mention Professor Williams's question as to the difference between Donnan and Masson's ideas with regard to the measure of the force tending to bring a gas into solution, being a measure of the concentration or of the vapour pressure. In a case where a substance obeyed Henry's law, the concentration might be taken as a measure of the pressure. He believed that was a point which everybody, in discussing absorption towers, had not taken into consideration up to the present. He believed that, starting with low velocities,

there were a lot of things occurring, and continuing to occur, as the velocity rose—the velocity of the gas particularly—to the point where the effects disappeared; they disappeared at different points, according to the velocity and the temperature of the gases they were working with. Although the rate of transfer, say, of the gas to the liquid was proportional to the vapour pressure, that would only be true when a certain velocity was exceeded. Below that particular velocity, which was a definite one, that would not be quite correct, on account of the difference in densities of the gas itself and the admixed gas. With a pure gas he believed it would be quite true, but with a gas which contained air and an admixed gas or two, and where they were absorbing one constituent, he believed it would not be true at low pressures that the rate of passage of the gas into the liquid would be exactly proportional to the vapour pressure.

Mr. Donald's Reply.

Mr. Donald, in reply, said, with regard to the velocity of the gas producing a maximum effect of about 12ft. per second, he had merely put that in because he had thought it rather confirmed the results he and his co-author had got, both with the spiral tower and the coke-packed tower. With regard to the remarks of Professor Williams, he (Mr. Donald) did not think that the variation from Henry's law in the case of SO_2 would make a great difference in the logarithmic mean. Professor Williams had said that the increased velocity gave a greater pressure driving force than a lower velocity, due to the fact that there was more SO_2. "Ka" included driving pressure, so that they automatically ruled out driving pressure when applying "ka." "Ka" was in lb. SO_2/min/mm. Hg. pressure, and he had allowed for that increased pressure by including it in "ka."

He admitted that the packing had an effect on the turbulence of the liquor. This also replied to a question asked by another speaker, as to how much was due to "k" and how much was due to "a." It would be seen from the paper that for each packing and each spray the authors had calculated approximately—as far as they could, at any rate—the area of surface exposed. It would be found that a certain amount of it was due to the increased area, but that did not account for all of it.

As regards chemical action or true solution, he did not think chemical action would bother them very much. He did not mind how the SO_2 was in the solution; all he wanted to know was what the vapour pressure of SO_2 was over that solution. With regard to different solutions affecting the rate of transfer, that came under the same heading. The other factors mentioned, which he had not been able to put on as complete a basis as he would have liked to do; would probably have an effect; but that was for future experiment. Mr. Finlayson had quoted something about work done in the States. As regards the effect of velocity on heat transfer, he believed that had been very well cleared up by some work by Macadams and Cross. Reference had been made by Professor Hinchley as to the effects of low pressure, but he (Mr. Donald) and his co-author had done no work on that.

THE PROBLEM OF CITY WATER SUPPLIES.

TREATMENT METHODS ADOPTED BY LIVERPOOL.

THE 1923-4 session of the Liverpool Section of the Society of Chemical Industry was opened on Friday evening last at the new quarters—namely, the Overseas League, 14, Elliot-street, Liverpool, Dr. E. F. Armstrong, F.R.S., president of the Society, presiding. A trustee of the Hurter Memorial Fund having to be elected, Dr. J. T. Conroy was adopted.

Mr. Edwin Thompson, C.C., chairman of the Liverpool Section of the Society, said the next meeting would be a symposium on: "The Society of Chemical Industry and What it Stands for." Having been for some years associated with the Water Committee of the City of Liverpool, and more particularly with the Water Estate, he chose "Our Water Supplies" as the subject for that evening's paper.

Drawbacks of Rapid Filtration.

There were three chief ways of purifying water—namely, filtration, storage, and sterilisation. The slow sand filtration was the one most commonly used, and it had really never been surpassed. There were many styles of rapid mechanical filters, but they did not give first-class bacteriological results. With nearly all rapid filters a coagulant, usually aluminium sulphate, was used. The output of a rapid filter was about 150 to 200 gallons per sq. ft. per hour. Liverpool obtained most of its water from Lake Vyrnwy and all of the water passed through slow, sand filter beds at Oswestry. They were fortunate in not having to sterilise their water, and in having an abundant supply of exceedingly soft and remarkably pure water.

Sterilisation by Chlorination.

The best method of sterilisation was by chlorination. Sir Alexander Houston, one of the pioneers of the process, showed that the addition of 15lb. of chloride of lime to 1,000,000 gallons of Thames water, destroyed the microbes derived from previous sewage contamination far more effectually than passing the water through a reservoir containing 88 days' supply. It was usual now, however, when the water had to be sterilised, to use chlorine gas. One to two parts in 5,000,000 had been found sufficient to sterilise the water completely in an hour or so. When chlorinating water, taste was one of the main things to be avoided. The chlorinous taste usually occurred through over-chlorinating, and the iodoform taste through not chlorinating sufficiently. The latter could be removed by potassium permanganate in doses of 2 to 8lb. per 1,000,000 gallons. The most certain way to overcome the taste trouble was to super-chlorinate and then to dechlorinate with sulphurous acid. This was, however, an expensive method, unless it was absolutely necessary.

London's Water Supplies.

The sources of water supply for Glasgow, Manchester, Birmingham and London, were next referred to, the distances the water was brought being stated. The supply of water from London came from the rivers Thames and Lee, and from a great number of wells. In round figures the average daily supply to water London was 250,000,000 gallons. It required 274 engines of 43,417H.P. for the collection and distribution of this water, through 6,577 miles of pipes. When the Thames was in high flood, the chlorination treatment was discontinued temporarily and Staines reservoir water was used instead, but as this water had been stored for 6 to 9 months, it was in a very high state of purity. One advantage of storage was that it had quite an appreciable softening effect on water.

It was interesting to note the difference in the consumption of water per head in this country and in America. Here, we used from 30 to 40 gallons per head, per day, whereas, in America it was anything from 150 to 200 gallons per head, per day. Few water undertakings in this country had a large margin over their requirements, and he anticipated that in 10 or 12 years' time the consumption per head in this country will be materially increased, and that many water engineers will be faced with a difficult problem.

Difficulties Due to Suspended Solids.

Suspended solids in water added greatly to problems of filtration. Sea gulls were frequently a great trial to those in charge of reservoirs. The growth of plant and animal life; sponges, polyzoa, and mollusca in endless variety might get into the storage reservoirs and block the mains to an alarming extent. Fresh water mussels might suddenly appear, and minute crustaceans might appear in overwhelming quantities. Algæ, diatoms and many floating plankton forms of life were mentioned as other common sources of trouble, and methods of treatment to remove them were spoken of.

The Liverpool Supply System.

Mr. Thompson then next described the Lake Vyrnwy water supply system, illustrating his subject from this point by photographic views, maps, and diagrams. The entire watershed has an area of 123,150 acres. The lake is nearly 5 miles long and half-a-mile wide. The length of the dam from rock-face to rock-face is 1,172ft. The height from the river bed to the overflow is 84ft., and the greatest height of the dam from the foundation to the coping of the parapet wall, 161ft. The width of the base is 127ft. The water travels 18 miles to Oswestry, where there are 12 sand filter beds. It then travels another 60 miles to Liverpool.

CANADIAN PULP INDUSTRY.—The Quebec Government are to offer valuable timber limits on the Manicouagan River and its tributaries adjacent to water power for sale by auction. The successful bidder must erect a pulp mill within five years within eight miles of one of the 22 large towns and cities in the Province.

SULPHATE OF AMMONIA FEDERATION.

THIRD ANNUAL GENERAL MEETING.

THE third annual general meeting of the British Sulphate of Ammonia Federation, Ltd., was held on the 15th inst., Mr. D. Milne Watson, chairman of the company, presiding.

The Chairman said: In spite of the political troubles on the Continent, the average price for last year (June 1, 1922, to May 31, 1923) was about ten per cent. higher than for the preceding year. We are still suffering from high costs of production, and, in particular, from the high price of sulphuric acid. Before the war sulphuric acid could be bought at 25s. per ton. The very lowest price at which acid is now being sold, as far as I am aware, is 55s. per ton—120 per cent. more than the pre-war figure. Most of you, however, are still paying 60s. per ton—140 per cent. more, and many large consumers are still being asked 80s. per ton in some districts.

Increased Volume of Trade.

Our production last year was about 50 per cent. larger than for 1921-22. Our total exports show a gain of 58 per cent., and home deliveries an increase of 3 per cent. on the previous year. This expansion in trade is, I think, very satisfactory, and as we know that there has also been an increase in the quantity used in America, we can say with confidence that the demand for sulphate of ammonia is steadily increasing, year by year. The increase in exports of 58 per cent. following after a year in which we had experienced very severe competition from America, is, I believe, very largely, I might almost say entirely, due to the remarkable improvement in the quality of our output. About 70 per cent. of our production is now of acid free or neutral quality, and can, therefore, be sent to the most distant parts of the world without fear that there will be loss in weight on arrival due to rotting of bags. What is possibly of more importance is that it will arrive in a condition ready to put on to the land. We have been able to trace an immediate result of the adoption of this high standard of quality in markets like Japan, which in the last two years seemed to have been altogether lost to us. The fact that we have been able to increase our home sales in a year which is generally admitted to have been disastrous for farmers, is a tribute to our propaganda work, although here, again, quality has undoubtedly played a great part in helping us to maintain our position. We have made an arrangement to do joint propaganda with Buxton lime firms.

We have reduced our home prices for sulphate of ammonia by £2. 10s. 6d. per ton—about 15 per cent.—since last spring. Our present price is well below the pre-war price.

Propaganda and Administration.

While we are thus devoting, I think, adequate attention to the home market, which, I would remind you, is still our largest individual market, and absorbed last year no less than 41 per cent. of the total British production, we are by no means neglecting foreign countries. Our propaganda offices in Spain, Canary Islands, Portugal, Egypt, and Italy are doing educative work framed to suit the conditions obtaining in those countries. We have made special arrangements in Japan and Java in order to develop consumption in those important consuming countries; we are co-operating with the Propaganda Organisation in France; and we have in view large schemes of expansion in the Far East, about which I hope to be able to say more at our next meeting.

Our cost of administration last year was 1s. 4d. per ton—a reduction of sixpence per ton on the previous year. We hope the figure will be further reduced this year. Our cost of propaganda last year was 1s. 5d. per ton, and we are going to ask you to vote a sum equal to about 1s. 7d. per ton for this year. That makes a total of about 2s. 9d. per ton for administration and propaganda. We have recovered over £3,000. from railway companies in over-charges during the year.

An Appeal to Non-Members.

Notwithstanding the manifest advantages which our organisation has to offer, I regret to say there are still just a few makers in England—whose aggregate production does not amount to ten per cent. of the total output in Great Britain—who have not yet been able to make up their minds to join us. As regards these outside firms we feel that it would be only fair that they should share the small expenses of working the Federation, especially its propaganda expenses. Moreover, the Federation is giving an advantage in price to the home market, and we again think it would be only fair that this subsidy should be borne by all makers.

I was able at our last meeting to announce a notable accession to our strength in the membership of Synthetic Ammonia and Nitrates, Ltd. I am sure we all congratulate them most heartily on having reached the producing stage, and we are glad to welcome Colonel Pollitt as a member of our Council. I have another piece of good, and, I think, very significant news for you to-day. That is, that Canadian producers of sulphate of ammonia, representing a large proportion of the total output in that country, have decided to throw in their lot with us, and have joined the Federation.

HOLDING COMPANIES AND AMALGAMATIONS.

ARE THEY DESIRABLE DEVELOPMENTS?

IN a lecture entitled "Sixty Years of Company Development" which Mr. Herbert W. Jordan, the well-known authority on company registration gave before the Secretaries' Association, Ltd., on November 14, the lecturer stated that during the past few years development in company formation has been the most marked in the directions of amalgamations and capitalisations.

Many important amalgamations have been effected, either by the absorption of one company by another undertaking, the former company going into liquidation, or by the acquisition by the latter of a controlling interest in the former. The second course is more generally favoured now, and is resorted to very largely. By acquiring shares of a company carrying most of, if not all, the voting rights in a number of other companies a "holding company" obtains absolute control over the latter. Companies having controlling interests in other undertakings occupy a favourable position, as they possess the strength and stability of an amalgamation without sacrifice of the individuality of the constituent companies. By a judicious exercise of its powers the holding company can frequently create an organisation sufficiently strong to enable it to meet competition more effectively.

Admittedly, on such combines becoming powerful enough to be described as "trusts," they are sometimes apt to act in an oppressive manner towards competitors and to raise the prices of their commodities against the consumer, but the British public has an aversion to monopolistic systems, and is not likely to fail to impose its will on trusts that overreach themselves. An impartial investigation would, however, probably show that on the whole the formation of holding companies, not excepting those popularly regarded as trusts, have contributed materially to our national wealth (if the term be permissible in these days). During the later stages of the war and the boom period that followed its conclusion, trusts were afforded unlimited opportunities of fleecing the public if they were so minded. Nevertheless, the reports of the various committees on trusts appointed under the Profiteering Acts, 1919 and 1920, convey the impression generally that the operations of many combines and trusts were beneficial, and that few have been guilty of serious transgressions. To place hindrances in the way of the formation of holding companies would be a retrograde step, although it is not improbable that in course of time legislation may be needed to safeguard the interests of the community. Were it not for the existence of some of our larger holding companies and amalgamations of various kinds and the interlocking connections between companies carrying on industries related in varying degrees to the dominant undertaking—as in the case of the shipping industry—we should undoubtedly have lost much overseas trade. Whether or not the tendency to form trusts would be accelerated by the imposition of tariffs we need not stop to inquire; but, as Mr. Baldwin has said, the trust to beware of is the international one.

New Organic Insecticide.—A recent patent of the Chemische Fabriken vorm. Weiler-ter-Meer, Uerdingen, Germany (British Patent 203,904, of 1922), claims the use of chloro-tetrahydro-naphthalene as an insecticide.

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

"FREE TRADE" AND THE BRITISH MARGARINE INDUSTRY.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—During the war there was a great shortage in this country of margarine and other essential fat foods. The raw materials for margarine (oil-seeds and oil-nuts) are largely produced in the British Empire, but owing to the "Free Trade" (for foreigners) policy of England these raw materials were (until prevented by the war) largely shipped to Germany and other foreign countries, to be milled and manufactured into oil or margarine for export to the British market.

By establishing their mills and works in a foreign country the millers and manufacturers obtain the benefit of *two* free markets—they have the great advantage of obtaining free entry to that foreign country's market, and can also dump their surplus production (free of duty) on the British market. This enables the foreign millers to run their mills always at full capacity, and thereby keep down their costs per ton of output and give full employment to their foreign workpeople. A British miller and margarine manufacturer, with his mills in Great Britain, is dependent on the British trade alone. The tariffs imposed by foreign countries prevent him from exporting his surplus production and working his mill at full capacity, so in slack times and low foreign wages and exchanges, like the present, he is compelled to run his mill at half capacity, and this fact increases his costs by at least £3. per ton on his output, and to that extent increases the cost of margarine to the British public, besides throwing half of his British workpeople out of employment, and making it quite impossible for him to compete successfully with his foreign rivals for the British trade.

When war broke out, the British Colonies found their nuts and oil-seeds unsaleable owing to the shortage of milling and manufacturing capacity in Great Britain, and the British public found themselves short of fatty foods owing to the impossibility of treating the superabundance of Colonial nuts then arriving in England. The foreign Governments prohibited the export of margarine for a time during the war, and this compelled several large foreign companies to establish mills and works in England, but latterly these foreign companies, from economic reasons, have again commenced to supply their British customers from their foreign mills and factories. The average imports of margarine into England are again over 1,200 tons per week.

If allowed to continue, the same economic causes will compel my company (Maypole Dairy Co., Ltd.) to close down part of our manufacturing operations in this country and again purchase a mill in a foreign country, where it will be profitable to manufacture our supplies for sale in the British unprotected market. It is a shortsighted policy to handicap the preparation of essential foods in England and force British millers and manufacturers either to close their British mills or to transfer their manufacturing operations abroad at a time when we have over 1,200,000 unemployed British workpeople. Our import laws should now be made to encourage British producers and manufacturers, who are more important and employ far more labour than merchants and distributors. The Free Trade (for foreigners) policy is unsuitable for present conditions.—Yours, etc.,

W. George Watson, Chairman
(Maypole Dairy Co., Ltd.).

November 19, 1923.

BRITISH EMPIRE EXHIBITION (1924).

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—It is well known to most people that at the forthcoming Exhibition next year at Wembley there will be shown a very complete representation of our present state of knowledge of natural science. The details of the arrangements perhaps are not so well known, and with a view to furnishing information to those already interested, and possibly enlisting the assistance of those who have not already offered it, I shall be glad to be allowed to make the following statement.

A committee of the Royal Society is dealing with an exhibit illustrating, so far as space permits, researches in various branches of pure science other than chemistry.

The Chemistry Exhibit is being organised by a committee of representatives of all the other scientific societies dealing with the science and application of chemistry. The two committees are working in the closest possible co-operation, having three members in common in order to prevent overlapping.

The space at the disposal of the committee is limited, but those who are able and willing to assist in the Chemistry Exhibit should communicate with Dr. Levinstein at 166, Piccadilly, W. 1, or any of the Conveners of Sections, with regard to exhibits dealing with chemistry. Subjects which are on the borderland of physics and chemistry, such as the structure of the atom, the inner structure of crystals and recent spectroscopic work, will be dealt with by the committee to which it is most appropriately referred. Arrangements will be made between the two committees to exhibit the work in its most appropriate place.

When the keys of the Exhibition were handed over on November 12 by the contractors to the Exhibition authorities, it was noticed that Messrs. Gaze and Co., of Kingston-on-Thames, had already commenced work on the Chemical Hall within the completed Palace of Industry.

The next meeting of the committee is to be held on December 19, and it is hoped that prior to this date sufficient information will be in the hands of each convener to enable him to make a close estimate of the amount of space he will require and the expenses which will be incurred in his section. It is essential that this date be adhered to, if the subsequent work is to be efficiently carried out.

The idea of having standard specimen bottles has been abandoned, and specimens will be shown in exhibitors' own bottles except in special circumstances. The importance of the scientific exhibits has already been well recognised by the Technical Press, and I am, therefore, encouraged to hope that the widest publicity may be given to the details of the arrangements which have already been made.—Yours, etc.,

W. J. U. Woolcock.

166, Piccadilly, London, W. 1,
November 21, 1923.

TARIFF REFORM AND INDUSTRY—THE LESSON OF THE PATENT ACT, 1909.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—It might be interesting to your readers to know that in the year 1909 an alteration was made to the then existing Patent and Designs Act, which was to the effect that articles patented in this country by foreign firms should be manufactured here.

We were very intimately connected with this matter in being instrumental in fixing up foreign firms with factories, etc., to work here, and our records show the following approximate figures:—

1. Value of land and premises acquired...	£367,000.
2. Amount expended in buildings, housing workpeople, etc.	£532,500.
3. Amount expended on plant, machinery, and equipment	£752,000.
4. Value of annual assessment on which rates were paid	£90,000.
5. Amount paid as rates per annum	£30,000.
6. Number of workpeople (male and female) employed, about	15,350.
7. Amount paid in wages per week, about	£17,600.
8. Number of foreign firms working	50.
9. Number of English firms manufacturing for foreign firms on royalty basis	35.

It must be borne in mind that the above analysis does not in any way represent the total benefit that accrued to England under this Act. The figures supplied are those which came under our special notice through dealing with the firms who established themselves here. We venture to think that what the Patents Act did to increase employment in the manufacture of patented articles, Tariff Reform will do for employment in our national industries.

An interesting sidelight on the present suggestions on Tariff Reform is before us as we write, by the applications received from Continental firms for establishing factories in this country if an alteration is made in our fiscal policy. We are quite confident there would be a great many works opened up here, which would mean a very considerable amount of labour being employed; money expended on land

and buildings; plant and machinery, with its attendant advantages to the community in general.—Yours, etc.,

Leopold Farmer and Sons,
Factory Specialists and Surveyors.

London, E.C. 2, November 16, 1923.

GLYCERINE PRICES.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Referring to Messrs. Higginbottom's prices current in your issue of November 16th inst., we wish to state that glycerine, chemically pure, Sp. Gr. 1.260, is £82. 10s. per ton for a 5-ton contract. This is the Association price, and there is no higher price anywhere in the country for the quantity named.

The price of £60. per ton for crude 80 per cent. glycerine is mentioned. This also is ridiculous. We believe we are absolutely correct in stating that the Glycerine Association, which controls the greater part of the British output, is quoting not more than £50. per ton. Yet it is possible to buy quantities at £48., and even £45. and less, according to the district, in this country.—Yours, etc.,

Geo. W. Phillips
(Managing Director),
Haller and Phillips, Ltd.

London, E.C. 2,
November 19, 1923.

[We are aware that £82. 10s. per ton is the price quoted by the Glycerine Association for 5-ton lots of chemically pure glycerine on contract. Our figure of £85. does not refer to such contracts, but is an average figure for smaller quantities. For quantities of glycerine less than 1cwt., for example, the Association price is £100. 10s. per ton in 28lb. containers. With regard to crude glycerine prices, and despite the assertions of our correspondents, we know definitely that considerable business is being done in the North of England to-day at £60. per ton naked at works. For some small parcels of 80 per cent. crude glycerine, indeed, a price of nearly £70. per ton is being obtained.—*Ed., C.T.J. and C.E.*].

ITALIAN CITRIC-ACID PRODUCTION.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—In connection with your monthly article, "Notes on the Italian Chemical Industry," we should like to draw your attention to a slight inaccuracy which has crept into the November 9 issue of your excellent journal. On page 553 your Genoa correspondent, when dealing with the Italian citric-acid industry, states that "at the present day there are only two citric acid works in Italy, one of which, the Società Goldenberg, was founded in 1909 at Palermo." As a matter of fact there are more than two factories. Our own company, which has a capital of 25,000,000 lire, is manufacturing tartaric acid, cream of tartar, Rochelle salts, tartar emetic, and many other chemicals, at its Milan works, whilst it also possesses two important works at Vercelli and Linate for the manufacture of citric acid. The first of these two latter works was established in 1916, and the second in 1921, and together they work up something like 2,500 tons of citrate of lime per year. We can claim to be the largest manufacturers of tartaric acid in the world, and are also able to supply citric acid in any quantity demanded.—Yours, etc.,

"L'Appula,"
Società per l'Industria Chimica Italiana.

Milan,
Via Tortona 27, November 15, 1923.

HYDRATED LIME IN ROAD TAR.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—The use of tar, either with road stone or for surface dressing, has been very much condemned of late. By the addition of hydrated lime to the tar the points raised against the use of tar for roads are overcome. The writer has found that the addition of hydrated lime (of extreme fineness and entirely free of caustic lime) to tarred stone or slag—

1. Eliminates the danger of damage to fisheries, vegetation, etc., caused by washings from tarred roads, as it absorbs the greater percentage of acids and oily matter;

2. Owing to its affinity for tar, tenacity and elasticity of the mass is produced, and therefore what is termed "cushioning" of the road brought about. The nearer the road approaches a rubber-like substance the better, as the two most important factors for a good road are springiness and elasticity, so as to withstand heavy traffic and climatic conditions respectively.

The use of hydrated lime in concrete also gives greater density and impermeability, besides a more easily worked mixture, which naturally considerably increases production, and yet it costs practically nothing.—Yours, etc.,

C. A. Longley.

London, S.E. 27,
November 15, 1923.

BLEACHING WITH HYDROGEN PEROXIDE.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—In Mr. Weber's paper on the above subject, reported in your issue of November 2, a remark is made about porcelain not standing wear and tear of bleaching plant. This may be correct so far as small porcelain vessels are concerned, but is not accurate in reference to the large porcelain-lined vats which we make, which will stand very much more severe action than any bleaching process, and preclude entirely the possibility of metallic contamination. For over eight years we have manufactured with success plant of this description, and the plant is fitted with iron outside and porcelain inside pipes, and ceratherm-porcelain centrifugal pumps.

We have had wide experience in the use of hydrogen peroxide, and have found that the greatest trouble has been the entry into the bleaching medium of any particles of metallic oxide which are serious enough on some fabrics to burn holes in them, and it was due to this problem that the development of ceratherm-porcelain pumps, vats, pipes, etc., was initiated.—Yours, etc.,

Guthrie and Co.

Accrington, Lancashire, November 16, 1923.

THE DISINFECTANT "IZAL."

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We are desirous of drawing your attention to one point in the interesting report on Disinfectants and Preservatives by Mr. S. N. Brown, F.C.S., in the *Chemical Trade Journal and Chemical Engineer* dated November 9. Mr. Brown is seriously in error when he mentions one of our products, "Izal," as being a reddish-brown liquid insoluble in water, and also suggesting that it is usually used as a 5 per cent. solution. The facts are that it is a pure white emulsion soluble in all kinds of water, soft, hard or brackish, and it is usually used at a dilution of 1 in 600. We should not dream of recommending its use at a strength mentioned by Mr. Brown.—Yours, etc.,

H. E. G. West (Chemical Manager),
Newton, Chambers and Co., Limited.

Thorncliffe, nr. Sheffield,
November 19, 1923.

THE CHEMICAL INDUSTRY CLUB.

The fifth annual meeting of the Chemical Industry Club was held in the Club Rooms, at 2, Whitehall Court, on Monday, November 12, Mr. A. Gordon Craig presiding. After the report of the Executive Committee and the accounts had been passed, Dr. W. R. Ormandy moved the election of Mr. J. Miller Jones and Dr. E. H. Tripp to the posts of honorary treasurer and honorary secretary, respectively. These appointments were approved unanimously, and hearty votes of thanks were accorded to the retiring officers, Mr. C. J. Goodwin and Mr. H. E. Coley. The rules, as revised during the past year, mainly through the labours of Mr. W. Cullen and Dr. A. Rule, were approved. Under the new regulations the Club is empowered to elect a president and a vice-president, to hold office for a period not exceeding two years, and Sir William Pope and Professor W. R. E. Hodgkinson were elected to fill these positions. A vote of thanks to Mr. Craig for his services as chairman of the Executive Committee during the past two years was passed with acclamation. Subsequently to the meeting, the Executive Committee appointed Mr. H. E. Coley to be its chairman for the ensuing year.

Arrangements for the Annual Dinner.

The speakers at the annual dinner of the Club, to be held in the Connaught Rooms, W.C., on Monday, November 26, will include Sir Lionel Phillips, Sir Arthur Duckham, Mr. F. W. Harbord, and probably Sir J. Cadman.

Those who still require tickets (15s. each, inclusive) should apply to the Secretary at 2, Whitehall Court.

THE SOUTH WALES PATENT FUEL INDUSTRY.

THE PROBLEM OF CHEAP PITCH SUPPLIES.

AN interesting account of how the patent-fuel manufacturers of South Wales have endeavoured to secure adequate supplies of cheap pitch is given by a correspondent in the *Times Trade Supplement* (Special "Industrial Wales" issue). He points out that of the three factors, cost of small coal, factory and overhead costs, and cost of pitch, which make up the total cost of production of patent fuel, the last-mentioned is the one most disproportionate to general market conditions, and is therefore the one in which most interest is taken by those within the industry.

The present price of pitch is well over three times the figure which may be taken as a fair average over a long period prior to the war. If pitch were obtainable at one-half of its present price it would make all the difference imaginable in the fuel position, while at the same time the tar distillers would, so the writer claims, be getting a price which would show a very fair relation to that obtainable before the war.

There are two ways of dealing with this difficulty. One is to reduce the percentage of pitch by modified methods of manufacture or by substituting some other material. These questions are engaging the attention of many people, within the industry and without. The other is to reduce the actual price of the pitch itself, and although this could easily be done, with the co-operation of the tar distillers, it is evidently too much to expect that they should be so disinterested as to accept from the South Wales fuel manufacturers one-half of the price which they can obtain for their product elsewhere.

First Purchase of American Coke-oven Pitch.

During the past year the fuel makers have taken two definite steps towards improving their position in regard to pitch. The first was the appointment of a single buyer to represent all the block fuel makers in the purchase of pitch. This was intended not as a ring or combine to fight the organisation of the tar distillers and chemical brokers, but as a means of avoiding competition between the fuel makers themselves; and therefore, as a method of bringing down prices, it could meet with only a very limited success. The second step was a determined effort to broaden the sources of supply, and it took the form of a purchase of a very substantial quantity of coke-oven pitch from the United States of America. This pitch was shipped during the spring of the present year; it was distributed between all the fuel works connected with the South Wales Patent Fuel Manufacturers' Association, and it sufficed to keep them at work for many months at a time when British pitch was not procurable except at totally prohibitive prices. This pitch proved to be of very fair quality; that is to say, it was inferior to the British fancy qualities, but superior to many British makes which are regularly used in South Wales; and the price was not much more than half the price of the British article.

This purchase for a time caused something like consternation in the ranks of the British dealers, but when it was found that no considerable additional quantities of suitable quality were forthcoming, matters gradually settled down, and by the end of the summer the dealers had the situation pretty well in hand once more. The transaction, however, had served its purpose; it had carried the industry over an exceedingly critical period and brought about a considerable, although only temporary, reduction in British prices; and signs are not wanting that the fuel makers will not be squeezed quite so hard again.

Outlook for the Near Future.

Two or three of the fuel companies united to follow up this success by sending representatives to the United States to investigate the whole position on the spot, and they ultimately purchased a further very large quantity of coke-oven pitch, but of a considerably harder quality than that customarily used in South Wales. Owing to this feature, this particular quality can be shipped all the year round, which is a great advantage, but as the temperature necessary to melt it cannot be attained in the ordinary fuel works plant, it has to be submitted to certain treatment before it can be used in fuel making. So far the plant for preliminary treatment is not at regular work, but it is understood that it has given satisfactory results in its trials, and that it will be put into regular commission as soon as the requisite auxiliary handling plant is installed. If the designers' hopes are realised, the quantity of British pitch required for South Wales during 1924 will be relatively small and should consequently be obtainable at a reasonable price. It is hoped to deliver the reconditioned pitch to the fuel works at a price substantially below the market price of British pitch. The whole position, therefore, as far as 1924 is concerned, turns very largely upon the degree of success attending the operations of the new plant. On the whole, it may be said that, as between the various companies concerned in the trade, some are better placed than others in regard to pitch, but that as far as the trade as a whole is concerned the pitch prospects for 1924 do not appear to show cause for grave anxiety.

THE MARKETS IN GASWORKS RESIDUALS.

MR. MILNE WATSON'S VIEWS.

IN the course of an inquiry by the Director of Gas Administration (Mr. H. C. Honey), on Wednesday, November 14, into an application by the London County Council for a reduction of the standard price—under the sliding scale—of the Gas Light and Coke Co., Mr. D. Milne Watson, the Governor of the Gas Light and Coke Co., gave some interesting information concerning the markets in residuals. He said the present export price of coke is not so good as it had been, for the reason that Germany, who used to export furnace coke, for a while became a buyer of British furnace coke, and that sent the price up.

Falling Prices for Furnace and Gas Coke.

Germany, however, had now ceased to be a buyer of British furnace coke. As a consequence, after the price of English furnace coke had increased under the influence of German buying—and with it the price of English gas coke,—the prices were now falling rapidly.

The price during recent weeks of English furnace coke had fallen to 33s. per ton, and whereas this year as much as 40s. per ton had been obtained for exported gas coke, at the present moment there were no buyers. The bottom had been knocked out of the market for the moment. When buying commenced again he expected a drop of at least 10s. per ton in gas coke. As a contrast, witness mentioned that during 1920 gas coke for export fetched up to £11. per ton. Again, gas companies were finding slack coal seriously competing in the market for breeze.

Pitch and Sulphate on the Downgrade.

As to tar, there were signs of a break in this market also. Pitch was at as high a figure as 190s. per ton in the first half of the year, but it had now sagged to 130s. Concerning sulphate of ammonia, as chairman of the Sulphate and Ammonia Federation he was sadly aware that prices are on the downgrade, and the Gas Light and Coke Co. estimated that the price of sulphate would be down to £13. per ton before the end of December next, and generally he did not see anything in the sulphate market to give much hope. There had been a very great increase in the output of sulphate all over the world, and the Germans had come into the export market with quite large quantities, with the natural result that prices had broken all over the world.

VERMILION INDUSTRY OF HONGKONG.

ONE of the oldest and best known of the Hongkong industries is the manufacture of vermilion, a pigment which is used by the Chinese for making varnishes, for colouring candles and paper, and for stamping and writing purposes. The annual output in Hongkong is estimated to be about 20,000 cases of 50 catties each (66⅔lb.), the total value being approximately 1,800,000 Hongkong dollars. Of the total output of 20,000 cases, about 10 per cent. is for local use in Hongkong, 10 per cent. for exportation to the United States and Europe, and 80 per cent. for exportation to Canton, Fatshan, and the neighbouring districts. The exports to the United States and Europe are small in consequence of the competition of coal-tar dyes, which are much cheaper. The present market price for vermilion in Hongkong is 90 Hongkong dollars per case, or 180 dollars per picul (1 picul = 133⅓lb.). There is only one grade of Chinese vermilion, made of a mixture of mercury and sulphur in the proportion of 100lb. of mercury to 90lb. of sulphur. The sulphur employed is secured from the near-by Provinces of South China. About 20,000 flasks of mercury are annually used in the Hongkong industry.

ITEMS OF INTEREST.

Fuller's Earth Deposit in Wales.—It is announced that a large deposit of fuller's earth has been discovered at Corwen, capable of producing 60 to 70 tons per week.

Russian Duty on Imported Coal.—The Soviet Government announces that it intends to introduce a new Customs tariff. Among its provisions is a higher duty on coal for the protection of Russian coal from British competition.

Change of Address. — Joseph Evans and Sons (Wolverhampton), Ltd., state that they have changed their London Office address from Salisbury House, London Wall, to Craven House, Kingsway, London, W.C. 2; telephone No., Gerrard 7044; telegraphic address, "Dryosbo, Westcent, London."

Unemployment Decreasing. —The number of persons on November 5, 1923, recorded on the live registers of the Employment Exchanges in Great Britain was 1,244,000. This was 11,996 less than in the preceding week, and 241,878 less than the figure recorded on January 1, 1923.

British Iron Production in October.—The production of pig iron in October amounted to 592,600 tons, compared with 558,600 tons in September and 481,500 tons in October, 1922. There were 188 furnaces in blast at the end of the month, a decrease of two compared with the preceding month, and a total decline of 35 since the end of May.

Pluviusin Products in Spain. — We learn that at the Barcelona Trade Exhibition a gold medal was awarded to Mr. R. M. Nosworthy of Calle Valencia, Barcelona, owing to the good quality of the P-V Brand Leather Cloth, for which Mr. Nosworthy has the sole sale for Spain on behalf of the British Pluviusin Company Limited, of Manchester, a Nobel Industries concern.

Belgian Glassworks Activity.—The glassworks in Belgium are passing at present through a period of unprecedented prosperity. Very important orders have lately arrived from China and Japan. The earthquake has opened an extensive market for window-pane manufacturers. Several ovens which were extinguished a year or two ago have now been relighted, and the construction of at least half a dozen new ones has been decided on.

Spanish Chemical Trade.—Imports of chemical products during the first six months of 1923 amounted in value to 163 million pesetas, an increase on the previous year of 47 millions. The principal items responsible for the increase were creosote, colouring materials, paints, sulphur, nitrate of soda, ammonium sulphate, superphosphates, tanning extracts, and pharmaceutical specialities. Exports of chemical products increased from 60 to 63.6 million pesetas in value, and of minerals and ores from 63 to 78 million pesetas.

Match Manufacture in India.—In order to assist small manufacturers of matches in Bihar and Orissa to overcome the many difficulties they are at present experiencing, the local Government have engaged Mr. A. P. Ghosh, who has been trained in Japan, Sweden, Germany, and England, to make an investigation and submit a report. He will examine all the forests of the Province, test the various woods available, and advise on the most likely sites for factories. He will inspect the existing match factories in the Province and advise on their defects. He will also draw up plans and specifications for a small demonstration factory, and advise where it should be located.—*The Indian Trade Journal.*

Non-Metallic Minerals in Canada.—A special report has been prepared by the Canadian Dominion Bureau of Statistics (Mining, Metallurgical, and Chemical Branch) on the consumption of prepared non-metallic minerals in Canada. Though extensive deposits of crude materials are known to exist in Canada, and though these deposits are in certain cases being worked, the bulk of the supply has been derived from importations. The present report, which has been prepared with a view to exploring the possibility of establishing plants in Canada to produce the bulk of the quantities demanded by Canadian industries, contains an excellent statistical summary of the present Canadian position in such things as barytes, calcite whiting, dolomite, corundum, felspar, fluorspar, gypsum, lime, magnesite, mica, iron oxides, asbestos, sulphur, silica, tripoli, talc, etc. Copies of the report may be obtained by readers interested on application to the Office of the High Commissioner for Canada, Kinnaird House, Pall Mall, London, S.W. 1.

Industrial Developments at Halesowen.—Plans have been passed by Halesowen (near Birmingham) Rural Council for the extension of a vinegar factory in that locality, also a new oil and varnish factory.

Chemical Works Fatality.—On Wednesday, two men employed in filling detonators with fulminate of mercury at the Middlestone (Durham) Works of G. I. Webb and Co. were killed as a result of an explosion in the detonator house.

World Coal Production.—According to the U.S. Geological Survey, the world coal production during the first six months of 1923 amounted to 666,000,000 metric tons, of which the United States contributed 294,261,000 tons (44 per cent.), and the United Kingdom 143,051,000 tons (21.5 per cent.).

British Manufacture of Candles.—Lever Brothers, Ltd., control a great part of the business of candle manufacturing in this country, and are marketing a candle of a new type. It is moulded into a triangular shape, with fluted sides, and it is claimed that it gives a 10 per cent. better illumination than the familiar round candle of commerce.

Business Notices.—Mr. L. H. Hartland-Swann, C.B.E., has joined the board of Lever Bros., Ltd., and been appointed a managing director of the company. He is also chairman of International Icilma Trading Co., Ltd., of Vinolia Co., Ltd., and Blondeau et Cie, Ltd. Mr. Hartland-Swann will devote his attention chiefly to the toilet companies associated with Lever Bros., Ltd

Microchemical Test for Lead.—Lawrence T. Fairhall, of Harvard University (*Jour. Biol. Chem.*, 1923, 57, 455-461), has studied the hexanitrite microchemical test for lead. This test depends on the crystallisation of regular rectangular plates or cubes of the hexanitrite of potassium, copper and lead from an aqueous solution. The test will reveal the presence of as small an amount as 0.001 milligramme of lead in 15 c.c. of a solution containing a considerable amount of other inorganic salts.—*J. Fr. Inst.*

Institution of Engineering Inspection. — We have received from the Institution of Engineering Inspection Incorporated, Palace Chambers, Westminster, London, S.W. 1, a leaflet describing the activities of the Institution, and also a list of fixtures arranged for the Session 1923-1924. We note that a number of interesting visits to works have been arranged, including one to the Inspection Department, Royal Arsenal, Woolwich, on December 5, and one to the Kodak Works at Wealdstone on January 10.

Tariff Notes.—According to the Board of Trade *Journal*, the text of the recent amendments to the New Zealand Customs shows that inorganic acids (n.e.i.), also benzoic, carbolic, citric, formic, gallic, lactic, oleic, oxalic, picric, pyrogallic, crude pyroligneous, salicylic, tannic and tartaric acids may be admitted duty free.—The Dominican export duty on lime juice cordial is reduced from 6d. to one penny per gallon.—A duty of 50 cents per lb. has been imposed on alum imported into the Federated Malay States, except under certain conditions.

Research On Enamelled Cast Iron.—The American Bureau of Standards has received a number of specimens of typical enamelling castings, and these are now being enamelled with several commercial cast-iron enamels. The chemical analysis of the castings has been made, and the Bureau also proposes to make up typical bodies of cast iron in its metallurgical department. The speciments thus obtained will also be analysed chemically and enamelled. An attempt will be made to correlate the blistering of the enamel and the chemical composition of the cast iron, with the object of obtaining a good commercial cast iron which will not produce blisters.—*The Engineer.*

The Sharples Super-centrifuge.—Four years ago the United Water Softeners, Ltd., became sole licencees for the Sharples Super-Centrifuge. The business has grown to an extent which has rendered the original organisation entirely inadequate, and has necessitated the formation of a separate company to deal exclusively with the Sharples business. This company has now been formed under the title of Super-Centrifugal Engineers, Ltd. No change in the directorate or management has been made, the directors of United Water Softeners, Ltd., remaining directors of the new company, but the Board has been strengthened by the inclusion of Mr. P. T. Sharples, the President of the Sharples Company of America, and of Messrs. A. H. Keable and Z. A. Toula, Technical Directors.

Sulphate of Copper Production. — The production of sulphate of copper in 1922 was higher than in 1921 in France and the United Kingdom; but, whereas the French production show a notable increase on the pre-war output, the yield of the United Kingdom showed a great decrease. The United States figures for 1922 are not available, but those for 1921 indicated a great diminution in production, especially in comparison with 1913. Data relative to the Italian yield in 1922 is also not available, it may be taken, however, states the International Institute of Agriculture, that the recent growth of manufacturing plant now gives Italy the lead as regards copper-sulphate producing capacity.

Oxygen for Blow-pipe Purposes.—In a discussion of the relative merits of electrolytic and atmospheric oxygen for blow-pipe purposes, *Industrial Gases* says that extensive experiments show: (1) If the quality of the oxygen is the same, the results obtained should be identical whether electrolytic or atmospheric oxygen is used. (2) A superiority of 0.5 per cent. in the quality of oxygen represents a saving of about 10 per cent. in the quantity. This difference does not, however, appreciably affect either the speed or the quality of the cut. (3) As between electrolytic oxygen of 99 per cent. purity and atmospheric oxygen of 98.5 per cent. purity the price of gas is the only important factor. If that is the same, then the electrolytic oxygen has a 10 per cent. advantage. These observations apply only to modern motor-driven cutting machines..

Industrial Methane.—Methane from the Rombacher mines in Coblenz and from the Fritz Hamm Gesellschaft in Dusselsdorf, compressed in the usual steel containers to 150 atmospheres, has, states the *Colliery Guardian*, recently been put on the market. This methane is entirely free from carbon monoxide, and is said to be generally useful as a cooking and lighting gas for soldering purposes, for the autogenic working of metals, as well as the autogenic cutting of iron. On account of its high calorific value and its extremely favourable kindling and compression points, methane is also useful as a material for gas motors, especially for vehicles. In the chemical use of methane, many prospects offer themselves. It is proposed to obtain sulphur from gypsum by reduction with methane, to produce methyl alcohol from methane, with methyl chloride as an intermediate product, and from atmospheric nitrogen by the use of methane or its cleavage products to prepare cyanogen products.

French Company News.—The annual general meeting of Les Etablissements Poulenc Frères was held in Paris on October 30 under the chairmanship of M. Gaston Poulenc The report and accounts for the year ending June 30, 1923, which were adopted unanimously, show a net profit of 6,128,014 francs, an increase of 3,914,843 francs over the previous year. A dividend of 45 francs per share (exclusive of taxes and payable on November 5) was declared. Total production of the firm shows an increase of 38 per cent. over 1921-1922. More than half a million francs has been allocated to the research fund, and 926,727 francs have been allocated to the depreciation and mortgage accounts. The Chairman stated that the business of the company had not been interfered with to any extent by the Ruhr occupation. Replying to a shareholder, he also stated that France had nothing to fear from the reappearance of Germany as a competitor in the chemical markets.

Hamburg Paraffin and Wax Market.—His Majesty's Consul-General at Hamburg has forwarded to the Department of Overseas Trade the following information based on a report appearing in the *Hamburger Fremdenblatt*, of November 2: Paraffin has been rising in price, stocks being very short, and the demand extremely brisk. American paraffin blocks 50—52° C. were quoted at 9.25 dollars, and paraffin shavings 50—52° C. at 8 dollars per kilo., undutied ex-quay. Galician paraffin is no longer on the market. Business in ceresin was quiet as before. Prices for common natural yellow ceresin 54—56° C. were 11 dollars, and for white 12 dollars, per 100kilos. undutied. Japanese wax was much in demand, as the information from Japan pointed to shortage of stocks. The first three qualities were quoted at 82s. per cwt. spot, and 77s. to 78s. for delivery. Demand for carnauba wax was quiet; fat grey realised 88s. spot, and current grey 85s. Sales of beeswax were limited. West African realised 96s. to 98s. per cwt., and East African 100s. per cwt. undutied. (Duty amounts to 15 gold pfennings per kilo for Japanese wax, and 10 gold pfennings per kilo. for all other kinds).

COMING EVENTS.

Society of Chemical Industry (Glasgow Section).—Meeting, **Friday, November 23,** at **7.15 p.m.,** at 39, Elmbank Crescent. Paper: "Artificial Resins: Their Preparations and Uses," by Dr. H. Hepworth.—**(Manchester Section):** Annual dinner, **Friday, November 23,** at **7.30 p.m.,** at the Queen's Hotel.

West of Scotland Iron and Steel Institute. — Meeting, **Friday, November 23,** at **7 p.m.,** at the Royal Technical College, George Street, Glasgow. Paper: "Effects of Time and Temperature on High Speed and Similar Steels," by W. E. Woodward.

Institute of Chemistry (Bristol Section).—Meeting, **Saturday, November 24,** at Exeter. Papers by A. Marsden and F. Southerden.

Faraday Society.—Meeting, **Monday, November 26,** at **3 p.m.,** at the Institution of Electrical Engineers, Victoria Embankment. Discussion: "Electrode Reactions and Equilibria."

Hull Chemical and Engineering Society.—Meeting, **Tuesday, November 27,** at **7.45 p.m.,** at the Hull Photographic Society's Rooms, Grey Street. Paper: "Recent Advances in Colloid Chemistry," by A. V. Slater.

Society of Chemical Industry (Birmingham Section).—Meeting, **Tuesday, November 27,** at **7.15 p.m.,** at the University, Edmund Street. Papers: "Acceleration of Vulcanisation by Xanthrates, and the Influence of Metallic Oxides as Activators," by Dr. D. F. Twiss and F. Thomas; "An Important Variable in Raw Rubber," by Dr. D. F. Twiss and F. B. Jones.

Society of Dyers and Colourists (Leeds Junior Branch).—Meeting, **Monday, November 26.** Paper: "Works Filtration," by Dr. Forster.—**(West Riding Section):** Meeting, **Thursday, November 29.** Paper: "The British Dye Industry," by Dr. H. Levinstein.—**(Midlands Section):** Meeting, **Thursday, November 29,** at Nottingham. Paper: "Bleaching with Hydrogen Peroxide," by I. E. Weber.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, November 30,** at **7 p.m.,** at 36, George Street.

Society of Chemical Industry (Liverpool Section).—Meeting, **Friday, November 30,** at **6 p.m.,** in the Clubrooms of the Overseas League, 14, Elliott Street. Discussion: "The Society of Chemical Industry and What it Stands For," to be opened by Dr. E. F. Armstrong.

Society of Chemical Industry (London Section).—Meeting, **Monday, December 3,** at **8 p.m.,** at the Chemical Society, Burlington House, Piccadilly, W.

Institution of the Rubber Industry (London Section).—Meeting, **Monday, December 3,** at **8 p.m.,** at the Engineers' Club, Coventry Street, London, W. Paper: "Accelerators," by Major V. Lefebure.

Society of Public Analysts. — Meeting, **Wednesday, December 5,** at **8 p.m.,** at Burlington House, Piccadilly, W.

Society of Chemical Industry (Bristol Section).—Joint meeting with the Institute of Chemistry, **Thursday, December 6,** at **7.30 p.m.,** at the University, Woodland Road. Paper: "Some Reminiscences of an Alkali Inspector," by R. D. Littlefield.

Society of Dyers and Colourists (Bradford Junior Branch).—Meeting, **Thursday, December 6.** Paper: "Wool Dyeing in the Piece," by H. Mitchell.—**(Scottish Section):** Meeting, **Friday, December 7.** Paper: "Wetting Power and Its Application to Industry," by W. H. Nuttall.

Society of Chemical Industry (Manchester Section).—Joint meeting with the Institution of the Rubber Industry, **Friday, December 7,** at **7 p.m.,** at the Textile Institute, 16, St. Mary's Parsonage. Papers: "Methods to be Adopted in Comparing the Activity of Various Accelerators," by S. Martin; "The Analysis of Rubber Vulcanisation Accelerators," by Dr. T. Callan and N. Strafford.—**(South Wales Section):** Meeting, **Friday, December 7,** at **7.30 p.m.,** at the Technical College, Cathays Park, Cardiff. Paper: "Coke Ovens," by T. G. Watts, to be followed later by a visit to the Maritime Coke Works, Pontypridd.

PRODUCTION OF THE RARE METALS.

REDUCTION OF THE CHLORIDES BY SODIUM.

THE success which has attended the production of metallic titanium (*J. Am. Chem. Soc.*, 32, 330; 1910) has led to the belief that other metals might be prepared in coherent form by the reduction of their anhydrous chlorides by sodium. The method has been tried out by M. A. Hunter and A. Jones (who presented an account of their work at the general meeting of the American Electrochemical Society at Dayton, Ohio, in September) with the chlorides of beryllium, chromium, uranium, vanadium, and zirconium with varying degrees of success. The main difficulty lies not in the reduction itself, but in securing enough of the anhydrous chlorides to reduce. If sufficient quantities of the chlorides were available, the authors do not doubt that all of the metals mentioned could be obtained in metallic form. With the limited quantities of the chlorides which have been prepared on a laboratory scale they have succeeded in obtaining beryllium, chromium, and zirconium in a more or less granular form, but with uranium and vanadium, metallic powders only with varying degrees of purity have been produced. Further details for each metal are given under the headings of the separate metals.

The Reduction Bomb.

Three types of reduction bombs have been made during the progress of the work. A small bomb was first constructed for preliminary investigations, where small quantities only of material were available for reduction. This was made from a solid-steel cylinder 12.7 cm. (5in.) deep and 7.6 cm. (3in.) in diameter. The second bomb had a capacity ten times that of the first small bomb. It had an outside depth of 16.5 cm. (6.5in.), and an inside depth of 12.7 cm. (5in.), and outside diameter of 10 cm. (4in.), and an inside diameter of 7.6 cm. (3in.). A third type of bomb, much simpler in construction and quite as effective in operation has been designed by L. E. Barton, of the Titanium Alloys Manufacturing Co., and was used in some of the later experiments. The cavity in the cylinder is closed by a slightly tapered plunger, which is held in position by a heavy cap threaded on the outside of the cylinder. A copper gasket is rendered unnecessary by this construction, and the chief source of weakness in the earlier bombs is thus entirely removed. A larger bomb has since been constructed by the Titanium Alloys Manufacturing Co. embodying the same principle in maintaining a tight joint between the lid and cylinder by means of perfect contact between two steel surfaces carrying a slight film of oil. In this larger bomb a 5lb. batch of metallic material can be made.

The operation of the bomb involves no novelty whatever. The requisite quantity of materials were introduced as rapidly as possible into the bomb. When the materials to be reduced were liquid below the reduction temperature, the sodium was introduced in large lumps. Where the materials were known to have melting points in excess of the reduction temperature the materials were introduced in successive laminæ with sodium. The bomb, after closing, was placed in a roughly constructed chamber built up of brickwork, and was heated by two blast lamps. The completion of the reduction was indicated by the sudden rise in temparature of the bomb. On cooling, the material remaining in the bomb was soaked with alcohol to remove traces of sodium still unused, and finally washed with water and dried in alcohol and ether.

Beryllium.

Beryllium oxide was extracted from beryl, and chlorinated after mixing with lamp black. The chlorination proceeded very slowly, and much time was required to produce enough chloride for reduction. When the oxide was converted to beryllium carbide under the electric arc, the chlorination proceeded much more rapidly. The beryllium chloride was freed from iron by sublimation and transferred as rapidly as possible to the reduction chamber. In this way 88 grammes beryllium chloride were reduced with 60 grammes sodium. After reduction the contents of the bomb were washed free from sodium chloride. A considerable amount of a light blue-black flocculent precipitate was removed by levigation. The residue consisted of small rounded grains of beryllium. The theoretical yield of beryllium was 9.8 grammes. Only 3.58 grammes were recovered in the coherent form, a recovery of only 36 per cent.

The beads recovered from the reduction were found to contain 99.6 per cent. beryllium. The beads of pure beryllium possessed a silver-like lustre, and when cold could be flattened easily under the hammer. The specific gravity of this material was 1.793. The melting point taken in hydrogen was found to be 1370° C. The beads could not be burned completely in air, thus showing a considerable resistance to oxidation. They were readily brought into solution by hydrochloric acid, whereas in cold concentrated nitric acid the beads did not dissolve. If large quantities of pure beryllium oxide or of beryllium chloride were available, there is no doubt that coherent metallic beryllium could be prepared by this method in considerable quantity, thus giving an opportunity for the further study of this interesting metal.

Chromium.

While chromium is not to be considered among the rarer metals, it is not ordinarily met with in the pure condition. The violet chromium chloride can, however, be obtained commercially in reasonable amounts, and can be readily reduced by sodium to metallic chromium. Of this chloride 350 grammes were reduced by 154 grammes of sodium. The largest pellet from the reduction weighed 11 grammes. The theoretical yield of chromium was 117 grammes. Sixty-seven grammes of coherent metal were obtained, a recovery of 57 per cent. of coarse metal. The material analysed 99.86 per cent. chromium. The specific gravity of the pure chromium was found to be 6.29 and 6.40 in two experiments. The metal is insoluble in hydrochloric or sulphuric acid in the cold, but dissolves readily in either when hot. In nitric acid the metal remains unattacked.

Uranium.

The reduction of metallic uranium by sodium was first carried out by Peligot in 1869. Attempts at obtaining the metal in coherent form by this method, using large quantities of the material, were not successful. In one experiment 308 grammes uranium chloride (UCl_5) were reduced by 120 grammes sodium. The theoretical yield is 177 grammes. Since 167 grammes of metal were recovered the yield is 94 per cent. The metal is produced in powder form only, no coherent metal being obtained. The fine powder is readily oxidised in air. One sample which analysed 99 per cent. uranium was found a year later to contain 89 per cent. The colour had meanwhile changed from dark grey to green, indicating the formation of uranium oxide.

Vanadium.

The metal vanadium has been recovered from the tetrachloride and trichloride by reduction with sodium. Its preparation from the liquid tetrachloride is difficult by reason of the great pressures which are developed in the bomb, due probably to the decomposition of the tetrachloride under the effect of heat. The solid trichloride can be reduced without difficulty. Seventy-two grammes of the liquid tetrachloride gave 11.87 grammes vanadium on reduction, a recovery of only 63 per cent. On the other hand, 38 grammes of the trichloride gave 11.67 grammes of residual metal, a 93 per cent. recovery. The powder obtained contained 95 per cent. of vanadium metal. No coherent grains of vanadium were obtained showing that the heat of reduction was not sufficient to melt the metal from the small amounts of material used. If carried out on a larger scale the pure metal could undoubtedly be obtained in coherent form. The specific gravity of the powder obtained was found to be 5.97.

Zirconium.

Zirconium chloride can be readily reduced by sodium. In one experiment 324 grammes of the chloride were reduced to zirconium metal. The theoretical yield is 126 grammes. Of this amount 96 grammes of metal only were obtained, a yield of 76 per cent. The material was found to contain 93.2 per cent. zirconium. The specific gravity of the product was found to be 5.29.

Zirconium has also been prepared by the reduction of potassium zirconium fluoride (Berzelius' method). Five hundred and twenty-three grammes of the double fluoride were reduced by 150 grammes sodium, giving 174 grammes of an air-dried metallic product containing 95.9 per cent. of zirconium metal. A second run on the same amount of material gave 43 grammes of a coarse product analysing 96.2 per cent. of zirconium and 107 grammes of fine powder analysing 97 per cent. zirconium. No large coherent pellets were obtained in either case, the heat of reduction not being sufficient to melt the metal. Subsequent attempts to melt the powder have met with no success, so that it is impossible at this time to indicate whether the metal is malleable at high temperatures.

FERTILISER NEWS.

Nitrate of Soda. — During the first half of the current month, shipments from Chile totalled some 60,000 tons, of which the United States took almost one-third, and Europe (including Egypt) the remainder. This low figure, as compared with the corresponding period of last year—viz., 153,000 tons,—is in the main attributable to the strikes at the shipping ports. Iquique is still affected; indeed, a Government Commission has gone there to investigate the situation, but it is understod that settlements have been arrived at in Pisagua and Tocopilla. Production during October reveals a considerable increase for the month, the output reaching 175,000 tons, leaving stocks at the end in the neighbourhood of 966,000 tons, compared with 1,405,000 tons same date last year, and 671,000 tons in 1913. Deliveries from ports in Europe are larger than last year for the fortnight, 22,500 tons against 20,000 tons. European stocks are therefore increased to 255,000 tons as at the 15th inst., which with 169,000 tons afloat, makes a visible supply of about 424,000 tons. Sales by the Association have revived to the extent of 90,000 tons during the fortnight, total sales thus amounting to 1,390,000 tons for the current fertiliser year, against 1,023,000 tons a year ago. Official announcements state that the European market has been rather more active lately, but it is likely that the rapidly changing political events on the Continent, notably the decision of the Germans to discontinue payments under the Reparation Recovery scheme, will result in a restriction of markets. Some business is reported in c.i.f. parcels at about £11. 16s. per ton for near arrival up to £12. 2s. 6d. for December-February shipment.

Rothamsted Station Report. — The recently published report of the Rothamsted Experimental Station at Harpenden, covering the years 1921 and 1922, deals in part with the investigations into fertiliser values. Much valuable data are contained in the statistical tables at the end of the report, and the following broad conclusions will be of interest to fertiliser manufacturers. Experiments indicated that urea has a value between that of nitrate of soda and sulphate of ammonia, but in addition, it has two attractive features—it is highly concentrated and it exerts no harmful influence on the soil. Ammonium chloride, it was found, is generally about 5 to 10 per cent. less effective than ammonium sulphate containing the same amount of nitrogen. Certain experiments on the new basic slags and mineral phosphates are also recorded, the general result up to the present, being that the high soluble slags are quicker in action and more effective than those of low solubility, but the low solubility slags are more effective than their solubility indicates. In 1922, field experiments were made with magnesium sulphate, the results indicating that while apparently ineffective in ordinary conditions, it has, in certain farming conditions, a considerable fertilising value.

General Notes.—According to official information a good deal of business has been done by New Zealand in the importation of high-grade phosphate rock from Nauru and Ocean islands, the actual quantity brought into the Dominion during the past financial year being 51,430 tons. The accounts of the commissioners controlling the business are made up for a different period, their trading year ending on June 30. For the ten months ending April 30, 1923, the importations into New Zealand comprised 16.96 per cent. of the total output.

There has been a brisk demand by Latvian agriculturists for artificial fertilisers. The Latvian Government had set aside a sum of about 280,000 lats for granting loans to farmers for the purchase of fertilisers, but this amount was quickly exhausted, and additional credits will probably be granted.

One of the large chemical manufacturers of the North is putting on the market a waste lime which has been dried and pulverised, containing about 80 per cent. carbonate of lime, or 44.8 per cent. of calcium oxide, the remainder being water, at a price of 5s. per ton, states the *Journal* of the Ministry of Agriculture.

The statistics supplied of recent operating results of the American Trona Corporation indicate that this potash-producing enterprise is at length working on a profit-earning basis. For the first four months of 1923 production of potash and borax showed a large increase; and at the same time costs were appreciably lower. This improvement in operating practice, coupled with an increased demand for the company's product, has resulted in an operating profit during the first nine months of the current year of 81,000 dollars, as against an operating loss of 335,000 dollars for the year 1922. Further, it is stated that the indications point to this rate of profit being maintained during the remainder of the year. These results are considered especially encouraging in view of the exceptionally low price to which potash has fallen in America this year, owing to severe German competition.

Exports of fertilisers and fertiliser materials from the United States expanded 32 per cent. in value and 27 per cent. in quantity during the first nine months of 1923 as compared with the corresponding period of 1922, having risen from 13,082,630 dollars (707,738 tons) to 17,210,449 dollars (896,332 tons). The demand for sulphate of ammonia advanced 28 per cent. from 7,076,650 dollars (120,959 tons) in the first nine months of 1922, to 9,087,848 dollars (124,600 tons) in the first nine months of 1923. Of the foreign countries receiving sulphate of ammonia from the United States, Japan took two-thirds of the total, and Cuba and Hong Kong each one-tenth. Shipments of phosphate rock in the period increased 10 per cent. from 4,442,948 dollars (535,920 tons) to 4,872,544 dollars (673,467 tons). Superphosphates to the value of 409,602 dollars (32,153 tons) were shipped to foreign countries. Gains were also made in the exports of prepared fertiliser mixtures, 670,747 dollars (14,427 tons) having been exported.

PARLIAMENTARY NEWS.

Food Preservatives.

In the House of Commons, on Thursday, November 15, Mr. Barnes asked the Minister of Health whether he has received resolutions from local authorities expressing the opinion that the use of chemical colouring matters and preservatives in food constitutes a menace to the community, and calling upon the Ministry of Health to exercise without delay power which it already possesses to safeguard the public in this respect; and whether he will state what action he proposes to take?

Sir W. Joynson-Hicks: Yes, I have received a number of resolutions to this effect. The subject is at present being investigated by a Departmental Committee appointed by my predecessor, and I do not propose to take any action in the matter until I have considered the Committee's Report.

Anglo-Persian Oil Company.

Mr. Chamberlain, replying to Lieut.-Col. Hodge, said: A proposal for the acquisition of the Government holding in the Anglo-Persian Oil Company has been under consideration for some time. No decision has yet been reached, but I can assure the hon. member that no step is contemplated by the Government which would have the effect of jeopardising the supply of oil fuel for the Navy and Mercantile Marine

Mr. Shinwell asked the Prime Minister whether he can now state what negotiations have taken place with regard to the sale of the Government holding in the Anglo-Persian Oil Company; and whether, in the event of Government co-operation in the affairs of the Anglo-Persian Oil Company being withdrawn, steps will be taken to safeguard the interests of the shale and oil industry in Scotland?

Mr. Chamberlain: As has been stated, an offer has been received by His Majesty's Government, and in considering it the point raised by the hon. member will be taken into account with all other relevant factors.

Mr. Shinwell: Will the right hon. gentleman give a definite assurance that, so far as the industry in Scotland is concerned, it will be maintained?

Mr. Chamberlain: I cannot give any such assurance.

Trinidad Pitch Lake Concession.

Mr. Ormsby-Gore, replying to Mr. A. M. Samuel, said: The Trinidad Pitch Lake was first leased on July 12, 1888, and, with the approval of the then Secretary of State, an extension to 1930 was granted by a deed dated July 28, 1891. The present owners of the concession, who are a company under American control, have been in negotiation with the Governor of Trinidad for a further renewal, and the matter is now under the consideration of the Secretary of State. I cannot undertake that the decision will be postponed. The Pitch Lake concession is not regarded as a suitable matter for public tender, but the Secretary of State will, of course, be prepared to consider any offer made for it.

GERMAN REPARATION DUTY.

REPUDIATION BY THE IMPERIAL GOVERNMENT.

THE following ordinance concerning suspension of the payments for refunding reparations dues raised by the English Government has been promulgated from Berlin under date November 15, 1923, and signed by President Ebert, Prime Minister Stressemann, Minister of Industries, Koeth, and Finance Minister Luther:—

On the basis of Article 48 of the Constitution of the Empire, I decree the following for the restoration of public security and order within the confines of the Empire:—

Paragraph 1.

All payments, mentioned in the Table of Payments appended to Article IX. of the London Ultimatum of May 5, 1921 (*Reichsgesetzbl*, 1921 S., 761), in respect of the refunding of the reparation dues raised by the English Government on the basis of the German Recovery Act, 1921, are suspended. No claim whatsoever can be admitted against the German Empire on account of the suspension of these payments.

Paragraph 2.

The decision contained in Paragraph 1 does not apply to reparation dues in respect of contracts which were already concluded when this Ordinance came into force, provided that the said contracts are submitted to the Peace Treaty Office (Friedensvertrag-Abrechnungsstelle, G.m.b.H., Charlottenburg, Berlinerstr. 17), accompanied by a sworn copy of the contract, and also by the G.R. receipt issued by the British Government not later than March 31, 1923, within a period of two weeks within the coming into force of the Ordinance.

Paragraph 3.

In so far as the reparation due is admitted, payment will be made at the option of the Empire in cash in the currency obtaining at the time, or in other bonds of the Empire. The Imperial Finance Minister is empowered to issue the necessary orders for the execution of this Ordinance.

OUR BOOKSHELF.

Systematic Organic Chemistry. Cumming, Hopper, and Wheeler. London: Constable and Co.; 25s. net.

Organic chemistry being one of the most highly systematised of the exact sciences, a text-book which approaches the subject from any other aspect than that of strict systematic treatment labours under a definite disadvantage. Nevertheless, there is always the danger of such systematic works losing what we may term the "human element" and degenerating into mere compilations of names, formulæ, physical constants, and methods of preparation. The authors of the present volume have, however, mainly as a result of their industrial experience, succeeded in preserving the general interest and readability of the book without sacrificing systemisation to any extent. A special effort is evident throughout to present as many examples as possible of the preparation of compounds of any one type. Paucity in this respect has in the past been all too frequent. The linking of carbon to carbon, gaseous elements and sulphur to carbon, occupy about 312 pages. Dyes, drugs, electrolytic preparations, decompositions, analysis, group estimations, etc., are all sections presented in a very able manner. We are confident that the volume will receive a cordial welcome from all concerned in the teaching and study of organic chemistry.

Organic Chemistry (Molinari) (Part II., Vol. II.). Translator, Thomas H. Pope, B.Sc., A.C.G.I., F.I.C. London: J. and A. Churchill; 30s. net.

In general and industrial circles few modern works secure the general approbation and high esteem which that of Molinari so deservedly holds. Possibly it is the most practical and informative work we have, never hesitating to pass from the pure scientific to descriptive, manufacturing and plant detail, applications, uses, commercial statistics, and a host of other details not to be found elsewhere. Prominent features in Part II., Vol. II., are the sections on Sugar; Coal Tar Products; Tanning; Celluloid; Dyes; Silk; and Artificial Silk. Chemistry and its relation to all industrial activity is always presented in Molinari with the maximum of helpfulness.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

Business in the hematite pig-iron and steel trades in the district between Workington and Carnforth is now of such a satisfactory character as to leave no doubt that in January next the coal and coking industries will be subjected to a pressure heavier than they have experienced since the slump in 1920. There is a good deal of forward buying being done in the iron market by consumers in other parts of the country, and to their requirements have to be added those of the steelmakers at Workington and Barrow, who expect their mills to be engaged three weeks in four during the first quarter of next year. How the collieries and coking plants are then to respond to the call that will be made upon them is not quite clear. It is true that the ovens are not at present working at their maximum pressure, but they are at all events using up so much of the output of smalls that practically none can be spared for the market. All the round coal is being easily disposed of. A large proportion—about 10,000 tons weekly—is being shipped to Ireland, and the remainder is being sold in the local landsale market. In January, however, this trade will be even brisker, and there will assuredly be a larger demand for industrial fuel, though it is doubtful whether production can be materially increased. It is not generally realised that since the Whitehaven strike there has been a shortage of labour. There is no change in coke prices to local smelters, the figure being 25s. to 27s. 6d. per ton, and none will take place until after the next ascertainment of the price of hematite iron. Bessemer mixed numbers have risen 7s. 6d. per ton in the past few weeks to £5. 17s. 6d. per ton, delivered Glasgow and Sheffield, and coke-makers will in due course benefit from the appreciation of values. There is very little coke being shipped to the Continent. Of the residuals, crude benzol and tar are moving away fairly well, but sulphate of ammonia is on the slow side. East Coast coke supplies this week are 9,900 tons.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Acid Products, Ltd., Bradford. — Registered October 30, mort., securing £960. and any further advances, to Halifax Permanent Benefit Building Society.

Dixon and Cardus, Ltd., Southampton, oil and cake manufacturers, etc.—Registered November 2, deb., to Lloyds Bank, Ltd., securing all moneys due or to become due to the bank.

Organam, Ltd. (late Elstree Chemical Works (1922), Ltd.), London, E.C.—Registered November 3, £2,000. debs. (filed under sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £300.

SATISFACTIONS.

Morris and Griffin, Ltd., London, E.C., chemical manufacturers.—Satisfaction registered November 1, all moneys, etc., registered July 22, 1921.

Reliance Fuel Company, Ltd., London, E.C.—Satisfaction registered November 3, £700., registered September 6, 1921.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Gazeland China Clay Company, Ltd.—S. H. Smith ceased to act as receiver. November 3.

Lead Mines of Wales, Ltd.—Resolved November 5: That the company be voluntarily wound up. E. A. Ashton, Moorgate Station Chambers, Moorfields, London, E.C., liquidator.

Oxide, Ltd., Brentford.—R. Carpenter, Midland Bank Chambers, North Street, Brighton, appointed receiver. October 24.

DISSOLUTION OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Whiteley and Co. (Joe Maurice Whiteley, Bertram Hilton, and Wm. Ellis), 103, Longwood Road, Huddersfield, chemical manufacturers and dealers. November 5. Debts by J. M. Whiteley, who continues. (November 9.)

REPORTS OF COMPANIES.

Lagunas Nitrate Syndicate, Ltd.

The annual meeting was held in London on Tuesday last, Sir Robert Harvey (the chairman) presiding. The Chairman, in moving the adoption of the report and accounts, said: The gross profit of £50,130. 1s. 6d. compares with last year's figure of £48,402. 5s. 5d., and by the deduction of debenture interest, London expenses, income-tax, corporation profits tax, and provision for stoppage expenses, is reduced to £22,496. 3s. 3d., which has been applied to the redemption of debentures.

The quota allocated to this oficina has been slightly increased. The south oficina was reopened in August, 1922. The monthly working returns have been regular, and show an improvement on previous results. A considerable quantity of potassium nitrate has been produced, all of which has been sold at a good premium. The market for this commodity appears, I am glad to say, to be expanding, and we look forward to making further sales at remunerative prices.

In our opinion, propaganda work should be extended not only in new countries, but in the old ones, particularly in the United States, which offers a practically unlimited area for operations. This, of course, will involve a larger expenditure. To-day the producers are actually contributing nearly £200,000. per annum, while the Chilean Government grants only a yearly subsidy of £40,000. In view of the large revenue derived by the Government from the direct duty of over 5s. on each metric quintal of nitrate shipped, the indirect duties on imported articles required by the oficinas, and the importance to the country generally of this industry, it would seem as if the aforesaid grant should be very materially increased.

The present combination comes to an end on June 30 of next year, and negotiations for its renewal will shortly commence. Certain modifications in the statutes may probably be advocated, and the English companies must be given ample time to consider any proposed alterations.

India Rubber, Gutta Percha, and Telegraph Works Company, Ltd.

The net profit for the year ended August 31 amounted to £96,344. This result follows net losses of £94,406. and £445,461. respectively for the two preceding years. The preference dividend required £12,500., a sum of £39,278. is added to reserve (last year a sum of £75,000. was transferred from reserve), and, including £3,592. brought forward, there is left a disposable balance of £48,158. The directors propose to pay a dividend of 5 per cent., free of tax, on the ordinary shares (against nil), and £10,658. is carried forward. The accounts include an E.P.D. refund (the amount is not given), but apart from this they show that the gradual improvement of the position has been maintained. The directors state that the allocation to reserve, raising it to £180,000., has been made after carefully considering the position of the assets in France arising from the abnormal exchange rates.

British Cotton and Wool Dyers' Association, Ltd.

The directors report that the profits for the half-year to September 30 last, including income from investments, etc., after charging administration expenses, £4,456. for specific depreciation, and £32,736. for repairs and renewals, and providing an estimated amount in respect of income-tax, corporation profits tax, and other contingencies, amounted to £75,929. From this have to be deducted audit fee and other professional charges £691., interest on first mortgage debenture stock £12,400., debenture-holders' trustees £100., and amount transferred to depreciation fund (which now stands at £202,500.) £12,500., leaving the profit for the period at £50,238. The amount brought forward at March 31 last (after deducting £5,250. voted at shareholders' meeting) was £37,132., which makes a credit balance on profit and loss account of £87,370.

Esperanza Nitrate Company, Ltd.

The report for the year ended June 30 states that the oficina, which was closed in June, 1921, was not reopened until April, 1923. The trading profit for the year was therefore derived from the realisation of nitrate stocks brought over from the previous year, from sale of a portion of the quotas allocated to the company, by the association, and from the sale of iodine. There was a net profit for the year of £2,807., which has been applied in reducing the construction account to £64,551. There is still a debit in the balance-sheet on profit and loss account of £89,551.

Pan de Azucar Nitrate Company, Ltd.

The report for the year to June 30 states that the balance brought forward was £44,393. After charging the whole of the expenses incurred during the stoppage and cost of reopening the oficina, there was a loss for the year of £1,423., leaving an available balance of £42,970. The directors propose to pay a dividend of 15 per cent., and to carry forward £30,491. The manufacture of nitrate at Pan de Azucar was not resumed until June 1 last, and the trading profit shown above was derived from the realisation of remaining nitrate stocks, from the sale of a portion of quotas allocated to the company, and from the sale of iodine.

Pena Copper Mines Company, Ltd.

Report for 1922 states: Losses on sales of produce, less interest, registration fees, and sundry other credits, after charging £7,707. for depreciation, amounted to £5,074., plus London expenses, income tax, and French dues and charges, £8,813., and interest on loans, £3,546., making loss for year of £17,433., which, deducted from balance brought in, £37,906., leaves to be carried forward £20,473

DIVIDENDS.

Cassel Cyanide Company, Ltd.—Final dividend of 6d. per share, making 9d. per share, less tax, for the year. This is the same as for the previous year.

Natal Ammonium Company, Ltd.—Accounts for two years to September 30, 1922, show loss for period, after charging interest, etc., of £51,886., increasing debit balance brought forward to £70,787.

Ilford, Ltd. — Dividend of 8 per cent. on the ordinary share capital for the year ended October 31. This is the fifth year in succession for which the ordinary shareholders have received 8 per cent.

Chloride and Electrical Storage Company, Ltd.—Interim dividend of 5 per cent. actual, less tax, on ordinary.

Eastman Kodak Company of New Jersey.—Regular dividend of 1.25 dollars per share and also an extra dividend of 1.25 dollars per share on the common stock, payable on January 2.

Birmingham Aluminium Company, Ltd.—Net profits for the year ended July 31 were £10,945., and £23,757. was brought forward. A dividend of 6 per cent., free of income-tax, is proposed on the ordinary shares, carrying forward £22,723.

Dominion Glass Company, Ltd.—Quarterly dividend of 1¾ per cent. on common stock, payable January 2 Last year, dividend same.

NEW COMPANIES.

African Pioneer Agency, Ltd. — Private company. November 7. Capital £10,000. To search for oil, mines, minerals, etc. Solicitors: Arthur Benjamin and Cohen, 23, College Hill, London, E.C.

C. Smethurst, Ltd.—Private company. Capital £8,000. Bleachers, dyers, and sizers. Office: Heady Hill Dye Works, off Bury New Road, Heywood.

Featherstone Hammond Partners, Ltd.—Private company. Capital £12,600., in 12,000 £1 preference and 12,000 1s. ordinary. Technical, consulting, and expert advisers, chemists, analysts, etc. Office: 28, Victoria Street, Westminster, S.W.

Gas Generators and Industrial Furnaces, Ltd. — Private company. Capital £5,000. Solicitors: Braund and Hill, 6, Grays Inn Square, W.C.

Harpic Manufacturing Company, Ltd.—Private company. Capital £10,000., 2s. shares. Manufacturing chemists, druggists, etc. Solicitors: Soames, Edwards and Jones, Norfolk Street, London, W.C

Key Products, Ltd.—Private company. Capital £100. Chemical manufacturers, etc. Address: The Haven, Wivenhoe, Essex.

T. Saville Whittle (Export), Ltd.—Private company. Capital £10,000., in £10. shares. Exporters of chemicals, drugs, etc. Office: 19, Lloyd Street, Albert Square, Manchester.

Thames Bank Chemical Works, Ltd. — Private company. Capital £100. Chemical manufacturers. Office: 92, Ealing Road, Wembley.

Vidrox, Ltd.—Private company. Capital £6,000., in 1s. shares. To acquire a secret process or processes for glazing tiles, bricks, etc. Solicitor: C. E. Brown, 4, Flowergate, Whitby.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN OCTOBER

(Concluded from page 586.)

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of Oct., 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the Returns.

TIN EXPORTS FROM MALAYA.—It is officially reported from Kuala Lumpur that 3,447 tons of tin were exported from the Federated Malay States during October, as compared with 3,026 tons in September and 2,837 tons in the corresponding month of last year. The total export for the ten months of the current year is 30,989 tons as against 29,277 tons last year and 28,211 tons in 1921.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN OCTOBER.

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during the month of October, 1923, compared with 1921 and 1922. As from April 1, 1923, the export trade of the Irish Free State is excluded from the returns.

LEGAL INTELLIGENCE.

THE TRANSPORT OF ZINC ASHES.

A. H. Brandt and Co. and F. W. Vogel and Co. *v.* L. B. and R. P. Shipping Company, Ltd.

The Court of Appeal, composed of Lords Justices Bankes, Scrutton, and Atkin, on November 19 concluded the hearing of the case of Brandt and others *v* Liverpool, Brazil and River Plate Steam Navigation Co., Ltd., upon the defendants' appeal from the judgment of Mr. Justice Greer (*C.T.J. and C.E.*, May 4, 1923, page 550), holding that A. H. Brandt and Co., merchants, of London, one of the two alternative plaintiffs, were entitled to recover damages from the defendants for delay in the carriage of a consignment of zinc ashes from Buenos Ayres to Liverpool.

Messrs. Brandt and Co. brought the action to recover damages for alleged breach of contract contained in a bill of lading dated March 23, 1920, and for the return of £748. paid under protest, and, in the alternative, by Messrs. F. W. Vogel and Co., the shippers of the goods, under the bill of lading for the same relief against the defendants, the owners of the s.s. Bernini. The plaintiffs alleged that the defendants, having received from the shippers on board the Bernini at Buenos Ayres in March, 1920, 6,000 bags of zinc ashes, wrongfully discharged 5,620 of the bags at that port, and only forwarded the same after unreasonable delay in s.s. Cavour, which left Buenos Ayres on July 15, 1920, and that the plaintiffs, in order to get delivery, were compelled to pay £748., the amount of the alleged expense for reconditioning the goods at Buenos Ayres between the time of the discharge and the time of their reshipment on the Cavour, in respect of which the defendants claimed a lien.

The case for the defendants was that they were justified in discharging 5,620 bags at Buenos Ayres, because they had become wet by rail before they received them; that the goods heated in the hold, and that it was for their own preservation and for the protection of the other cargo in the same hold that they should be discharged and reconditioned; that they were guilty of no unreasonable delay in dealing with the goods; and that they were therefore not liable for the consequences of any delay in the carriage of the goods to Liverpool. Defendants also counterclaimed for £167, the difference between £915., which they alleged to be the actual cost of reconditioning modified by the rate of exchange at the time they sent forward the claim and the £748. which had been paid to them in discharge of their lien.

Mr. Justice Greer gave judgment for the plaintiffs, A. H. Brandt and Co., for the return of the money they had paid under protest, £748., and damages for failing to carry the goods on board the Bernini and deliver them in due course on the arrival of the vessel in Liverpool, such damages to be assessed. His lordship also gave judgment for the same plaintiffs on the counterclaim, and dismissed the claim of Vogel and Co. with costs. From this result the defendants now appealed.

The main question in the case was whether Brandt and Co. were entitled to sue the shipowners, and at the conclusion of the arguments their lordships decided this and other points in favour of Brandt and Co., and dismissed the appeal with costs.

SOUTH WALES NOTES.

(Specially Contributed.)

There has been further improvement in the tinplate trade, and orders from abroad are coming in steadily. The returns for October show a large increase in exports, over 16,000 tons more than for October, 1922, the main increase being accounted for by Japan, who last year bought only 249 tons, compared with 5,203 tons this year. It is confidently anticipated that there will be no serious trouble with the engine-drivers and stokers in connection with the notice to cease employment. The spelter trade is buoyant, the galvanised-sheet trade being very good, Japan again being the foremost market. A well-known spelter works near Swansea, it is currently reported, is again to come into operation. Several well-known commercial men are arranging to take over the factory and to instal new machinery. The patent-fuel trade is in a better condition. During the last few days an appreciable quantity of pitch has been purchased much below the published market quotations. Cokes continue to be in good call, and the ovens are increasing output. By-products, taken collectively, are now a strong market, and there is every appearance of still further progress being made. At the moment, however, there is little demand for sulphate of ammonia. Tar is in less call, but business is fairly good for the refined qualities.

Among the imports for the week were 27 tons zinc ashes and 10 tons superphosphates from New York, 4½cwt. olive oil from Bilbao, to Cardiff; 3cwt. nitrate of ammonia from Rouen, 1,865cwt. nickel oxide from Montreal, 20 tons calcium carbide from Antwerp, 200cwt. potassium sulphate and 295cwt. barytes from Hamburg, to Swansea. Exports included the following: 480 tons sulphate of ammonia to St. Hellan and 26 tons soda ash to Buenos Ayres, from Cardiff; 15cwt. white lead to Calcutta, 10 tons white zinc to Bombay, 10 tons white lead, four tons china clay, 90cwt. painters' colours to Buenos Ayres, from Newport.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

United Kingdom.

The Director-General, India Store Department, Branch No. 14, Belvedere Road, Lambeth, S.E. 1, requires supplies of copper sulphate. Tenders by November 30. Tender forms obtainable from above.

Tenders are invited for supply of 30,000 gallons of refined tar for road dressing, for the Epsom Rural District Council. The tar to be supplied at Gas Company's works, or in barrels at Tadworth, Ewell, and Cobham Stations. Tenders, on contractor's own forms, to be addressed to the Chairman of the Council before November 29.

Brazil.

A Rio de Janeiro firm is desirous of obtaining the representation of British firms for tinplate and industrial chemicals, etc. (Ref. No. 556.)

Spain.

A commission agent of Barcelona is desirous of securing the representation of a British manufacturer of drugs, pharmaceutical and industrial chemicals. (Ref. No. 546.)

Switzerland.

A Swiss firm at Geneva desires to secure the representation of British manufacturers of pharmaceutical products or proprietary medicines. Correspondence in French. (Ref. No. 547.)

Czecho-Slovakia.

An agent at Prague desires to secure the representation of British merchants dealing in aluminium, ferrosilicon, tin, zinc, phosphate, nickel, and various alloys. (Ref. No. 533.)

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," November 24, 1888.)

The Chemical Trade.—The makers of bleaching powder met in Liverpool on the 1st inst., and decided to prolong their Association's existence. The importance of the announcement is not at first apparent; but it may be said that that Association practically includes the whole of the makers of bleaching powder in the United Kingdom, and it is through its operations that the position of the chemical trade has been so greatly changed. The newer process of manufacture of soda threatened the existence of that older process with which the Tyne has such an honourable record; but the older process had a by-product not included in those of the newer. That by-product gives us the bleaching powder of which the Association regulates the price, and which has given greater financial aid to the makers of alkali. It seems to be the belief of chemical makers now that alkali is more able to take care of itself, and that next year it will command much higher prices. Still, in the meeting at Liverpool they decided to continue the Association, which they believe has done them such good service. But they continue it from month to month to merge it in one which will regulate the decomposition of salt, and thus affect the various products that flow thereout.

THE PATENT LIST.

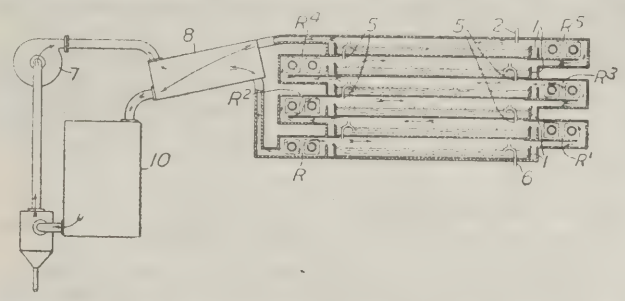
ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Acetic-acid Distillation. British Cellulose and Chemical Manufacturing Company, Ltd., London; and W. Bader, Spondon, near Derby. British Patent **204,196,** of 1922.

Volatile constituents of a liquid mixture are separated by heating the liquid to a temperature below its boiling-point while it is covered with a thin layer of a liquid, such as oil, which floats upon and is immiscible with the liquid, and preferably has a higher boiling-point, and continuously removing the vapours by a gas or air current passed over the surface. The composition of the vapours is determined mainly by the solubility of the constituents in the oil. The gas or air may be used as heating-agent for the liquid, and it may be cooled, compressed or liquefied to separate the vapours. As applied to the distillation of dilute acetic acid, the liquid is passed in succession through trays 1 from an



inlet pipe 2, through overflow pipes 5, to an outlet pipe 6, and the surface of the liquid in each tray is covered with a thin layer of a high-boiling petroleum distillate, for example, spindle oil. Air from a blower 7 is passed through a heat exchanger 8, and over a radiator R which brings its temperature to about 100° C. and then in succession through the horizontal spaces between the trays, radiators R^1 . . R^5 being used to maintain its temperature at about 100° C. The vapour-laden air passes through the heat-exchanger 8 to a condenser 10 and is returned to the blower 7. In treating acetic acid of 30 per cent. strength a distillate of 60 per cent. strength is obtained. A second treatment will yield acid of 80 per cent. strength and a third treatment, acid of 92.95 per cent. strength.

Dyeing Cellulose Acetate. J. Y. Johnson, London. (Badische Anilin and Soda Fabrik, Ludwigshafen-on-Rhine, Germany.) British Patent **204,280,** of 1923.

Cellulose esters, particularly cellulose acetate silk, are dyed with the bisulphite compounds of insoluble or difficultly-soluble azo dyes. In an example, cellulose acetate is dyed golden-orange from a bath containing the bisulphite compound of benzene-azo-β-naphthol and acetic acid.

Sulphuretted Dyes. R. B. Ransford, London. (L. Cassella and Co., Ges., Frankfort, Germany.) British Patent **204,108,** of 1922.

New sulphur-containing products are prepared by condensing a *p*-arylquinone of the benzene or naphthalene series, or a halogen derivative thereof, with an *o*-aminoarylmercaptan or an equivalent thereof such as an *o*-aminoarylthiosulphonic acid, an *o*:*o*-dinitrodiaryldisulphide, an *o*:*o*-diaminodiaryldisulphide, or the product of the action of disulphur dichloride on an aromatic amine or the transformation product of such a substance described in Specifications 17417/14 and 18292/14; alternatively a corresponding *p*-hydroquinone may be oxidised together with an *o*-aminoarylmercaptan. By treatment with sulphurising agents these compounds yield dyestuffs which dye particularly vegetable fibres from the vat or sulphide bath in shades fast to washing, chlorine, and light. Examples are given.

Dyeing Cellulose Acetate. R. Clavel, Basle, Switzerland. British Patent **204,179,** of 1922.

In the production of azo dyes upon cellulose acetate silk, films, etc., the development is effected at temperatures of from 75° C. to boiling-point; the application of the bases may be effected at the same high temperatures or not; the bases and developers may be applied in separate baths or in a combined bath; the diazotisation is effected in a separate bath at ordinary or low temperatures.

Washing-compositions. A. G. Bloxam, London. (Akt.-Ges. für Anilin-Fabrikation, Treptow, near Berlin.) British Patent **204,077**, of 1922.

A solid washing agent comprises a mixture of a bisulphite compound of an aldehyde or ketone, acting as a fibre protector, and soap or one or more alkaline compounds such as alkali carbonate, borate or silicate or the soap and alkaline compounds may be used together. *Reference has been directed by the Comptroller to Specification* 12283/11.

New Vat Dyestuffs. J. Y. Johnson, London. (Badische Anilin and Soda Fabrik, Ludwigshafen-on-Rhine, Germany.) British Patent **204,241**, of 1922.

New vat-dyestuffs dyeing or printing in grey to blue-black shades are prepared by the action of hydroxylamine on a dibenzanthrone compound; a solution of hydroxylamine as obtained by the electrolytic reduction of nitric acid may be used. The products are possibly aminodibenzanthrones and their sulphuric acid solutions take up nitrous acid in quantity corresponding with a monoamino compound; the dyestuff isolated from this solution dyes cotton in more bluish shades. In examples a solution of dibenzanthrone in sulphuric acid is acted upon with hydroxylamine sulphate or hydrochloride in the presence of copper sulphate, or with hydroxylamine sulphate alone. Specification 16538/04 is referred to.

Purifying Hydrocarbons. A. E. Dunstan, Sunbury-on-Thames. British Patent **204,078**, of 1922.

Liquid hydrocarbons containing unsaturated bodies are purified by treatment in the liquid state with chlorine water or a solution in water of hypochlorous acid, and the product is treated with alkali to convert the chlorinated bodies into ethers and so produce a liquid suitable for use as a motor fuel. The chlorinated bodies may be isolated by steam distillation, treated with alkali, and the ethers produced added to the hydrocarbon liquid. Highly-cracked gasoline may be subjected to a preliminary treatment to polymerise the more active unsaturated hydrocarbons—*e.g.*, it may be filtered through bauxite or other mineral adsorbent, or treated with mineral acid or with anhydrous chloride of aluminium or zinc. In an example, a gasoline containing 0.3 per cent. of sulphur is agitated with a solution of hypochlorous acid containing 35.5 grammes of chlorine per litre until absorption ceases. The product is boiled gently with dry shaked lime, until the chlorine is substantially eliminated, and is then distilled.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Boron Carbides. Hartstoff-Metall Akt.-Ges., Berlin. (Assignees of E. Podszus, Berlin.) British Patent **204,337**. Convention date, September 20, 1922.

Boron carbides having a greater proportion of carbon that has B_6C, such as B_3C are obtained by fusing a mixture of boron, boron carbide (B_6C) or boron nitride with the requisite quantity of carbon. The product is rapidly cooled to prevent decomposition with the separation of graphite. The process may be effected under pressure, which facilitates the solution of the carbon. To increase the strength of the product small quantities of metals having a high melting-point such as tungsten or titanium or the carbides of these metals may be added.

China.—Department of Overseas Trade Report on the Industrial and Economic Situation (to June, 1923), by Mr. H. J. Brett, Commercial Secretary to H.M. Legation, Shanghai; together with a report on Chinese Turkestan, by Mr. C. P. Skrine, H.M. Consul, Kashgar. London: 1923: H.M. Stationery Office; price 1s. 6d. net.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals. — The tone of the spot market is hardening as a result of the German default in payment of the reparation levy of 26%, to which we refer on another page. The future trend of prices is likely to be towards higher values. **Acetic Acid,** 80% technical, £46. to £47.; 80% pure, £47. 10s. to £48.; 98% glacial, £60. in casks and £72. per ton in glass demijohns, ex wharf London; dealers' prices are fully maintained at these figures, and the market is very steady; business has again been limited. **Acetone,** British Government specification, about £124. per ton, in drums; the spot position is very steady, although business has been poor. **Alum,** lump, £10. to £10. 10s. per ton, in casks; importers are offering at about these figures, with the demand still small. **Arsenic,** Cornish white powdered, £63. to £64. for Cornwall, about £68. f.o.b.; business is much quieter, but the market stands quite firm, and no reaction is looked for. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; dealers continue to quote at this price, with the demand small. **Bleaching Powder,** 35—37%, £10. to £10. 10s. per ton; prices on spot are perhaps a shade firmer this week, with business slow. **Barium Chloride,** 98—100%, £14. 15s. to £15. per ton; the spot position is firming up, and may advance to the higher figure quoted here. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P. crystals, about 1s. 5d. per lb., less 5%; the improved state of this market reported last week has not been sustained; the position is again dull and unsteady. **Cream of Tartar,** 99—100%, about 85s. per cwt.; business remains slow, but prices are being steadily maintained. **Epsom Salts,** commercial quality, about £4. 10s. to £4. 15s. per ton, in bags; business remains slow, with prices unchanged. **Formaldehyde,** 40% volume, about £65. per ton; prices quoted are dearer here, and the position generally is firmer. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton; prices quoted are about the same, but business remains slow and small. **Lead Acetate,** brown, about £43.; white, about £43. 10s. per ton; spot supplies are small, and Continental offerings are limited and dearer. **Litharge,** imported, about £36. per ton; dealers' prices are rather firmer, with business somewhat better. **Lithopone,**

30% Continental red seal, £23. to £24. per ton; dealers prices are advancing in consequence of firmer conditions on the Continent. **Ammonium Chloride,** grey galvanising, £31. per ton; this higher rate is about the lowest price now quoted, and the tendency is towards still higher spot rates. **Nickel Sulphate,** home trade, single and double salts, £38. per ton; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these rates. **Oxalic Acid,** 5¾d. to 6d. per lb.; the market has again been almost inactive, and prices are none too steady. **Carbonate of Potash,** 90—92%, about £25. 10s. to £26.; 96—98%, about £28. per ton; as a result of the unsettled state of Germany, prices on spot are much firmer, and tend to go still higher. **Chlorate of Potash,** crystals and granular, 2¾d. to 3d. per lb.; dealers are meeting with little inquiry for this article; prices are unchanged. **Caustic Potash,** 88—92%, £31. to £32. per ton; the spot position is certainly firmer, and the market is likely to advance still further in the near future. **Permanganate of Potash,** commercial quality, about 9d. per lb.; business has been slow here, with quoted prices about level on the week. **Prussiate of Potash,** yellow, about 10½d. per lb.; dealers offering British material continue to quote at about this rate, but business does not seem to have been anything great of late. **Sulphate of Potash,** 90%, £11. per ton; there is no change in this article to record. **Mercury,** about £10. per bottle of 75—76lb.; the spot position seems quite steady, and business has been better of late. **Red Lead,** imported, about £36. 10s. per ton; dealers' prices are dearer, with the market quite steady. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; spot supplies are now rather limited, and supplies from the Continent are doubtful; dealers' prices for actual stocks here are dearer, and stand very firm; higher prices are expected. **Saltcake,** home trade, about £4. 10s. per ton; this item is very steady, and most supplies have been taken up. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; dealers continue to quote at these old prices, with not much business coming their way. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; and 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary according to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags free; British makers' price to home trade only, carriage paid quoted; dealers are offering at competitive rates. **Bichromate of Soda,** home trade, 4½d. per lb.; British makers' continue to quote at this figure, carriage paid; dealers' prices are about the same. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers' price for home trade is slightly dearer. **Soda ash,** 58% light alkali, £7. 10s. per ton, in bags; British makers quote at this price for home trade only, packages free, carriage paid in Great Britain; their prices for export vary as to destination. **Hyposulphite of Soda,** pea crystals, about £15. to £15. 10s. per ton; commercial quality, fully £10. to £10. 10s. per ton; owing to the position on the Continent, dealers offering imported material are asking higher rates, but prices mentioned are at present very irregular. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b.; prices are about the same on a steady market. **Nitrite of Soda,** 100%, about £26. 10s. per ton; there is no further change in price to record here; market steady. **Prussiate of Soda,** about 5½d. per lb. as quoted by dealers offering British material; this market remains dull, and is rather weak. **Sodium Sulphide,** 60—62% solid, about £14.; ditto, broken, about £15., in drums; the spot position remains dull, but prices may harden a little, owing to the position on the Continent. **Tin Crystals,** about 1s. 3½d. per lb.; there is no change to record here. **Tartaric Acid,** B.P. crystals, 1s. 1½d. per lb., less 5%; the spot position remains dull and rather weak, with the price quoted more or less nominal. **White Lead,** imported, about £43. to £44. per ton; higher prices are being mentioned by dealers, with little doing. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' continue to quote at these unchanged rates.

Pharmaceutical Chemicals.—The spot market in fine chemicals stands very firm indeed, and business has again been active. Reports from the Continent, especially Germany and France, point to an acute shortage by the end of the year. Spot holders are now very firm in their quotations. **Acetanilid,** crystals and powder, 2s. 6d. to 2s. 9d. per lb.; the spot position is again firmer, with supplies limited; business for home and export account has again been active. **Acetyl-Salicylic Acid,** B.P., 3s. 9d. per lb.; the spot price is fully maintained at this level; business has been very active, and spot supplies are now small. **Benzoic Acid,** N.P., 3s. 6d. to 3s. 9d. per lb.; this price is quoted by dealers, but there is some difficulty being experienced in obtaining import licences, although the material is badly wanted here. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; dealers continue to quote at this figure, but there is not much doing. **Salicylic Acid,** B.P., 2s. 4d. to 2s. 6d. per lb.; this item is firmly held at these rates, and business has again been good. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; this article is tending to firm up to the higher figure quoted. **Amidopyrin,** about 15s. per lb.; business is still small, but prices as quoted are steady. **Ammonium Bromide,** B.P., 8d. to 8¼d. per lb.; on spot little material is being offered below these figures, and the tendency is certainly towards still higher rates. **Benzonaphthol,** about 5s. per lb.; there is very little interest shown in this article; dealers' quotations are unchanged. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; dealers continue to quote at this higher figure, but business has been slow. **Benzaldehyde 03,** about 3s. per lb.; the spot position is steady, but rather quiet. **Calcium Lactate,** 2s. to 2s. 3d. per lb.; this market is firming up, and the higher price is likely to obtain by the end of this week. **Chloral Hydrate,** duty paid, about 4s. 3d. per lb.; the spot position is fully maintained, and tends to advance again. **Creosote,** B.P., about 2s. 6d. per lb.; this spot price is fully maintained, and any movement will be to higher rates. **Creosote Carbonate,** about 8s. 6d. per lb., nominal; no interest is shown in this article. **Guaiacol Carbonate,** about 13s. per lb.; the spot position is very firm, and some opinions favour still higher prices to come. **Hexamine,** about 4s. 3d. to 4s. 6d. per lb.; the tendency here is for the spot price to firm up to the higher price quoted; supplies are short, and little is offering from the Continent. **Hydroquinone,** 4s. 3d per lb.; most of the offers at 4s. per lb. have been taken up, and the higher price mentioned now governs the market. **Methyl Salicylate,** 2s. 10d. to 3s. per lb.; prices on spot are firm at these levels, and an advance is not unlikely. **Methyl Sulphonal,** about 25s. per lb.; the spot position now seems to have reached this unusually high rate, and very little is offering cheaper. **Paraformaldehyde,** 3s. 9d. per lb.; dealers quote firm at this rate, and a fair volume of business has been done. **Paraldehyde,** 1s. 7d. to 1s. 8d. per lb.; the tendency here is for the spot position to move up to the higher price quoted. **Phenacetin,** 7s. 6d. per lb.; it is difficult to locate supplies on spot offering below this figure; higher prices are expected. **Phenazone,** about 8s. 6d. per lb.; some spot holders are now looking for 8s. 9d. per lb., and this price will probably obtain at the end of this week. **Phenolphthalein,** 8s. 3d. to 8s. 6d. per lb.; still further advances are recorded here, and there is very little offering on spot. **Potassium Bromide,** B.P., crystals and granular, about 7½d. per lb.; at this level the spot position is now very firm, and some good business has been transacted; it is considered likely that higher prices will obtain before long on spot. **Potassium Permanganate,** B.P., about 9½d. per lb.; dealers' quoted prices are firm at this level, but there has not been much doing. **Potassium Sulphoguaiacolate,** about 7s. per lb.; the market remains dull, with quoted rates unchanged. **Resorcin,** about 6s. per lb.; spot holders continue to offer at this price, and are doing a fair business. **Salol,** about 4s. 3d. per lb.; dealers holding spot supplies are not willing to sell much below this higher figure. **Sodium Benzoate,** about 2s. 9d. per lb.; dealers are offering at this price; not much inquiry at present. **Sodium Bromide,** B.P., crystals and granular, fully 8d. per lb.; this item is now firm on spot, and there is every evidence of still further advances in spot prices; business has again been brisk. **Sodium Diethylbarbiturate,** about 18s. per lb.; the spot price is the same as last week, with the market dull. **Sodium Salicylate,** B.P., crystals 3s., powder 2s. 10d., per lb.; dealers holding spot stocks are very firm at these rates, and have been doing a good volume of business; supplies are now very limited, and higher prices are expected. **Sulphonal,** about 20s. per lb.; the spot price is now steady at this rate, and some fair business has been done. **Terpin Hydrate,** about 1s. 9d. per lb.; dealers continue to quote at this rate, with the market dull. **Thymol,** 15s. 6d. to 16s. per lb.; dealers quoting at these figures for spot supplies.

Coal-tar Products, Intermediates, Etc.—With the exception of pitch, which is again easier on a dull market, the

products in this section show no change on the week. Business throughout has been quiet and small in volume. Many items as quoted are not at all steady. **Aniline Oil,** 9d. to 9½d. per lb.; at these rates the position is fairly steady, but business is lacking. **Aniline Salt** 9½d. to 10d. per lb.; prices quoted are level on the week, with the market quiet. **Beta-naphthol,** 1s. 1d. to 1s. 2d. per lb.; although this market is dull, prices may harden a little. **Benzol,** about 1s. 3½d. to 1s. 4d. per gallon, f.o.r. makers' works, in buyers' packages; makers continue to quote at about these prices, but business is slow, and prices rather easy. **Toluol,** 1s. 8d. to 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; this market has again been dull; quoted rates are unchanged. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon, drums extra; dealers prices are level on the week, with the market dull. **Naphtha,** about 1s. 2d. per gallon; at this quoted rate the market is rather weak, with business slow and small. **Solvent Naphtha,** 90/160, about 1s. 2d. per gallon, drums extra; a further reduction in price is notified, with the market still quiet. **Heavy Solvent Naphtha,** 90/190, 1s. 2d. per gallon, drums extra; dealers have made a further cut in their quoted prices, but so far business remains poor. **Burning Oils,** crude, No. 3, 8½d.; No. 2, 8d. per gallon, barrels free; dealers' prices are maintained at these old levels. **Special Oil,** for Diesels and motors, 10d. per gallon, barrels free; the market is steady at this unchanged rate. **Creosote Oil,** about 9½d. per gallon, f.o.b.; dealers are offering at this rate, with the market steady, but not very active. **Carbolic Acid,** crystals, about 1s. 1½d. per lb.; dealers' prices are close up to this level; business continues to drag. **Naphthalene,** about £19. per ton; this market may recover its recent decline in value before long; crude, £5. to £11.; crystals, £23.; powder, £17.; balls, £24.; tablets and candles, £28. per ton, packages free. **Disinfectants,** 3s. 9d. per gallon, barrels free; the market is unchanged. **Pyridine,** 22s. per gallon; the spot price is well maintained at this level, and tends to advance slightly. **Hexamethylene,** 3s. 9d. to 4s. per gallon; this article is dearer on spot, with the market moving up to the higher rate quoted. **Pure Methyl Alcohol,** about £90. per ton, in drums, ex wharf London; dealers' prices are steady on a quiet market. **Pitch,** about 130s. per ton, f.o.b. East Coast; this market has remained dull, and prices are much easier on the week; the demand has been disappointing.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £61. to £61. 2s. 6d., cash; £61. 12s. 6d. to £61. 15s., three months; electrolytic, £66. 10s. to £67. **Tin:** Standard, £223. 7s. 6d. to £223. 10s., cash; £224. to £224. 2s. 6d.; three months; Straits, £223. 17s. 6d.; English, £224. 2s. 6d. **Lead,** soft foreign, £30. 5s., prompt; English, £32.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt, £32. 7s. 6d.; hard, £27. 5s. **Antimony,** English regulus, 99%, £35. 5s. to £35. 10s.; special brands, £42. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 15s. to £9. 17s. 6d. **Bismuth,** 10s. **Platinum,** £29. per oz.; scrap, £27. **Wolfram,** spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** prices as a whole are unchanged, with a firm tendency: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

Business generally continues on the dull side both on home and export account, with few alterations in value to record. For alkali products prices are steady at recent rates, and makers fairly well engaged with orders. So far, nothing has been done regarding next year's contracts. **Bleaching Powder,** softwoods, dull at £11. 5s. on rails. **Glauber's Salt,** easy at 70s., carriage paid. Roasted **Saltcake,** slow of sale at £4. 10s. per ton. Recovered **Sulphur,** firm at £5. 5s. on rails, in bulk. **Chlorates** have a higher tendency; **Potash** at 3d., and **Soda** 2¾d., per lb. **Bichromates** unaltered. Demand for **Copper Sulphate** continues slack, and price nominal at £25., f.o.b. **Phosphate** and **Hyposulphite of Soda** are dull; **Nitrite** is firm at £26. 10s., ex store. White powdered **Arsenic** continues in short supply, and Cornish make quoted at £70., delivered. Yellow **Prussiate of Potash,** steady at 10½d., delivered; **Soda,** 5¾d. per lb. **Carbonate** and **Caustic Potash** have an upward tendency. **Acetic Acid** and **Acetate of Soda** are moving off fairly well. Brown **Acetate of Lime** scarce, and price advanced to £14. 10s. per ton; grey, firm at £22. per ton. **Acetone,** £124. Miscible **Wood Naphtha,** 6s. per gallon. **Lead Salts** are higher on account of the scarcity of foreign supplies: White **Acetate** at £44.; brown, £45.; and **Lead Nitrate,** £44. per ton. Green **Copperas** is in steady request. **Oxalic Acid,** dull at 5¾d. per lb. **Permanganate of Potash,** 8½d., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Tinplate prices are very firm, and based on £1. 3s. 1½d. per standard box, f.o.b. **Galvanised Sheets** in good demand, with an upward tendency at £19. 2s. 6d. per ton, f.o.b. **Copper** firmer, with prompt at £61. 2s. 6d. per ton, and three months £61. 12s. 6d. **Tin** firm, with moderate buying at £219. 12s. 6d. per ton cash, and £220. 2s. 6d. three months. **Lead** rather easier; prompt, £30. 2s. 6d. per ton; forward, £28. 12s. 6d.; English, £32. **Spelter** shows good inquiry; prompt, £32. 7s. 6d. per ton; forward, £32. 11s. 3d. **Zinc Sheets** in fair demand at £39. 12s. 6d. per ton, on rail makers' works. **Sulphate of Copper,** dull at £25. 12s. 6d. per ton, less 5%, in casks, f.o.b. **Sulphate of Ammonia,** very steady at £14. 15s. per ton for home requirements; some export business passing at £14. 2s. 6d. per ton, f.o.b. **Nitrate of Soda** quiet, with prompt at £13. 7s. 6d. per ton, f.o.b. **Bone Meal** rather neglected at £9. 2s. 6d. per ton, f.o.b. **Pitch** easier, with some buying at £6. 3s. 6d. per ton, delivered docks. **Creosote** very steady, and in good demand at 8¾d. per gallon. **Benzol** in strong demand, and dearer at 1s. 4½d. per gallon, and crude at 9¾d. **Arsenic** in better inquiry, with dearer quotations; white powdered at £64. 12s. 6d. per ton, f.o.b. **Oxalic Acid** slow at 6½d. per lb. on rail. **Copperas** in fair demand at £2. 3s. 6d. per ton, including delivery London or equal. **Sulphuric Acid** meets with steady demand at unchanged quotations. **Seed Oils** firmly held, with raw **Linseed** at £2. 6s. 3d. per cwt., and boiled £2. 8s. 3d. **Cottonseed Oil,** common edible £2. 3s. 3d., and deodorised £2. 6s. 3d., per cwt. **Rape Oil** steady; refined, prompt, £2. 6s. 3d. per cwt. **Cod Oil** quiet; Newfoundland, prompt £2. 5s 1½d., and English £1. 14s. 3d. per cwt., at docks. **Coconut Oil** firm, with Ceylon at £2. 6s. 8d. per cwt. **Castor Oil,** very firm at £2. 13s. 9d. per cwt., net, in barrels. **Palm Oil** quietly steady; Lagos £37. 17s. 6d. prompt, and £37. 12s. 6d. forward; softs £37. 10s. prompt, £37. 7s. 6d three months; mediums £37. 11s. 6d., and hards £37. 17s. 6d., prompt, per ton. **Turpentine** easier; American, prompt, £3. 13s. 10d. per cwt. **Olive Oil** steady, with small offers at £67. 17s. 6d. per ton, ex ship. **Coal** somewhat irregular, with good outlook: Best Admiralty smokeless, £1. 7s. 6d. to £1. 8s. 6d.; seconds, £1. 6s. to £1. 7s.; ordinaries, £1. 5s. 6d. to £1. 6s.; Monmouthshire black vein, £1. 4s. 6d.; all per ton, f.o.b. **Anthracite** active, best large £2. 6s., seconds £1. 15s. 3d.; Paris and French nuts, £2. 17s. 6d. per ton, f.o.b. **Patent Fuel,** firm and unchanged. **Cokes** are a strong market; export, £2. 5s. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks, at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for chemicals of the heavier class, for use in the United Kingdom, have been made on a very fair scale, special interest being shown in supplies likely to be available, and prices for such supplies, in the early part of 1924. In the export department business has been more active, and shipments have been fairly heavy. **Bleaching Powder** has been rather more in demand; for spot lots and for export, £11. 5s. per ton is quoted; special prices, according to requirements, being quoted in contracts. **Chloride of Calcium** has been in moderate demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has had a quietly steady sale on home-trade account, and a fair shipment for export; the price of spot, for home-trade use, is £19. 7s. 6d. per ton; special terms are quoted for contracts, according to requirements. **Bicarbonate of Soda** has sold somewhat freely on home-trade account, and has had a steady but moderate shipment to foreign ports; it is £10. 10s. per ton, carriage paid, to users in the United Kingdom. **Soda Crystals** have been rather more in request for home-trade use, but have been quiet in the export branch; they are £5. 5s. per ton for use in the United King-

dom, carriage paid. **Nitrate of Soda** has had a quietly steady sale, and is £13. 5s. to £13. 10s. per ton. **Borax** has been more in request for home-trade use; commercial crystals are £25. per ton, and powdered £26.; higher grades are—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid in the United Kingdom. **Saltcake** has had a steady inquiry for home-trade use, and supplies for early deliveries have been light; the price is £4. 10s. to £5. per ton for use in the United Kingdom, and £5. to £6. per ton for export. **Bichromate of Soda** has had a moderate sale, and is 4¾d. per lb., c.i.f., to stated ports. **Ammonia Alkali** continues in rather good request for home-trade uses, and has had a heavy shipment for foreign ports; it is £7. 10s. per ton for spot, f.o.r. at works, and £8. per ton for export, varying according to destination; for contracts special prices are quoted. **Hyposulphite of Soda** has been rather more in demand; it is £10. per ton in 2cwt. bags for commercial, and £15. per ton for photographic. **Sulphide of Soda** has had a fair inquiry, and the price has hardened; it is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has been very quiet, and is 3d. per lb. **Phosphate of Soda** has moved but slowly, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been but little called for, and is 6d. per lb. **Yellow Prussiate of Potash** has been quieter, and is 10½d. to 11d. per lb. **Red Prussiate** has been inactive, and the price has eased; it may be given as 2s. 9d. per lb. **Carbonate of Potash** has had a moderate sale, and is £25. to £27. per ton. **Nitrate of Potash** has again sold with some freedom, and is £29. to £30. per ton. **Chlorate of Potash** has been quieter, and is 3½d. to 4d. per lb. **Caustic Potash** has been in fair request, and is £29. to £30. per ton. **Permanganate of Potash** has been in very fair demand, and is 9d. to 9¼d. per lb. **Bichromate of Potash** has been rather more in request, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has had steady inquiry; first quality is £57. per ton, second quality £54. per ton. **Sulphate of Ammonia** continues to meet with but little inquiry for home-trade use, but has been shipped more freely on foreign account; neutral of 25¾% is £14. 15s. per ton, and ordinary of 25¼% £13. 12s. per ton. **Carbonate of Ammonia** has sold rather freely, and is 4d. per lb. **Muriate of Ammonia** has been in moderate demand, and is £32. per ton. **Magnesia** has had a quietly steady sale; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been rather more in demand; it is £11. per ton for home-trade use, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been but little called for, and is £8. to £11. per ton, according to quality. **Sulphur** has been in very fair demand; flowers are £10. per ton; roll is £8. 10s. per ton; rock is £8. to £8. 10s. per ton; and American, £5. 10s. per ton. **Tartaric Acid** has been quieter, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has been in quietly steady demand, and the price has been easier; it may be given as £4. 8s. to £4. 10s. per cwt. **Boric Acid** has been steadily called for; commercial is £48. per ton, and powdered £51.; B.P. grades are £54. to £60. per ton. **Citric Acid** has been more inquired for, and the price has hardened; it is 1s. 5d. per lb. **Oxalic Acid** has again had a slow sale, and is 6d. per lb. **White Acetate of Lead** has had a fair inquiry, and is £42. to £43. per ton. **Sulphate of Copper** has moved but slowly for home-trade use or for export, and quotations have been somewhat lower; the price may be given as £25. 10s. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has again been in fair request on home-trade account, and has been more inquired for on American account; supplies of English white powdered are light; the price has consequently varied within a wide range; it may be given as £63. to £69. per ton.

WEST OF SCOTLAND CHEMICALS. Wednesday.

Some improvement is to be noted in the home market during the past few days, though the volume of trade is not large on account of the uncertainty as to the future. Arsenic is a much stronger market, but lump salammoniac has been reduced in price. Prices on the whole are steady. Export inquiry still continues to be of small dimensions. Quotations, net at Glasgow, are as follows:—**Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, scarce and dearer at £68. 10s. per ton on spot; an improving market. **Barium Chloride,** £14. 10s. per ton; at this price the market remains steady; foreign imported material offered round £13. 10s. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, carriage paid in the U.K., makers' prices; demand rather poor. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid,** 1s. 5d. per lb., less 5%; a little business about. **Copper Sulphate,** £26. 15s. per ton, less 5%; a rather neglected market. **Cream of Tartar,** £4. 2s. 6d. per cwt. for 99% at Glasgow; quotation steady, and inquiry small. **Lead Acetate,** white, £42. 15s. per ton on spot; brown, more inquiry at £45. per ton; Continental material offering at cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at much under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. per lb.; at this reduced price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £55. and £52. 10s. per ton respectively; crystals, £48. 10s. per ton; at these unchanged quotations the market keeps steady. **Saltpetre,** £1. 11s. 6d. per cwt., net; a better market, with quotations unaltered; fresh arrivals are cheaper. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex-store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 5s in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid,** 1s. 0¾d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

Unspecified
Auckland, 1 t. 2 c., £14. ; Christiania, 31 t. 4 c., £149. ; Dunedin, 2 t. 4 c., £36. ; Montreal, 52 t. 12 c., £858. ; Melbourne, 9 c., £11. ; Skien, 5 t. 10 c., £75. ; Sydney, 2 t. 1 c., £21.

TAR (STOCKHOLM)—
Jaragua, 18 c., £18.

TARTARIC ACID—
Durban, 4 c., £29. ; Melbourne, 4 t. 10 c., £546. ; Sydney, 5 t., £630.

TIN CHLORIDE—
Demerara, 19 c., £105.

TIN CRYSTALS—
Antwerp, 3 c., £23.

TIN OXIDE—
Montreal, 1 t., £230.

TRICHLORETHYLENE—
Buenos Ayres, 2 t. 10 c., £115.

VANADIUM OXIDE—
Dunkirk, 1 t. 5 c., £1,068.

VANILLIN—
Havre, 4 c., £342.

WOOD PRESERVATIVE—
Auckland, 4 t. 5 c., £129. ; Batavia, 12 c., £19. ; Singapore, 2 t. 10 c., £64.

ZINC AMMONIUM CHLORIDE—
Boston, 4 t. 14 c., £80.

ZINC CHLORIDE—
Calcutta, 13 t. 6 c., £334.
Madras, 9 c., £12.

ZINC OXIDE—
Havre, 40 t., £1,960.
Melbourne, 1 t., £40.

Week ending November 16.

BASIC SLAG—
Fremantle, 200 t.

CALCIUM CHLORATE—
Melbourne, 37 pkgs.

CAUSTIC SODA—
Adelaide, 10 drms. ; Alexandria, 251 drms. ; Alexandretta, 32 drms. ; Algoa Bay, 206 drms. ; Amsterdam, 51 drms. ; Antonina, 100 pkgs. ; Auckland, 136 drms. ; Bahia, 260 drms. ; Bari, 185 drms. ; Barranquilla, 65 drms. ; Bombay, 25 drms. ; Cartagena (Col.), 30 drms. ; Bourgas, 80 drms. ; Brisbane, 65 pkgs. ; Buenos Ayres, 67 drms. ; Cape Town, 81 drms. ; Ceara, 95 drms. ; Christiania, 40 drms. ; Cochin, 100 drms. ; Colombo, 67 drms. ; Delagoa Bay, 3 drms. ; Dunedin, 50 drms. ; Durban, 10 drms. ; East London, 210 drms. ; Hamburg, 485 drms. ; Fremantle, 40 drms. ; Genoa, 119 drms. ; Guayaquil, 10 drms. ; Hong Kong, 84 drms. ; Hankow, 155 drms. ; Jaffa, 51 drms. ; Lagos, 12 drms. ; Las Palmas, 11 drms. ; Maceio, 52 drms. ; Madras, 100 drms. ; Malta, 4 cs. ; Mazatlan, 75 drms. ; Melbourne, 160 pkgs. ; Montreal, 350 drms. ; Natal (Brazil), 60 drms. ; New York, 100 drms. ; Penang, 30 drms. ; Pernambuco, 124 drms. ; Piraeus, 9 drms. ; Pisco, 9 drms. ; Pt. Said, 60 drms., 25 cs. ; Pto. Cabello, 25 drms. ; Pt. Elizabeth, 69 cs. ; Progresso, 80 drms. ; Quebec, 200 drms. ; Rangoon, 69 drms. ; Reval, 829 drms. ; Riga, 1 drm. ; Rio de Janeiro, 695 drms. ; Rotterdam, 105 drms. ; Samarang, 30 drms. ; Santos, 175 drms. ; Sekondi, 100 drms. ; Shanghai, 609 drms. ; Sibolga, 5 drms. ; Sierra Leone, 6 cs. ; Stockholm, 53 drms. ; Sydney, 17 drms. ; Talcahuano, 60 cs. ; Tripoli (Syria), 10 drms. ; Valparaiso, 300 drms. ; Vera Cruz, 87 drms. ; Wellington, 9 drms. ; Zanzibar, 73 drms.

FERRO MANGANESE—
Antwerp, 114 t.
Baltimore, 972
Copenhagen, 1
Hamburg, 200
Lyttleton, 5
Montreal, 85
New Orleans, 97
Phildaelphia, 571

FERRO VANADIUM—
Rouen, 10 drms.
Trieste, 10 c.

GLUE, SIZE, AND GELATINE—
Bombay, 2 cks. ; Boston, 240 bgs. ; Delagoa Bay, 8 pkgs. ; Demerara, 8 pkgs. ; Havana, 40 pkgs. ; Montreal, 42 pkgs. ; Newcastle, 114 pkgs. ; New York, 270 bgs. ; Pt. Elizabeth, 10 cks. ; Quebec, 29 cks. ; Rangoon, 22 bgs. ; Rio de Janeiro, 5 cks. ; Rotterdam, 40 tins. ; Shanghai, 20 bgs. ; Valparaiso, 5 cs. ; Vera Cruz, 10 pkgs.

MANGANESE ORE—
Santander, 1 t.

PARAFFIN WAX—
Maceio, 32 bgs.

SALT—
Accra, 9 t. ; Antwerp, 265 t. ; Auckland, 71 t. ; Baltimore, 20 t. ; Barbados, 65 t. ; Bonny, 20 t. ; Burutu, 39 t. ; Calcutta, 2,974 t. ; Calabar, 97 t. ; Copenhagen, 7 t. ; Cotonou, 17 t. ; Conakry, 10 t. ; Demerara, 9 t. ; Dunedin, 19 t. ; Duala, 9 t. ; Durban, 25 t. ; Grand Lahou, 8 t. ; Guernsey, 5 t. ; Iddo, 555 t. ; Lagos, 354 t. ; Opobo, 13 t. ; New York, 175 t. ; Norrkoping, 150 t. ; Opobo, 40 t. ; Quebec, 100 t. ; Rio de Janeiro, 18 t. ; Saltpond, 11 t. ; Sierra Leone, 30 t. ; Sourabaya, 2 t. ; Stockholm, 400 t. ; Wellington, 434 t. ; Winnebah, 7 t.

SOAP—
Accra, 1,009 pkgs. ; Alexandria, 1,239 pkgs. ; Amboina, 100 bxs. ; Antwerp, 10 pkgs. ; Auckland, 107 pkgs. ; Bandjermassin, 90 cs. ; Bangkok, 881 pkgs. ; Barbadoes, 398 pkgs. ; Barcelona, 2 drms. ; Batavia, 140 cs. ; Bathurst, 172 cs. ; Beira, 178 pkgs. ; Belawan, 3 drms. ; Belize, 1,479 pkgs. ; Benghazi, 13 bxs. ; Bombay, 1,797 pkgs. ; Black River, 16 pkgs. ; Bourgas, 35 pkgs. ; Buenos Ayres, 1,430 cs. ; Burutu, 51 bxs. ; Calcutta, 638 pkgs. ; Cape Palmas, 20 pkgs. ; Casablanca, 5 pkgs. ; Ceuta, 128 pkgs. ; Colombo, 1,258 pkgs. ; Constantinople, 60 pkgs. ; Copenhagen, 250 pkgs. ; Curacao, 100 pkgs. ; Dunedin, 28 pkgs. ; Durban, 316 pkgs. ; Egwanga, 100 pkgs. ; Funchal, 6 bxs. ; Genoa, 2 pkgs. ; Grand Bassam, 30 pkgs. ; Grenada, 18 pkgs. ; Hong Kong, 145 pkgs. ; Iddo, 126 bxs. ; Jesselton, 10 pkgs. ; Kingston, Ja., 116 pkgs. ; Kobe, 100 pkgs. ; Koko, 20 pkgs. ; Kuala Lumpur, 10 pkgs. ; Lagos, 1,412 pkgs. ; Larache, 125 pkgs. ; Las Palmas, 655 pkgs. ; Livingston, 50 pkgs. ; Lyttleton, 8 pkgs. ; Maceio, 20 bxs. ; Madras, 53 cs. ; Malta, 15 pkgs. ; Menado, 50 cs. ; Monrovia, 77 bxs. ; Onitsha, 51 pkgs. ; Opobo, 14 cs. ; Palembang, 70 cs. ; Penang, 44 bxs. ; Pt. Said, 414 pkgs. ; Rangoon, 1,427 pkgs. ; Rio de Janeiro, 3 cs. ; Rotterdam, 420 cs. ; Rouen, 5 bxs. ; Saltpond, 1 pkg. ; Samarang, 250 pkgs. ; Santa Cruz (Brazil), 5 pkgs. ; St. John's, N.F., 458 pkgs. ; San Juan del Sur, 50 pkgs. ; St. Kitts, 75 pkgs. ; St. Lucia, 55 pkgs. ; St. Vincent, 62 pkgs. ; Sekondi, 3 bxs. ; Shanghai, 1,068 pkgs. ; Sierra Leone, 4 cs. ; Singapore, 2,099 pkgs. ; Sydney, 4 cs. ; Sourabaya, 891 pkgs. ; Tangier, 31 bxs. ; Teneriffe, 211 pkgs. ; Tjilatjap, 80 cs. ; Trinidad, 1,102 pkgs. ; Valparaiso, 30 drms. ; Wellington, 5 brls.

SODA ASH—
Ahrs, 200 pkgs. ; Antwerp, 5,000 pkgs. ; Brisbane, 30 pkgs. ; Calcutta, 4,646 bgs. ; Christiania, 250 pkgs. ; Christchurch, 80 pkgs. ; Cochin, 1,000 bgs. ; Copenhagen, 2,200 pkgs. ; Copenhagen, 300 pkgs. ; Dalny, 5,264 pkgs. ; Hamburg, 1,975 pkgs. ; Helsingborg, 500 pkgs. ; Hong Kong, 1,568 pkgs. ; Helsingfors, 100 pkgs. ; Kalmar, 100 pkgs. ; Karachi, 100 pkgs. ; Kobe, 9,196 pkgs. ; Malmo, 100 bgs. ; Maranham, 5 brls. ; Melbourne, 20 cks., 1,074 bgs. ; Moji, 4,869 bgs. ; Monte Video, 200 cks. ; Montreal, 500 bgs. ; Norrkoping, 50 bgs. ; Pelotas, 100 pkgs. ; Penang, 10 pkgs. ; Piraeus, 100 pkgs. ; Rangoon, 800 pkgs. ; Reval, 500 bgs. ; Riga, 150 pkgs. ; Rio de Janeiro, 147 bgs. ; Rotterdam, 6,010 pkgs. ; Shanghai, 2,408 pkgs. ; Stockholm, 800 bgs. ; Sydney, 2,627 pkgs. ; Vera Cruz, 4,800 pkgs. ; Zanzibar, 20 bgs.

SODA CRYSTALS—
Gibraltar, 20 pkgs. ; Patras, 10 pkgs. ; Rosario, 100 pkgs. ; Zanzibar, 10 brls.

SODIUM BICARBONATE—
Alexandria, 30 brls. ; Alexandretta, 48 bgs. ; Algoa Bay, 40 pkgs. ; Auckland, 320 pkgs. ; Barbados, 20 brls. ; Bari, 40 kgs. ; Bombay, 140 pkgs. ; Bourgas, 40 kgs. ; Brisbane, 58 pkgs. ; Dalny, 224 cs. ; Delagoa Bay, 50 pkgs. ; Demerara, 10 pkgs. ; Dunedin, 20 pkgs. ; East London, 20 pkgs. ; Gdnoa, 118 pkgs. ; Gibraltar, 10 pkgs. ; Kobe, 5,385 pkgs. ; Leghorn, 135 pkgs. ; Lyttleton, 20 pkgs. ; Melbourne, 337 pkgs., 20 kgs. ; Monte Video, 10 kgs. ; Penang, 10 pkgs. ; Pt. Alegre, 20 pkgs. ; Pt. Sudan, 30 pkgs. ; Reval, 600 pkgs. ; Salonika, 40 drms. ; Sandakan, 12 kgs. ; Smyrna, 40 kgs. ; Stockholm, 25 bgs. ; Sydney, 326 pkgs. ; Tampico, 300 kgs. ; Teneriffe, 10 kgs. ; Venice, 50 kgs. ; Wellington, 140 pkgs.

SODIUM BISULPHITE—
Penang, 25 drms.
Pt. Swettenham, 25 drms.

SODIUM CARBONATE—
Bombay, 10 cs.

SODIUM CYANIDE—
Sydney, 37 drms.

SODIUM HYDROSULPHITE—
Durban, 5 kgs.
Leghorn, 4 kgs.

SODIUM HYPOSULPHITE—
Sourabaya, 5 kgs.

SODIUM SILICATE—
Alexandria, 480 bgs. ; Algoa Bay, 3 pkgs. ; Barranquilla, 30 cks. ; Buenos Ayres, 843 cks. ; Cartagena, Col., 60 cks. ; Hankow, 78 pkgs. ; Hong Kong, 25 pkgs. ; Kobe, 143 pkgs. ; Marseilles, 3 pkgs. ; Melbourne, 7 cks. ; Newcastle, 5 pkgs. ; Pernambuco, 102 bgs. ; Rangoon, 15 pkgs. ; Rio de Janeiro, 16 pkgs. ; Rouen, 20 cks. ; Sourabaya, 18 pkgs. ; Sydney, 3 cks. Zanzibar, 11 drms.

SODIUM SULPHIDE—
Alexandria, 4 drms. ; Dunedin, 12 pkgs. ; Genoa, 21 pkgs. ; Gothenburg, 28 pkgs. ; Santos, 103 drms. ; Pasages, 12 drms. ; Piraeus, 21 drms. ; Sekondi, 83 drms.

TALLOW—
Danzig, 37 brls.

WAX (VEGETABLE)—
Maceio, 5 cs.

ZINC ASHES—
Antwerp, 5 t.

LONDON.

OFFICIAL AMENDMENTS.

From return for week ending September 5, 1923, deduct—

CHEMICALS (*otherwise undescribed*)
Durban, 2 pkgs. (pt.), £5.

Week ending November 14.

ACETANILID—
Brisbane, 3 cs. (pt.), £12.

ACETIC ACID—
Alexandria, 2 cs., £6. ; Auckland, 34 cs., £112. ; Bombay, 4 cs., £12. ; Launceston, 2 cs., £7. ; Lyttleton, 6 cs., £21. ; Perth, 2 cs., £5.

ACETONE—
Antwerp, 34 drms., £1,260.
Melbourne (F.), 2 drms., £15.

ACETYL SALICYLIC ACID—
Brisbane, 2 cs. (pt.), £53. ; Calcutta, 2 cs. (pt.) £13. ; Melbourne, 2 cs., £39. ; Montreal, 7 cs. (pt.), £87. ; Shanghai, 4 cs. (pt.), £19. ; Sydney, 1 cs. (pt.), £5. ; Wellington, 1 cs. (pt.), £11.

ALKALINE TARTRATE—
Santander, 1 t. 13 c., £125.

ALUM—
Alexandria, 3 brls., £5.
Bombay, 40 kgs., £45.

ALUMINIUM HYDRATE—
Barcelona, 2 cks., £19.

AMMONIA—
Bombay, 8 drms., £86. ; Calcutta, 15 cs., £27. ; Cape Town, 24 cs., £40. ; Colombo, 6 cs., £11. ; Karachi, 5 cs., £9. ; Nice, 1 cs., £10. ; Shanghai, 10 cs., £17.

AMMONIA (ANHYDROUS)—
Irish Free State, 4 cylds., £46. ; Kilindini, 4 cylds., £16. ; New York (F.), 2 cylds., £15. ; Rotterdam, 56 cylds., £370.

AMMONIUM CARBONATE—
Antwerp, 1 t., £33. ; Bangkok, 1 t. 10 c., £89. ; Calcutta, 14 c., £57. ; Copenhagen, 10 c., £14. ; Coquimbo, 18 c., £50. ; Genoa, 1 t. 2 c., £32. ; Hamburg, 1 t. 10 c., £41. ; Hong Kong, 18 c., £50. ; Madras, 2 c., £7. ; Melbourne, 1 c., £6. ; Paris, 2 t. 10 c., £64. ; Penang, 1 t. 2 c., £55. ; Pt. Elizabeth, 4 c., £8. ; Singapore 10 c., £28.

AMMONIUM CHLORIDE—
Zanzibar, 1 ck., £8.

AMMONIUM IODIDE—
Melbourne, 1 cs. (pt.), £7.

AMMONIUM SULPHATE—
Auckland, 25 t., £398. ; Dunkirk, 25 t., £337. ; Jamaica, 100 t., £1,450.

ANTIMONY SULPHIDE
Antwerp, 2 cks., £11. ; Montreal, 34 cks., £265. ; New York, 44 cks., £505. ; Stockholm, 6 cks., £30. ; Toronto, 38 cks., £323.

ARSENIC—
Santos, 60 drms., £192.
Valencia, (F.), 5 cks., £58.

ARSENIC SULPHIDE—
New York, 10 kgs., £31.

BISMUTH CARBONATE—
Brisbane, 1 cs. (pt.), £21.
Melbourne, 2 cs., £143.

BISMUTH CITRATE—
Melbourne, 1 cs. (pt.), £16.

BISMUTH SALTS (*otherwise undes.*)
Calcutta, 3 pkgs., £162.
Rangoon, 1 cs. (pt.), £6.

BITUMEN—
Colombo, 35 brls., £145.
Singapore, 4 brls., £10.

BLEACHING POWDER—
Irish Free State, 2 c., £19.

BORAX—
Bombay, 3 c., £14.
Rotterdam, 8 t. (F.), £190.

BORIC ACID—
Bombay, 5 c., £13. ; Calcutta, 15 c., £42. ; Dar-es-Salaam, 2 c., £6. ; Hong Kong, 6 c., £18. ; Toronto, 2 c., £6.

BROMIDES (*otherwise undescribed*)
Sydney, 4 cs., £100.

CALCIUM CARBIDE—
Channel Islands (F.), 2 t. 5 c., £32. ; Kilindini, 1 c., £6. ; Pt. Sudan (F.), 1 t. 1 c., £21.

CALCIUM GLYCEROPHOSPHATE
Montreal, 5 cs., £140.

CARBON BISULPHIDE—
Mombasa, 10 cs., £17.

CARBON DIOXIDE—
Calcutta, 1 cs., £6.

CARBON TETRACHLORIDE—
Madras, 14 cs., £44.

CAUSTIC POTASH—
Karachi, 2 cs. (pt.), £7.
Lyttleton (F.), 5 cs., £15.

CAUSTIC SODA—
Kilindini, 9 c., £15.
Shanghai, 7 c., £29.

CHEMICALS (*otherwise undescribed*)
Adelaide, 10 cs. (pt.), £165. ; Alexandria, 35 pkgs., £143. ; Amoy, 5 pqgs. (pt.), £10. ; Auckland, 8 cs., £40. ; Bangkok, 13 pkgs. (pt.), £23. ; Barcelona, 6 cks., £36. ; Bombay, 1 pkg. (F.), £15. ; Bombay, 13 cs. (pt.), £30. ; Brisbane, 5 cs. (pt.), £13. ; Calcutta, 20 cs. (pt.), £51. ; Cape Town, 25 pkgs., £88. ; Christchurch, 2 cs. (pt.), £7. ; Colombo, 16 pkgs. (pt.), £25. ; Danzig, 150 pkgs., £368. ; Durban, 1 cs. (pt.), £6. ; East London, 7 pkgs., (pt.) £29. ; Fremantle, 44 pkgs., £151. ; Hamburg, 150 pkgs., £375. ; Jamaica, 5 pkgs., £6. ; Karachi, 2 cs. (pt.), (F.), £11. ; Karachi, 11 cs. (pt.), £53. ; Kilindini, 1 cs., £41. ; Launceston, 13 pkgs., £16. ; Lyttleton, 3 cs., £10. ; Madras, 78 pkgs. (pt.), £247. ; Melbourne, 78 pkgs. (pt.), £738. ; Mombasa, 7 pkgs., £6. ; Montreal, 10 cs. (pt.), £97. ; Nairobi, 4 cs., £15. ; New York, 50 cs., £45. ; Otago, 5 cs., £63. ; Perth, 4 pkgs. (pt.), £6. ; Petrograd, 50 pkgs., £125. ; Petrograd, 425 pkgs. (F.), £500. ; Pt. Elizabeth, 2 cs. (pt.), £10. ; Pt. Sudan, 4 cs., £9. ; Pt. Swettenham, 3 pkgs., £11. ; Rangoon, 8 pkgs. (pt.), £15. ; Rotterdam, 40 pkgs. (F.), £346. ; Rotterdam, 235 pkgs., £950. ; Sekondi, 4 pkgs., £15. ; Shanghai, 13 cs. (pt.), £26. ; Stockholm, 60 pkgs. (F.), £300. ; Stockholm, 10 pkgs., £25. ; Sydney, 24 pkgs. (pt.), £371. ; Toronto, 1 cs., £12. ; Wellington, 2 cs. (pt.), £6. ; Zanzibar, 5 pkgs., £6.

CITRIC ACID—
Amsterdam, 10 c., £73. ; Auckland, 5 c., £37. ; Bangkok, 1 c., £6. ; Bluff, 10 c., £12. ; Bombay, 1 c., £10. ; Brisbane, 2 c., £14. ; Colombo, 1 c., £6. ; Hong Kong, 5 c., £46. ; Irish Free State, 5 c., £39. ; Montreal, 8 c., £73. ; Napier, 1 c., £8. ; Rangoon, 2 c., £20. ; Rotterdam, 1 t., £158. ; Sydney, 17 t., £1,559. ; Tientsin, 4 c., £39.

COAL TAR PRODUCTS—
Anthracene Oil
Boston, 48 drms., £163.
Benzol
Irish Free State (F.), 50 brls., £176. ; Rotterdam (bulk), 68,168 galls., £4,841. ; Rouen (bulk), 164,760 galls., £11,714.
Carbolic Acid
Channel Islands, 8 drms., £34. ; Hamburg, 25 drms., £238. ; Singapore, 2 drms., £18.
Creosote
Durban, 11 drms., £37. ; Kilindini, 10 drms., £14. ; Malta, 2 brls., £15. ; Vancouver, 14 drms., £182.
Naphthalene
Madras, 6 cs., £9.
Pt. Sudan, 4 kgs., £8.
Pitch
Antwerp (bulk), 540 t., £3,780. ; Dunkirk (bulk), 447 t., £2,888. ; Rouen (bulk), 588 t., £4,245. ; Valparaiso (F.), 20 brls., £38. ; Valparaiso, 2 cks., £10.
Pyridine
Corinto, 10 drms., £113.
Tar
Alexandria, 139 pkgs., £320. ; Chinde, 100 drms., £81. ; Hobart (F.), 12 drms., £6. ; Montreal, 1 cs., £6. ; Mozambique, 50 brls., £128.

COBALT OXIDE—
France, 1 cs., £113.

COLOURS (*otherwise undescribed*)—
Bangkok, 3 cs. (pt.), £11. ; Bombay, 4 cs. (pt.), £8. ; Hong Kong, 2 cs., £8. ; Madras, 2 cs., £5.

COPPER SULPHATE—
Delagoa Bay, 5 c., £8.
Valparaiso, 3 c., £6.

CREAM OF TARTAR—
Auckland, 3 t., £254. ; Bluff, 10 c., £42. ; Brisbane, 5 t. 3 c., £435. ; Dunedin, 1 t., £85. ; Geraldton, 5 c., £22. ; Hong Kong, 5 c. (F.), £35. ; Melbourne, 14 t. 10 c., £1,226. ; Sydney, 19 t., £1,679.

CRESYL PHOSPHATE—
Bombay, 2 cs., £54.

DISINFECTANTS (*otherwise undes.*)
Aden, 4 c., £9. ; Auckland, 5 c., £93. ; Barranquilla, 3 c., £18. ; Cape, 1 t. 16 c., £45. ; Christiania, 2 c., £6. ; Colombo, 7 c., £15. ; Curacao, 1 c., £8. ; Demerara, 3 c., £16. ; Hong Kong, 2 t. 2 c., £146. ; Lagos, 15 c., £60. ; Limon, 1 c., £9. ; Malta, 9 c., £15. ; Melbourne, 3 c., £39. ; Penang, 2 t. 1 c., £69. ; Pt. Sudan, 9 c., £23. ; Pt. Swettenham, 19 c., £22. ; Samarang, 18 c., £18. ; Singapore, 1 t. 14 c., £76. ; Sydney, 1 t. 4 c., £153. ; Tanga, 9 c., £15. ; Trinidad, 7 t. 18 c., £248. ; Valparaiso, 3 c., £8. ; Wellington, 1 c., £8.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 20 kgs., £179.
Unspecified
Adelaide, 6 kgs., £103. ; Boulogne 10 kgs., £61. ; Helsingborg, 1 kg., £14. ; Lyttleton, 1 cs., £13. ; Madras, 2 kgs., £494. ; Melbourne, 1 cs., £18. ; New York, 2 cs., £19. ; Perth, 1 cs., £21. ; Singapore, 1 cs., £43. ; Sydney, 1 cs., £11.

ETHER—
Kilindini, 2 cs. (pt.), £7.
Melbourne, 1 cs., £10.

FERTILISERS (*otherwise undes.*)—
Auckland, 1 cs. (pt.), £5. ; Channel Islands, 22 t. 18 c., £172. ; Melbourne, 16 c., £36. ; Savannah, 300 t., £1,620. ; Wellington, 1 c., £7.

FORMALDEHYDE—
Alexandria (F.), 5 cs., £10. ; Bombay (F.), 8 cs., £25. ; Wellington, 7 cs., £26.

GALLIC ACID—
Sydney, 1 cs., £37.

GLYCERINE—
Alexandria, 1 t., £80. ; Jamaica, 1 c., £14. ; Pt. Said, 4 c., £16. ; Wormerveer, 5 t. 14 c., £293. ; Yokohama, 9 t. 14 c., £750.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
Bombay, 1 cs. (pt.) £10. ; Brisbane 1 cs., £6. ; Montreal, 2 cs. (pt.), £8.

GUANO—
Barbados, 6 t., £50.

HYDROFLUORIC ACID—
Bangkok, 1 cs., £6.
Durban, 1 cs., £7.

HYDROGEN PEROXIDE—
Calcutta, 3 cs., £14. ; Irish Free State, 3 cs., £38. ; Nice, 2 cs. (pt.), £6. ; Rangoon, 9 cs., £23. ; Sydney, 5 cks., £30.

IODIDES (*otherwise undescribed*)—
Calcutta, 2 cs. (pt.), £37.
Rangoon, 1 cs. (pt.), £27.

IODINE—
Adelaide, 1 cs. (pt.), £53. ; Bilbao, 10 cs., £1,033. ; Brussels, 2 cs., £310. ; Calcutta, 1 cs., 1 ck., £152. ; Rangoon, 1 cs. (pt.), £13. ; Sydney, 1 cs. (pt.), £13.

IODINE (RESUBLIMED)—
Rangoon, 1 cs., £55.

IRON AMMONIUM CITRATE—
Bombay, 1 cs. (pt.), £7.
Sydney, 1 cs. (pt.), £6.

LEAD ACETATE—
Madras, 5 kgs., £12.

LEAD PEROXIDE—
Antwerp, 183 bgs., £315.

MAGNESIA—
Auckland, 15 cs., £36. ; Brisbane, 3 cs., £7. ; Christchurch, 10 cs., £24. ; Gisborne, 5 cs., £12. ; Guayaquil, 4 cs., £29. ; Napier, 10 cs., £24. ; Singapore, 4 cs., £8. ; Sydney, 12 cs., £29.

MAGNESIUM CARBONATE—
Adelaide, 2 cs., £7. ; Alexandria, 4 cs., £7. ; Bombay, 4 cs., £7. ; Calcutta, 2 cs., £9. ; Dunedin, 4 cs., £14. ; East London, 6 pkgs., £18. ; Melbourne, 1 ck., £18. ; Sydney, 5 cs., £11.

MAGNESIUM CITRATE—
Barcelona, 40 cs., £600.
Rangoon, 2 cs., £14.

MAGNESIUM SULPHATE—
Auckland, 2 t. 10 c., £55. ; Bombay, 6 c., £7. ; Brisbane, 1 t. 2 c., £24. ; Calcutta, 6 c., £14. ; Melbourne, 2 t. 19 c., £65. ; Mombasa, 5 c., £6. ; Montreal, 3 t. 90 c., £51. ; Napier, 5 c., £6. ; Sydney, 1 t., £22.

MANGANESE HYPOPHOSPHITE
Montreal, 1 cs., £18.

MERCURIALS (*otherwise undes.*)—
Calcutta, 5 cs. (pt.), £59.

MERCURY AMMONIUM CHLORIDE—
Adelaide, 1 cs. (pt.), £6. ; Melbourne, 1 cs. (pt.), 1 cs., £19. ; Montreal, 2 cs., £50.

MERCURY BICHLORIDE—
Melbourne, 1 cs., £10.
Montreal, 10 cs., £205.

MERCURY IODIDE—
Melbourne, 1 cs. (pt.), £9.

MERCURY OXIDE—
Montreal, 1 cs., £25.

MOLYBDIC ACID—
Pt. Elizabeth, 1 cs. (pt.), £5.
Sydney, 1 cs., £9.

NICKEL OXIDE—
Brussels, 1 cs., £7.

NICKEL SALTS (*otherwise undes.*)—
Durban, 5 cs., £23.
Melbourne, 7 cs., £16.

NITRIC ACID—
Alexandria, 4 c., £22.
Bangkok, 1 c., £7.

PARAFORMALDEHYDE—
Lyttleton, 1 cs., £19.

PETROLEUM ETHER—
Alexandria, 8 cs., £17.

PHOSPHATES (*otherwise undes.*)—
Pt. Elizabeth, 5 kgs., £18.

PHOSPHORIC ACID—
Adelaide, 3 cs., £12.
Melbourne, 7 cs., £28.

PHOSPHORUS—
Havana, 130 cs., £574. ; Melbourne, 1 cs., £9. ; Puerto Colombia, 24 cs., £115.

POTASSIUM ACETATE—
Alexandria, 1 cs., £6.

POTASSIUM BROMIDE—
Auckland (F.), 1 cs., £6. ; Rangoon (F.), 2 cs., £5. ; Sydney, 3 cs., £13.

POTASSIUM CARBONATE—
Adelaide, 2 kgs., £5.
Melbourne, 1 cs., £6.

POTASSIUM CHLORIDE—
Melbourne, 5 pkgs. (pt.), £9.

POTASSIUM CITRATE—
Bombay, 1 cs., £14. ; Brisbane, 1 cs. (pt.), £8. ; Calcutta, 1 cs., £12. ; Colombo, 1 cs. (pt.), £5. ; Melbourne, 5 cs., £50. ; Montreal, 20 cs., £93. ; Otago, 1 cs., £7. ; Sydney, 5 cs., £57.

POTASSIUM CYANIDE—
Adelaide, 1 cs., £6.
Melbourne, 4 cs., £26.

POTASSIUM IODIDE—
Bombay, 1 cs., £88. ; Brisbane, 1 cs. (pt.), £28. ; Brussels, 3 cs., £259. ; Christchurch, 1 cs., £22. ; Colombo, 1 cs. (pt.), £22. ; Half Assine, 1 cs., £19. ; Hong Kong, 1 cs., £88. ; Melbourne, 1 cs. (pt.), 5 pkgs. (pt.), 1 cs., £368. ; Rangoon, 2 cs. (pt.), £110. ; Sydney, 1 cs. (pt.), 1 cs., £100. ; Wellington, 1 cs. (pt.), £22.

POTASSIUM PERMANGANATE—
Adelaide, 2 kgs., £9. ; Brisbane (F.), 1 kg., £11. ; Colombo, 1 cs., £6. ; Hong Kong, 1 drm., £5.

POTASSIUM PRUSSIATE—
Hamburg, 17 cks., £345.

POTASSIUM SULPHOGUAIACOLATE—
New York (F.), 4 cs., £126.

PRUSSIAN BLUE—
Paris, 4 cks., £79.
Vera Cruz., 2 cks., £89.

PYROGALLIC ACID—
Abo, 1 bx., £12.

SALAMMONIAC—
Adelaide, 5 kgs., £16. ; Callao, 20 cs. (pt.), £5. ; Colombo, 1 cs. (pt.), £20. ; Talcahuano, 2 cks., £14. ; Valparaiso, 5 cks., £46.

SALICYLATES (*otherwise undes.*)
Montreal, 1 cs., 3 cs. (pt.), £36.

SALICYLIC ACID—
Bombay, 2 cs. (pt.), £7. ; Hong Kong, 1 cs., £11. ; Jamaica, 1 cs., £14. ; Melbourne, 1 ck., 1 cs., £25.

SALTPETRE—
Auckland, 1 t., £35. ; Dunedin, 2 t., £77. ; Melbourne, 2 c., £6. ; Pernambuco, 2 t. 19 c., £117. ; Teneriffe, 2 t. (F.), £57.

SHEEP DIP—
Christchurch, 19 t. 6 c., £1,200. ; Nelson, 6 t. 5 c., £390. ; Timaru, 12 t. 8 c., £748.

SILVER NITRATE—
Fremantle, 1 cs., £29.

SODA CRYSTALS—
Mombasa, 10 c., £11. ; Nassau, 5 c., £6. ; Penang, 15 c., £6.

SODIUM ACID PYROPHOSPHATE
Fremantle, 1 t., £78.

SODIUM BENZOATE—
Adelaide (F.), 1 c., £11.
Paris, 16 c., £210.

SODIUM BICARBONATE—
Calcutta, 19 c., £56. ; Fremantle, 1 t. 2 c., £25. ; Geraldton, 5 c., £6. ; Havana, 12 c., £12. ; Melbourne, 10 c., £20. ; Toronto, 2 t. 12 c., £123.

SODIUM BISULPHITE—
Belawan, 2 t. 10 c., £48. ; Colombo, 2 t., £38. ; Penang, 1 t. 5 c., £25.

SODIUM BROMIDE—
Melbourne, 2 c., £7.
Sydney, 2 c., £9.

SODIUM CITRATE—
Montreal, 4 t. 13 c., £911.

SODIUM HYDROSULPHITE—
Calcutta, 10 c., £79.

SODIUM HYPOPHOSPHITE—
Montreal, 1 c., £18.

SODIUM IODIDE—
Melbourne, 1 cs. (pt.), £13.
Sydney, 1 cs., £26.

SODIUM PERBORATE—
Gothenburg, 1 t., £91.

SODIUM PRUSSIATE—
Rio de Janeiro, 1 t., £78.

SODIUM SALICYLATE—
Christchurch, 2 c., £28. ; Durban, 1 cs., £7. ; East London, 2 c., £28. ; Melbourne, 1 c., £15. ; Wellington, 2 c., £29.

SODIUM SULPHATE—
Calcutta, 1 c., £6.
Jamaica, 11 cks., £7.

SODIUM SULPHITE—
Cape Town, 1 t., £17. ; Calcutta, 1 c., £6. ; Penang, 1 t. 5 c., £32.

SODIUM TARTRATE—
Adelaide, 10 c., £35. ; Calcutta, 3 c., £15. ; Melbourne, 7 c., £32. ; Sydney, 6 c., £21.

SULPHUR—
East London, 1 c., £5.

SULPHURIC ACID—
Bangkok, 1 c., £7. ; Channel Islands, 15 c., £20. ; Kilindini, 12 c., £13. ; Rio de Janeiro, 1 t., £20. ; Santos, 1 t. 7 c., £74.

SUPERPHOSPHATE—
Channel Islands, 110 t., £275.

TARTARIC ACID—
Cape Town, 1 c., £8. ; Durban, 6 c., £38. ; Jamaica, 4 c., £32. ; Melbourne, 6 t. 10 c., £831. ; Paris, 2 t., £240. ; Pt. Sudan, 1 c., £6. ; Rangoon, 2 c., £26. ; Sydney, 10 c., £60.

ZINC OXIDE—
Adelaide, 2 cs., £13. ; Calcutta, 1 cs., £9. ; East London, 1 ck., £5. ; Riga, 40 cks., £76. ; Toronto, 1 ck., £7.

ZINC SULPHIDE—
New York, 2 cks., £102.

Week ending November 17.

ANTIMONY REGULUS—
Calcutta, 10 c.

BEESWAX—
Durban, 10 c.

CERESINE WAX—
Durban, 5 c.

FULLER'S EARTH—
Montreal, 60 t.
New York, 25 t.

GLUE, SIZE, AND GELATINE—
Antwerp, 1 t. 10 c. ; Bangkok, 5 t. 12 c. ; Calcutta, 3 t. ; Colombo 8 c. ; Durban, 19 c. ; Dunkirk, 2 t. ; East London, 5 c. ; Helsingfors, 9 c. ; Jamaica, 1 c. ; Jesselton, 3 c. ; Kobe, 30 t. ; La Guayra, 6 c. ; Limon, 1 c. ; Los Angeles, 3 t. ; Madras, 4 c. ; Melbourne, 1 c. ; Montreal, 1 c. ; New York, 22 t. ; Riga, 3 t. 2 c. ; Perth, 6 c. ; Rangoon, 1 t. 1 c. ; Sydney, 1 t. 11 c. ; Toronto, 1 t. ; Wellington, 3 c.

ISINGLASS—
Antwerp, 3 c.

MINERAL WAX—
Melbourne, 15 t.

PLUMBAGO—
Amsterdam, 1 c. ; Copenhagen, 4 c. ; East London, 7 c. ; Gothenburg, 10 c. ; Stockholm, 2 c. ; Tampico, 1 t. ; Valparaiso, 6 c.

QUININE—
Bombay, 2,340 oz. ; Calcutta, 10,780 oz. ; Colombo, 178 oz. ; East London, 228 oz. ; Ghent, 10 oz. ; Karachi, 137 oz. ; Madras, 200 oz. ; Pt. Swettenham, 1,760 oz. ; Riga, 1,212 oz. ; Rio de Janeiro, 20 oz. ; Sydney, 1,274 oz. ; Zanzibar, 400 oz.

ROSIN—
Hong Kong, 4 t.
Melbourne, 1 t. 13 c.

SALT—
Kilindini, 3 c. ; Kobe, 6 c. ; Madras, 14 c. ; Pt. Said, 4 c. ; Pt. Sudan, 14 c. ; Shanghai, 2 c.

SHELLAC—
Ghent, 2 c.
Italy, 1 t. 4 c.

SOAP—
Accra, 19 t. 16 c. ; Alexandria, 2 c. ; Amsterdam, 8 t. 11 c. ; Antwerp, 1 t. 6 c. ; Auckland, 2 t. 10 c. ; Bermuda, 2 c. ; Bombay, 1 t. ; Calcutta, 1 t. 18 c. ; Cologne, 3 c. ; Copenhagen, 3 c. ; Dar-es-Salaam, 1 c. ; Durban, 2 c. ; Fremantle, 1 c. ; Gibraltar, 10 c. ; Half Assinie, 6 t. 6 c. ; Hamburg, 2 c. ; Havre, 1 c. ; Helsingfors, 2 c. ; Hong Kong, 5 c. ; Iddo, 5 c. ; Italy, 1 c. ; Jamaica, 6 t. 3 c. ; Karachi, 3 c. ; Kilindini, 11 c. ; Kobe, 2 c. ; Limon, 1 c. ; Madras, 1 c. ; Malta, 3 c. ; Melbourne, 1 c. ; Mombasa, 7 c. ; Monrovia, 1 t. 3 c. ; Pt. Swettenham, 1 c. ; Perth, 1 c. ; Montreal, 2 c. ; New York, qty. ; Ouideo, 1 t. 5 c. ; Ostend, 3 c. ; Pt. Sudan, 1 c. ; Rangoon, 1 c. ; Reval, 3 t. 1 c. ; Saltpond, 13 t. 13 c. ; Sapele, 2 c. ; Sekondi, 16 t. 1 c. ; Singapore, 4 c. ; Tientsin, 4 c. ; Vancouver, 1 t. 4 c. ; Warri, 4 c. ; Winnebah, 12 t. 14 c.

TALLOW—
Danzig, 10 t. 3 c. ; Hamburg, 15 t. ; Jamaica, 4 c. ; Pasages, 74 t. 15 c. ; Rotterdam, 21 t.

TAR (STOCKHOLM)—
Jamaica, 2 c.

WHITE LEAD—
Adelaide, £144. ; Auckland, £2,420. ; Bombay, £105. ; Brisbane, £118. ; Calcutta, £33. ; Dunedin, £434. ; Fremantle, £162. ; Jamaica, £14. ; Limon, £40. ; Lyttleton, £771. ; Malta, £63. ; Melbourne, £200. ; Panama, £28. ; Pt. Elizabeth, £14. ; Shanghai, £131. ; Singapore, £31. ; Sydney, £615. ; Wellington, £317.

ZINC ASHES—
Antwerp, 5 t.

MANCHESTER.

Week ending November 17.

ALBUMEN—
New York, 16 cks.

CHEMICALS (*otherwise undescribed*)
Belgium, 5 cks.
France, 13 drms.

COAL TAR PRODUCTS—
Aniline Oil
Basle, 12 drms.
Naphthalene
New York, 499 bgs.
Naphthol
Holland, 2 kgs.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 500 kgs., 135 cks.
Copenhagen, 1 kg.
Unspecified
Bombay, 10 kgs., 17 cks., 4 drms. ; France, 1 ck. ; Lyons, 1 kg. ; Rouen, 3 kgs.

LEAD NITRATE—
France, 10 cks.

MAGNESIUM CARBONATE—
France, 198 bgs.

SOAP—
Basrah, 76 cs. ; Holland, 26 cs. ; Pto. Barrios, 7 cs.

TALLOW—
Bombay, 47 brls.

NEWCASTLE-ON-TYNE

Week ending November 17.

AMMONIA—
Alicante, 1,541 bgs. ; Bergen, 30 kgs. ; Valparaiso, 66 bgs.

ANTIMONY—
Christiania, 1 ck. ; Montreal, 307 cks. ; Valparaiso, 8 cks.

CAUSTIC SODA—
Christiania, 119 drms.
Gothenburg, 68 drms.

COAL TAR PRODUCTS—
Pitch
Bergen, 1,688 bgs.
Gothenburg, 1 tin.

CUPROUS OXIDE—
Bergen, 10 drms.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Bergen, 1 cs.

LITHARGE—
Christiania, 26 cks.
Gothenburg, 21 cks.

MAGNESIA—
Montreal, 80 cs.

RED LEAD—
Christiania, 28 cks. ; Copenhagen, 5 cks. ; Gothenburg, 26 cks. ; Valparaiso, 20 kgs.

SODIUM HYPOSULPHITE—
Batavia, 20 kgs.

SODIUM SALTS (*otherwise undes.*)
Copenhagen, 90 drms.

SODIUM SULPHATE—
Bergen, 30 bgs.

SUPERPHOSPHATE OF LIME—
Pernau, 2,075 bgs.

WHITE LEAD—
Copenhagen, 9 cks.

N. & S. SHIELDS.

Week ending November 17.

NIL.

PRICES CURRENT.

WEDNESDAY, NOV. 21, 1923.

PREPARED BY MESSRS. HIGGINBOTTOM & CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. *at makers' works, but it must be understood that the prices in different localities may vary*

		£	s.	d.
ACIDS.				
Acetic, 40% and 80%	*cwt.	23- / &	46/-	
Acetic, (Glacial, B.P.) in carboys	*ton	70	0	0
Arsenic, S.G. 2.000	ton	90	0	0
Boric (crystals)	†ton	48	0	0
Citric	lb.	0	1	5
Formic, 80/85%	*ton	51	0	0
Hydrofluoric, 59/60%	*lb.	0	0	7½
Lactic, 50%	ton	43	0	0
Muriatic (Tower Salts), 28° Tw.	*carboy	0	4	0
Nitric, 80° Tw.	*ton	21	10	0
Oxalic	lb.	0	0	5¾
Phosphoric, 1,500° tech.	*ton	33	0	0
Sulphuric (168°)	*ton	7	10	0
Sulphuric (140°)	*ton	3	15	0
Sulphuric (free from Arsenic, 144°)	*ton	4	10	0
Tannic (commercial)	lb.	0	1	6
Tartaric (crystals)	lb.	0	1	1½
COAL TAR PRODUCTS.				
Aniline Oil	*lb.	0	0	9
Aniline Salt	*lb.	0	0	9
Anthracene, 40/45%, "A"	unit	0	0	4
Benzol, 90%	*gallon	0	1	4
Carbolic Acid (crude 60%)	gallon	0	3	4
Carbolic Acid (crystals 40°)	lb.	0	1	2
Creosote	*gallon	0	0	9½
Cresylic Acid, 95%	*gallon	0	2	3
Naphtha, crude, 30%	*gallon	0	0	9
Naphtha, solvent (90/160)	*gallon	0	1	3
Naphthalene, refined	ton	17	10	0
Pitch (f.a.s. Liverpool)	ton	6	17	6
Pyridin	gallon	1	3	0
Tar, crude	ton	4	10	0
Tar, refined	barrel	2	4	6
Toluol	*gallon	0	1	9
Xylol, (pure)	*gallon	0	2	3
GENERAL CHEMICALS.				
Acetone	*ton	124	0	0
Alum, loose lump (delivered)	*ton	10	10	0
Aluminium Sulphate, 17/18%	ton	10	10	0
Aluminium Sulphocyanide	lb.	0	0	7
Aluminoferric (in slabs) 20° Tw.	ton	7	0	0
Ammonia, anhydrous	*lb.	0	1	4
Ammonia, .880	*ton	22	10	0
Ammonia, .920	*ton	14	10	0
Ammonium Carbonate (lump)	lb.	0	0	4
Ammonium Muriate (grey)	†ton	30	0	0
Ammonium Nitrate	ton	35	0	0
Ammonium Phosphate	ton	60	0	0
Ammonium Sulphate, 25¾% delivered	†ton	14	15	0
Ammonium Sulphocyanide, 95%	lb.	0	1	3
Antimony (Golden Sulphide)	lb.	0	0	9
Arsenic (Cornish White)	ton	70	0	0
Barium Carbonate (native), 92/94%	ton	5	15	0
Barium Chlorate	lb.	0	0	7
Barium Chloride (in casks)	ton	14	10	0
Barium Sulphate	ton	£5	to	£7
Barium Sulphocyanide, 95%	lb.	0	0	9½
Bleaching Powder, 35%	*†ton	11	5	0
Bleaching Liquor, 7%	*ton	4	5	0
Calcium Chloride	†ton	5	10	0
Carbon Bisulphide	*ton	26	0	0
Casein (commercial)	ton	81	0	0
China Clay (at Runcorn), in bulk	ton	50/-	to	90/-
Chromium Acetate (crystals)	lb.	0	0	8
Copper Sulphate	ton	25	0	0
Formaldehyde, 40%	ton	64	0	0
Glycerine (chemically pure, S.G. 1,260)	*ton	85	0	0
Glycerine (crude), 80%	*ton	60	0	0
Iodine	*oz.	0	1	0
Iron Nitrate, 80° Tw.	*ton	6	5	0
Iron Sulphate (copperas), delivered in bulk	*ton	2	2	6
Iron Sulphide (lumps)	ton	6	0	0
Lead Acetate (white)	ton	44	0	0
Lead Acetate (brown)	ton	45	0	0
Lead Carbonate (White Lead)	ton	47	0	0
Lead Nitrate	ton	44	0	0
Lime Acetate (brown)	*ton	14	10	0
Lime Acetate (grey), 80%	*ton	22	0	0
Lime Bisulphite (S.G. 1,070)	*ton	8	0	0
Lime Superphosphate, 30%	ton	3	5	0
Litharge (British)	ton	45	0	0
Magnesite, Calcined (delivered)	ton	11	0	0
Magnesite, Raw	ton	3	0	0
Magnesium Carbonate (light)	cwt.	2	0	0
Magnesium Chloride (solid)	ton	3	0	0
Magnesium Sulphate (Epsom Salts, coml.)	ton	4	0	0
Magnesium Sulphate, B.P.	ton	6	0	0
Manganese Borate, 85%	ton	112	0	0
Manganese Sulphate, 90%	ton	45	0	0
Methylated Alcohol, 64° (industrial)	gallon	0	3	1
Naphtha (Wood), Solvent	*gallon	0	6	0
Naphtha (Wood), Miscible, 60° p.	gallon	0	6	0
Potassium Bichromate	lb.	0	0	5½
Potassium Carbonate, 90%	ton	23	0	0
Potassium Chlorate	lb.	0	0	3
Potassium Hydrate (Caustic Potash), 88/90%	ton	31	0	0
Potassium Hydrate (Caustic Potash), 75/80%	ton	27	0	0
Potassium Hydrate (liquid), 50° Bé.	ton	16	0	0
Potassium Chloride 80%	ton	8	10	0
Potassium Nitrate (refined)	ton	25	0	0
Potassium Permanganate (commercial)	lb.	0	0	8½
Potassium Prussiate (yellow)	lb.	0	0	10½
Potassium Prussiate (red)	lb.	0	2	6
Potassium Sulphate, 90% (ex ship)	ton	11	0	0
Potassium Sulphocyanide	lb	0	1	6
Salammoniac, lump (sublimed) 1st & 2nd	cwt.	55/- &	52/-	
Sodium Acetate	ton	24	0	0
Sodium Arsenate, 45%	ton	45	0	0
Sodium Borate (Borax), Crystals	†ton	25	0	0
Sodium Bicarbonate (2 cwt. bags)	†ton	10	10	0
Sodium Bichromate	lb.	0	0	4½
Sodium Carb. (Alkali), 58% bags	†ton	7	10	0
Sodium Carb. (Soda Crystals), bags, car. pd.	†ton	5	5	0
Sodium Chlorate	lb.	0	0	2¾
Sodium Cyanide (100% basis) for export	†lb.	8d. to 8½d		
Sodium Hydrate (76% C. Soda), f.o.r.	†ton	19	7	6
Sodium Hydrate (70% C. Soda)	†ton	17	17	6
Sodium Hydrate (60% C. Soda)	†ton	16	17	6
Sodium Hydrate (Liquid, 90° Tw.)	†ton	8	5	0
Sodium Hydrate, 77/78% powdered (99%)	†ton	22	0	0
Sodium Hyposulphite (commercial)	†ton	9	10	0
Sodium Hyposulphite (photographic)	ton	14	10	0
Sodium Manganate (basis 25%)	ton	45	0	0
Sodium Nitrate, 96% ref'd, f.o.r. L'pool	ton	13	5	0
Sodium Nitrite, 100% basis	ton	26	10	0
Sodium Perborate	lb.	0	0	14½
Sodium Phosphate	ton	14	10	0
Sodium Prussiate	lb.	0	0	5¾
Sodium Silicate (glass), Alkaline	†ton	11	5	0
Sodium Silicate (liquid, 140° Tw.)	†ton	9	0	0
Sodium Sulphate (Saltcake)	†ton	4	10	0
Sodium Sulphate (Glauber's Salt)	ton	3	10	0
Sodium Sulphide (conc.), 60/65%	ton	14	10	0
Sodium Sulphide Crystals (casks)	†ton	9	0	0
Sodium Sulphocyanide (liquid)	lb.	0	0	6
Sulphur (Flowers) ex ship, Sicilian	ton	8	0	0
Sulphur (Roll Brimstone)	ton	8	0	0
Sulphur (Texas Gulf)	ton	5	5	0
Tartar Emetic, 43/44%	lb.	0	1	1
Tin Crystals	lb.	0	1	3½
Tin Perchloride fused	lb.	0	1	10
Titanous Chloride	lb.	0	1	0
Zinc Chloride (solution, 102° Tw.)	*ton	20	0	0
Zinc Sulphate, Crystals	ton	13	10	0
METALS.				
Aluminium (Ingot Metal 98/99%)	ton	115	0	0
Antimony	ton	42	0	0
Copper	ton	61	0	0
Lead (Chemical Sheet), delivered	cwt.	1	17	6
Lead (Foreign Pig)	ton	30	5	0
Nickel	ton	130	0	0
Silver	oz.	0	2	9½
Tin, English Ingots	ton	2[illegible]3	0	0
Zinc (Spelter)	ton	32	5	0
Zinc Dust, 90/92%	ton	50	0	0
OILS.				
Cottonseed	*ton	44	0	0
Linseed, Raw	*ton	46	0	0
Stearine, 115-120° M.P.	ton	48	0	0
Tallow	ton	39	0	0
Turpentine	cwt	3	13	3

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.
Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

HIGH PRESSURES IN SULPHURIC-ACID MANUFACTURE.

THE mechanism of the formation of sulphuric acid by the chamber process has been the subject of numerous researches from the time of Clément and Désormes, who in 1806 discovered the intermediate formation of nitrososulphuric acid, and propounded the first theory of the effect of the nitrous gases, up to the present day. If we leave the purely theoretical considerations on one side, however, and confine ourselves to those investigations which have had for their immediate object the elucidation of the mechanism of acid formation with regard to the concentration, composition, and temperature of the reacting gases, and the design of the leaden chambers, we find that the classical investigations of Lunge and Naef, carried out at the Uetiken Alkali Works, near Zurich, in 1883-1884, still represent the most reliable data at our disposal. These experiments were particularly useful, because they were actually carried out on the plant, but this advantage itself introduced limitations, inasmuch as the conditions under which the reaction was studied could not be modified from the normal to any marked extent. The work of Lunge and Naef demonstrated clearly that the conversion of sulphur dioxide into sulphuric acid takes place very quickly so far as the middle of the first chamber, then slackens considerably, but is suddenly accelerated again when the gases pass into the second chamber. Under normal conditions of working, it was shown, over 70 per cent. of the sulphurous acid is oxidised before the middle of the first chamber is reached. The influence of temperature and defective mixing of the gases was also studied, and, as a direct result of these investigations, many marked improvements were introduced into the design of chamber plants. A good deal of work on the subject has, of course, been carried out since 1884, but this has been mainly desultory, and Lunge and Naef's results retain their original authority. Within the last year or two, however, the problem has been attacked anew, and this time the work has been carried out on the laboratory scale, under conditions which could be varied as often and as widely as wished. These investigations have been conducted under the direction of the late Professor Ph. A. Guye, in the laboratories of the University of Geneva, where special methods of gas manipulation technique and special apparatus have been devised. The earlier work was confined to the initial stages of sulphuric-acid formation, but the latest work

(*Helvetica Chim. Acta*, June, 1923) deals with the reaction in its entirety. The apparatus used is too complicated to describe here in detail, but it may be briefly mentioned that it consisted essentially of seven glass tubes, connected in series. The products formed in each tube could be isolated and examined separately, and the results could be interpreted either as applicable to a seven-chamber system, or to a one-chamber system. Generally speaking, the conclusions of Lunge and Naef have been confirmed, but many new data have been established, and the foundations for a complete theoretical understanding of the mechanism of the reaction have been well laid. The effect of gaseous concentration and pressure have been closely studied, and it has been found that the proportion of sulphuric acid formed is almost quadrupled when the pressure of the gas admitted to the chambers is doubled. The possibilities of working under pressures above atmospheric are thus opened up, and the suggestion of replacing lead by materials such as iron-silicon alloys is made. The possibility is certainly worthy of detailed examination, but a great deal more investigation and experience will be necessary before it can be stated that the disadvantages of so radical an alteration of chamber-construction methods do not outweigh the advantages accruing from increased production. Experience in modern intensive systems of sulphuric-acid production by chamber or tower processes has proved the general correctness of the views once expressed by the late Mr. George E. Davis: "If you go on in the old way, working with 25 cubic feet of space per pound of sulphur per 24 hours, the process goes on absolutely by itself. Decrease your chamber space to 15 cubic feet, and you want a chemist and a clever foreman; while with 8 cubic feet, neither foreman nor chemist know what peace is either by night or day." We are not implying that many of the modern systems in which chamber capacity has been reduced, by providing for more effective mixing of the reacting gases, control of the temperature, or the use of higher concentrations of nitrous gas together with efficient recovery methods, have not been successful, but rather that each decrease in chamber capacity per unit of sulphur burned has brought with it difficulties of supervision and depreciation which may, if the process of intensification be carried far enough, be sufficiently great to more than counterbalance the concomitant advantages.

DYESTUFFS CORPORATION FINANCE.

Up to the time of writing, the directors of the British Dyestuffs Corporation have added nothing to their preliminary announcement that a scheme of capital reconstruction is under the consideration of the board. There is little room for doubt, however, that the direction of reconstruction will be a more or less drastic writing down of capital, and the only questions awaiting elucidation are the exact amount of reduction, and how the sacrifice is to be shared by the various classes of security holders. The announcement, whilst causing considerable interest and comment, has occasioned no surprise, for the imminence of some scheme of reconstruction was foreshadowed definitely by Sir William Alexander in his address to the shareholders, in Manchester, this June. It may be recalled that the Corporation's paid-up capital consists of £4,117,117. of 7 per cent. non-cumulative £1. preference shares, £4,085,794. of 8 per cent. non-cumulative £1. preferred ordinary shares, and £994,190. of deferred ordinary shares, also of £1. par value. The Government hold 850,000 of the preferred ordinary shares and 850,001 of the preference shares. The amount of capital to be sacrificed by the general body of shareholders will probably depend largely upon the attitude of the Government and how far it is prepared to go in the matter of its own holdings. The belief is prevalent that no claim will be made on the holders of preference shares, who have preferential rights as to capital, and who have received no dividend for the past three years. The general view of the market is that the holders of the preferred and deferred ordinary shares will bear the whole of the reduction, and one forecast, which may or may not be inspired, fixes the reduction at 25 per cent. in the former case and 75 per cent. in the latter. This would mean a total capital reduction of nearly £2,000,000., a figure which should meet those items in the last balance-sheet which seem to require total extinction if the Corporation is to be placed on a sound capital basis. The items to which we are referring are: Preliminary expenses, £251,000.; balance of loss, £700,000.; and "goodwill, patents, and other rights," £1,020,000., although in the last-mentioned case drastic writing-down, and not complete cancellation, will be the probable course. From the standpoints of range, quantity and quality of output, the Corporation has now reached a very satisfactory position, and there is every reason for hoping that when its capitalisation has been reduced to more practical dimensions, the undertaking will enter upon a period of comparative prosperity.

PROTECTION BY PATENTS.

An American lawsuit concerning the alleged infringement of patent rights, which will probably be heard in the near future, promises to be something of a novelty in patent litigation. A firm of dyestuffs manufacturers who acquired certain of the German chemical patents seized by the Alien Property Custodian during the war, are now seeking to prohibit the importation from Germany of those products covered by the patents, on the grounds that such importations constitute a definite infringement of their (the American manufacturers') rights, and that the importing firm should have obtained a licence from the American patent holders. Certainly, had the patents in question been assigned by the German owners under normal circumstances, an action such as the American owners are now bringing would appear to have a fair chance of ending successfully, but as both the legality and the equity of the original patent seizure by the Alien Property Custodian are still matters of dispute, no definite opinion on the ultimate outcome of the new lawsuit can profitably be expressed.

THE LINSEED OIL INDUSTRY.

By "Omega."

LINSEED OIL is the oil contained in the seed of the flax plant, *Linum usitatissimum* (Linn). The plant is of Asiatic origin and thrives to the best advantage in a moist climate where there is an abundant rainfall. The soil most favourable to its growth is a deep, moist, fertile and well-drained loam, covering a heavy sub-soil. Calcareous soils tend to retard the growth of the plant (*B. of Agriculture Leaflet*, No. 278). Linseed is now being cultivated extensively in North and South America, India, Russia, and Morocco, and to a limited extent in the British Isles. There are two varieties of the seed, the white and the red, the oil produced from the white linseed being considered generally to be of superior quality. The British Flax Growers' Association (*J.S.C.I.*, 1919, p. 65R), state that for the production of linseed in England, the River Plate seed is the most suitable from all points of view. Similar results were also obtained from experiments conducted by the Board of Agriculture at Wye during 1919.

Market Prices of Linseed Products.

The following table shows the fluctuation in market prices of linseed, linseed oil, and linseed cake during recent years:

Year.	Seed. Per Ton.	Oil. Per Ton.	Cake. Per Ton.
1914	£12	£25	£7
1920	£36	£70	£22
1921	£16	£29	£11
1922	£21	£39	£13
1923	£21	£42	£11

The market price of linseed oil has fluctuated considerably during the current year, the price per ton in January, 1923, being £28., in May £44., and in November, £42.

Extent of the Linseed Oil Industry.

The acreage under flax cultivation in Russia has naturally varied widely during the last few years, and no figures are available for the present year. The flax seed acreage of the U.S.A. for 1923 is 2,285,000 acres, of Canada 563,400 acres (*U.S.A. Agric. Returns*, 1923), and of India 3,532,000 acres (*Indian Government Returns*, 1923). The following figures show the progress in the production of linseed, the figures being those of the acreage of land under linseed cultivation in the principal producing countries:

	Argentine.	India.	U.S.A.	Canada.	Russia.
1904	740,000	571,832	585,013	13,388	471,836
1908	1,048,852	163,200	645,125	79,133	500,339
1912	1,130,000	641,200	701,825	528,505	650,000

Principal Directions of Trade.

The total imports of linseed into England during some recent years are as follows (*Board of Trade figures*):

	1913.	1919.	1920.
Tons	654,812	552,912	389,367
£	7,195,399	20,662,835	15,688,378

The quantity of seed exported was (*Board of Trade Returns*):

	1913.	1919.	1920.
Tons	5,781	3,486	1,370
£	69,695	278,918	55,629

The seed retained and pressed in England being:

	1913.	1919.	1920.
Tons	649,031	549,426	387,997
£	7,125,704	20,383,917	15,632,749

The principal sources of the seed imported into England were as follows (*Board of Trade Returns*):

	1913.	1919.	1920.
CANADA:			
Tons	255,535	5,585	2,424
£	2,792,955	540,383	223,690
ARGENTINE:			
Tons	225,373	216,205	216,625
£	2,398,635	7,744,217	8,207,810
BRITISH INDIA:			
Tons	136,589	318,953	143,161
£	1,564,428	11,737,891	5,776,933
RUSSIA:			
Tons	19,849	280	1,763
£	228,167	12,700	118,367
U.S.A.:			
Tons	8,587	413	314
£	98,366	42,473	14,600

The total quantity of foreign linseed oil itself imported into England was as follows:

	1913.	1919.	1920.
Tons	11,888	976	1,595
£	310,670	105,156	166,107

The English pressed oil exported was as follows:

	1913.	1919.	1920.
Tons	29,911	75,002	48,421
£	880,833	6,952,027	4,959,404

Production of the Oil from the Linseed.

The flax seed is a small brown pod about ¼in. long and 6 milligrammes in weight. The average percentage composition of the seeds (*Thorpe's Dict.*) is: Water, 9.0; protein, 22.8; and fat, 44.4; nitrogen-free substances, 22.8; fibre, 6.8; and ash, 4.2.

The oil-seed trade recognises several qualities of linseed, and these are usually designated by the name of the country or district where the seed has been grown. The Baltic seed is generally considered of first-class quality, and gives the best drying linseed oil. Baltic seed is now marketed and sold on a basis of 95 per cent. purity and some varieties as high as 97 per cent. Some of the lower-quality seeds have been found to contain hemp, rape, and mustard seeds, due to contamination during cultivation or harvesting. The proportion of oil contained in flax seeds cultivated in different countries varies between 30 and 40 per cent. The following are average figures and are quoted from Leather (*Memoirs of Dept. of Agric. of India*, Vol. I., No. 2, p. 38):

	Per Cent.
Russian Linseed	32/38
Indian Linseed	37/43
River Plate Linseed	35/36
N. American Linseed	36/38
Levant Linseed	37/42
Hungarian Linseed	36/38
Morocco Linseed	36/40
Sicilian Linseed	41/42
Chinese Linseed	31/38

The linseed oil to be used for edible purposes and by artists is made by pressing the seed in the cold, a light yellow-coloured product with a pleasant odour and taste being obtained. The commercial oil is obtained by hot expression of the seed at high hydraulic pressures, after a preliminary maceration and heating at about 70° C. The high-quality seeds are crushed direct, but the poorer qualities are first screened to remove any foreign matter. The residual matter after expression of the oil is used as a cattle food. In Germany some attempts have been made to extract the oil by means of volatile solvents, but little success has been met with, except in the cases of low grade or contaminated seed. Solvent-extracted linseed oil has been found to be of a very dark colour, unsuitable for high-quality paints and the cake is of little value as a cattle food. In the United States some linseed oil is obtained by extraction methods, using naphtha as the solvent medium. Mastbaum (*Zeit. angew. Chem.*, 1896, Vol. 9, p. 719), has shown that the oil obtained by pressing the seed has superior drying qualities to that obtained by solvent extraction, this being due to the former containing a higher percentage of low-melting glycerides of the unsaturated fatty acids.

Linseed Cake.

The percentage composition of the linseed cake obtained by the two processes of expression and solvent extraction are given as follows by Kellner:

	Water.	Protein.	Fat.	N. Free Extract.	Fibre.	Ash.
Pressed	11.0	33.5	8.6	31.7	8.7	6.5
Solvent extracted ..	10.2	37.4	3.8	32.7	9.1	6.8

In the treatment of linseed, enzyme action plays an important part. Such action on the cyanogenetic glucoside contained in the seed is liable to become active when the seed is crushed and moistened (Jorrissen, *Bull. Acad. Roy. Belg.*, 1883, Vol. 3, p. 750). Heating the seed before cold pressing destroys all enzymes. The bacterial and enzymatic decomposition of linseed has been studied very extensively by Collins and Blair (*Analyst*, 1914, Vol. 39, p. 70, and *Chem. News*, 1915, p. 19), these authors stating that linseed cultivated in tropical countries contain a more active type of hydrolysing enzyme than the linseed grown in sub-tropical and temperate countries. Collins (*Proc. Durham. Phil. Soc.*, 1914, Vol. 4, p. 99/108), concludes that any fermentation that would take place in linseed under optimum conditions is relative to: (1) extent of the enzyme and cyanogenetic glucoside present; (2) temperature; (3) acidity. The acidity

of the animal stomach being about N/20, linseed cannot under normal conditions ferment when fed to carnivorous or herbivorous animals. Extensive researches are now being conducted in the U.S.A. as to the conditions under which any fermentation products are formed and liberated from linseed or linseed cake.

Owing to its high protein and fat value linseed cake has found extended application as a cattle feeding stuff. The following table quoted from Henrys "*Feed and Feeding*" gives typical percentage analyses of the more common feeding cakes.

	Protein.	Fat.	Extract.	Fibre.	Ash.	Water.
Soya	42.7	6.0	28.1	6.0	5.9	11.3
Cottonseed	33.9	7.8	35.7	7.3	5.5	9.8
Linseed	45.3	10.2	24.0	6.3	6.6	7.0

From a digestible nutrient standpoint, the value of linseed meal is as follows (*Ministry of Agriculture Journal*, August, 1923, p. 461):

Proteid	30.8
Soluble carbohydrates	27.2
Nutritive Ratio	1 : 1
Maize meal equivalent per 100lb. maize	74

Taking the price of linseed cake as £10. 10s. per ton:

The manurial value per ton is	£1 19 0
Cost of food value per ton is	£8 11 0
Starch equivalent per 100lb.	75
Price per unit starch equivalent	£0 2 4
Price per lb. starch equivalent	1.25d.

The British Linseed Cake Trade.

The production of linseed oil cake in Great Britain alone during the last three years has exceeded 1,000,000 tons per year. This was supplemented by the importation of 300,000 tons. The total linseed cake exported last year (1922) was 42,000 tons. The extent of the British trade in linseed cake, is shown in the following tables (*Board of Trade figures*):

	1913.		1919.		1920.	
	Tons.	£	Tons.	£	Tons.	£
Imported into England	83,679	626,118	71,252	1,639,245	44,290	954,013
Exported from England	7,435	57,687	1,965	45,820	4,199	99,111
Principal sources of Imports—						
U.S.A.	24,837	185,253	43,112	1,006,566	22,313	483,692
Russia	18,747	146,592	—	—	—	—
British India	17,606	129,707	14,310	288,594	10,413	21,849
Canada	15,233	112,899	10,165	257,220	1,423	33,382
Argentine	2,318	16,306	488	11,749	2,098	44,594
Spain	2,187	15,506	400	10,000	680	13,694
Germany	1,788	12,788	—	—	—	—

The Properties of Linseed Oil.

Linseed oil is a light-brown liquid, with a characteristic odour and taste and very pronounced drying properties. Its physical constants are tabulated below:

Specific gravity at 15.5/15.5° C.	0.9340
Melting point	−16° to −20° C.
Solidifying point	−25°
Saponification value	190 to 195mgms. KOH
Iodine value	170 to 200
Reichert—Meissel value	Nil.
Maumené test	104 to 120° C.
Heat of bromination	30° to 31° C.
Refractive Index at 15° C.	1.4835
,, ,, at 20° C.	1.4807
Oleo-Refractometer at 22° C.	+50°
Butyro-Refractometer at 20° C.	84 to 90°
Viscosity at 20° C.	212 seconds
Coefficient of expansion	0.00075
Distillation number	16.3
Flash point	240° C.
Acetyl value	4.0
Ozone number	33.5
Oxygen number	18.0
Acid value	0.8 to 8.5
Unsaponifiable matter	0.5 to 1.0
Valenta value (alcohol reagent)	57 to 74° C.
(acetic ,,)	5.9
Drying test	18 to 84 hours
Hehner value	95
Hexabromide value	43.0

Linseed Oil Fatty Acids.

Specific gravity at 15.5/15.5° C.	0.9233
Melting point	24° C.
Solidifying point	16° C.
Titre point	19 to 19.4° C.
Neutralisation value	198mgms. KOH
Mean molecular weight	283
Iodine value	195
,, of liquid fatty acids	209
Refractive index at 60° C.	1.4546
Ether-insoluble bromides	35 per cent.
Heat of bromination	21° C.

U.S. Government Specifications for Crude and Boiled Oils.

The U.S.A. Government enforce rigidly the following specification for the supplies of linseed oil:

	Maximum.	Minimum.
Specific gravity at 15° C.	0.936	0.932
,, 25° C.	0.931	0.927
Iodine value (Hanus)	190	178
Saponification value	192	189
Acid value	3.0	Nil
Ref. index at 25° C.	1.4805	1.4790
Unsaponifiable matter	1.5 per cent.	Nil.

The following specifications for boiled linseed oil issued by the U.S. Navy Department, November 20, 1911, are the ones now ruling.

1. The oil must be absolutely pure boiled oil of the best quality, made wholly by heating pure linseed oil to over 350° F., with oxides of lead and manganese for a sufficient length of time to secure a proper combination of the constituents and be properly clarified by settling or other suitable treatment.

2. Evidence of the presence of any matter not resulting solely from the combination of the linseed oil with the oxides of lead and manganese shall be considered grounds for rejection.

3. To be acceptable the oil must show on examination:—Unsaponifiable matter—Not more than 1.5 per cent. Lead oxide (PbO)—Not less than 0.20 per cent. Manganese oxide —Not less than 0.04 per cent. Iodine No. (Hanus)—Not less than 170. Specific gravity at 60° F.—Not less than 0.938.

4. The oil shall give no appreciable loss at 212° F., in a current of hydrogen, and the oil flowed over glass and allowed to drain in a vertical position must dry free from tackiness in 12 hours at 70° F.

5. To be purchased by the commercial gallon; to be inspected by weight, and the number of gallons to be determined at the rate of 7½lb. of oil to the gallon.

6. Before acceptance the oil will be inspected. Samples of each lot will be taken at random, the samples well mixed together in a clean vessel, and the sample for test taken from this mixture. Should the mixture be found to contain any impurities or adulterations the whole delivery of oil it represents will be rejected.

7. To be delivered in shipping cans and cases which shall conform to the latest specifications for the same issued by the Navy Department, or, if specifically stated in the contract, in strong, tight, well-made white oak casks, hooped with eight iron hoops; the chime hoops to be about 1¾ inches wide; the bilge hoops to be about 1½ inches wide; each cask to have a capacity of about 50 gallons.

8. Barrels to be marked with gross and net weight, and their weights will be verified by the inspecting Officers as may be deemed necessary.

9. The quantity of oil delivered in 5-gallon shipping cans will be determined by taking the gross weight of 10 per cent. of the total number of cans, selected at random, from which the average gross weight of the delivery will be determined. A sufficient number of these cans will be emptied to determine the average tare, and the net weight of the oil will be taken from the figures thus obtained.

10. Each delivery will be considered a lot by itself, and each lot will be inspected and accepted or rejected as it passes or fails to pass the test required. No second test of any lot rejected will be permitted.

Chemical Composition of Linseed Oil.

Linseed oil is composed of a complex mixture of triglycerides. Being a natural product, it is liable to vary in composition, with the type of soil and seed, climatic conditions, period of harvesting and state of maturity at time of expression. The identities of all the acids contained in linseed oil have not yet been definitely established, and the proportion in which the various acids exist as determined by various authorities, vary widely. It is generally accepted that linseed oil contains the following saturated organic acids: stearic, palmitic, arachidic, myristic and the following unsaturated organic acids, oleic, linolic and linolenic. Hazura (*J.S.C.I.*, 1896, p. 77), considers that the drying oils as a class consist mainly of mixtures of oleic, linolic, linolenic, and iso-linolenic, all of which are liquid. The composition of linseed oil according to Hazura and Mulden is as follows:

	Hazura and Grüssner (*Monatsh*, 1876, Vol. 8 p. 260).		Mulder (*Die chemie der austrocknenden Oele*. Berlin, 1867, p. 40–49).
Oleic	5	....	10
Linolic	15		
Linolenic	15		80
Isolinolenic	65		
Myristic	—	....	5
Palmitic	—	....	5

A more detailed account of the composition of linseed oil is given in the following table, No. 1 Fahrion (*Zeit. angew. Chem.*, 1903, Vol. 16, p. 1,193); No. 2 (*Zeit. angew. Chem.*, 1910, Vol. 23, p. 1,106). Nos. 3 and 4 are those calculated by Newton Friend ("*Composition of Linseed Oil*") from the figures in Hazura and Grüssner given in the last table:

	No. 1.	No. 2.	No. 3.	No. 4.
Oleic	17.5	17.5	4.3	9.5
Linolic	26.0	30.0	12.9	—
Linolenic	10.0	38.0	68.9	75.8
Isolinolenic	35.5			
Unsap. matter	0.8	0.6	1.0	1.0
Saturated organic acids (palmitic, myristic, and arachidic)	8.0	9.3	8.6	9.4
Glyceryl radicle	4.2	4.6	4.3	4.3

Mitchell considers linseed oil to consist of 10 to 15 per cent. of the glycerides of solid fatty acids (principally palmitin), and 85 to 90 per cent. of the glycerides of liquid fatty acids, the latter consisting of 5 per cent. oleic, 15 per cent. linolic, 15 per cent. linolenic, and 65 iso-linolenic. Newton Friend (*loc. cit.*), suggests that for linseed oil to give an iodine value lying between 170 and 180, the percentage composition would be as follows:

Constituents.		Iodine Value.		Iodine Value.
Unsap matter	10	0	10	0
Saturated organic acids				
Oleic acid	5	4.5	5	4.5
Linolic acid	59.1	107.2	48.3	87.9
Linolenic acid	21.3	58.3	32.1	87.6
Glyceryl radicle	4.6	0	4.6	0

Schicht (*Seif.*, 1914, Vol. 34, 6. 673), has identified in linseed oil the presence of linolo-palmitostearin, dioleostearin and linolodistearin. Orloff (*Jour. Russ. Phys. Chem. Soc.*, 1911, Vol. 43, p. 1508/1525), gives the results of his classic researches into the composition of and distribution of oxygen in the dried layers of linseed oil. Orloff found that with an oil layer 100 square centimetres in area, oxygen was absorbed to the extent of 12 per cent. at a stage when setting takes place, and then oxidation proceeded further reaching a maximum at 16 per cent. A solid phase is formed at 12 per cent. A physical process also takes place, oxygen penetrating or diffusing into the oil.

The Refining of Linseed Oil.

The refining of linseed oil is to eliminate impurities and foreign matter such as water, mucilage, and odouriferous and colouring matters. Edible linseed oil is deodourised and decolourised by treating with charcoal or fuller's earth under vacuum and filtering and then tanking or allowing to stand for some time so that any colloidal matter may subside. Artists' linseed oil is prepared by bleaching the cold-expressed oil by exposure in thin layers to sunlight or to the action of ultra-violet light. Hot-expressed linseed oil is refined by first allowing the crude oil to settle out, at a temperature of about 70° C., drawing away the impurities, adding a small quantity of sulphuric acid, well stirring the whole and allowing to stand for a few days when the carbonaceous impurities settle out and leave a clear and pale oil. Various oxidising agents such as potassium permanganate, potassium bichromate and hydrogen peroxide have been proposed as refining agents and have found some application In any refining process, the preliminary settling appears to be an important and efficient means of obtaining a good-quality product.

Common Adulterants and Their Detection.

Continental linseed oils have been found occasionally to be adulterated by the addition of cheap fish oils, rosin, mineral oils, cottonseed or other semi-drying oils. The refractive index, iodine value and flash-point are in general indicative of any adulteration. The refractive index is depressed by animal and fish oils, and raised by polymerised linseed or mineral oils. Sjollema (*Zeit. Unters. Nahr. Genussm.*, 1903, Vol. 6, p. 631), states that genuine linseed oil remains clear at −14° C., any adulteration being detected by turbidity at low temperatures. Rosin and mineral oil adulteration may generally be detected by the flash-point, and the Liebermann-Storch reaction; cottonseed oil adulteration by Halphen's reaction; fish oils by the darkening of the insoluble bromides when heated and also by the cholesteryl acetate reaction. Linseed oil of density below 0.930 is to be regarded with suspicion. The iodine value should not be below 175.

An outstanding characteristic of genuine linseed oil is the insoluble bromide test and the heat evolved on treatment with sulphuric acid. The following list shows the heat value for various oils: linseed 104° C., hemp seed 98° C., whale oil 91° C., poppy seed 74° C., arachis 67° C., rape 57° C., castor 47° C., olive 42° C. Lewkowitsch (*Analyst*, 1904, Vol. 29, p. 334), states that the insoluble bromide value of the glycerides is an important figure in differentiating various types of treated linseed oils. The following table gives typical values:

Oil.	Specific Gravity.	Iodine Value.	Insoluble Bromide. Per Cent.
1. Linseed oil	0.9308	186.4	24.17
2. Pale boiled oil	0.9429	171.0	20.97
3. Double boiled oil	0.9449	169.96	13.03
4. Linseed oil heated to 600° F.	0.9354	176.3	8.44
5. Linseed oil blown at 120° C. for 10 hours	0.9460	166.6	23.16
6. Ozonised oil (Baltic oil)	0.9310	180.1	36.26—36.34
7. "Thin" lithographic varnish	0.9691	125.3	2.00
8. "Medium" „	0.9693	121.9	0.95

Applications and Uses of Linseed Oil.

The principal applications of linseed oil are in the manufacture of varnish, paint, linoleum, oilcloth, and soft soap. Linseed oil gives a quick lathering soap of characteristic odour and colour. It is used in the manufacture of transparent soap and in pharmacy in making green "sapo verdigris." The majority of its uses are based on linseed oil possessing the best drying qualities of all oils. Polymerised linseed oil is used in the printing trade, in the manufacture of inks, for lithographic work and in the preparation of plastic masses. Polymerised linseed oil is also a valuable carrying agency for pigments in paints and varnishes and in the preparing of putty. A rubber substitute, produced by the interaction of sulphur and linseed oil at elevated temperatures, has recently been marketed.

The type of linseed oil used, either raw or treated, varies with the particular industry. In the paint and varnish industries the Baltic oil is considered the best obtainable from a drying standpoint. Recent investigations, however, have shown that the River Plate seed gives an oil equal in quality to the Baltic oil when cultivated under supervision and harvested under modern methods.

The hardening of linseed oil is now being conducted on an extensive scale. The stearine produced is of a good grade and commands a high market price. Woodmansey (*J.S.C.I.*, 1919, p. 104T) has shown that for permanency, a polymerised linseed oil is superior to an oxidised oil as a paint vehicle, and that the oxidised oil after drying may be decomposed by lengthy exposure, with the formation of liquid acid compounds, which in the case of a paint containing white lead may be neutralised to form a brittle coating, but if the paint contains an inert base—*e.g.*, barytes or iron oxide, the paint becomes tacky and is easily removed by soap. This has been borne out by the experience of painters and lineleum printers, who used raw oil and a dryer instead of boiled oil, and found the paint to weather badly.

The Drying of Linseed Oil.

The drying of linseed oil with the production of linoxyn, is generally considered a process of oxidation and not a simple evaporation as the name would imply, the coagulation of the oxidised glycerides being an important factor. In the production of blown or oxidised oils for paint and linoleum manufacture, the oil is either sprayed at about 100° C., or air is blown through the hot oil. It has been shown that very little if any polymerisation takes place during oxidation. Various catalysts or driers are used to accelerate the oxidation of linseed oil, the better known of these being litharge, red lead, and the acetates, resinates, and oleates of lead and manganese. An excellent drier is prepared by heating together rosin and ammonium metavanadate. Vanadium driers act more readily and give better drying oils and films than cobalt, lead or manganese in spite of somewhat darkening the oil. Gentle (*Zeit. angew. Chem.*, 1906, Vol. 19, p. 2087), states that a resin is obtained from an eastern tree, *Rhus vernicifera*, which is an extremely active accelerator for the drying of linseed oil Fokin (*Jour. Phys. Chem. Russia*, 1907, Vol. 39, p. 617), and Lipport (*Zeit. angew. Chem.*, 1905, Vol. 18, p. 94), have studied the oxidation of linseed oil and give the following conclusions:—(1)

the rate of oxidation is doubled for every 10° C. rise in temperature; (2) the oxygen absorption at 100° C., is 27 per cent.; (3) pressure has a marked influence on the rate of oxidation. Fokin claims that this is directly proportional to the pressure: (4) the density of the oil is increased; (5) Ostwalds formula for auto-catalysis is applicable. (6) The oxidation of linseed oil is a two-stage process, the first consisting of the oxidation of the glycerides, the second in the coagulation of the oxidised glycerides from the sol to the gel form (*Zeit. angew. Chem.*, 1921, Vol. 34, p 86). The extent of the saturated glycerides present in linseed oil have also an important bearing on the rate of the drying of the oil.

Oxidation and Polymerisation of the Oil.

The oxidised linseed oil is made on a commercial scale by an initial heating of the linseed oil so as to eliminate any moisture, 0.5 per cent. of accelerator added, the oil thoroughly agitated by means of an air current, allowed to settle and the clear oil decanted. The oxidised linseed oil dries very much more rapidly than the raw product. During oxidation the iodine value of the oil is reduced with a corresponding increase in density. Proctor (*J.S.C.I.*, 1905, Vol. 24, p. 1,287), conducted a number of experiments, heating the oil and oxidising at 100° C., the change in constants being as follows:

Hours Treated.	Specific Gravity.	Iodine Value.
0	0.930	165
8	0.933	158
16	0.940	145
24	0.943	140

Heating linseed oil brings about a marked change in its physical and chemical properties. Heating up to about 250° C., effectually coagulates the mucilage, and polymerises the oil, commencing with the linolenic glycerides. Coffey (*J.S.C.I.*, 1921, p. 19T), has made a comprehensive study of the polymerisation of linseed oil with the following results:

Hours of Heating.	Sp. Gr. 20° C.	Viscosity 20° C.	Acid Value.	Sap. Value.	Iodine Value.	Hexa Bromide Value.
0	0.9310	1.00	6.4	189	189	43
7	0.9480	2.26	10.4	188	177	Nil
21	0.9714	4.00	12.6	188	142	,,
35	0.9810	34.40	15.0	188	116	,,
42	0.9875	50.00	15.0	188	107	,,

The extent of polymerisation at higher temperatures is shown in the following table, Friend (*J.C.S.*, 1917, Vol. II, p. 162):

Time of Heating (hours)	Temp.	Molecular Weight
0 ..	15°C ..	740
30 ..	200 ..	760
36 ..	300 ..	1,000

Future Prospects of the Linseed Industry.

The importance of the linseed industry to Great Britain was brought into marked prominence during the war. The British Flax Growers' Association has expressed the opinion that Great Britain is capable of growing all the linseed necessary for home consumption and hence may become independent of foreign supplies of seed or oil. From an economic standpoint the present value of a linseed crop is £27. per acre, the cost of production being £9. per acre. The quantities of oil obtained from the pressing of the linseed imported into England for the last three years have been as follows:—1920, 125,000 tons; 1921, 155,000; and 1922, 117,450. The tariff laws of the various countries have a marked effect on the price and production of linseed and its allied products. One instance is of the Fordney tariff by which an import duty of £17. per ton was placed on all linseed oil imported into the United States, with the result that the linseed oil trade between Great Britain and North America has been absolutely destroyed (*Economist*, February 17, 1923, p. 355).

The growing of linseed for fibre and oil purposes is important from a national standpoint in making the country self-supporting and also in the fostering of trade, the soil and climate of England being quite suitable for cultivation purposes. The growing demand for pure linseed oil for industrial purposes within recent years should assist the industry and allow it to compete successfully with other treated oils which are less suitable, particularly in the paint and linoleum industries.

PRUSSIAN BLUE FROM COAL GAS.*

NEW PROCESS FOR ITS DIRECT PREPARATION.

By A. Delcleve.†

BOTH coal gas and coke-oven gas contain cyanogen compounds, according to the work of M. Lewis, only in the form of free cyanogen and hydrocyanic acid. Thiocyanic acid, if formed, would be decomposed immediately in the presence of hydrogen, according to the following equation:

$$CNSH + H_2 = CNH + H_2S.$$

Again, ammonium cyanide cannot be present in the gases for this compound decomposes at temperatures above 266° C., and the presence of ammonium thiocyanate has not been detected by any experimental method. The cyanogen compounds met with in the gas liquors result from secondary reactions. Thus ammonium ferrocyanide is formed by the action of free hydrocyanic acid in the presence of ammonia, on the sulphide of iron, which itself results from the action of the hydrogen sulphide on the iron pipes and scrubbers.

$$6HCN + 6NH_3 + FeS = Fe(CN)_6(NH_4)_4 + (NH_4)_2S.$$

The thiocyanate is formed by the interaction of carbon bisulphide and the ammonium sulphide dissolved in the liquors:

$$(NH_4)_2S + CS_2 = NH_4CNS + 2H_2S.$$

Drawbacks to the Bueb Recovery Method.

The industrial importance of the cyanogen compounds need not be emphasised here, but it may be mentioned that the world's consumption of the alkaline cyanides alone reaches almost 20,000 tons per annum. The ferrocyanides have numerous uses in dyeing, organic chemistry and metallurgy. Prussian blue itself finds important outlets in the leather industry, and for colouring paper and plastic materials. There is little doubt that were the price of Prussian blue not so high, its uses could be increased several fold.

All the processes for the direct extraction of hydrocyanic acid from coal gas that have been proposed hitherto have been displaced by the Bueb process. In this process a pasty mixture consisting of a complex of iron, cyanogen compounds, and ammonia in ammoniacal liquor is obtained. After the free ammonia has been eliminated and the material filtered and dried, the resultant product is of very low value, and consists, in the author's opinion, of a mixture of Prussian blue 30 per cent., ammonium ferrocyanide 44 per cent., and ammonium sulphate 4 per cent. The abandonment of the direct extraction processes is due largely to the two facts—firstly, that transport and concentration costs for ammoniacal liquor are unduly high; and secondly, that the products obtained are not very valuable. In France, even the Bueb process is but rarely worked as the cost of purifying the Prussian blue-ammonium thiocyanate mixture is prohibitive.

Outlines of the Recovery Process.

The process to be described below has for its object the direct production from the gas itself of Prussian blue in commercially saleable form. It is based upon experimental work in which the effect of passing the cyanogen-containing gas through aqueous solutions of ferrous salts and suitable alkaline salts, was closely studied.

When an alkaline solution is added to the solution of a ferrous salt, a precipitate of ferrous hydroxide is formed.

$$2M^1OH + FeSO_4 = M^1_2SO_4 + Fe(OH)_2.$$

If the gas resulting from the distillation of coal is bubbled through an alkaline solution containing ferrous hydroxide in suspension, iron sulphide is formed:

$$Fe(OH)_2 + H_2S = FeS + 2H_2O.$$

This iron sulphide suspended in the alkaline solution, gives the alkali ferrocyanide in the presence of the hydrocyanic acid of the coal gas:

$$FeS + 6HCN + 4M^1OH = M^1_4Fe(CN)_6 + H_2S + 4H_2O.$$

The Harmful Secondary Reactions.

At the same time however, the following secondary

* *Chimie et Industrie*, October, 1923.
† Chemical Engineer to the Société des Houilleries de St. Etienne.

reactions, which are by no means negligible, occur:

$$2M^{I}OH + H_2S = M^{I}_2S + 2H_2O.$$

$$M^{I}OH + HCN + H_2S = M^{I}CNS + H_2O + H_2.$$

Part of the hydrocyanic acid, therefore passes into the state of sulphocyanide, whilst the liquor becomes charged with sulphur compounds which upon oxidation may give rise to polysulphides, thiosulphates and similar compounds. Again, since the coal gas can never be without traces of free oxygen, deposits of free sulphur may also be formed:

$$2H_2S + O_2 = 2H_2O + S_2.$$

$$H_2S + 2Fe(OH)_2 + O_2 = 2Fe(OH)_3 + S.$$

The free sulphur formed combines in the presence of moisture with the iron monosulphide to form various polysulphides which can react with the hydrocyanic acid to form thiocyanic acid:

$$2FeS + S = Fe_2S_3.$$

$$Fe_2S_3 + HCN = HCNS + 2FeS.$$

$$Fe_2S_3 + FeS = Fe_3S_4.$$

$$Fe_3S_4 + S_2 = 3FeS_2.$$

Measures to Avoid the Secondary Reactions.

In order to avoid as far as possible these undesirable secondary reactions, the following measures must be adopted: The use of caustic alkalies should be avoided and substituted by the salts of weak acids, so that the weak acid may be replaced by hydroferrocyanic acid formed in the liquor, and at the same time the hydrogen sulphide be prevented from reacting with the alkali. Sodium carbonate meets these conditions. The presence of air in the coal gas should be as far as possible avoided.

The means the writer has adopted for the prevention of the accumulation of free and combined sulphur and the formation of sulphocyanides are the following:

(1) Ferrous salts in solution when treated with a solution of alkaline carbonate give first a precipitate of ferrous carbonate which rapidly becomes converted into ferrous hydroxide. This hydroxide reacts with hydrogen sulphide to give iron sulphide which, as shown earlier, can react to give the alkaline ferrocyanide.

(2) The presence of caustic alkalies and the alkaline sulphides having been recognised as harmful, it has been considered advisable to work with gas freed from its ammonia.

(3) On raising the temperature of the alkaline ferrocyanide mixture the following reaction, which does not take place at all at ordinary temperatures, occurs:

$$Na_4Fe(CN)_6 + 3S_2 = 4NaCNS + Fe(CNS)_2.$$

(4) To avoid the adverse effects of oxygen, the ferrous salts employed should be as free from ferric salts as possible.

If the above four conditions are realised, by bubbling the coal gas through the absorption medium to saturation point, there will be obtained a mud consisting of a solution of alkaline carbonate, alkaline ferrocyanide, alkaline sulphate, and a little sulphocyanide, which is formed in spite of all the precautions taken, and containing in suspension iron sulphides rich in sulphur proceeding from the action of the oxygen in the gas.

Separation of the Insoluble Iron Compounds.

The direct separation of the iron sulphides from the solution containing the ferrocyanide is inadvisable. The process recommended by the author is to bubble air vigorously through the suspension. By this means the iron sulphides are decomposed into ferric oxide and sulphur, whilst the hydrogen sulphide which entered into the solution during the treatment with the coal gas is oxidised to sulphuric acid, and is finally converted to alkaline sulphate.

$$2FeS + 3O + 3H_2O = 2Fe(OH)_3 + 2S.$$

$$Fe_2S_3 + 3O + 3H_2O = 2Fe(OH)_3 + 3S.$$

$$H_2S + 2O_2 + Na_2CO_3 = Na_2SO_4 + H_2O + CO_2.$$

$$Na_2S + 2O_2 + Na_2CO_3 = Na_2SO_4 + Na_2CO_3.$$

This oxidation completed, it is easy to separate the precipitate of ferric oxide and sulphur from the solution. The soluble ferrocyanide can then be precipitated as ferric ferrocyanide (Prussian blue) by the usual processes. The precipitate of ferric oxide and sulphur is treated with dilute sulphuric acid. The free sulphur is separated, and the filtrate, which is a solution of ferric sulphate, is utilised for oxidising the ferrous ferrocyanide to Prussian blue.

Advantages of the New Process.

Utilising simple methods the present process permits of:

(1) Recovering the whole of the hydrocyanic-acid contained of coal gas.

(2) Avoiding the formation in the iron oxide purification mass of compounds inert to hydrogen sulphide.

(3) Obtaining Prussian blue directly saleable, a small quantity of solid free sulphur, and sufficient ferric sulphate to provide the oxidising agent for completing the manufacture of the blue.

(4) Avoiding the formation of valueless sulphocyanides.

Of all processes for the manufacture of Prussian blue, the present process appears to be the cheapest. The plant required is relatively modest. A rotary washer of the standard three-compartment type for washing the gas, several bubbling vats, one, or preferably two, Zenith filters for filtration and drying, will be all that is necessary.

With regard to the necessity for working with ammonia-free gas, it is important to note that in the processes for the manufacture of ammonium sulphate by the semi-direct method, the passage of the gas through a solution of sulphuric acid containing 12-15 grammes per litre of free acid, is in no way deleterious to the hydrocyanic-acid content of the gas.

SEWAGE WORKS PROBLEMS.

STANDARD ANALYTICAL METHODS AND SLUDGE DISPOSAL.

SEWAGE works chemists and managers are troubled not a little just now in regard to several important matters—namely, the methods of testing the purity of effluents in order to avoid pollution of rivers, and also the formulation of some means for standardising the various tests adopted by sewage works managers and chemists all over the country. The Association of Sewage Works Managers has been holding a conference in London in connection with the Public Works, Roads and Transport Exhibition and the above matters were discussed. The Association which has been working very closely with the Ministry of Health has now formed a sub-committee to collect and collate information with regard to the methods of testing adopted in various parts of the country. Many of these, apparently, differ from the method suggested by the Royal Commission on sewage disposal, and as showing the need for standardisation it may be pointed out that even adopting the Royal Commission test it has been found that results differing by 50 per cent. have been obtained as between the use of distilled water and ordinary tap water for the purpose. In these circumstances the sub-committee is drafting definite proposals which will subsequently be placed before the Ministry of Health in the hope that the Ministry will then call a conference of sewage authorities, rivers boards, county councils, the Institute of Chemistry, the Society of Public Analysts, and any other interested parties.

The Sludge Digestion Process and Fertiliser Values.

Another matter which continues to cause sewage works managers and chemists trouble is the treatment of their sewage sludge without creating a nuisance. It is admitted that generally speaking the sludge question so far as its treatment is concerned, stands where it did when the Royal Commission of Sewage Disposal issued its fifth report in 1908. The most recent experiments on the problem have been carried out by Mr. J. D. Watson, engineer to the Birmingham, Tame, and Rea District Drainage Board, and aim at the treatment of the sludge by what is termed the digestion process. Disposal by digestion, it is claimed, has the merit that after the sludge is removed from the drying areas it is absolutely devoid of odour. Moreover, the method obviates waste of nitrogen and so enables the sludge to be used profitably as a fertiliser. The process is based on the Imhoff tank, and the dry sludge matter contains 2.71 per cent. of nitrogen. In the case of the Birmingham sludge, it is sold to contractors with a water content of about 25 per cent. and the contractors fortify it after further reducing the water content, with sulphate of ammonia, bone phosphates, and sulphate of potash. Whilst in some cases the contractors say that sewage sludge is not a profitable proposition from their point of view, on the other hand we hear that at Worcester as much as £2 per ton is being obtained for it, whilst in other parts a figure of £1 per ton is mentioned.

On the problem of the cost of transport, the Ministry of Health is doing all it can to secure a reduction in the rate,

FIFTY YEARS OF BRITISH AMMONIA SODA.

THE JUBILEE OF BRUNNER, MOND AND CO.

IN October of the year 1873 John Tomlinson Brunner and Ludwig Mond, after many months of anxiety and trouble, had the satisfaction of seeing building operations commence on the estate they had acquired at Winnington. In the spring of the following year the first works in Great Britain for manufacturing soda ash by the Solvay ammonia-soda process were put into operation, and the two young partners had the further satisfaction of being in a position to demonstrate practically that, under capable management, the process was a commercial success.

The First Plant at Winnington.

The first works, which were very modest, and built almost entirely to Solvay's plans, consisted of what at that time Solvay termed "one element," that is five small (4ft. 4in. diam.) Solvay towers, four stills, one lime kiln, one blowing engine, one driving engine, five filters, four furnaces, a mill and a water pump. Barns and other buildings existing on the estate were utilised for cooperage, joiner's shop, and smithy; the time office, stores, and laboratory were housed in another building after some extension, while the partners themselves, with their office staff, took possession of the harness room in the stable yard. From these modest beginnings, and in the short space of fifty years, the firm of Brunner, Mond and Co. has grown until there is no corner of the earth which its fame and the fame of its products have not reached. The ramifications and world-wide interests of the firm at the present day are too well known to our readers to necessitate detailed reference here, and some account of the early vicissitudes of the undertaking were given in our columns in February of this year, when the centenary of the British alkali industry was being celebrated by the United Alkali Company.

A Jubilee Commemorative Volume.

To commemorate their fifty years of progress, the firm of Brunner, Mond and Co. have just published an excellently produced and illustrated volume which, although written primarily to interest the past and present staff of the undertaking, yet contains much material of undoubted value not only to that portion of the public interested directly in the chemical industry, but also to the general public. The history of Brunner, Mond and Co. is essentially the history of the lives of the three great men whose courage, far-sightedness, and labours made it possible for such a gigantic organisation to be built up, and consequently the first chapter of the work deals with the lives of John T. Brunner, Ludwig Mond, and Ernest Solvay. In the words of Mr. John I. Watts, the editor of the volume, "at present their deaths are of too recent date for the world to realise what great men they were, and what it owes to their strenuous lives. The statement that they provided mankind with cheap soda, and thereby contributed in no small degree to the welfare of the human race, is of little significance until it is realised that this has meant lowering the cost of soap, glass, paper, woollens, textiles, and numbers of other necessaries that make up the cost of living. Each of them, too, started life with very little money; and each, when he became rich, devoted enormous sums to promoting the enlightenment and comfort of his fellow-men."

The second chapter deals briefly but explicitly with the rise of the alkali-chemical industry from the discovery of the Leblanc process to the year 1873, and the following chapter gives a fascinating account of the Brunner and Mond partnership. The "Progress of Fifty Years" is then dealt with in a comprehensive chapter. In looking back and comparing the works of 1881 with those of to-day, one is struck by the completeness of the change in the plant employed, and is led to marvel that the ammonia-soda process became a commercial success with the apparatus employed in the early days. That it did so certainly shows what an essentially sound process it is, and that the margin for profit between cost and selling price was ample in those first years. When it is realised that the whole of the plant has been remodelled, enlarged, or altered, not once, but many times, and that every part had to be specially designed, some idea can be obtained of the ceaseless activity that has been required to bring the process to its present state of its near approach to perfection.

War-time Services and Welfare Work.

The great services rendered by the company to the country during the war will be still fresh in the memory of most of our readers, but the facts and figures given in the Jubilee Volume on the production of calcium nitrate, ammonium nitrate, T.N.T., and synthetic phenol are presented in an exceedingly illuminating form. A powerful factor contributing to the success of Brunner, Mond and Co. has been the great and personal interest evinced from the outset by the leaders of the undertaking in the welfare, both material and intellectual, of the large number of workpeople employed. This phase of the company's activities is revealed very clearly in the book under consideration. A full list of the employees of the firm who laid down their lives during the war, both on active service with the forces and in the great T.N.T. explosion at Silvertown in 1917 are given, together with splendid photographs of the various memorials that the firm have erected. The numerous measures adopted by the firm to enhance the welfare of their employees are recounted in detail, and the list of Mond pensioners leaves the definite impression that very few other large industrial undertakings, either in this country or abroad, can produce an equal number of long-service employees.

Commercial Developments.

The final chapter of the volume deals with the commercial development of the firm. The policy of only one grade of product—the best—has been pursued unremittingly, with the result that the growth of the business has become so rapid that it has been necessary to establish separate sales companies in China, Japan, and India. Brunner, Mond and Co. are to be congratulated on publishing a commemorative volume which, for the intrinsic value of its contents no less than for the beautiful manner it is produced and illustrated, will ensure its becoming a valued possession to many.

THE CHEMICAL INDUSTRY CLUB.

FIFTH ANNUAL DINNER.

ON Monday, November 26, at the Connaught Rooms, Great Queen Street, London, the Chemical Industry Club held its fifth annual dinner. Mr. H. Edwin Coley (Chairman of the Executive Committee of the Club) presided. Among those present were Lord Exmouth, Sir Lionel Phillips, Sir Arthur Duckham, Mr. A. G. Craig, Professor Hodgkinson, Professor J. W. Hinchley, Sir William Pope, and Mr. J. A. Reavell.

Sir Lionel Phillips and Tariff Reform.

Sir Lionel Phillips proposed "The Profession and Industry of Chemistry," and emphasised the marvellous advance which had taken place in chemical and physical science. Chemistry was playing so important a part in our lives that it should be included and supported in the social system, as its great brother science, medicine, had been. Discussing tariff reform and free trade, Sir Lionel said that, whilst it might have been a very good thing in days gone by to go in for that glorious thing that we hold up to-day as a shibboleth—namely, free trade, the conditions of the world had changed enormously; theoretical economics no longer applied. We must view the position as it exists; it was no good our putting our heads in the sand and saying that we were the only people who knew how to manage our affairs; the rest of the world knew something as well, and the rest of the world, on the whole, appeared to have been doing pretty well by its action with regard to tariffs.

Mr. F. W. Harbord, C.B.E., F.I.C., responding, said there was no profession which was brought into more intimate relation with all the industries of the country than the chemical industry.

Sir Arthur Duckham said he was very glad to have been asked to attend the dinner, because he was very interested in the chemical industry, and was instrumental, more or less, in forming the new Institution of Chemical Engineers, of which he is the first president. The reason he had taken a part in the formation of the Institution was that he had hoped it would be the last straw, in the way of institutions and societies, which would break the camel's back, and would "bust the lot." He was certain all present would agree that there were too many societies and institutions, and

the time had arrived when there should be some merging of their activities. Many works in this country were inefficient, and the message he had to convey to his hearers was that he would rather see efficient combination and good production than protection.

The Objects of the Club.

Sir William Pope (President of the Club) proposed the toast of "The Chemical Industry Club." The Club, he said, was looked upon as providing a social link between all the great interests of chemistry. The membership of the Club included a variety of different types of people—the chemical manufacturer, the business man, and the down-trodden professorial class, which he had the honour more intimately to represent. The Club had been going on for roughly five years, and had become very important; he believed that it was going to become a sort of "key" club to the whole of the chemical fraternity. But the members of the Club ought to conserve very carefully a recollection of the men who founded it, in face of a good deal of opposition, and should be everlastingly grateful to those men. One of the founders was Mr. Coley (the Chairman), whom he (Sir William Pope) hoped to see in the Chair for a long time to come. He paid a tribute to Mr. Coley, and coupled his name with the toast.

The Chairman, in response, said that a great deal of work had been done on behalf of the Club by others as well as himself. Referring to the Executive Committee, Mr. Coley said he had never served on committees which had been so harmonious, pleasant, and unanimous in their efforts as the committees which had served the Club during the past seven years. It was the endeavour to make a Club in which every member was equal; they had appealed to nobody for support financially, and had never endeavoured to push any particular person forward because he had been an officer of the Club; that seemed to him to be one of the greatest successes achieved. There had also been democratic control, and he hoped sincerely that that democratic control would be continued in the future, so that it could never be said that the Club had been run for any particular person's advantage. The Club was the one concern connected with the industry and profession which was unbiassed and uninfluenced by any particular person or persons connected with the trade, and it was on that, he believed, that the future Club would be built.

Mr. W. Cullen then proposed "The Guests." Professor J. W. Hinchley, replying, said that the Institute of Chemical Engineers looked upon the Club as one which it was the bounden duty of everyone connected with the industry to support.

Presentation to the Chairman.

Mr. A. G. Craig proposed the final toast, of "The Chairman." On behalf of the members of the Club, he presented to Mr. Coley a gold half-hunter watch, as a mark of appreciation for his untiring work as the Club's first Hon. Secretary.

The Chairman, expressing his appreciation, said he accepted the gift with the greatest possible delight, because his resignation from the secretaryship was a step he little desired to take. The Club had been part of his life for seven years, and he had given up the work because he had felt that he could not carry it on as it should be carried on. His seven years of service were the most pleasant he had ever experienced.

SOCIETY OF CHEMICAL INDUSTRY.

PAPERS BEFORE NOTTINGHAM SECTION.

AT a meeting of the Nottingham Section of the Society of Chemical Industry held on November 21, Dr. H. S. Holden and Mr. J. E. T. Gilbert read a paper on "Observations on Some Micro-Organisms Growing in Glycerol."

Micro-Organisms Growing in Glycerol.

Glycerol, they stated, was generally considered to have a distinct lethal action on bacteria as seen in the preservation of calf lymph in a sterile condition by addition of an equal volume of 50 per cent. glycerol. This concentration of glycerol was largely used in bacteriological laboratories as a temporary mounting medium, and one such stock solution was found to contain a white flocculent deposit which consisted of one dominant mould (*Penicillium* type) and several kinds of yeast.

Of the latter two were isolated, one a white variety which formed smooth white colonies on agar, and the other a pink which showed similar, but larger colony characteristics. The first variety grows well on beerwort agar, and slowly fermented maltose and saccharose, but not on lactose. Glucose was fermented rapidly with the formation of acid and gas, while glycerol was fermented with the production of traces of alcohol and formic acid. The most remarkable character of this yeast, however, was its tolerance of high concentrations of glycerol even up to 75 per cent. solutions. The growth in solutions of lower concentration (5-20 per cent.) was increased considerably by supplying nitrogen either in the form of ammonium sulphate or peptone solutions. Growth in glycerol solutions caused change of form and also definite reduction in size.

The pink yeast resembled the white one in its tolerance of glycerol of high concentration, but of the carbohydrates mentioned glucose alone was fermented. The effect of the yeasts is the production of a general cloudiness in the glycerol, while the flocculent precipitate is a result of infection by moulds. This fungus and the pink yeast are probably the result of contamination from the air, and the production of the white yeast is possibly derived from the glycerol. Two drops of chloroform water (B.P.) to 10 c.c. of the culure solution inhibits the growth of both of the yeasts and the mould. The white yeast has not yet been identified with any known species.

Mr. Richmond mentioned that Savage had discovered certain yeasts which exhibited similar tolerance of condensed milk, and were also capable of fermenting sugar.

New Organic Compounds of Tin.

Mr. H. Lambourne then read a paper entitled "Organic Compounds of Tin," in which he described the so-called methyl-stannonic acid $CH_3.SnO.OH$, and some new acyl derivatives which seemed to show that they did not correspond to the simple type as represented by $CH_3.SnO.OR$. A condensed form of three molecules of the ortho type $CH_3.Sn(OH)_3$, would give a cyclic compound $(CH_3SnOOH)_3$, and some of the new derivatives he had prepared corresponded to such polymerised structure in which the tin and oxygen atoms were alternately combined. Other compounds appeared to be of open chain structure still containing the tin and oxygen atoms in alternate combination, while just recently he had obtained derivatives of even more complex constitution, possibly of the type $(CH_3SnOOR)_6$.

Hydrogen-ion Concentration—Its Value in Analysis.

Dr. Prideaux then gave a demonstration of a universal regulator of acidity, with some suggested uses in analysis, and showed the advantages of using the symbol PH in quantitative and graphical treatment of acidity and alkalinity. The lecturer showed how rapid changes of PH with added alkali corresponded to good titrations, while buffer mixtures produced gradual changes which corresponded to good hydrion regulations. He showed how the "B.D.H." universal buffer mixture together with their universal indicator improved the reguiation by the introduction of acids of intermediate dissociation constants, and indicated how the PH values of milk and other fluids could be tested.

It could be shown that the PH of beer lies between 3.9 and 4.7 by adding pure litmus to one sample which should give a red colour, and to another sample bromphenol blue which should give violet. The exact PH of beer could then be determined by using the universal buffer with methyl red. The use of the "B.D.H." comparator case was demonstrated as improving the accuracy of the determination. In hopped worts, prevention of the growth of disease was obtained if the PH was below 5.4, and this value could be as low as 4.3 without inhibition of yeast growth. The PH of vinegar is given by different authorities as 2.36 to 3.21 and 2.67 to 2.84 respectively, and it should not be below the lowest of these values. Buffer solution and Tropaolin OO showed a sample of vinegar after five-fold dilution to have a PH of 2.8.

Mr. Burford asked as to what was the advantage in taking the PH of ordinary drinking water. Mr. Calam inquired as to the sensibility of the palate towards liquors of low acidity, and mentioned the very different taste of beer and vinegar although of similar PH values.

In reply, Dr. Prideaux stated that the PH determination was useful in conjunction with other chemical properties of water. As yet no sensitiveness of the palate to PH had been found, but probably 0.001 N was about the limit, but considerable variation occurred according to whether the PH was produced by a strong acid in low concentration, or a weak acid in higher concentration.

LEGAL INTELLIGENCE.

MANUFACTURE OF "MILTON" IN AMERICA.

Milton Manufacturing Co., Ltd., *v.* W. D. Forbes.

In the King's Bench Division, on November 21, the Lord Chief Justice and a special jury heard an action by the Milton Manufacturing Co., Ltd., of Bunhill Row, London, E.C., against Mr. Wm. Dick Forbes, of Pinners Hall, London, E.C. Plaintiffs, who are the manufacturers of a disinfectant called "Milton," sued the defendant for £6,800., which represented the balance of the price of 12,500 £1 preference shares in the company, with interest. Mr. Forbes counter-claimed for a recession of the agreement to purchase the shares, alleging that he purchased them because of misrepresentations made by Mr. D. M. Rogers, the managing director of plaintiff company.

Mr. Forbes, in his evidence, stated that Mr. Rogers described the American market of Milton as wonderful, and said he had a site upon which a factory out there was to be built so that the 25 per cent. importation duty might be saved. It was upon the representation that £100,000 was to be spent in advertising in England and building an American factory that he bought the shares. In cross-examination Mr. Forbes agreed that the directors of the company took up 27,000 shares out of the 100,000, and the people who underwrote most of the 73,000 had paid up. Milton might have been a successful commodity in England, and there was every reason for believing that it would be successful in America. He also agreed that it was necessary that the company should have money with which to advertise and push their goods in America, and that the company had a smart agent in America. It was a fact that delay had occurred through the difficulty of getting the American authorities to accept labels on the bottles, while the agents there owed the company a huge sum on contracts.

At this stage the defendant submitted to judgment on the claim and counter-claim, his counsel observing that after hearing the defendants' admission in cross-examination he could not advise him that it would be wise to proceed.

CHEMICAL MANUFACTURER'S BANKRUPTCY.

Bertram Levin.

Bertram Levin, chemical manufacturer, carrying on business at Deansgate, Manchester, who was stated to have had large interests in several chemical companies, including the Comet, the Semolina, and Victors, Ltd., appeared for further examination at Manchester Bankruptcy Court on Friday of last week.

Debtor, it was stated by the Official Receiver, did not admit insolvency. He stated that apart from contingent creditors his assets exceeded his liabilities, and as touching contingent claims it was difficult to estimate his liability. His difficulties really arose out of his connection wth Victors, Ltd. The accounting statement supplied by debtor opened with a surplus of £36,405. on July 31, 1921, since which date he had earned an income of £2,000. To account for this sum of £38,405., he estimated that he had £11,437. bad debts, his household expenses were £2,000. and he had lost on shares held in Victors, Ltd., £14,280., whilst his liabilities *re* Victors, Ltd., was £4,928. His surplus, according to this statement, was £912.

Debtor stated, in the course of further examination, that he had not been asked to prepare a trading account.

An application was made on behalf of the petitioning creditor for an order to compel debtor to prepare a trading account. It was impossible to see debtor's position from the accounts he had provided.

The Registrar (Mr. Atkinson): The accounts are hopeless. For an educated business man I never saw a more clumsy statement. No business man, in fact, would dream of putting things in this way.

Debtor was ordered to file a proper cash account, and the examination was further adjourned until February 8 next.

SALE OF A FISH OIL PROCESS.

E. G. Oliver *v.* J. Wolstenholme.

In the King's Bench Division, on November 22, the Lord Chief Justice and a special jury heard an action by Mr. Edmund Gifford Oliver, of 59, Cadogan Square, W., against Mr. James Wolstenholme, of Great London Wall, E.C., in which the plaintiff claimed the return of £1,000. he had paid defendant in return for a one-third share of the price received for the sale of a process for the manufacture of edible fats from fish oils. Mr. Oliver's case was that Mr. Wolstenholme told him that he had an option of the purchase of valuable process from the Lewkowitsch Laboratories, and that he was putting up his own money to develop the matter in connection with the process he controlled that it might be sold at a good profit. It was ascertained a long time after plaintiff paid over his money that Mr. Wolstenholme had never controlled the process, and plaintiff charged him with misrepresentation and claimed his money back for want of consideration.

Mr. Wolstenholme, in his evidence, said he held an option on the process for some months, and showed it to Mr. Oliver. He negotiated with Spencer and Co., of Aberdeen; Lever Bros., and other big firms for the sale of the process without success.

The jury later stopped the case and returned a verdict for the defendant, for whom judgment was entered with costs.

POTASH FIRM'S LIQUIDATION.

Alsace Lorraine Development and Trading Company, Ltd.

A meeting of the creditors of the Alsace Lorraine Development and Trading Company, Ltd. (Societe Generale d'Alsace Lorraine), Pinners Hall, Old Broad Street, E.C., was held on November 23. The liquidator, Mr. A. H. Partridge, stated that the meeting was really a sequel to a conference of some of the larger creditors which was held on June 19 last, when the position of the company was explained. A statement of affairs showed liabilities of £12,743 6s., of which £9,642. 7s. 6d. was due to unsecured creditors. There was one partly secured creditor (the bank) for £4,056. 1s. 7d., who held security £2,355. 3s. 1d., leaving £1,700. 18s. 6d. to rank as unsecured. There was also a creditor for rent, £2,000., who held as security furniture valued at £600., leaving £1,400. to rank. The assets comprised £8,999. 2s. 3d., from which had to be deducted £30. for preferential claims, leaving net assets of £8,969. 2s. 3d. of a deficiency of £3,774. 3s. 9d. There were claims against the company for income tax, £1,360. 13s. 4d.; excess profits duty, £880.; and corporation profits tax, £1,720. 6s., which were at present under investigation. The company was incorporated on March 8, 1919, with a nominal capital of £50,000., made up of 40,000 shares of £1. each and 40,000 founders shares of 5s. each. After some discussion it was decided to confirm the voluntary liquidation of the company, with Mr. Partridge as liquidator, together with a committee of five of the principal creditors.

THE SEA TRANSPORT OF CORROSIVE ACIDS.

RESTRICTIVE POLICY OF BRITISH SHIPPING COMPANIES.

THE British heavy chemical industry, states a correspondent to the *Times Trade Supplement*, is now not altogether satisfied with the conditions on which consignments of corrosive acids are accepted by British shipping companies. These acids, by reason of their dangerous character, are shipped, as a rule, on deck, and it seems that the restrictions of the British companies are considerably more exacting than those of some Continental lines, and especially of German companies.

Sulphuric acid, for instance, is usually shipped in jars in wooden cases, in iron drums, or in carboys. Chemical firms report that frequently the shipping companies will not accept cases of a total weight of 3cwt., which means, allowing for tare, a net weight of the acid of 1½cwt., or even less. In some instances the total weight of the cases acceptable is understood to be limited to 1cwt. The number of cases which the companies will accept for one vessel is also restricted. Some of the Continental lines are not nearly so exacting in their requirements, with the result that foreign manufacturers are in a more advantageous position.

Limitations on Size of Drums.

Similarly, some shipping companies are understood to refuse to accept iron drums weighing more than about 3cwt. gross, while others limit the total weight to 1cwt., and it is common to restrict the number of drums for any one vessel to about 25. German companies, on the other hand, will accept drums of any weight, such as 11½cwt., which allows for 10cwt. of acid, and they impose no restrictions as to the numbers. They will accept, it is also understood, 500 drums for shipment in one vessel.

CORRESPONDENCE.

*** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE "SENSIBLE HEAT" COAL-CARBONISATION PATENTS.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—There have recently been quite a number of patents taken out for retorts in which the so-called "sensible heat" of gases is used for carbonisation of coal or other materials. I believe that the original idea was that of myself and the late Mr. John West (Patent No. 114,937). This patent was applied for on June 11, 1917, and the complete patent accepted April 25, 1918.

We did not use the words "sensible heat," but applied what is now called "sensible heat" to the ordinary Glover-West retorts with very useful results. We returned a portion of the stripped gas back through the incandescent coke, thereby partially cooling the coke and at the same time heating the gas, so that "sensible heat" helped in the carbonisation of the upper layers. In our case, we had external as well as internal heat. In several cases which have recently been noted in the Press, the "sensible heat" has been entirely used within the retort without external heating. The gas used for "sensible heating" is naturally an inert gas—that is to say, any gas which contains no oxygen, such as producer gas.

On August 28, 1917, in conjunction with Nitrogen Products and Carbide Company, I took out another patent (No. 128,660), in which acetylene was used as the inert gas. This was completed July 3, 1919. I have not found that anyone before these dates had suggested the use of the (sensible heat) inert gas for carbonisation, and it seems to me to make very little difference whether a combination of the "sensible heat" of inert gas is entirely used, or whether it is use in conjunction with external heat.—Yours, etc.,

F. Mollwo Perkin.

"Albion House," 59, New Oxford Street,
London, W.C. 1. Nov. 27, 1923.

TRADE MARKS IN THE IRISH FREE STATE.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We have received a number of inquiries with reference to the registration of trade marks in the Irish Free State. So far the Irish Parliament has not passed any measure requiring registration in that country, but it is expected that a Statute Law will in due course be introduced dealing with trade mark registration there. In the meantime the Ministry of Commerce and Industry have granted facilities by which trade-mark owners may enter their marks on the official records of the Ministry in Dublin, so as to constitute evidence of deposit, and of the date from which title by user is claimed. Such deposit will in fact be a preservation on public record of a firm's trade marks which is evidence of a claim to title, so that when legislation is introduced legalising their registration in the Irish Free State, such marks on the official list will have priority over those not on the official list.

It therefore, becomes a matter of first importance to consider the necessity of entering one's marks on the Irish records in Dublin, so as to set up a claim to title in priority to later applicants and if any of your readers will furnish us with specimens, in duplicate, of the trade marks used in connection with their business, together with the approximate date of first user, we shall be happy to undertake their deposit in the official lists above referred to. We shall be pleased to supply any further information desired.—Yours, etc.,

W. H. Beeston, Director,
Trade Mark Protection Society.

50, Lincoln's Inn Fields,
London, W.C. 2,
November 22, 1923.

CHEMICAL ENGINEERING AND HYDROCHLORIC-ACID TREATMENT.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—At the meeting of the Chemical Engineering Group, reported in your issue of November 23, Professor Hinchley made certain statements concerning chemical engineering and hydrochloric acid treatment. We have made a study of this problem for some years, and have in operation a number of plants dealing with difficult hydrochloric acid problems. In one works not very far from the Professor's lecture room we have been pumping *aqua regia* for some considerable time and while we cannot, for obvious reasons, give exact details of the process, we have documents in our possession from the firm, which is one of the best known in the country, stating how entirely satisfactory the results are.

In the Midlands we have had a series of vessels of some hundreds of gallons capacity working on hot hydrochloric acid for six years. We have not yet experienced deterioration. The Ceratherm Glandless Pump is already being applied for continuous use of hot hydrochloric acid in seven different countries, although it was only made available to the trade early this year. Finally we hardly think it possible that the conditions of use of hydrochloric acid which Professor Hinchley has experienced can be so very much more severe than those encountered in other works, and we cannot conceive them being as severe as some of the *aqua regia* and other processes for which we have to cater.—Yours, etc.,

Guthrie and Co.

Accrington, Lancashire,
November 26, 1923.

THE DISINFECTANT "IZAL."

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Referring to the letter of Messrs. Newton, Chambers and Co., Ltd., in your issue of November 23, *re* the statement in my recent article on "Disinfectants and Preservatives," concerning "Izal": in "Practical Sanitary Science," by R. Sommerville, 1906, the following paragraph occurs:—"Izal is a reddish-brown liquid, insoluble in water, and is derived from the oil produced during the carbonisation of coke in close ovens. It is a highly efficient disinfectant, and mixes with water in all proportions, forming a milky-white emulsion. For the disinfection of fluids, and fluids containing solids, a copious solution, at least 5 per cent. in strength, should be applied for half an hour."

When considering the efficiency of a disinfectant of a certain strength, it is necessary to bear in mind that it must come into contact with the germs to be destroyed without undergoing further dilution, and remain in contact with them for a considerable time, so that if the material to be disinfected is bulky, the strength of the disinfectant must be increased accordingly. However, it is well-known that the product "Izal," manufactured by Newton, Chambers and Co., Ltd., is highly efficient in such dilution as 1 in 600, which is the usual dilution employed for ordinary processes of disinfection. The statement quoted above by R. Somerville probably refers to extremely bulky solutions or fluids containing a high percentage of solids.—Yours, etc.,

Nov. 23, 1923. S. N. Brown.

THE SPANISH TRADE IN RED IRON OXIDE.

AMONG the more important products exported from Malaga is red oxide of iron. According to the U.S. Vice-Consul at Malaga it is mined, principally in the mountainous regions in the Province of Jaen. The crude ore is carried to Malaga, where it is levigated. Nearly all of the larger mining companies now possess overhead cables which connect the mines with the main railroad.

The ore milled in Malaga is reputed to be of very good quality, not equal in colour to the more expensive variety mined in the Persian Gulf region, but much higher in ferric-oxide content and therefore of more value as a preservative for iron and woodwork. Moreover, the Persian ore is only shipped in the crude form, there being no levigating nor grinding plants on the island of Ormuz nor in Persia.

The red-oxide industry has expanded considerably during the last 10 years, the greatest increase having occurred during the past three years. This is accounted for by the growing use of paints in construction work of all kinds. The cement and rubber trades also now consume large quantities, and a large amount is used in paper staining. Approximately 60 per cent. of the ore exported from Malaga is shipped to the United States, about 30 per cent. goes to the United Kingdom, and the remaining 10 per cent. is taken by various other countries. During the first six months of 1923 the total exports of levigated oxide from Malaga may be taken as 10,000 long tons.

ITEMS OF INTEREST.

Tariff Notes.—It is officially announced that the export duty on palm oil and gum copal from Sierra Leone has been abolished.

Unemployment Decreasing. — The number of persons on November 19 recorded in Great Britain was 1,234,700. This was 9,704 less than in the preceding week, and 251,178 less than the figure recorded on January 1, 1923.

Tin Prices Rising.—The price of tin has of late considerably advanced, and on Wednesday the price spurted further to £236. 17s. 6d. per ton for cash, and £237. 7s. 6d. for three months' delivery. It is necessary to go back to 1920 to find a quotation in excess of this figure, the highest level that year being £420. per ton for cash.

Industrial Cancer. — A coroner's jury in Bradford, on Wednesday, returned a verdict of accidental death at an inquest on William Henry Tate, chemical works' labourer, of 3, Providence Place, Cleckheaton, adding a rider in accordance with the medical evidence that the cancerous growths from which the man had suffered had arisen in the course of his employment as a tarworker.

Dangerous Drugs in Switzerland. — The Swiss Department of Public Economy has drafted a law relating to narcotic drugs with a view to controlling their sale, as well as the manufacture, import, and export of opium, cocaine, morphine, and heroin. When this law has been passed and put into force Switzerland will be in a position to ratify the Hague Opium Convention.

Petroleum Spirit Storage.—The Home Office has issued a new regulation to come into force on January 1, under the Locomotives on Highways Act, with regard to the storage of petroleum spirit. The new regulation provides, among other things, that the storehouse must be at least 20ft. from any other building or any highway or public footpath. Provision must be made by excavation or by retaining walls to prevent outflow of the spirit in the event of fire.

Sicilian Sumac Crop.—The present Sicilian sumac crop is estimated to be about 20,000 tons, but the quality is not as good as last year's, because of the unusually few rainy days during this season. Stocks of the previous crop are entirely exhausted, and, in consequence, prices are above normal. The superior grades of the new crop will undoubtedly command high prices, but just now prices do not reach high levels because of the small foreign demand.

State Reward for Mme. Curie. — A Bill has been laid before the Chamber by the Minister of Public Instruction for the purpose of conferring on Mme. Curie, Professor at the Faculty of Science, University of Paris, a pension of forty thousand francs. It is proposed that the pension shall be conferred on the twenty-fifth anniversary of the discovery of radium by Mme. Curie and her late husband, and as a mark of national recognition of her scientific work.

Litigation Over Carbonisation Patents.—On Dec. 12 next is due to be heard in the Comptroller-General's Court at the Patent Office, a case regarding patents for low-temperature carbonisation processes applied for respectively by Dr. S. R. Illingworth and Mr. John Roberts. On the eve of the date for sealing Mr. Roberts' patent an opposition was filed on behalf of Dr. Illingworth, in which it was alleged that Mr. Roberts' claims were covered by a prior grant of patent to Dr. Illingworth. A counter-action was commenced by Mr. Roberts applying to the Comptroller for the revocation of Dr. Illingworth's patent on several grounds. Both specifications refer to blending of inferior coals for carbonising.

U.S. National Exposition of Chemical Industries.—No exhibition will be held in 1924, but the tenth Chemical Industries Exposition will be held in the Grand Central Palace, New York, during the week, September 28 to October 5, 1925. From preliminary announcements we have received it appears that nearly all the floor space has already been booked by those exhibitors who have been present in previous years, and that additional floor space will be needed. The experiment of holding a course for students in the fundamentals of chemical engineering practice, which was a feature of the 1923 Exposition, proved such a success that it has been decided to increase this aspect of the Exposition's functions in 1925. The attendance of disinterested casual visitors is to be discouraged by greater strictness in the allocating of admission tickets.

British Coal Output.—The output of coal from the mines of Great Britain during the week ended the 17th inst. was 5,574,100 tons, against 5,571,900 tons in the preceding week and 5,376,000 tons for the corresponding period of last year.

Swiss Artificial Silk Industry.—According to the *Swiss Exporter*, the favourable marketing conditions for Swiss artificial silk are causing the Viscose S.A. of Emmebrücke (Lucerne) to contemplate the erection of a second factory. Moreover, a new undertaking for the manufacture of artificial silk is about to be established at Stockborn by the "Borvisk" Artificial Silk Works, Ltd., of Zürich.

Lancashire Dyers' Dispute Settled. — The dispute between Manchester merchants and the Piece Dyers' Association ended this week, the piece dyers having withdrawn the condition that all the dyeing in Great Britain shall be sent to their Federation, and consented to a reduction in prices of 7½ per cent., with a further rebate ranging from 1 to 5 per cent., based on the amount of work done.

British Empire Exhibition.—Included in the programme of conferences to be held during the course of the British Empire Exhibition at Wembley next year are: The Institute of Mining and Metallurgy, from June 3 to 6; the Textile Institute, June 10 to 12; the Society of Dyers and Colourists, June 11 and 12; and the Association of British Chemical Manufacturers on July 10.

Separation of Asphaltenes from Mineral Oils.—M. Jakes (*Chem. Zeit.*, 1923, 113/114, 757) recommends the use of purified cyclohexane instead of petroleum spirit (benzine) for the separation and estimation of asphaltenes in mineral oils. Comparative analyses with benzine and cyclohexane of a cylinder oil rich in asphaltenes showed that the former solvent gives a higher result (1.38 per cent.) than the latter (0.36 per cent.).

Coke Price Agreement.—It is reported that the price of blast-furnace coke, which has latterly been fixed on a month-to-month basis, has now been settled till the end of March, as a result of a conference between the collieries and the consumers. The existing price of 24s. per ton, at oven, will apply over the intervening period. The coke suppliers of Lancashire, Yorkshire, Derbyshire, Nottinghamshire, and Staffordshire are parties to this arrangement.

Explosion on British Steamer.—A fire followed by an explosion occurred on Friday of last week on board the British steamer Otterburn, belonging to the Guernsey Shipping Company, Limited, which was lying off Marseilles. The Otterburn has been grounded, and lies with her stern waterlogged. The casualties are not yet known, but the captain and five sailors are missing. It is believed that the accident was due to the explosion of some barrels of chlorate of potash.

Rating of Machinery.—The Minister of Health and the Secretary for Scotland have appointed a committee, with Mr. Edward Shortt as chairman, to inquire into the present law and practice regarding the rating of machinery and plant in England and Scotland respectively; to make recommendations as to alterations which are desirable and practicable, having regard to the considerations involved, with a view to removing inequalities, and if possible assimilating the law and practice of the two countries, and to make definite proposals thereon.

The Hamburg Wax Market. — According to a report of Consul General Oliver, dated November 20, the position of the market is unchanged, inland business is at a standstill, while sales abroad on a small scale were firm for the most part. Carnauba wax realised 89-90 shillings per cwt. fat grey, and 87-88 shillings per cwt. current grey. Japanese wax was quoted at 84-85 shillings per cwt. for the first three qualities. There is practically no demand for beeswax, prices remaining unchanged at 95-103 shillings per cwt. for West African, 98-106 shillings for East African, and for finer qualities up to 120 shillings; 40-45 dollars are asked for ozokerit-ceresin natural yellow 62—64° C., 48-50 dollars for ozokerit-ceresin prime white 62-64° C., 15 dollars for ceresin natural yellow 54-56° C., and 13.50 dollars for ceresin prime white 54-56° C. The increased demand for paraffin continued, chiefly from abroad, and could not be met. American prices were 9.25 to 9.50 dollars per 100kilogs., c.i.f. Hamburg. Sales took place at 9.50 to 10 dollars per 100kilog., according to quantity, for prime white American paraffin blocks, and at 8.50 to 9 dollars for white American paraffin shavings. All prices (except for wax and ceresin) were undutied, net cash.

Liquid Oxygen as an Explosive.—The results of an investigation at the U.S. Bureau of Mines experimental station at Pittsburgh indicate that liquid oxygen explosives may be used to advantage, especially in the lessening of blasting costs, in iron, salt, and other mineral mines and quarries. Among the advantages of liquid oxygen are the low cost per unit of material blasted and greater safety in use. Since liquid oxygen explosives are made at the place of consumption, the danger common in the transportation of other explosives is eliminated, and there is practically no likelihood of premature ignition.

Arsenic Ores in Turkey. — Arsenic is found in several places in the Province of Smyrna, and also at Zara, in the Province of Sivas, Turkey, states a U.S. Consular report. Prospects have been opened in other parts. The chief source at present is that of the Balia lead mines, the arsenic ore production of which has reached a maximum of 262 tons in a year. It is operated by the Société Anonyme de Balia Karaidin (French). The Balia Karaidin Mines have not, however, produced any arsenic since October, 1922. Their 1921-22 output of arsenic ore amounted to 200 tons, and was exported to Belgium. Transactions ordinarily are with Belgium and Germany.

The Colour of Dakin Solution.—Dakin solution is a buffered aqueous solution of sodium hypobromite, and is used as a bactericide. When prepared from chloride of lime and a mixture of carbonate and bicarbonate of sodium, Dakin solution frequently has a pink colour. J. Holden (*U.S. Naval Med. Bull.*, 1923, 19, 156-157) states that this pink colour is due to the presence of sodium permanganate; manganese may be present in the chloride of lime as calcium manganate, and is converted into sodium permanganate in the preparation of the Dakin solution. The presence of permanganate is believed to be desirable rather than objectionable.—*J. Fr. Inst.*

British Industries Fair.—The demand for exhibiting space at both the White City and Birmingham Sections of the next British Industries Fair, says the Board of Trade *Journal*, has shown a decided advance on that of the corresponding period in the organisation of the 1923 Fair. Since 1921, the scale of charges for stand erection has been reduced year by year. The comparison in the cost to the exhibitor of a stand in 1921 as against the prices ruling for the next Fair is shown in the following table:—

Sq. ft.	1921 £ s. d	1924 £ s. d.
100	13 6 8	8 18 11
200	26 13 4	13 13 0
500	66 0 0	17 18 11

The Future of the Imperial Institute.—In view of the changes in the constitution of the Imperial Institute which have been decided upon, Professor Wyndham R. Dunstan will, it is announced, resign the directorship of the Institute next month. Professor Wyndham, who became director in 1903, was connected with the Institute from the year 1896. It will be recalled that under the reorganisation scheme approved by the Imperial Economic Conference, the work of the Institute is to be curtailed appreciably. Investigations relative to new Empire raw materials are to be confined to analyses and preliminary examination only, and the Exhibition Galleries are to be discontinued. It has been agreed that for a period of five years the Imperial Government shall contribute £9,000. yearly to the Institute, the Colonies and Protectorates £8,000., and the Dominions and India £8,000. between them. This, with the endowment fund and other minor sources of income, will provide the reconstituted Institute with £40,000. per year.

Anise Oil Market at Hongkong.—Anise oil is exported from Hongkong to the value of approximately 150,000 dollars annually, principally to Great Britain, the United States, Japan, Germany, and France. Most of the exports consist of oil secured from the Provinces of Kwangsi and Kwangtung in South China, and the best quality is obtained from a district north of Woochow, in Kwangtung. The American Consul at Hongkong states that anise oil is being freely offered in that market at 90 Hongkong dollars per picul (1 picul = 133⅓lb.) at warehouse, including packing. Sales are usually contracted for on the basis of certificates issued by local analysts. Payments are made cash against documents on confirmed letter of credit. The oil is packed in cases of four lead containers of 16⅔lb. net each, the average can occupying three cubic feet. It is not expected that the market will improve until stocks at London and Hongkong are considerably reduced.

COMING EVENTS.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, November 30,** at **7 p.m.,** at 36, George Street.

Society of Chemical Industry (Liverpool Section).—Meeting, **Friday, November 30,** at **6 p.m.,** in the Clubrooms of the Overseas League, 14, Elliott Street. Discussion: "The Society of Chemical Industry and What it Stands For," to be opened by Dr. E. F. Armstrong.

Society of Chemical Industry (London Section).—Meeting, **Monday, December 3,** at **8 p.m.,** at the Chemical Society, Burlington House, Piccadilly, W.

Institution of the Rubber Industry (London Section).—Meeting, **Monday, December 3,** at **8 p.m.,** at the Engineers' Club, Coventry Street, London, W. Paper: "Accelerators," by Major V. Lefebure.

Society of Public Analysts. — Meeting, **Wednesday, December 5,** at **8 p.m.,** at Burlington House, Piccadilly, W.

Society of Chemical Industry (Bristol Section).—Joint meeting with the Institute of Chemistry, **Thursday, December 6,** at **7.30 p.m.,** at the University, Woodland Road. Paper: "Some Reminiscences of an Alkali Inspector," by R. D. Littlefield.

Society of Dyers and Colourists (Bradford Junior Branch).—Meeting, **Thursday, December 6.** Paper: "Wool Dyeing in the Piece," by H. Mitchell.—**(Scottish Section):** Meeting, **Friday, December 7.** Paper: "Wetting Power and Its Application to Industry," by W. H. Nuttall.

Chemical Society. — Meeting, **Thursday, December 6,** at **8 p.m.,** at Burlington House, Piccadilly, W. 1.

Society of Chemical Industry (Manchester Section).—Joint meeting with the Institution of the Rubber Industry, **Friday, December 7,** at **7 p.m.,** at the Textile Institute, 16, St. Mary's Parsonage. Papers: "Methods to be Adopted in Comparing the Activity of Various Accelerators," by S. Martin; "The Analysis of Rubber Vulcanisation Accelerators," by Dr. T. Callan and N. Strafford.—**(South Wales Section):** Meeting, **Friday, December 7,** at **7.30 p.m.,** at the Technical College, Cathays Park, Cardiff. Paper: "Coke Ovens," by T. G. Watts, to be followed later by a visit to the Maritime Coke Works, Pontypridd.

Institute of Chemistry. — Annual dinner, **Monday, December 10,** at **7.30 p.m.,** at the Hotel Victoria, Northumberland Avenue.

Institute of Metals (Scottish Section).—Meeting, **Monday, December 10,** at **7.30 p.m.,** at 39, Elmbank Crescent, Glasgow. Paper: "Cold Working of Metals and Its Influence on the Properties and Uses," by A. T. Adam.—**(N.-E. Coast Section):** Meeting, **Tuesday, December 11,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Paper: "Admiralty Gunmetal," by S. G. Homfray and F. Adam.—**(Birmingham Section):** Meeting, **Tuesday, December 11,** at **7 p.m.,** at the Chamber of Commerce, New Street. Paper: "Extrusion Problems," by Major R. M. Sheppard.—**(London Section):** Meeting, **Thursday, December 13,** at **8 p.m.,** at 85-88, The Minories, Tower Hill, E. 1. Paper: "Some Foundry Problems," by A. H. Mundey.—**(Sheffield Section):** Meeting, **Friday, December 14,** at **7.30 p.m.,** at the University, St. Georges' Square. Paper: "The Metallurgical Microscope," by J. H. G. Monypenny.—**(Swansea Section):** Meeting, **Friday, December 14,** at **7.15 p.m.,** at University College, Singleton Park. Paper: "The Brinell Hardness Test," by A. L. Norbury.

Hull Chemical and Engineering Society. — Meeting, **Tuesday, December 11,** at **7.45 p.m.,** at the Photographic Society, Grey Street. Paper: "Recent Advances in the Study of Corrosion," by Dr. J. Newton Friend.

Society of Chemical Industry (Edinburgh Section).—Meeting, **Tuesday, December 11,** with the Institute of Chemistry. Paper: "H.M. Factory, Gretna," by Allin Cottrell.—**(Newcastle Section):** Meeting, **Wednesday, December 12,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Paper: "The Sterilisation of Preserved Foods," Miss C. M. Dugdale.

Institute of Chemistry (South Wales Section).—Visit on **Wednesday, December 12,** to the Chemical Department of University College, Swansea.—**(Leeds Section):** Meeting, **Thursday, December 13,** at **7 p.m.** Paper: "Practice Under Modern Patent Law," by Griffith Brewer.

REPORTS OF COMPANIES.

Langdale's Chemical Manure Company, Ltd.

The annual general meeting was held at Newcastle on Friday, November 16. Mr. E. L. Beckingham (chairman) presided, and, in moving the adoption of the report and balance-sheet, referred to the effects of foreign competition in the superphosphate trade. There had unfortunately been no relief during the year under review. The French and Belgian makers were favoured by lower wages, lower rates and general cost. Further, the abnormal rate of the exchanges gave them an additional advantage in selling on our market. He understood that labour in France was paid at the rate of 20 francs per day, which was equal to 30s. per week of 48 hours; in Belgium, he believed, it was less. As there was no unemployment in these countries, industry was spared the very heavy addition to rates and taxes to deal with it. The Fertiliser Manufacturers' Association had placed a recommendation before the Prime Minister asking for his assistance to prevent many of the manufacturers of superphosphate from closing down, but he was not sanguine that any help was to be expected from that quarter. What might occur if an import duty were put on French superphosphate was that the French Government might retaliate by discriminating against us with an export duty on North African phosphate rock. The phosphate rock supplied within the Empire, on account of their distant situation in the Pacific, were at prices beyond the means of chemical-manure manufacturers, faced with these selling prices that they were. Difficult as the foreign competition undoubtedly was to fight, the company had not lain down under it during the past year, and, with much contriving and effort, had sold more sulphuric acid and fertilisers from their works than last year. There was a growing belief and hope that the tide was on the turn, and improvement in trade generally in sight. In the trade there was a distinct stiffening of prices on the Continent during the last few weeks, which led to the hope that, if continued, the competition might relax, and they might be able to dissolve more of their own superphosphate.

The adoption of the report and accounts was agreed to.

Pan de Azucar Nitrate Company, Ltd.

The annual meeting was held in London on Tuesday, Lord Hunsdon (the chairman of the company) presiding.

The Chairman, in moving the adoption of the report and accounts, said:—With regard to the position of the nitrate industry generally, the outlook when we met last year was uncertain, but a marked improvement took place in the spring of 1923, when demand developed strongly in all consuming markets. Sales of nitrate in the current year are going on well, and in some quarters it appears to be expected that the total will reach 2,300,000 tons. This seems to me to be a rather high figure, but if it should be realised, and assuming that production in Chile is not materially increased, the world supply at June 30, 1924, may be reduced to about 1,000,000 tons. The average sale price so far secured for the current year is about 9s. 3¾d. per Spanish quintal, and as the price for further sales is fixed at the equivalent of about 9s. 8d. per Spanish quintal, these further sales will improve the average price. From the average price obtained we have to deduct 4d. per quintal compensation to the Pool, as was the case last year, but if the present rate of sales be maintained, this compensation should be completed by March 31, 1924. Altogether the situation is much healthier than it was twelve months ago.

Liverpool Nitrate Company, Ltd.

Presiding at the meeting of the Liverpool Nitrate Company, Ltd., in Liverpool, Sir Robert Harvey said his forecast of a year ago of a good result for this year had been justified, the gross profit having been £132,544., as against £6,096.; and the net profit £41,009., as against a loss of £79,549. Moreover, it was in August and September, 1922, that oficina San Lorenzo and Ramirez reopened, and oficina San Donato did not start until January last. Their compensation to the Nitrate Pool amounted to £20,587., an increase of nearly £10,000. The total amount of compensation which the Nitrate Association agreed should be paid to the Pool was £1,500,000. Up to date £996,000. had been collected, and probably by April next they would be entirely relieved of this levy.

London Nitrate Company, Ltd.

Report and accounts to June 30 show that profit on trading, after deducting depreciations, is £80,377., which is increased by transfer fees to £80,411., add amount brought forward £17,968., making £98,379. Deduct office expenses in Liverpool and directors' fees £3,261., income tax and corporation profits tax £13,991. Debenture interest £7,934., bank interest and discount £917., and one-fifth, being balance of expenses of debenture issue, £856., leaving £71,418. Directors have appropriated £30,000. to reserve for redemption of debenture stock, and interim dividend paid in June last absorbed £10,000., leaving £31,418., from which final dividend for year of 1s. 6d. per share free of tax will be paid on December 6 next amounting to £15,000., leaving £16,418. to be carried forward.

Malayan Tin Dredging, Ltd.

The report for the year ended June 30, 1923, states that the total quantity of tin ore produced was 1,167½ tons, which realised £128,646., or an average price of £110. 3s. 10d. per ton, as compared with £93. 5s. 6d. per ton for the previous year. The profit, after writing o depreciation, amounts to £36,467., making, with £60,005. brought forward, £96,472. Deducting dividend of 1s. per share paid May 15 last, £9,000.; amount written off plant and machinery, £25,396.; and transfer to reserve account, £20,000., leaves a balance (subject to corporation profits tax) of £42,076., out of which a further dividend of 1s. per share paid paid on August 21.

Castner Kellner Alkali Company, Ltd.

Report for the year ended September 30 states the net profit is £263,187., add amount brought forward £55,494., making £318,681.; deduct debenture interest £7,351., interim dividend paid on May 24, 1923, £80,000., leaving an available balance of £231,330.; £120,000. in payment of a final dividend of 12 per cent., making 20 per cent. for the year, payable on December 5, 1923; £75,000. to be carried to suspense account, £36,330. carried forward.

DIVIDENDS.

Zinc Corporation, Ltd.—The directors have declared a dividend of 2s. per share on the preference shares, being the last half of the fixed preferential dividend of 20 per cent. for the year 1913, also an interim participating dividend of 1s. per share on both the preference and ordinary shares, less tax.

Parke's Drug Stores, Ltd.—Interim dividend of 2½ per cent., less tax, on ordinary for half-year to August 31, payable November 30.

Anglo-Persian Oil Co., Ltd.—Dividend on ordinary shares of 10 per cent. less tax for year ended March 31, 1923, carrying forward £1,777,788.

OUR BOOKSHELF.

Clouds and Smokes. William E. Gibbs, D.Sc. London: J. and A. Churchill; 10s. 6d. net.

Commencing with a foreword by Sir Oliver Lodge, this book aims at a clear and comprehensive account of "aerosols" (matter in a highly disperse condition in a gas) and their practical and industrial applications. Part I. is devoted to the formation of aerosols, general properties, particle movement, and experimental determinations. Part II. concerns itself very suitably with the industrial treatment of fumes and dusty gases, gas washing, electrostatic precipitation, dust explosions, and various other practical considerations. The monograph ought to make a large number of friends in various directions.

Industrial Alcohol. John Geddes M'Intosh (2nd edn. rev. Stocks). London: Scott, Greenwood and Son; 12s. 6d.

A well-known work, which deals in a very practical manner with the production of alcohol from various forms of raw material, including beet, cane, grain, and molasses. Consideration of general principles which form good practice in fermentation is followed by good descriptive detail and illustrations of plant from a wide variety of sources. A chapter is devoted to alcohol by synthetic processes, all of which have a long way to go to compete with alcohol produced from cheap and more or less waste raw materials. "Statistics and Uses of Alcohol" is a section of interest, as is also "Alcohol for Power," etc

FERTILISER NEWS.

Nitrate of Soda.—Judging by the remarks let fall by certain speakers at recent nitrate company meetings, the self-imposed burden of the producers in respect of compensation for the famous "Pool" of a couple of years ago is becoming considerably lightened. It will be remembered that the huge stocks accumulated by the "Pool" on this side, and produced at high cost, were, by a sudden cessation of demand, left high and dry. How to dispose of these stocks on a falling market was a problem, and the members of the "Pool" were promised compensation to the extent of £1,500,000. to help them to meet their losses. This large sum was to be wiped off by levying a toll on every quintal sold and shipped, and, according to the most recent estimates, almost £1,000,000 has been raised in this way to meet the grant. Production is increasing month by month, and it is estimated that the levy, which now stands at 4d. per quintal, should be complete by the end of April next. In the last nitrate year some 46 per cent. of the total exported from Chile went to the United States and its possessions, the total amount reaching 979,000 tons. It is anticipated that the current fertiliser year will see an improvement on this, in consequence of the larger area under cotton. Demand at the present time, however, is reported to be far from brisk, and there is a general feeling that prices are too high. Many consumers are holding back their orders, under the impression that prices will eventually fall; but seeing that the quotation is regulated in the producing country, and most of the f.o.b. business is transacted by the Association at its fixed price, the only price-cutting that could take place is in the difference in the margin of profit which merchants allow themselves. So long as the American sulphate of ammonia market remains so strong, however, there is little hope of a reduction in quotations in the entire absence of any competitive conditions. On this side, the situation is very similar. The European demand is very quiet at the present time, and unsold stocks are being steadily, if slowly, accumulated in Continental ports. So far as the United Kingdom is concerned, consumers on the agricultural side are by no means anxious to place orders for nitrate at £13. 10s., when they have plentiful supplies of a relatively much cheaper nitrogenous fertiliser at hand.

Sulphate of Ammonia.—The new list of prices as circulated by the British Sulphate of Ammonia Federation comes as something in the nature of a surprise. Taking the neutral, 25¾% per cent., quality material, the quotation for December delivery is raised by 1s. per ton to £14. 16s. The advent of the new year, however, witnesses an increase of 6s. per ton on this figure, and the spring prices are given as £15. 2s. for January, £15. 3s. for February, and £15. 5s. per ton for March-May delivery. It is quite understood, of course, that these prices are for sulphate of ammonia destined for use in the United Kingdom only, and the export trade of the Federation is safeguarded by a clause in the contracts enforcing a penalty should any sulphate sold under the above price-list find its way abroad. Judging by the export prices now being realised, however, it is highly improbable that this rule will be infringed. The average price realised for exported material in September was, according to the Board of Trade returns, £15. 7s. per ton, f.o.b.; but in October, only £14. 17s. per ton f.o.b. was obtained. Speaking before the Director of Gas Administration on November 14 last, Mr. D. Milne Watson, Governor of the Gas Light and Coke Company, and Chairman of the Sulphate of Ammonia Federation, stated that the price of sulphate was on the downgrade, and expressed the opinion that it would touch £13. per ton before the end of December next. The latest circular of the Federation, referred to above, does not hold out any hope that home prices will be reduced, rather does it indicate the possibility of further increases without notice. The only alternative, therefore, is that Mr. Milne Watson was referring to the export prices—a supposition which is borne out by the evidence in the Trade Returns. Shortly, then, there will be the anomalous position of an industry endeavouring to foster the domestic demand by charging the home consumer higher prices than the foreign customer. Reports from the United States claim that sulphate is being imported, in spite of the tariff, but that producers are gradually reducing prices to meet this competition. Japan is said to be very anxious to buy in that market, but the export organisation is by no means in running order, so that British producers have no need to anticipate serious competition from America for some little time.

Czecho-Slovakia's Fertiliser Trade. — Czecho-slovakia imported 230,158 tons of fertilisers, valued at 188,997,800 crowns, during the calendar year 1922. Imports of Chilean nitrate amounted to 24,354 tons, valued at 74,094,800 crowns. Approximately 50 per cent. of this amount was shipped direct from Chile, 28 per cent. from Belgium, 16 per cent. from Germany, and 6 per cent. from other countries. Germany supplied practically the entire imports of potash salts, while Belgium, the Netherlands, and Sweden furnished practically all of the superphosphates. Natural phosphates, totalling 31,460 tons, were imported, 50 per cent. of which came from French Africa. Considerable shipments, however, were also received from the United States, Germany, and Tunis. During the first seven months of 1923 imports of fertilisers totalled 155,798 tons, valued at 96,957,800 crowns. The importation of all items of fertilisers remained practically normal, as compared with the last calendar year, with the exception of natural phosphates, which increased from 31,460 tons during 1922 to 59,792 tons during the first seven months of 1923. The imports of natural phosphates during the period were valued at 23,815,500 crowns. The difference in values, as compared with 1922, was caused by the appreciation of the Czecho-Slovak crown and its stabilisation during 1923. Of the natural-phosphate imports, 50 per cent. were purchased in Germany, while Tunis supplied 8,810 tons and Algiers 5,000 tons. The United States sold to Czecho-slovakia 6,682 tons during the first seven months of 1923, as compared with 7,275 tons during the calendar year 1922.

The production of superphosphates in the United States during the first half of 1923 amounted to 1,758,039 short tons, as compared with 1,198, 724 short tons in the first half of 1922, an increase of 46.5 per cent. The production during the second half of 1922 was 1,589,483 tons. Stocks on hand at June 30, 1923, amounted to 1,111,120 short tons, against 1,179,794 tons at the corresponding date of the previous year.

SOUTH WALES NOTES.

(Specially Contributed.)

In the tinplate trade conditions have improved during the week, and a large volume of business is being transacted. The Stabilisation Committee have advanced prices by 4½d. per box to £1. 3s. 6d. Exports are increasing, and the steel tinplate-bar makers have reduced the price of bars to £8. 18s. 9d., less a rebate of 7s. 6d. to the tinplate manufacturers. This enables sellers to accept business in forward lines, and it is confidently anticipated that before long most of the factories will have sufficient orders on hand to keep the mills going over the first half of next year. The galvanised-sheet trade, although orders are not numerous, is in a fairly active state; forward orders are being received in small quantities. The patent-fuel works are steadily employed, and the export business has rallied. The difficulties encountered in the use of American pitch have been partly overcome, and further large orders are to be placed for this material. Coke ovens are operating full time, in view of the good demand for coke, while the residuals, on the whole, are being well sought for. Sulphate of ammonia is dull, and buyers are standing off for a reduction in price.

Among the imports for the week were 800 tons iron pyrites from Pomaron to Swansea; five tons of salt from Hamburg, 15,500cwt. of petroleum pitch from Rotterdam, 175 tons calcium carbide from Sebonico, 106cwt. red arsenic from Antwerp, to Cardiff. The exports included 45 tons green copperas to St. John (N.B.) from Cardiff; and 94 tons painters' colours to Cape Town from Newport.

Estimation of Eugenol in Essential Oils.—A weighed quantity (2 to 3 drops) of clove oil, or other essential oil containing eugenol, is treated, in a method worked out by P. N. van Eck (*Pharm. Weekblad*, 1923, 60, 937), with 25 c.c. of 0.1 *N* silver-nitrate solution, to which sufficient ammonia has been added just to dissolve the precipitate first formed. The flask is then heated beneath a reflux condenser for a short time until a silver mirror is formed on the sides, after which the liquid is filtered, the filter and flask washed, the filtrate slightly acidified, with nitric acid, and the unreduced silver titrated with 0.1 *N* thiocyanate solution. Experiments with pure eugenol showed that the mgrms. of reduced silver divided by the mean factor 1.75 give the corresponding weight of eugenol.

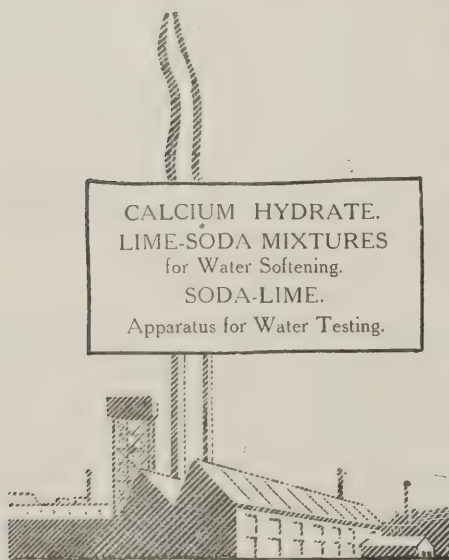
SOFNOL SUPER-LIME SPECIALITIES

Can you really afford boiler scale?



¶ Boiler scale *is* costly. Its presence means, not only a loss of working efficiency through bad heat transference, but also actual deterioration of boiler plant, due to local overheating and corrosion of shells and tubes. The prevention of scale is thus of vital importance if real efficiency is to be attained.

¶ The Lime-Soda process of water treatment *can* give a water which cannot form scale. To do this the reagents must be added in the *exact* proportions required by the particular water. Moreover, they must be in a fine and uniform state to ensure complete mixing.

¶ These conditions are realised in Sofnol Lime-Soda Mixtures. These are made in every case to the analysis of the individual water to be treated. There is no mixing to be done, no mess. Labour is saved and efficiency assured. Sofnol Lime-Soda Mixtures *prevent* scale. Have you read our booklet "The Chemistry of Water Softening"? Why not send for a copy now?

SOFNOL LTD., WESTCOMBE HILL, GREENWICH, S.E.10

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN OCTOBER.

(Concluded from page 623.)

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during Oct., 1923, compared with 1921 and 1922. As from April 1, 1923, export trade of the Irish Free State is excluded from the Returns.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

Interesting information is now available as to the intentions of the tar producers who formerly sent their tar to the chemical works of Brotherton Bros., Ltd., at Workington Docks. It may be remembered that the Leeds firm were unable to obtain a renewal of the lease of the site on which they erected their works some years before the war. The plant is now being dismantled, and in the meantime, the tar from the collieries with whom Brotherton's had an agreement (which expires at the end of this year), is being sent to Sunderland. There are now good grounds for stating that the tar producers who were concerned in that agreement have entered into an agreement with the United Steel Company for the laying down of a distillation plant near the latter firm's by-product coking plant at Lowca. The coal and coking industries are exceedingly busy. All the coal is being readily disposed of, and the landsale trade has become very active during the last ten days. The call for industrial fuel alone is dull, but that too is likely to be heavier. The steelworks at Workington will be re-started on Monday and the rail mill, it is said, will roll for three weeks in succession. That being the case a large proportion of the output of ordinary iron will have to be reserved for local consumption, so that in the New Year when the steel plant is expected to be employed three weeks in four, additional furnaces will have to be put into blast. At the present time only seven furnaces are in draught in West Cumberland, and of the seven in the Furness district there are very few that use the local coke. The time is coming, it is hoped, when there will be forthcoming sufficient coal of the quality required to yield the coke that is wanted for the smelting of low phosphorus iron, and then also there will be an important extention of the coking plants in this district. Meantime, the ovens are disposing of nearly the whole of the output of small coal from the Cumberland collieries, the proportion that can be spared for the open market being indeed negligible. Prices are unchanged at 25s. to 26s. 6d. per ton according to carbon content. For export the price is 35s. per ton, but little coke is now going to the Continent. East Coast coke supplies this week are slightly under 10,600 tons.

NEW COMPANIES.

Latex Developments, Ltd.—Capital £6,250., in 5,000 £1. ordinary shares and 25,000 1s. deferred. Manufacturers of and dealers in rubber, rubber latex, and rubber goods of all kinds, etc. Office: 7 and 8, Great Winchester Street, E.C. 2.

Alsace-Lorraine and General Products Company, Ltd.—Private company. Capital £10,000., in 6,000 7 per cent. cumulative preference and 3,600 ordinary shares of £1. and 8,000 founders' of 1s. Importers and manufacturers of and dealers in chemicals, metals, oils, paints, etc. Solicitors: Hutchinson and Cuff, 6, Stone Buildings, Lincolns Inn, W.C.

Bellamy and Wakefield, Ltd.—Private company. Capital £3,000. Manufacturing, wholesale, and retail chemists, at 1, Easy Row, Birmingham.

C. V. Aluminium Syndicate, Ltd.—Private company. Capital £1,000. Office: 8, Drapers' Gardens, E.C. 2.

John J. Clark Company, Ltd.—Private company. Capital £1,500. Wholesale and retail chemists, etc. Office: 18, Southwark Street, S.E.

Mineral Deposits, Ltd. — Private company. Capital £2,100., in 2,000 £1. 10 per cent. cumulative preference and 2,000 1s. ordinary. Miners, smelters, etc. Office: 17, Mincing Lane, E.C.

Senior, Crozier and Co., Ltd.—Private company. Capital £5,000. Wholesale and retail chemists, etc. Office: Union Works, Main Street, Stratford, E.

Sanaphos, Ltd. — Private company. Capital £2,000. Manufacturers of foods, medicinal preparations, etc. Solicitors: C. Butcher and Simon Burns, 32, Gresham Street, E.C.

Calumite Lead Products, Ltd.—Private company. Capital £10,000. Manufacturers of and wholesale dealers in chemical compounds, etc. Office: Calumite Works, Linwood, Renfrew.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Basic Slag and Phosphate Companies, Ltd. (late Slag Phosphate Company, Ltd.), London, S.W.—Registered November 8, deb., to Lloyds Bank, Ltd., securing all moneys due or to become due to the bank.

Collier (John) and Co., Ltd., Liversedge, soap manufacturers.—Registered November 8, agreement extending time for payment and securing increased rate of interest on £4,700. 1st debs., to Mrs. F. M. Stephens, 130, Kyverdale Road, Stamford Hill, and ors.

Flinn and Son, Ltd., Fishergate, dyers.—Registered November 9, £1,450. mort., to Sir B. S. Johnson, Abbots Lea, Woolton, and ors.

Laycocks (Ashton-under-Lyne), Ltd., lard compound manufacturers.—Registered November 12, mort., to London Joint City and Midland Bank, Ltd., securing all moneys due or to become due to the bank.

Northern Smokeless Fuels, Ltd., London, S.W.—Registered November 6, £7,000. deb., to Bishopsgate Nominees, Ltd., 15, Bishopsgate, London, E.C.

Organam, Ltd. (late Elstree Chemical Works (1922), Ltd.), London, E.C.—Registered November 8, £250. debs., part of £2,000.

Smiths (Hampton), Ltd., soap manufacturers.—Registered November 7, charge collateral to charge dated July 1, 1921, securing £9,000 outstanding, to W. A. Jones, 39, Orchard Road, Kingston-on-Thames.

Standardised China Clay Company, Ltd., London, E.C.—Registered November 12, £1,800. debs., part of £30,000.

Tidy Betty, Ltd., Leeds, stove-polish manufacturers.—Registered November 8, £400. further charge, to J. H. Broughton, Ferrybridge.

Whelpton (G.) and Son, Ltd., Hemel Hempstead, manufacturing chemists.—Registered November 7, mort., to Westminster Bank, Ltd., securing all moneys due or to become due to the bank.

SATISFACTIONS.

Frater (Geo. A.) and Co., Ltd., Gateshead, paint manufacturers.—Satisfaction registered November 13, £6,000., registered February 16, 1921.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Rare Metals, Ltd.—Resolved November 3: That the company be voluntarily wound up. C. Comins, 50, Cannon Street, E.C., liquidator.

Waferleaf Gelatine, Ltd.—Resolved October 5, confirmed October 24: That the company be voluntarily wound up. R. A. McQuitty, 78-81, Fetter Lane, E.C., liquidator.

BANKRUPTCY INFORMATION.

Calvert, Jackson, Wagaraw, Greenhead Rd., Huddersfield, manufacturing chemist. 1st and final dividend, 4s. 10¾d., at O.R.'s, Bradford, November 20.

Myer, Robt. H., trading as Ross Supply Company, 186, Wandsworth Road, S.W., manufacturing perfumer. 1st and final, 4s. 4d., at D. Hart's, 5, Argyll Street, London, November 22.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Burlington Industrial Laboratory, Ltd., 6 and 7, Charing Cross Chambers, 15, Duke Street, Adelphi, London, W.C.; £23. 19s. 7d.. October 9.

Lambert (Samuel) and Co., Ltd., 10, Great St. Helens, druggists; £19. 12s. 6d.. October 9.

Whitehead, Harold, 7, Newton Park, Lightcliffe; dyer and finisher; £22. 4s. 6d. October 8.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 12 to 17 (inclusive).

Emulsions of Bituminous Compounds. Billinghame, W. E. 28,419 and 28,420.
Acylacetyl Compounds. Bloxam, A. G. (*Chemische Fabrik Griesheim-Elektron*). 28,997.
Fuel-binding Agent. Brechin, W. M. 29,069.
Reverberatory Furnace. British Reverberatory Furnaces, Ltd.; and Sklenar, W. F. 28,834.
Electrolytic Tanks. Carrera, L. A. 29,097.
Dehydration of Oils. Chase, D. E. 28,866.
Wood Pulp and By-products. Cross, C. F.; and Engelstad, A. 28,864.
Tunnel Kilns. Duckham, Sir A. M.; and Woodall, Duckham and Jones (1920), Ltd. 28,527.
Sulphur from Gas Containing Hydrogen Sulphide. Farbenfabriken vorm. F. Bayer and Co. 29,008.
Producing or Reactivating Decolourising Carbon. General Norit Co., Ltd.; and Naamlooze Vennootschap Algemeene Norit Maatschappij. 28,620.
Indicating Presence of Smoke or Dust in Gases. Kelvin, Bottomley, and Baird, Ltd. 28,575.
Cooling Gases. Lameda, E. A. 28,885.
Printing Inks. Leadbetter, J. W. 28,784.
Refining Hydrocarbons. Lomax, E. L.; Lucas, O. D.; and V.L. Oil Processes, Ltd. 28,699.
Testing Gas Mixtures. Marks, E. C. R. (*Siemens and Halske Akt.-Ges.*). 28,759.
Peat. Perkin, F. M. 28,758.
Conveyer-elevator-drier for Sulphate of Ammonia. Poulson, J. 28,901.
Diaphragm for Electrolytic Processes. Reinhardt et Cie, P. 28,853.
Fertilisers. Soc. Chimique de la Grande Paroisse (Azote et Produits Chimiques). 28,464.
Plating Aluminium. Vautin, C. T. J. 28,744.
Calcium Oxalate from Vegetable Material. Wade, H. (*Fraymouth and Bhopal Produce Trust, Ltd.*). 28,766.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Para-Nitrophenetol. W. Lewcock, and Gas Light and Coke Company, London. British Patent **204,594**, of 1922.

p-Nitrophenetol is prepared by heating an aqueous alcoholic solution of *p*-nitrochlorbenzene of low concentration with a quantity of an alkaline reagent, such as sodium ethoxide, not substantially in excess of that chemically equivalent to the chloro-derivative, at or above the normal boiling point of the aqueous alcohol and without ebullition. For concentrations of the chloro-derivative of 3 per cent. and upwards, less than the equivalent of the alkali may be used. According to examples, concentrations of 3 and 5 per cent. of *p*-nitrochlorbenzene in 85 per cent. alcohol are heated with sodium ethoxide and caustic soda respectively in an autoclave at temperatures of 90-120° C. To prevent reduction to azoxy-compounds the autoclave is lined with enamel, silver, or nickel.

Black Pigment. W. J. Mellersh-Jackson, London. (American Cotton Oil Company, New York, U.S.A.) British Patent **204,393**, of 1922.

A black pigment is produced by burning or carbonising, preferably in an open pan, fuller's earth containing vegetable oil. Fuller's earth which has been used for refining vegetable oil is preferably used, and the heating is continued until the mass burns quietly. The carbon formed in the carbonising operation may be collected and utilised separately or mixed with the pigment. The product is ground, and may be mixed with other pigments or fillers and a vehicle such as linseed oil, with or without driers, to form a paint, or for making printers' ink or shoe polish, and may be compounded with rubber with or without other pigments, fillers, and vulcanising agents.

Borneol and Isoborneol. J. Schindelmeiser, Dorpat, Esthonia. British Patent **204,662**, of 1923.

The monobasic fatty acid esters of borneol and isoborneol are saponified by adding solid caustic alkali and then pouring in water. The caustic alkali should preferably be in excess. An example is given of the production of borneol by the saponification of bornyl acetate by adding dry caustic soda, followed by hot water, and then maintaining the temperature at 100° C.

Nitrogen Peroxides. F. Stacey, Birmingham. British Patent **204,543**, of 1922.

Apparatus for producing peroxides of nitrogen by drawing atmospheric air through an electric arc comprises, as one machine, two, three, or more gas-producing units operative independently for the production of different grades, strengths, or standards of gas, but all driven mechanically from one drive, and all fed electrically from one supply. The units may be of the type comprising an arc chamber supplied with air by a pump, and are chain-driven from a shaft through clutches mounted thereon, and so constructed that engagement is only possible in the one position which allows the correct sequence of operations. The upper electrodes are connected through variable resistances and ammeters to independent switches. The apparatus is illustrated.

Lactic Acid in Vat Dyeing. J. Morton, Midlothian; and K. R. Wood, Gretna, Dumfriesshire. British Patent, **202,757**, of 1922.

In the vat dyeing of animal fibres, such as wool and silk, or materials containing them, by the caustic soda-sodium hydrosulphite process, to prevent the deleterious action on the fibres of the caustic alkali, lactic acid is added to the dyebath.

Crystallising. E. Passburg, Berlin; and H. Griffiths, London. British Patent **204,559**, of 1922.

In obtaining large crystals by passing a saturated solution through a rocking trough from an inlet to an outlet, provision is made to prevent the cooler solution from the outlet end passing towards the inlet end owing to accumulation of small crystals near the outlet, and to prevent longitudinal surges of liquid owing to the movements of the crystals in the solution. For this purpose the trough is divided by transverse partitions, which may be fixed or removable. A single spiral partition may be used. The partitions may be supported so as to leave a clearance at one side or at the bottom. The partitions may be supported by a rod extending above the trough, and may move with the trough or be held stationary. The rod or the individual partitions may be adjustable vertically. Scrapers which move across or lengthwise of the trough may be provided in the separate compartments.

Chloranthraquinone. H. Dodd, W. C. Sprent, and United Alkali Company, Ltd., Liverpool. British Patent **204,528**, of 1922.

o-Dichlorbenzene, or a mixture thereof with *p*-dichlorbenzene, is heated with phthalic anhydride and aluminium chloride under certain conditions, and the resulting chlorbenzoylbenzoic acid heated with sulphuric acid to yield 2-chloranthraquinone, one chlorine atom being eliminated; the *p*-dichlorbenzene remains unchanged. The phthalic anhydride and aluminium chloride are added to the dichlorbenzene, the mixture heated gradually to about 115° C., cooled, poured into water, and made alkaline; after separating unchanged dichlorbenzene the alkaline liquor is acidified, the precipitated chlorbenzoylbenzoic acid heated with sulphuric acid at 100°-155° C., and the 2-chloranthraquinone precipitated by pouring into water; instead of isolating the chlorbenzoylbenzoic acid the reaction mixture may be added directly to the concentrated sulphuric acid. An example of the method is given.

Alumina. A. Hurter, London. British Patent **203,798**, of 1922.

Alumina is obtained in a form soluble in acids by heating crude aluminium sulphate with solid, liquid, or gaseous reducing agents to a dark red heat. Sulphuretted hydrogen, sulphur dioxide, and sulphur are among the products. Sulphur may be used as a solid reducing agent in conjunction with reducing gases, and the issuing gases containing sulphuretted hydrogen can be again used for reduction of a new charge. The iron may be removed by treating the product with dilute acids. The aluminium sulphate may be made by calcining kaolin at 800° C., adding sulphuric acid, heating to render silica insoluble, leaching, and crystallising or evaporating to dryness. The aluminium sulphate may be heated in hydrogen at 500° C. in an externally-heated oven. The charge is preferably moved in counter-current against the hydrogen. Or the charge may be internally heated by admitting oxygen, air, chlorine, or the like to the hydrogen, but not in such amount as to destroy the reducing character of the gases. Or the sulphate may be conveyed upwards in an upright channel containing pipes of ferro-silicon or of iron coated with silica or of a metal not attacked by sulphuretted hydrogen, while a stream of a mixture of hydrogen, sulphuretted hydrogen, and nitrogen which have been preheated in the tubes, is passed downwards against the sulphate. Air is admitted at the top where the alumina leaves. A revolving furnace can also be employed. Specification 895/79 is referred to.

Lead Arsenate. I. McDougall and F. Howles, Manchester. British Patent **204,223**, of 1922.

Lead arsenate is obtained by reacting with arsenic acid upon a colloidal solution of lead oxide in water, aqueous solution, or other suitable dispersion medium, preferably at a raised temperature. The arsenate precipitates in a finely divided form. An example describes the production of the arsenate $PbHAsO_4$ in this manner, the colloidalising of the lead oxide in water being effected in a Plauson mill, steam being passed through the jacket of the mill so as to raise the temperature to 80-100° C. The arsenic acid is run into the mill and the re-action is effected in a few minutes.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

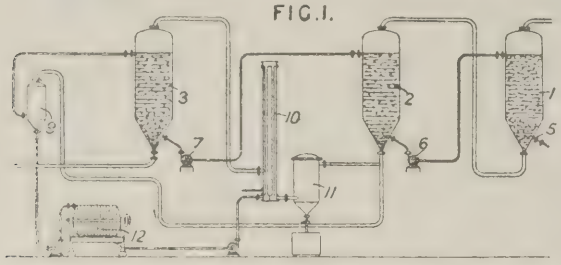
Storing Compressed and Liquefied Gases. Soc. Anon d'Applications des Gaz Liquéfiés, Paris. British Patent **204,715**. Convention date, September 27, 1922.

The opening and closing of a screw-stoppered capsule or cylinder of compressed or liquefied gas are effected by a co-acting screw and nut, the screw being connected to rotate with either the capsule or its stopper and the nut similar connected with the stopper or capsule accordingly. The relative longitudinal movement of the nut and screw during the opening movement energises a spring which effects the closure. Several types of apparatus are illustrated.

Digesting and Evaporating Apparatus. Appareils et Evaporateurs Kestner, Lille, France. British Patent 204,670. Convention date, September 28, 1922.

In digestors for effecting reactions under pressure, agitation of the materials is effected by injection of steam, and the steam passing from the digestor is used as heating-agent in an evaporator, the steam generated in which is passed into a second digester in which lower pressure is maintained. In a plant, applicable, for instance, for forming caustic soda and evaporating the solution obtained, liquid is fed in succession through digesters 1, 2, 3, and from an inlet 5 by pumps 6, 7 between the digesters, and thence to an expansion chamber

FIG.I.



9, a filter 12, and an evaporator comprising a tubular heater 10 and a vapour-separator 11. Steam is injected into the lower end of digester 3, and passes from its upper end into the evaporator. The steam generated in the evaporator passes from the separator 11 into the base of digester 2, and from the top of this digester into the base of digester 1. The steam from the digester 3 may be compressed by a rotary or a jet compressor before use in the evaporator. Four digesters may be combined with a quadruple-effect evaporator, the last effect of which is under vacuum and is connected to a barometric condenser.

Vulcanisation Accelerators. Pirelli and Co., Milan, Italy. British Patent, 201,912. Convention date, August 5, 1922.

Trisubstituted thio-ureas are used as accelerators in the vulcanisation of rubber mixings. The preferred substances are monoaryl-dialkyl derivatives, such as phenyldimethyl-thiourea, and monoaryl-alkylene derivatives, such as phenyl-pentamethylene-thiourea. They are prepared by condensing an aryl sulphocyanide with a secondary aliphatic or alicyclic base.

Barium and Strontium Salts. Rhenania Verein Chemischer Fabriken Akt.-Ges., Aachen, Germany. British Patent, 201,528. Convention date, July 31, 1922.

Residues obtained in extracting barium or strontium sulphides from the reduced sulphates, are treated with calcium, magnesium, or ferrous salt solutions for extracting the remaining barium or strontium. The salts mentioned are the chlorides and nitrates, and waste or residual liquors containing the salts may be used. Barium or strontium chloride or nitrate are obtained from the solutions by concentration. Strontium carbonate is obtained by treating the strontium chloride with sodium carbonate.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," December 1, 1888.)

The Chemical Expert in the Law Court.—Recent cases, both in our own country and abroad, have shown strongly the great necessity for a closer definition of the position to be occupied by the chemist giving evidence on behalf of a litigant, and of the extent to which legal prejudice is to interfere with the statement of scientific facts in a scientific manner. Some chemists, taking upon themselves the office of advocate for the party in whose interests they appear, incur the odium of the court and weaken their own case by such advocacy; but as from the very nature of things the scientific witness is generally intended to be more or less of an advocate, it is only just and fair to all parties so to define the functions of the experts that the facts and explanations he has to offer may be given in such a manner as to throw the greatest possible light on the point at issue, and that, while on the one hand he is enabled to do full justice to his clients' interests, he may, on the other, be guarded from that depreciation in the value of his evidence which would follow upon any unintentional display of advocacy or bias. In order, then, to avert most of the evils resulting from the procrustean treatment that chemical cases generally receive at the hands of the law, we would suggest the appointment of a duly qualified committee of experts, who should receive the technical evidence, examine the experts retained by the litigants, and, after the manner of a jury, hand in their report to the judge. This committee of experts would, of course, be differently constituted according to the exigencies of different actions, but it would probably be well that one of the members should be a permanent official who should act as a chairman of the committee, and be the recognised medium of communication between the committee and the court. It must be thoroughly understood that we are in no wise advocating here the formation of a technical board of arbitration or of a chemico-legal bench. Our object is simply and strictly to provide for the settlement of any chemical question arising in the law courts by chemists and chemists only. When the chemical question is solved the chemists' work is done, and the judge must adjudicate upon the solution.

Tariffs and Agriculture.—"A short statement on the need of a tariff, and of a regenerated agriculture in Great Britain." By Samuel Turner. Published by E. Wrigley and Sons, Rochdale. Single copies 1½d., by post 2d.

Lime and Plant Disease.—"An Experiment on Finger-and-Toe by Liming," by Professor James Hendrick, B.Sc., F.I.C., of Aberdeen. Bulletin No. 29 of the North of Scotland College of Agriculture.

Norway's Foreign Trade.—We have received from the Swedish Consulate General in London (Bank Chambers, 329, High Holborn, W.C. 1) a brochure with parallel texts in English and Swedish containing data on some phases of the development of Swedish industrial life during the last few decades. The compilation was produced in connection with the Gothenburg Jubilee Exhibition, held last summer.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—Although there is no material improvement in the demand, prices are holding firmly, and in many directions advances are expected. Continental supplies are offering in limited lots only, and at much higher prices. Now that the German Government have defaulted

on the 26 per cent. levy, any supplies brought in from that source are bound to be at much higher prices. **Acetic Acid,** 80% technical, £47.; 80% pure, £48. 10s. to £49.; 98% glacial, £60. in casks and £73. in glass demijohns, ex wharf London; spot prices are dearer, with the market holding quite firm, stocks are limited; demand slow. **Acetone,** British Government specification, about £124. per ton, in drums; prices for spot supplies are very steady, with business poor. **Alum,** lump, £10. to £10. 10s. per ton, in casks; dealers continue to offer at this price, with inquiry small. **Arsenic,** Cornish, white powdered, £64. per ton, f.o.r. Cornwall; supplies are limited, with values steady, but demand has fallen off. **Anhydrous Ammonia,** 90.95%, about 1s. 5d. per lb.; importers are offering at about this price, with no great demand at present. **Bleaching Powder,** 35—37%, £10. to £10. 10s. per ton; this market, although rather quiet, keeps very steady. **Barium Chloride,** 98—100%, £15. per ton; a further hardening in spot values is recorded; Continental prices are firm. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P., crystals, about 1s. 4½d. to 1s. 5d. per lb., less 5%; after the recent slight improvement this market has fallen back, and is again dull and unsteady. **Cream of Tartar,** 99—100%, about 85s. per cwt., in one-ton lots; dealers continue to quote at about this figure, with not much demand; the market is very steady. **Epsom Salts,** commercial quality, about £4. 10s. to £4. 15s. per ton, in bags; plenty of spot material offering; demand slow; prices steady. **Formaldehyde,** 40% volume, about £65. per ton; this item is very steady on spot, although there is not much business about; Continental prices are very firm. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton; there is still but little inquiry for this product; prices are unchanged. **Lead Acetate,** brown, about £43.; white, about £44. per ton; it is doubtful if there are any large stocks now available on spot; prices are very firm indeed; little to be obtained on the Continent. **Litharge,** imported, about £37. 10s. per ton; dealers are now quoting at about this higher rate; forward offers are slightly cheaper. **Lithopone,** imported, about £23. 5s. to £24. per ton for 30% Continental red seal; dealers' prices as given are firm, with supplies short, and spot very limited on the Continent. **Ammonium Chloride,** grey galvanising, £31. per ton; holders of spot material are firm at this value, and higher prices are expected; supplies here are short. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at about these figures. **Oxalic Acid,** about 5¾d. per lb.; business remains quiet; the market continues rather unsteady. **Carbonate of Potash,** 90—92%, about £25. 10s.; 96—98%, about £27. 10s. per ton, on spot; dealers are offering from stocks at these rates, with not much business about; fresh imports will cost more. **Chlorate of Potash,** crystals and granular, 2¾d. to 3d. per lb.; the spot position shows no change; business slow; prices steady. **Caustic Potash,** 88—92%, £31. to £32. per ton, in drums; the spot position is now very firm at these rates, with not much material available; at present business is slow; fresh imports dearer. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers are quoting at about this price, with little doing. **Prussiate of Potash,** yellow, about 10¼d. per lb.; dealers are offering British material round about this price, but are not finding much good business. **Sulphate of Potash,** 90%, £11. per ton; the position is as last reported. **Mercury,** about £10. per bottle of 75—76lb.; the spot position has not been at all active, and, as quoted, is rather easy and inclined to weaken a little. **Red Lead,** imported, about £37. 10s. per ton, on spot; dealers are offering at this figure, and quote about £36., c.i.f. forward. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; holders of spot stocks are finding business at about these prices, with not much material available; Continental prices will be much dearer. **Saltcake,** ground and unground, about £4. 10s. per ton, for home trade; this market keeps very steady, and is likely to hold to the end of the year. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; merchants are offering at about these prices, with still but small inquiry. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags free; British makers quote at this price, for home trade only; dealers are offering at competitive rates. **Bichromate of Soda,** home trade, about 4½d. per lb., delivered; British makers continue to quote at this rate; their prices for export are generally slightly higher. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers quote at this level for export. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags; British makers' price to domestic consumers on contract is unchanged at this rate, packages free, carriage paid to destination; their prices for export vary according to destination. **Hyposulphite of Soda,** pea crystals, about £15. to £15. 10s. per ton; commercial quality, about £10. 10s. per ton, in casks; dealers' prices are fully maintained, and tend to advance; Continental offerings are dear. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b. U.K. port; this item keeps very steady. **Nitrite of Soda,** 100%, about £26. 10s. per ton; the position is as last reported, with the market quiet. **Prussiate of Soda,** about 5½d. per lb.; dealers who are offering British-made material at about this figure are still doing but small business. **Sodium Sulphide,** 60—62% solid, about £14. 10s.; broken, about £15. 5s. per ton, in drums; dealers' prices are somewhat firmer at these rates; business, however, is still slow. **Tin Crystals,** about 1s. 3½d. per lb.; at this price the market keeps steady. **Tartaric Acid,** B.P., crystals, 1s. 1½d. per lb., less 5%; dealers are offering spot supplies freely at about this figure, with still but a very small inquiry; the market is not at all steady. **White Lead,** imported, about £40. per ton; dealers holding limited stocks are quoting at about this rate. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers are quoting at about these figures.

Pharmaceutical Chemicals.—The spot shortage of supplies is becoming more acute each day in many items, and prices are still moving upwards. The tone throughout is strong, with holders showing every confidence. Any further movements up to the end of the year are almost certain to be towards still higher values. **Acetanilid,** crystals and powder, about 3s. per lb.; a further jump in spot values is recorded, with the market firm and supplies short. **Acetyl-Salicylic Acid,** B.P., 3s. 9d. per lb.; the spot position is fully maintained, with business brisk for the limited stocks available. **Benzoic Acid,** B.P., about 3s. 6d. per lb., nominal; owing to the refusal of the Board of Trade to grant import permits, the spot market is bare of supplies; there is a big demand. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. per lb.; dealers' quoted prices are maintained, with little interest shown. **Salicylic Acid,** B.P., fully 2s. 6d. per lb.; this market is again firmer at the higher price quoted, and the tendency is towards still higher values. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; business has been good, and the market tends to move up to the higher figure quoted. **Amidopyrin,** about 15s. per lb.; the market remains dull; dealers quoting at about this figure. **Ammonium Bromide,** B.P., about 9d. per lb.; a further sharp advance is recorded here, with business brisk; Continental offerings are much above the spot parity. **Benzonaphthol,** about 5s. per lb.; this market is still dull, with the quoted price unchanged. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; dealers are offering at this figure, with the demand slow. **Benzaldehyde 03,** about 3s. per lb.; prices are level on the week, with the market dull. **Calcium Lactate,** about 2s. 6d. per lb.; this article is quoted at much higher values for spot supplies, and the tendency is for further advances. **Chloral Hydrate,** duty paid, fully 4s. 3d. per lb.; the few lots of spot material available are firm at this figure. **Creosote,** B.P., about 2s. 6d. per lb.; although the demand remains slow, prices are fully

maintained. **Creosote Carbonate**, about 8s. 3d. per lb.; spot supplies are very limited, but at present there is little demand. **Guaiacol Carbonate**, about 14s. per lb.; spot supplies seem to be very scarce, and a further advance is recorded, with a rising tendency on the market. **Hexamine**, fully 4s. 6d. per lb.; at the further advanced price mentioned this article is very firm, and still higher prices may be expected. **Hydroquinone**, 4s. to 4s. 3d. per lb.; this market is rather irregular on quotation; some moderate business has been done. **Methyl Salicylate**, 2s. 10d. to 3s. per lb.; a good business has been done during the past week, and prices as stated are very firm on spot. **Methyl Sulphonal**, about 25s. per lb.; spot values are close up to the quoted price, and the market is gradually firming up to this figure; supplies are short. **Paraformaldehyde**, about 3s. 9d. per lb.; spot values are fully maintained, with a fair volume of business being done. **Paraldehyde**, 1s. 7d. to 1s. 8d. per lb.; the market quoted at last week's prices has a firmer tone. **Phenacetin**, about 8s. per lb.; the few holders of spot supplies are now asking close up to the figure quoted. **Phenazone**, fully 8s. 9d. per lb.; a further advance in spot values is recorded, with business brisk and spot supplies now limited. **Phenolphthalein**, 8s. 3d. to 8s. 6d. per lb.; it is difficult to locate supplies of any size; prices are likely to go still higher. **Potassium Bromide**, B.P., crystals and granular, 8d. per lb.; this item continues to harden on spot, with spot values again higher, and supplies well sought after. **Potassium Permanganate**, B.P., about 9½d. per lb.; this is about the lowest price now mentioned on spot; the market has a rising tendency. **Potassium Sulphoguaiacolate**, about 7s. per lb.; there is little interest shown in this article; quoted rates unchanged. **Resorcin**, about 6s. 6d. per lb.; spot prices are again higher, and the market is firm. **Salol**, about 4s. 3d. per lb.; a further advance in spot values is recorded, and this movement may continue. **Sodium Benzoate**, about 2s. 9d. per lb.; practically no supplies available, owing to continued stoppage or imports of acid. **Sodium Bromide**, B.P., crystals and granular, about 9d. per lb.; the spot price of this article shows a further jump, and the tone of the market is firm. **Sodium Diethylbarbiturate**, about 18s. per lb.; dealers quote at about this figure on a dull market. **Sodium Salicylate**, B.P., crystals, 3s.; powder, about 2s. 10d. per lb.; at these prices the spot position is now very firm, with a rising tendency; business has again been brisk. **Sulphonal**, about 20s. per lb.; spot supplies appear to be scarce, and the market is likely to hold at this figure. **Terpin Hydrate**, about 1s. 9d. per lb.; this item keeps very steady at this price, with a fair demand for spot supplies. **Thymol**, 15s. 6d. to 16s. per lb.; spot prices continue to be quoted at about these figures.

Coal-tar Products, Etc.—Pitch continues slow in demand, with the price gradually falling away. Other items are generally very steady, and some little better business has been done. **Aniline Oil**, 9d. to 9½d. per lb., naked at works; prices are unchanged, with the market dull. **Aniline Salt**, about 9½d. per lb., naked, at works; the market remains dull, with prices unchanged. **Betanaphthol** is quoted unchanged at about 1s. 1d. to 1s. 2d., with the market still sluggish. **Carbolic Acid**, crystals, 1s. to 1s. 1d. per lb.; this market remains dull and weak at the price quoted. **Cresylic Acid** has been more called for, and the price is steady for 97—99% at 2s. to 2s. 2d. per gallon. **Benzol**: The following are British makers' prices—crude 65's, 8d. to 10d.; standard motor, 1s. 1d. to 1s. 4d.; pure, 1s. 6½d. to 1s. 8d. per gallon, in tank wagons; no change on the week. **Toluol** continues to be quoted round about 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; 90%, about 1s. 4d. per gallon. **Xylol**, pure, is steady as quoted at 2s. 3d. per gallon, on a dull market. **Creosote Oil** has been in better demand, with dealers' prices steady at about 9½d. per gallon, f.o.b. in bulk. **Naphtha** (crude) remains slow of sale, with the price about 8½d. to 8¾d. per gallon; solvent naphthas are quiet features, with the price for 90/160 and heavy 90/190 about 1s. 2d. to 1s. 3d. per gallon. **Naphthalene** is improving, with the price already up to £19. 10s. per ton, and likely to move still higher; there has been more inquiry, and supplies are limited. **Pyridine** is firm on spot, with dealers quoting fully 22s. per gallon. **Hexamethylene**, 3s 9d. to 4s. per gallon; dealers quote firmly at these rates for the limited spot stocks offering. **Pure Methyl Alcohol**, about £90. per ton, in drums, ex wharf London; importers' prices are fully maintained at this old level, with a fair inquiry being received. **Pitch**, about 125s. per ton, f.o.b. East Coast; prices are again easier this week, with the market still showing but little life; the tone at the close is by no means steady, and further declines are possible. **Wood Tar**, steady but quiet at £4. 15s. to £6. per ton, according to quality.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £62. 12s. 6d. to £62. 15s., cash; £63. 7s. 6d. to £63. 10s., three months; electrolytic, £67. 10s. to £68. **Tin**: Standard, £236. 15s. to £237., cash; £237. 5s. to £237. 10s., three months; Straits, £237. 15s.; English, £237. 10s. **Lead**, soft foreign, £30. 15s., prompt; English, £32. 5s.; chemical sheet, 37s. per cwt. for 2-ton lots, delivered. **Spelter**, prompt, £33. 7s. 6d.; hard, £28. **Antimony**, English regulus, 99%, £36.; special brands, £42. **Aluminium**, 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel**, 130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 15s. to £9. 17s. 6d. **Bismuth**, 10s. **Platinum**, £29. per oz.; scrap, £27. **Wolfram**, spot, 12s. to 12s. 3d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** prices as a whole are unchanged, with a firm tendency: Highest grade English, 93—95%, £48. per ton, delivered; Beaver brand, 90—92%, £47. 10s.; American, 92—94%, £47. 10s.; Continental, 85—88%, £45. 10s.

MANCHESTER CHEMICAL MARKET. Wednesday.

Business generally continues on the quiet side, and there is not much likelihood of improvement during the present disturbed conditions. Quotations for alkali products remain unchanged at recent rates—namely: **Caustic Soda**, 76%, £19. 7s. 6d.; **Bicarbonate of Soda**, 2cwt. bags, £10. 10s. per ton; **Ammonia Alkali**, 58%, £7. 10s.; **Soda Crystals**, £5. 5s. per ton, all carriage paid. **Bleaching Powder** remains dull at £11. 5s., softwoods, on rails works. Owing to interference with German supplies, **Chlorates** are firmer; **Potash** 3¼d. per lb. and **Soda** 3d. per lb., ex store. **Bichromates** are unaltered at recent rates. The demand for **Sulphate of Copper** remains quiet, and prices are nominal at £25. to £25. 10s., f.o.b. Liverpool. Roasted **Saltcake** easy at £4. 10s. in bulk, carriage paid. There is little or no inquiry for **Phosphate** and **Commercial Hyposulphite of Soda. Nitrite of Soda** is dearer at £28. per ton, ex store. Concentrated **Sodium Sulphide**, dull at £14. 10s., carriage paid. Supplies of white powdered Cornish **Arsenic** continue scarce, and price firm at £70., net, carriage paid. **Yellow Prussiates** are easier; **Potash** at 9¾d. and **Soda** 5½d. per lb. **Carbonate** and **Caustic Potash** have advanced in price, owing to the new situation in Germany, and spot supplies are short. **Acetic Acid** and **Acetate of Soda** have also an upward tendency. Grey **Acetate of Lime** is firm at £22. per ton; brown, £14. 10s. per ton, carriage paid. **Barium Chloride**, steady at £14. 10s. to £15., ex store. **Lead Salts** are firmer; white **Acetate** £45., brown £45.; and **Nitrate** £44., carriage paid. Green **Copperas** is moving off freely, and stocks are low. **Oxalic Acid**, quiet at 5¾d. per lb. **Permanganate of Potash**, commercial quality, 8½d. to 9d. per lb., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Tinplates had an improved demand, the quotation being higher on the basis of £1. 3s. 6d. per standard box, f.o.b. **Galvanised Steels** in fair demand at £19. 2s. 6d. per ton. **Copper** easier at £61. 2s. 6d. per ton for prompt, and £61. 17s. 6d. three months. **Tin** prices firm at £227. 7s. 6d. cash, and £228. 7s. 6d. per ton three months. **Lead** steady at £30. 7s. 6d. per ton prompt, and forward £28. 17s. 6d.; English, £32. **Spelter**, fair business passing at £33. 2s. 6d. per ton prompt, and £33. 12s. 6d. forward. **Zinc Sheets** in good demand at £39. 7s. 6d. per ton, on rail at makers' works. **Sulphate of Copper** slow, with prompt at £25. 7s. 6d. per ton, and forward £25. 12s. 6d., less 5%, in casks, f.o.b. **Sulphate of Ammonia** steady at £14. 15s. per ton, delivered home stations. **Nitrate of Soda** quiet, with prompt at £13. 7s. 6d. per ton. **Bone Meal** dull, with Indian, prompt, at £9. 2s. 6d. per ton. **Sulphuric Acid**, active sales, quotations being unaltered. **Oxalic Acid** in poor demand at 6¼d. per lb., f.o.b. **Arsenic** in better call, with poor supplies of white powdered at £68. 7s. 6d. per ton prompt. **Pitch** again easier, with slow demand at £6. 3s. 6d. per ton, delivered docks. **Copperas**, trade dull at £2. 2s. 6d. per ton, delivered London or equal. **Benzol** less active at 1s. 2d. to 1s. 4½d. per gallon. **Creosote** very firm at 8¾d. per gallon. **Tar** in fair demand at £1. 13s. 6d. per 40-gallon cask. **Seed Oils** firmly held; raw **Linseed Oil** £2. 6s. 9d., and boiled £2. 8s. 9d.

per cwt., f.o.b. **Cottonseed Oil** in good demand, with common edible at £2. 5s. 2d., and deodorised £2. 7s. 3d. per cwt., net. **Rape Oil** quiet; best refined, £2. 7s. 3d. per cwt. **Cod Oil** steady; Newfoundland, prompt, £2. 5s. 3d. per cwt.; and English, £1. 14s. 3d., f.o.b. **Coconut Oil** steady, with Ceylon at £2. 6s. 8d. per cwt. **Castor Oil** dearer at £2. 16s. 3d. per cwt., net, in barrels. **Olive Oil** steady, with fair inquiry at £67. 7s. 6d. per ton, ex ship. **Palm Oil** steadily held, but in good call, with Lagos £37. 12s. 6d. prompt, and £37. 17s. 6d. forward; softs, £37. 2s. 6d. prompt, and £37. 7s. 6d. forward; mediums, £37. 17s. 6d., and hards £37. 12s. 6d., all per ton. **Turpentine** rather quiet at £3. 13s. 9d. per cwt. for prompt American. **Coal** in more active inquiry: Best Admiralty smokeless, £1. 8s. to £1. 8s. 6d.; seconds, £1. 7s. to £1. 7s. 6d.; ordinaries, £1. 5s. to £1. 6s., all per ton. **Anthracite** prices firm: Best large £2. 5s., seconds £1. 15s.; Paris and French nuts, £2. 17s. 6d. per ton. **Patent Fuel**, good demand at unchanged rates. **Cokes** very firm and active; export, £2. 7s. 6d. to £2. 12s. 6d. per ton; foundry, £2.; and furnace, £1. 10s. per ton.

LIVERPOOL CHEMICAL MARKET. Wednesday.

A steady and very fair demand for chemicals of the heavier class, for use in the United Kingdom, can be reported, with interest still being shown in prices and supplies for the early part of the coming year. In the export branch of the trade business has been rather more active, and shipments have been on a large scale. **Bleaching Powder** has been in quietly steady demand on home-trade account, and has had a fair shipment to foreign ports; the price for spot and for export is £11. 5s. per ton; in contracts special prices are quoted, according to requirements. **Chloride of Calcium** has again been in moderate request for the home trade and for export; it is £5. 12s. 6d. per ton. **Caustic Soda** has been in somewhat freer request for use in the U.K., and has had an active shipment to foreign ports; spot, for home-trade use, is £19. 7s. 6d. per ton, carriage paid in Great Britain; contract terms are quoted, according to requirements. **Bicarbonate of Soda** has been in good request for home-trade use, and has had a fairly large shipment; it is £10. 10s. per ton, carriage paid, to home-trade users. **Soda Crystals** have been in very fair request on home-trade account, but are still quiet in the export branch; the price is £5. 5s. per ton, carriage paid, for the home trade. **Nitrate of Soda** has had a moderate inquiry, and is £13. 5s. to £13. 10s. per ton. **Borax** has sold rather more readily for use in the U.K., but has been quiet in the shipping branch; commercial crystals are £25. per ton, and powdered £26.; higher grades are—crystals £29. per ton, powdered £30., and superfine £31. per ton, in 2cwt. bags, carriage paid to home-trade users. **Saltcake** has sold more freely for use in the United Kingdom, and supplies at hand are still light; prices are £4. 10s. to £5. per ton for use by the home trade, and £5. to £6. per ton for export. **Bichromate of Soda** has had a quietly steady sale, and the price has eased slightly; it is 4½d. to 4¾d. per lb. **Ammonia Alkali** continues to be well inquired for on home-trade account and for export; shipments have been on a large scale; the price is £7. 10s. per ton for use by the home trade, and £8. per ton for export, varied according to destination; for contracts special prices are quoted, according to requirements. **Hyposulphite of Soda** has been in very fair demand; it is £10. per ton, in 2cwt. bags, for commercial; and £15. per ton for photographic. **Sulphide of Soda** has been quieter, but the price is firm; it is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has moved but slowly, and is 3d. per lb. **Phosphate of Soda** has had a limited inquiry, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been but little in request, and is 6d. per lb. **Yellow Prussiate of Potash** has been in quietly steady demand, and is 10½d. to 11d. per lb. **Red Prussiate** has been quiet, and the price has been easier; it may be given as 2s. 9d. per lb. **Carbonate of Potash** has been more in request, and the price has tended to harden, through the new German complication; it may be given as ranging from £24. to £28. per ton, according to test. **Nitrate of Potash** continues to sell with some freedom, and is £29. to £30. per ton. **Chlorate of Potash** has had a small sale, and is 3½d. to 4d. per lb. **Caustic Potash** has been rather more in demand, and the price is very firm; it is £31. to £32. per ton. **Permanganate of Potash** has been quieter, and is 9d. to 9½d. per lb. **Bichromate of Potash** has been in quietly steady demand, and is 5¼d. to 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in fair request; first quality is £57. per ton, and second quality £54. per ton. **Sulphate of Ammonia** has been quiet in the home-trade department, but has had a fairly large shipment for foreign ports; neutral of 25¾% is £14. 15s. per ton, and ordinary of 25¼% £13. 12s. per ton. **Carbonate of Ammonia** has been in very fair demand, and is 4d. per lb. **Muriate of Ammonia** has been but little in request, and is £32. per ton. **Magnesia** has been rather more in demand; **Carbonate** is £2. 5s. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has had a quietly steady sale; the price is £11. per ton for the home trade, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been rather more in request, and is £8. to £11. per ton, according to quality. **Sulphur** continues to meet with a very fair inquiry; flowers are £10. per ton; roll is £8. 10s. per ton; rock, £8. to £8. 10s. per ton; and American, £5. 10s. per ton. **Tartaric Acid** has been in moderate demand, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has had a fair inquiry, and the price has eased; it may be given as £4. 6s. to £4. 8s. per cwt. **Boric Acid** has been in quietly steady demand; commercial is £48 per ton, and powdered £51.; B.P. grades are £54. to £60. per ton. **Citric Acid** has been quieter, and the price is 1s. 5d. per lb. **Oxalic Acid** has been inactive, and is 6d. per lb. **White Acetate of Lead** has had a moderate sale, and the price has hardened; it is £43. 10s. to £44. per ton. **Sulphate of Copper** has been but little in demand for home-trade uses, and shipments have been on a small scale; the price is £25. to £25. 10s. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been quieter, but the price is high and firm; white powdered is £64. to £69. per ton.

WEST OF SCOTLAND CHEMICALS. Wednesday.

The usual day-to-day demand for chemicals on home-trade account continues fair, and it is encouraging to note an improvement in inquiry in the export market. There is little to record in price alterations other than arsenic, which has advanced to £70. per ton on spot. Tartaric and citric acids are firm, though quotations are unchanged. **Alum**, lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic**, white powdered, scarce and still dearer at £70. per ton on spot; an improving market. **Barium Chloride**, £14. 10s. per ton; at this price the market remains steady; foreign imported material offered round £13. 10s. **Bleaching Powder**, quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid**, crystals, £48. per ton, carriage paid in the U.K., makers' prices; demand rather poor. **Borax**, crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride**, 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid**, 1s. 5d. per lb., less 5%; a little business about. **Copper Sulphate**, £26. 15s. per ton, less 5%; a rather neglected market. **Cream of Tartar**, £4. 2s. 6d. per cwt. for 99% at Glasgow, quotation steady, and inquiry small. **Lead Acetate**, white, £42. 15s. per ton on spot; brown, more inquiry at £45. per ton; Continental material offering at cheaper rates. **Magnesium Chloride**, £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at much under this figure. **Oxalic Acid**, quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax**, 2½d. per lb.; a steady export trade. **Potassium Bichromate**, 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate**, crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate**, 1s. per lb.; at this reduced price there is a rather better inquiry, with some export business. **Salammoniac**, first and second lump, £55. and £52. 10s. per ton respectively; crystals, £48. 10s. per ton; at these reduced quotations the market is rather inactive. **Saltpetre**, £1. 11s. 6d. per cwt., net; a better market, with price unaltered; fresh arrivals are cheaper. **Sodium Bichromate**, 4½d. per lb.; unchanged. **Sodium Chlorate**, 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate**, 7d. per lb., ex store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate**, £9. 15s. per ton, in 2cwt. bags; £11. 5s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic**, 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid**, 1s. 0¾d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

At the Principal Ports of the United Kingdom.

GLASGOW.

Week ending November 24.

BARYTES—
Antwerp, 350 bgs.

BORAX—
Wilmington, 500 sks.

BORON MINERAL
Wilmington, 7,028 sks.

CALCIUM CARBIDE—
Trondhjem, 1,350 drms.

CARBON BLACK—
New York, 71 cs.

DEXTRINE—
Baltimore, 462 bgs.

DYESTUFFS (NATURAL)—
Logwood
New York, 25 cks., 130 pkgs.

GLUCOSE—
Danzig, 105 brls.

GLUE—
Antwerp, 229 bls.

IRON OXIDE—
Marseilles, 32 cks.

MANGANESE ORE—
Calcutta, 2,000 t.

OCHRE—
Rouen, 53 cks.

PHOSPHATE (*otherwise undes.*)—
Sfax, 900 t.

RED LEAD—
Genoa, 18 cks.

SALAMMONIAC—
Antwerp, 7 cks.

SALT—
Hamburg, qnty. and 105 cks., 1,300 bgs., 1 cs.

SOAP—
Genoa, 280 cs.
Melbourne, 600 cs.

SODA CRYSTALS—
Baltimore, 16 cks.

SODIUM ACETATE—
Antwerp, 36 cks.

SODIUM HYPOSULPHITE—
Marseilles, 20 cks.

STEARINE—
Buenos Ayres, 115 trcs.
Monte Video, 61 pkgs.

SULPHUR—
Catania, 337 pkgs.

TANNING MATERIALS—
Quebracho

Algoa Bay, 20 cs.; Batavia, 26 pkgs.; Buenos Ayres, 20 kgs.; Colombo, 100 pkgs.; Famagusta, 20 brls.; Kingston (Ja.), 35 pkgs.; Malta, 30 bgs.; Pernambuco, 25 pkgs.; Pto. Mexico, 15 brls.; Rangoon, 100 pkgs.; St. Lucia, 10 kgs.; Sourabaya, 20 kgs.; Sydney, 71 pkgs.; Trinidad, 10 pkgs.

SODIUM BICARBONATE—
Adelaide, 22 pkgs.; Alexandretta, 10 bgs.; Bourgas, 170 kgs.; Catania, 30 pkgs.; Cape Town, 20 pkgs.; Colombo, 220 pkgs.; Constantinople, 50 pkgs.; Copenhagen, 17 pkgs.; Durban, 30 pkgs.; East London, 10 pkgs.; Famagusta, 10 kgs.; Fremantle, 158 pkgs.; Hamburg, 50 pkgs.; Larnaca, 10 kgs.; Malta, 25 kgs.; Melbourne, 275 pkgs.; Moji, 1,077 kgs.; Naples, 150 kgs.; Penang, 4 pkgs.; Pt. Swettenham, 4 kgs.; Singapore, 10 kgs.; Sydney, 802 kgs., 121 drms.; Varna, 70 kgs.; V. Cruz, 20 kgs.

SODIUM HYDROSULPHITE—
Sydney, 44 kgs.

SODIUM PHOSPHATE—
Perth, 20 kgs.

SODIUM PRUSSIATE—
Kobe, 300 pkgs.

SODIUM SILICATE—
Auckland, 8 cs.; Buenos Ayres, 146 pkgs.; Manzanillo, 397 bgs.; Melbourne, 868 pkgs.; Messina, 32 cks.; Montreal, 16 pkgs.; Parahyba, 32 pkgs.; Pt. Said, 57 pkgs.; Pernambuco, 16 pkgs.; Rangoon, 49 pkgs.; Rio de Janeiro, 33 pkgs.; Shanghai, 473 bgs.; Suva, 11 pkgs.; Vera Cruz, 251 bgs.

SODIUM SULPHIDE—
Sydney, 64 drms.

SODIUM SULPHITE—
Algoa Bay, 12 pkgs.
Genoa, 17 pkgs.

STEARINE—
Bordeaux, 13 bgs.
Concepcion, 16 bgs.
Philadelphia, 5 pkgs.
Rangoon, 234 bgs.

TALLOW—
Catania, 50 brls.
Danzig, 71 brls.

TURPENTINE—
Tripoli (Syria), 1 ck.

ZINC DUST—
Hamburg, 10 t.

LONDON.

OFFICIAL AMENDMENTS.

From return for week ending July 18, 1923, deduct—

AMMONIUM CARBONATE—
Wellington, 8 c., £20.

Week ending November 21.

ACETIC ACID—
Brisbane, 6 cs., £21.; Buenos Aires, 1 cs., £5.; Dunedin, 30 cs., £97.; Hamilton, 5 cs., £13.; Sydney, 6 cs., £18.; Timaru, 2 cs., £6.

ACETONE—
Antwerp, 3 drms., £118.
Sydney (F.), 3 drms., £43.

ACETYL SALICYLIC ACID—
Cape Town, 3 cs. (pt.), £11.; Irish Free State, 1 cs. (pt.), £7.; Singapore, 1 cs. (pt.), £9.

ALUM—
Durban, 20 cs., £9.; East London, 20 cs., £9.; Wellington, 1 kg., £16.

ALUMINIUM SULPHATE—
Wellington, 5 cs. (pt.), £5.

AMMONIA—
Beira, 6 cs., £13.; Bombay, 7 cs., £12.; Buenos Aires, 9 cs., £28.; Calcutta, 28 cs., £47.; Callao, 9 cs., £26.; Cape Town, 5 cs., £9.; Delagoa Bay, 20 cs., £35.; Durban, 41 cs., £73.; East London, 10 cs., £17.; Irish Free State, 12 cs., £76.; Nairobi, 2 cs., £7.

AMMONIA (ANHYDROUS)—
Cape Town, 20 cylds., £156.; Durban, 50 cylds., £375.; East London, 50 cylds., £375.; Pt. Elizabeth, 20 cylds., £150.; Rotterdam, 68 cylds., £451.; Singapore, 30 cylds., £195.

AMMONIUM ACETATE—
Calcutta, 1 cs., £8.

AMMONIUM CARBONATE—
Antwerp, 3 t., £84.; Calcutta, 1 t. 2 c., £87.; Cape Town, 4 c., £8.; Colombo, 1 c., £5.; Demerara, 13 c., £35.; Genoa, 1 t., £28.; Monte Video, 6 c., £16.; Pt. Elizabeth, 4 c., £8.

AMMONIUM CHLORIDE—
Wellington, 1 brl., £6.

AMMONIUM SULPHATE—
Barcelona, 148 t., £1,955.; Cape Town, 100 t., £1,375.; Jamaica, 100 t., £1,450.; Kobe, 100 t., £1,394.; Mauritius, 400 t., £5,575. Oporto, 50 t., £675.; Piraeus, 200 t., £2,700.

ANTIMONY OXIDE—
Durban, 180 kgs., £125.
Sydney, 1 ck., £11.

ANTIMONY SULPHIDE—
Bilbao, 7 cks., £124.; Copenhagen, 2 cks., £35.; Ghent (F.), 4 cks., £54.; Singapore, 5 cs., £93.; Trelleborg, 4 cks., £78.

ARSENIC—
Alexandria, 16 drms., £73.; Buenos Aires, 1 ck., £9.; Prague, (F.), 1 ck., £13.; Rotterdam (F.), 1 ck., £12.

ARSENIOUS ACID—
Bombay, 1 cs., £7.

BARIUM SULPHATE—
Paris, 2 cks., £100.

BISMUTH SALTS (*otherwise undes.*)
Athens, 1 cs. (pt.), £32.
Alexandria, 5 cs. (pt.), £15.

BITUMEN—
Bombay, 11 bgs., £22.
Melbourne, 1 cs., £9.

BONE FERTILISER—
Hamburg, 4 t. 1 c., £57.

BONE MEAL—
Antwerp (in transit), 25 t., £200.

BORAX—
Bombay, 4 c., £19.; Delagoa Bay, 2 c., £5.; Durban, 10 c., £22.; Irish Free State, 1 c., £5.; Petrograd, 10 t. (F.), £245.; Petrograd, 5 t. 9 c., £120.; Pt. Elizabeth, 1 t., (F.) £15.; Rotterdam, 2 t. 10 c. (F.), £65.

BORIC ACID—
Bolivar, 4 c. (F.), £10.; Buenos Ayres, 2 t., £108.; Canton, 2 c., £7.; Colombo, 3 c., £18.; Demerara, 3 c., £9.; Dominica, 1 c., £5.; New Plymouth, 1 c., £9.

CALCIUM HYDRATE—
Brussels, 10 bgs., £48.

CALCIUM SULPHATE—
Irish Free State, 5 cks., £23.

CHEMICALS (*otherwise undescribed*)
Alexandria, 10 cs., £22.; Antwerp, 2 cs., £81.; Switzerland, via Antwerp, 110 pkgs., £304.; Barbados, 4 pkgs. (pt.), £6.; Beira, 21 pkgs., £78.; Bombay, 22 pkgs. (pt.), 6 cs., £105.; Bourgas, 6 pkgs., £15.; Brisbane, 16 cs. (pt.), £298.; Broom, 7 pkgs., £116.; Buenos Ayres, 5 cs. (pt.), £23.; Calcutta, 22 cs. (pt.), £74.; Cape Town, 4 cs. (pt.), £18.; Christchurch, 4 cs. (pt.), £18.; Colombo, 23 pkgs. (pt.), £64.; Constanza, 50 pkgs., £125.; Dalny, 2 cs. (pt.), £5.; Delagoa Bay, 32 pkgs., £83.; Demerara, 6 pkgs., £10.; Demerara, 2 cs. (pt.), (F.), £6.; Durban, 12 pkgs., £30.; Durban, 2 pkgs., (F.), £6.; East London, 3 pkgs., £5.; Hamburg, 15 pkgs., £38.; Hong Kong, 5 cs., £87.; Irish Free State, 3 cs. (pt.), £11.; Jamaica, 1 cs., £9.; Karachi, 4 c., £27.; Kilindini, 1 cs., £16.; Lourenco Marques, 2 pkgs., £5.; Madras, 13 cs. (pt.), £42.; Malta, 5 pkgs., £10.; Mossel Bay, 1 pkg., £5.; Nairobi, 9 pkgs., £11.; New York, 3 cs. (pt.), £8.; Pt. Elizabeth, 1 cs. (F.), £8.; Pt. Elizabeth, 4 pkgs., £6.; Pt. Said, 5 cs., £15.; Rangoon, 10 pkgs., £14.; Ronneby, 100 pkgs., £250.; Shanghai, 18 pkgs. (pt.), £43.; Singapore, 9 cs. (pt.), £20.; St. Lucia, 3 cs., (pt.) £33.; Sydney, 12 cs. (pt.), £130.; Trinidad, 10 cs. (pt.), £25.; Wellington, 7 pkgs., (pt.) £27.; Zanzibar, 28 pkgs. (pt.), £14.

CITRIC ACID—
Calcutta, 2 c., £18.; Dunedin, 3 c., £18.; Durban, 16 c., £128.; East London, 3 c., £24.; Hong Kong, 4 c., £30.; Sydney, 10 c., £75.; Timaru, 1 c., £17.; Toronto, 1 t., £183.

COAL TAR PRODUCTS—
Carbolic Acid
Calcutta, 2 cs., £22.; Mauritius, 10 drms., £17.; Singapore, 2 cs., £9.

Creosote
Pt. of Spain, 5 brls., £21.
Sydney, 2 cts., £7.

Naphthalene
Antwerp, 1,000 bgs., £1,010.; Irish Free State (F.), 5 brls., £7.; Lagos, 5 cs., £7.

Pitch
Antwerp (bulk), 160 t., £983.; Dunkirk (bulk), 2,107 t., £14,135.; France (bulk), 470 t., £2,471.; Durban, 4 brls., £14.; Ferrol, 10 bxs., £26.; Genoa, 15 brls., £53.; Irish Free State, 20 drms., £10.; Napier, 4 cks., £6.; Pt. Said, 200 pkgs., £253.

Tar
Alexandria, 61 brls., £123.; Cape Town, 200 drms., £19.; Durban, 350 drms., £69.; Pt. Elizabeth, 80 drms., £11.

COBALT ACETATE—
Amsterdam, 1 cs., £21.
Copenhagen, 1 cs., £25.
Esbjerg, 1 cs., £25.

COBALT CHLORIDE—
Sydney, 6 cs., £98.

COBALT OXIDE—
Delagoa Bay, 1 cs., £7.
Genoa, (F.), 6 pkgs., £680.
Seville (F.), 3 pkgs., £135.

COLOURS (*otherwise undescribed*)—
Bombay, 1 cs., £6.

COPPER SALTS (*otherwise undes.*)
Sydney, 1 cs. (pt.), £6..

COPPER SULPHATE—
Delagoa Bay, 1 t. 3 c., £34.
Durban, 15 c., £25.
Jamaica, 100 t., £1,450.
Sydney, 3 c., £5.

CREAM OF TARTAR—
Calcutta, 1 c. (F.), £10.; Cape Town, 2 c. (F.), £14.; Durban, 1 c., £6.; Durban, 9 c. (F.), £59.; Karachi, 2 c., £12.; Karachi, 1 c. (F.), £6.; Pt. Elizabeth, 3 c., (F.), £19.; Pt. Said, 3 c., £13.; Sydney, 1 t., £86.

DISINFECTANTS (*otherwise undes.*)
Aden, 11 c., £37.; Bangkok, 8 t. 17 c., £299.; Berbice, 7 c., £15.; Bombay, 3 t., £71.; Calcutta, 2 t. 12 c., £129.; Cape Town, 18 t. 11 c., £684.; Christchurch, 4 t. 19 c., £730.; Colombo, 1 t. 6 c., £34.; Delagoa Bay, 5 t. 16 c., £215.; Dunedin, 3 c., £39.; Durban, 8 t. 13 c., £340.; Hong Kong, 12 c., £25.; Irish Free State, 9 c., £27.; Kilindini, 4 c., £13.; Mauritius, 16 c., £43.; New Plymouth, 15 c., £145.; Paris, 4 t. 12 c., £75.; Penang, 2 t. 2 c., £75.; Pt. Sudan, 2 t. 6 c., £49.; Rangoon, 4 c., £5.; Sekondi, 4 c., £11.; Singapore, 12 t. 5 c., £411.; St. Lucia, 1 c., £9.; Sydney, 5 c., £41.; Toronto, 3 c., £40.; Vancouver, 1 t. 14 c., £60.; Wellington, 7 t. 8 c., £472.; Zanzibar, 4 c., £8.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 20 kgs., £170.
Madras, 1 kg., £9.

Unspecified
Adelaide, 1 cs., £6.; Adelaide (F.), 1 cs., £19.; Brussels, 2 kgs., £23.; Delagoa Bay, 4 pkgs., £55.; Dunedin, 1 kg., £9.; Durban, 1 cs., £11.; Melbourne, 8 pkgs., £714.; Sydney, 1 kg., £12.; Wellington (F.), 1 kg., £14.

ETHER—
Pt. Said, 10 cs., £23.

FERTILISERS (*otherwise undes.*)—
Channel Islands, 99 t. 4 c., £961.; Irish Free State, 5 c., £6.; New York, 2 t., £51.

HYPOPHOSPHITE OF LIME—
Genoa, 8 cs., £149.

HYPOPHOSPHITE SALTS—
Paris, 5 cs., £71. (*otherwise undes.*)

IODIDES (*otherwise undescribed*)—
Shanghai, 1 cs. (pt.), £86.

IODINE—
Athens, 1 cs., £53.; Alexandria, 5 cs. (pt.), £5.; Calcutta, 1 cs., £26.; New York, 1 cs., £11.; Paris, 1 t., £26.; Sydney, 1 cs., £105.

FORMALDEHYDE—
Calcutta, 5 cs., £13.; Rio de Janeiro, 2 cs., £10.; Trinidad, (F.), 8 cs., £29.

GLYCERINE—
Bangkok, 1 c., £6.; Bombay, 2 cs., £6.; Calcutta, 2 c., £17.; Demerara, 2 c., £9.; Hong Kong, 1 c., £6.; Madras, 2 c., £10.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
New York, 1 cs. (pt.), £7.

GUANO—
Demerara (F.), 50 t., £813.

HYDROCHLORIC ACID—
Calcutta, 6 c., £11.

HYDROGEN PEROXIDE—
Irish Free State, 2 cs., £31.

IODINE (RESUBLIMED)—
Bombay, 4 cs., £439. ; Brisbane, 3 cs. (pt.), £5. ; Buenos Ayres, 1 cs., £118. ; Karachi, 2 cs. (pt.), £5. ; Melbourne, 1 cs., £53.

IRON AMMONIUM CITRATE—
Bombay, 8 cs. (pt.), £20. ; Calcutta, 2 cs., £11. ; Shanghai, 1 cs., £6.

IRON PERCHLORIDE -
Sydney, 5 drms., £7.

IRON SULPHIDE—
Melbourne, 4 drms., £7.
Sydney, 3 drms., £5.

KIESELGUHR—
Rio de Janeiro (F.), 1 t. 1 c., £18.

LEAD ACETATE—
Buenos Aires, 1 ck., £7.
France, 4 cks., £46.
Sydney, 1 cks., £15.

LEAD ARSENATE—
Durban, 1 cs., £6.
Sydney, 20 kgs., £50.

MAGNESIA—
Brisbane, 4 cs., £10. ; Havana, 2 cs., £56. ; Lyttleton, 10 cs., £24. ; New Plymouth, 15 cs., £36. ; Wellington, 10 cs., £24.

MAGNESIA (CALCINED)—
Buenos Ayres, 3 cs. (pt.), £21. ; Sydney, 1 cs., £5. ; Wellington, 1 cs., £5.

MAGNESIUM CARBONATE—
Bombay, 3 cs., £14. ; Havana, 1 cs., £7. ; Rio de Janeiro, 4 cs., £16. ; Sydney, 7 cs. (pt.), £15.

MAGNESIUM CITRATE—
Havana, 1 cs., £8.

MAGNESIUM SULPHATE—
Auckland, 16 c., £19. ; Barbados, 9 c., £18. ; Bombay, 5 c., £6. ; Calcutta, 3 c., £8. ; Cape Town, 13 c., £16. ; Co.mbo, 1 t., £14. ; Delagoa, 6 c., £8. ; Durban, 1 t. 12 c., £40. ; Irish Free State, 1 t., £16. ; Jaffa, 1 t., £26. ; Karachi, 7 c., £12. ; New Plymouth, 1 t. 3 c., £27. ; Pt. Elizabeth, 16 c., £21. ; The Bluff, 1 t. 5 c., £28. ; Timaru, 1 t. 10 c., £33. ; Trinidad, 2 t. 1 c., £25. ; Wanganui, 6 c., £8. ; Wellington, 5 t., £111.

MANGANESE BORATE—
Antwerp, 6 c., £17.

MANGANESE DIOXIDE—
Bilbao, 9 cks., £97.

MERCURY BICHLORIDE—
Havana, 1 cs., £14.
Melbourne, 1 cs., £20.

MERCURY CHLORIDE—
Habana, 1 cs. (pt.), £9.
Havana, 2 cs., £38.

MERCURY SUBCHLORIDE—
Sydney, 1 cs. (pt.), £6.

NICKEL SALTS (*otherwise undes.*)—
Sydney, 11 cs. (pt.), £34.

NITRIC ACID—
Calcutta, 2 c., £7.

PARALDEHYDE—
Sydney, 1 cs., £6.

POTASSIUM CARBONATE—
Cape Town (F.), 4 kgs., £8.

POTASSIUM CITRATE—
Bombay, 2 cs. (pt.), 2 cs., £39. ; Calcutta, 2 cs., £19. ; Melbourne, 2 cs., £19. ; Wellington, 2 cs., £11.

POTASSIUM CYANIDE—
Brisbane, 3 cs. (pt.), £5.
Switzerland, 1 cs., £6.

POTASSIUM FLUORIDE (ANHYDROUS)—
Napier, 1 cs., £15.

POTASSIUM IODIDE—
Addah, 2 cs., £29. ; Antwerp, 1 cs., £86. ; Bangkok, 3 cs., £289. ; Bombay, 6 cs., £455. ; Brisbane, 3 cs. (pt.), £9. ; Buenos Ayres, 1 cs., £46. ; Colombo, 1 cs. (pt.), £22. ; Demerara, 1 cs. (pt.), £12. ; Durban, 1 cs. (pt.), £24. ; Rio de Janeiro, 2 cs., £190. ; Trinidad, 1 cs. (pt.), £6.

POTASSIUM NITRATE—
Zanzibar, 28 pkgs. (pt.), £9.

POTASSIUM PERMANGANATE—
Melbourne, 7 kgs., £37. ; Paris, 2 kgs., £10. ; Sydney, (F.) 5 cs., £16.

POTASSIUM PRUSSIATE—
Antwerp, 5 cks., £89. ; Paris, 28 pkgs., £297. ; Rouen, 5 kgs., £48.

PRUSSIAN BLUE—
Melbourne, 1 cks., £98.
Paris, 4 cks., £154.

ROCHELLE SALTS—
Montreal, 3 c., £20.

SALAMMONIAC—
Callao, 2 cks., £14.

SALICYLATES (*otherwise undes.*)—
Cape Town, 1 cs. (pt.), £10.
Sydney, 3 cs. (pt.), £33.

SALTPETRE—
Adelaide, 1 t., £41. ; Auckland, 1 t., £42. ; Beira, 5 c. (F.), £9. ; Copenhagen, 7 c., £54. ; Durban, 2 t. 9 c., £112. ; East London, 16 c., £35. ; Irish Free State, 5 c., £20. ; Pt. Elizabeth, 1 t. 2 c., £48. ; Santos, 1 t. 5 c., £19. ; Seychelles, 5 c., £11. ; Zwolle, 1 t., £45.

SHEEP DIP—
Buenos Ayres, 3 t. 19 c., £200. ; Durban, 10 t. 6 c., £474. ; Irish Free State, 18 c., £24. ; Pt. Elizabeth, 1 t. 7 c., £62.

SILVER NITRATE—
Beira, 1 cs. (pt.), £10.

SODIUM ARSENITE—
Delagoa Bay, 2 t. 18 c., £208. ; Durban, 4 t. 9 c., £308. ; Pt. Elizabeth, 1 t. 2 c., £81.

SODIUM BENZOATE—
Calcutta, 9 c., £117.
Paris, 2 c., £30.

SODIUM BICARBONATE—
Brussels, 9 c., £13. ; Calcutta, 2 t. 1 c., £121. ; Cape Town, 10 c., £15. ; Durban, 2 t. 16 c., £79. ; East London, 14 c., £20. ; Karachi, 2 c., £6. ; Melbourne, 6 c., £6. ; Pt. Elizabeth, 2 t., £60. ; Seville, 4 c., £8.

SODIUM BISULPHITE—
Amsterdam, 5 t., £107. ; Buenos Ayres, 10 t., £213. ; Paris, 1 t., £26. ; Rotterdam, 5 c., £20.

SODIUM CARBONATE—
Singapore, 4 c., £7.
Zanzibar, 9 c., £6.

SODIUM CITRATE—
Bombay, 1 c., £6.
Calcutta, 2 c., £16.

SODIUM HYPOPHOSPHITE—
Bombay, 1 c., £10. ; Calcutta, 8 c., £8. ; Genoa, 4 c., £86. ; Madras, 10 c., £9.

SODIUM HYPOSULPHITE—
Shanghai, 5 c., £6.

SODIUM IODIDE—
Bombay, 1 cs. (pt.), £25.
Sydney, 1 cs. (pt.), £25.

SODIUM PRUSSIATE—

CURRENT TOPICS.

LEUCITE AND THE FIXATION OF NITROGEN.

THE unique potentialities of Italian leucite as a raw material for chemical manufacture, which were brought to the notice of the British chemical industry by Professor Hinchley a fortnight ago, have aroused the keenest interest, and it is only natural to suppose that investigations on the material will be commenced in this country. Meanwhile Italy possesses a commanding lead, both in the scientific investigation and the industrial exploitation of the mineral. In addition to the various plants described by Professor Hinchley, we now learn that the manufacture of potassium nitrate from leucite is to be commenced under the auspices of Dr. Carlo Rossi, the well-known Italian chemical engineer. A company with a capital of four and a half million lire has been formed, and is erecting a factory at Civita Castellana for this purpose. It is anticipated that the factory will be in full operation by the spring of next year and that a daily production of ten tons of pure potassium nitrate will be realised. The method to be adopted is the decomposition of the potassium-aluminium silicate by treatment of the mineral with a solution of sodium nitrate under a pressure of 25 atmospheres, and the separation of the resultant potassium nitrate by fractional crystallisation. Professor Hinchley foreshadowed the elaboration of a method of utilising leucite whereby the fixation of atmospheric nitrogen and the conversion of the potash into the soluble form could be simultaneously accomplished. It appears that considerable work to this end has already been carried out, the most recent being that of Professors Montemartini and Lósana, of Turin, who have worked out a method, the principal feature of which is the heating of an intimate mixture of finely ground leucite and carbon in a current of nitrogen. By this operation the whole of the potash is volatilised, mainly, it appears, in the form of metallic potassium, but a small amount is obtained as potassium cyanide. The alumina is converted wholly into aluminium nitride, from which ammonia and aluminium compounds are obtained by the well-known process. From experiments that have been carried out on the semi-large scale, excellent yields are to be expected from the process. The construction of the furnace, however, presents difficulties from the points of view of large-scale and continuous working. For the reaction to be successful the mass of the original mixture must be raised to a temperature of at least 2,000° C., and the problem of

constructing a furnace capable of withstanding the severe conditions of the process without undergoing too rapid depreciation is yet to be solved. This proved the main stumbling block in the original aluminium-nitride process of nitrogen fixation, but once the problem is attacked in earnest by the chemical engineer, there can be little doubt that its eventual solution will be forthcoming.

FINE CHEMICALS AND RUBBER MANUFACTURE.

It is just about eighteen months ago that the British Dyestuffs Corporation added organic accelerators of rubber vulcanisation to the list of its manufactures, but from the details given by Major Lefebure before the Institution of the Rubber Industry on Monday night, it is evident that the venture has met with marked success. Experience has shown that of the multitudinous accelerators now on the market, para-nitroso-dimethylaniline, diphenylguanidine, triphenylguanidine, hexamethylene tetramine, and aldehyde-ammonia are, in general, the most serviceable, and these products are among those at present being made by the Corporation. In the past the manufacture of organic accelerators has been wholly in the hands of comparatively small firms, and while the credit for the greater part of the pioneer work in educating the British rubber manufacturer to the manifold advantages of accelerated vulcanisation must be accorded these smaller firms, yet the entry of the dyestuffs-making industry into the field has probably been an inevitable development. It was in the laboratories of the Bayer Company that the value of piperidine as a vulcanisation accelerator was discovered in 1912, and the impetus given to the search that has since proved so fruitful. It is interesting to note that as a result of investigations by the Dyestuffs Corporation, the exceptional all-round value of para-nitroso-dimethylaniline as an accelerator has been confirmed. The activity of this product, it may be remembered, was discovered by Peachey in 1914, and its action in rubber vulcanising seems to differ from that of the other accelerators in that it is directly connected with the nitroso group, and is not a function of basicity. By putting on the market accelerators of standard and guaranteed purity, the dyestuffs industry is undoubtedly rendering a great service to the British rubber industry. At the same time it must not be overlooked that the application of the accelerators is by no means so simple a matter as the application of dyestuffs, and that their successful employment depends to a large extent upon the patience and perseverance of the user in finding the accelerator which best serves his purpose. Not only does the composition of the rubber mix, but also the method and temperature of vulcanisation, influence the activity of the accelerator. A list of the comparative activities of the various accelerators in a mixing composed wholly of rubber and sulphur, useful as it may be as a general guide, does not do away with the necessity for the user carrying out what in the majority of cases prove to be lengthy experiments to determine the most suitable accelerators for his own manufacturing practice. Still, there is no doubt that in the past the uncertain purity of some of the organic accelerators has been a bar to their extended use by British rubber manufacturers, and that the standardisation of the products in the hands of our largest dyestuffs manufacturing firm will prove of great assistance to our rubber industry.

SILICATE OF SODA IN ROAD CONSTRUCTION.

The recognition of the value of sodium-silicate solutions for adhesive purposes has extended considerably the field of application of the material. It seems now, however, that a new use for the product has been discovered, which should lead to the consumption of much larger quantities of silicate than could possibly be the case with even the widest use of silicate-containing adhesives. We refer to the employment of sodium-silicate solutions for the surface treatment of concrete roads. In the United States some thousands of square yards of concrete have been treated with success. The method used has been to spray the clean road several times with a very dilute solution, allowing the surface about 24 hours in which to dry between each successive application. What apparently happens is that the hydrated lime liberated during the setting of the cement reacts with the sodium silicate to give a calcium silicate, which hardens rapidly and effectively. The result is the formation on the road surface of a hard non-porous layer, not only highly resistant to abrasion and dusting, but also perfectly waterproof. We believe that the process has been tried in Great Britain, but that the results have not been very satisfactory, and that in consequence a considerable amount of prejudice exists in the matter. It is now contended, however, that these failures were resultant upon an unsuitable silicate and wrong methods of application. Thus, whereas ordinary commercial waterglass contains approximately two parts of silica to one part of soda, for concrete road work a much higher percentage of silica in the product is necessary. We understand that Brunner, Mond and Company, who within recent months have given particular attention to this subject are now putting on the market a brand of sodium silicate specially adapted for roadwork. Roads treated with silicate will not, it is believed, require further treatment with tar, and increased supplies of the latter material should be available for the patent-fuel makers of South Wales.

CO-OPERATION BETWEEN CHEMICAL SOCIETIES.

Glancing through a heap of old papers the other day, we came across the programme of a joint conversazione and reception held on July 8, 1885, by the presidents of the Chemical Society, the Institute of Chemistry, and the Society of Chemical Industry, at the Royal Institute of Painters in Water Colours. We wonder how many of those who were present on that occasion are still with us, and what their views are on the progress that has been made towards closer co-operation between the three societies concerned during the last thirty-eight years.

ELECTROLYTIC METHODS IN ORGANIC CHEMISTRY.

PROCESSES WITH COMMERCIAL POSSIBILITIES.

By "Investigator."

ALTHOUGH Kolbe's pioneer preparation of ethane by the electrolysis of potassium-acetate solution dates from as far back as 1849, very little further progress had, until quite recently, been made in the field of electro-synthesis. Other types of process, however, have from time to time received much attention, and resort was had to electrolytic methods in order to meet the war-time demands for acetic acid and related materials.

In the past, many of the comprehensive claims advanced for organic electrolytic processes have, on examination, proved unfounded—a result attributable in part to the insufficient description of the large number of factors controlling the course of these processes. In this connection the exhaustive elucidatory studies of Fichter and his co-workers should be of great assistance.

Synthesis of Dibasic Acids and Their Derivatives.

Kolbe's original method has been extended by Sir J. Walker to the synthesis of complex dibasic acids. Thus by the electrolysis of sodium ethyl malonate $NaOOC.CH_2.COOEt$, ethyl succinate $EtOOC.CH_2.CH_2.COOEt$, is formed, and, from the mono-sodium derivative of this, by repeating the process, adipic ester $EtOOC.(CH_2)_4.COOEt$, may be prepared. In general, the electrolysis may be formulated as follows:—

$$2NaOOC.(CH_2)n.COOEt = 2Na + 2CO_2 + EtOOC.(CH_2)2n.COOEt.$$

Applying this synthesis to the potassium ethyl ester of azelaic acid, where n is 7, the acid of the resulting ethyl ester, which contains 14 (CH_2) groups, proved to be identical with the thapsic acid occurring in juniper berries (*Biochem. Z.*, p. 75, 1920). Up to the present, owing to conductivity difficulties connected with the soap-like nature of the more complex compounds, the synthesis has not been successful with the ester containing 16 (CH_2) groups, while useful results with aromatic compounds are yet wanting.

Willstätter has utilised this method in order to prepare tropine derivatives, the basic substances of the atropine, cocaine, and scopolamine alkaloids (*Ger. Pat.* 300,672, of 1917). Starting with citric acid, the potassium ethyl ester of acetone dicarboxylic acid $CO_2Et.CH_2.CO.CH_2.CO_2K$, is first prepared. From two molecules of this, by electrolysis in neutral solution, the ethyl ester of succinyl diacetic acid $CO_2Et.CH_2.CO.CH_2.CH_2.CO.CH_2.CO_2Et$ results, a product which combines with ammonia and amines to form derivatives containing the pyrrole ring. Thus the product of the reaction with methylamine readily yields tropinone.

The products of the electrolysis of the zinc, lead, and sodium salts of the fatty acids in the molten state approximate closely to those from their aqueous solutions, but the yields are much smaller (Petersen, *Z. Elektrochem.*, 1914). Unsaturated hydrocarbons result from the electrolysis of unsaturated acids. An instance of this is potassium citraconate $CO_2K.CH = C.CH_3.CO_2K$, which, in feebly acid solution, gives oxygen, carbon dioxide, and allylene $CH \equiv C.CH_3$, as anode products (Henrich and Schenk, *Berichte* 1919).

Electro-Chemical Chlorination.

Many cases of so-called electrolytic chlorination are simply processes for the direct utilisation of electrolytic chlorine. A case in point is the production of chlor-hydrocarbons by mixing olefine-containing gases with the liberated chlorine; or the anode may be maintained in an atmosphere of the unsaturated gases (*U.S. Pats.* 1,264,535-6, of 1918). For the preparation of chlorhydrins, a mixture of steam and oil-gas is blown into the anode chamber of an alkali cell with its contents at the boiling-point, and the vapours condensed. In another method, a liquid olefine is emulsified with the anode-salt solution, any chlorhydrin being removed subsequently by distillation with steam (*Brit. Pat.* 140,831, of 1917).

In a study of the progressive electro-chemical chlorination of aromatic hydrocarbons, Fichter and Glanzstein (*Berichte* 1916, pp. 2,473-2,487), worke! in a homogeneous medium. Their electrolyte consisted of benzene or toluene dissolved in glacial acetic acid containing hydrochloric acid, and their electrodes were of pla'inum With benzene, the products of progressive chlorination were chlorobenzene, *p*-dichlorobenzene, *symm.* tetrachlorobenzene, and hexachlorobenzene, the last-named product crystallising out practically pure. A point of interest is the formation of pentachloro-phenol by oxidation, if the chlorination is pushed beyond the tetrachlorobenzene stage. Some of the chloro-phenol reacts with the solvent to form a phenol acetate. Another oxidation product is chloranil (tetrachloro-quinone). Factors favourable to chlorination are high current density, low benzene concentration, and high temperature, while light is without appreciable effect.

On the contrary, with toluene, absence of light is essential, as otherwise complications ensue. Substitution takes place both in the nucleus and in the methyl group, but the latter is not affected until the ring has taken up at least three chlorine atoms. Here, again, there is a certain amount of oxidation, such products as 2.4.5-trichloro-3.6-dihydroxy-benzylidene chloride and hexachloro-benzene being present in the reaction product. Here, also, mention may be made of the electrolytic preparation of iodoform and bromoform, the former by the electrolysis of an aqueous alcoholic or acetone solution of sodium iodide, the latter from an aqueous-acetone solution of potassium bromide. Chloral may be obtained by the gradual addition of alcohol to the anode chamber of an alkali cell in action.

Formation of Quinones.

Quinones result from the anodic oxidation of benzene, naphthalene, and anthracene. In the case of benzoquinone, the benzene is allowed to rise through the electrolyte to the anode, whence the benzene solution of quinone is removed and continuously circulated through the cell until sufficiently concentrated for recovery. Similarly, by interchanging electrodes, it is possible to reduce the quinone solution to quinol (*U.S. Pat.* 1,322,580, of 1919). Another method is to oxidise an aniline-sulphate solution to quinone with the aid of small quantities of manganese sulphate (0.012 per cent.) or chromic acid. The latter is automatically regenerated in the anode compartment, it being only necessary to add about 5 per cent. of chrome alum at the start.

According to the detailed investigations of Ono (*J. Chem. Soc., Japan*, 1921), the products of the electro-chemical oxidation of naphthalene are naphthaquinone, phthalic acid, and a resinous substance, together with smaller quantities of α-naphthol and its compound with quinone. For the best results, the electrolysis should be carried out in the presence of acetone or acetic acid, with dilute sulphuric acid (1 acid : 4 water). Suitable current densities are 2 and 3 ampères per 100 sq. cms. for anodes of lead peroxide and platinum respectively. With a platinum anode, the yield of naphthaquinone increases with rise in temperature, but a lead peroxide electrode works best at ordinary temperatures. An increase in the current density leads to more oxidation, but does not result in a proportional yield of quinone. The oxidation is promoted by oxygen-carriers, a selection of these, arranged in diminishing order of effectiveness, comprising cerium nitrate, vanadic acid, potassium chlorate, potassium chromate, manganese sulphate, potassium ferrocyanide, and chrome alum.

Anthraquinone from Anthracene.

The formation of anthraquinone from anthracene constitutes the most important application in this field. In the absence of salts of chromium, vanadium, cerium, or manganese, there is no oxidation in a dilute sulphuric-acid medium, but under similar conditions as much as 80 per cent. of the anthracene will be oxidised when one of the above compounds is present.

According to Mollwo Perkin (*J. Soc. Dyers. Col.*, May, 1920), the most favourable conditions are as follows: 20 parts of anthracene paste (made by subliming the hydrocarbon with steam into cold water) are stirred with 1,000 parts of dilute sulphuric acid (20 per cent) by means of a lead cathode, which should be small in comparison with the anode. The electrolysis should be carried out in a lead cylinder which forms the anode, in the presence of chrome alum (15 per cent.), manganese sulphate (10 per cent.), or ceric sulphate (0.15 per cent.). Working at a temperature above 70° C., with a current density of 5 amps. per 100 sq. cms. at 2.8-3.5 volts, a current efficiency of almost 100 per cent. can be attained, a kilo. of anthracene requiring 1,000 ampère-hours according to theory. To prevent secondary changes, it is not profitable to carry the oxidation to an anthracene-content of less than 20 per cent. As carried out on the large scale in Germany, a vanadium salt is used as catalyst.

Oxidation of Toluene and Its Derivatives.

In the absence of a solvent, an emulsion of toluene and dilute sulphuric acid is completely oxidised to carbon dioxide and water. A similar result obtains with the xylenes. When acetone is present, however, and with a comparatively large platinum anode, there is a partial conversion to benzaldehyde and benzyl alcohol, a suitable electrolyte consisting of 50 parts toluene, 200 parts sulphuric acid (10 per cent.), and 275 parts acetone. Owing to the small yield, the process has not, up to the present, been commercially feasible.

An exhaustive study of this process has laid bare the complexity of its mechanism (Fichter and Uhl, *Helv. Chim Acta*, 1920, pp. 22-29). The successive products of the oxidation are benzyl alcohol and benzaldehyde. A portion of the latter is then converted into the highly oxygenated compound, dibenzylidene perox.de hydrate $C_6H_5CH(OH).O_2.(HO)$-CHC_6H_5, which, in turn, oxidises any unchanged aldehyde to benzoic acid The latter acid then undergoes a three-fold oxidation, one portion forming quinol, another salicylic acid, 2.5-dihydroxy- and 2.4.5-trihydroxybenzoic acid in successive stages, while the remainder yields quinone, 3.4-dihydroxy- and 2.4.5-trihydroxy acids, through the intermediate formation of *p*-hydroxybenzoic acid. From these, further oxidation products are possible.

By the anodic oxidation at 80° C. of *p*-nitrotoluene, the corresponding nitro-acid results. A suitable electrolyte for this process consists of 7½ parts of nitro-compound, 40 parts glacial acetic acid, and 20 parts of sulphuric acid. To catalyse the oxidation, the addition of 0.1 part of manganese sulphate is beneficial, while the current density should be 1.75 amp. per 100 sq. cms.

According to Plauson (*Brit. Pat.* 181,848, of 1921), substances of the nature of fatty acids may be prepared by the anodic oxidation of emulsions of mineral oil in alkali-bisulphate solutions containing a persulphate. For efficient oxidation, the anode should be of small size compared with the cathode, so that it can be maintained at a high temperature by the current. For general oxidations, the materials, as such or in solution, may be introduced into the anolyte through a tube, the end of which forms the anode.

The Rôle of Metallic Salts in Electrolytic Oxidations.

In order to elucidate the cause of the beneficial effect of small quantities of many metallic salts (the so-called "oxygen carriers") in electro-chemical oxidations, their action in the electrolytic formation of chlorates from alkali chlorides has been investigated (Schlötter, *Z Electrochem.*, 1921). One result of their presence is to minimise reduction at the cathode, and so to enhance the current efficiency. The effect of any salt was found to depend on its concentration and on the composition of the electrode. Thus with platinum electrodes concentrations of 0.5 and 0.21 gramme per litre of cupric chloride and lead peroxide respectively will totally eliminate cathodic reduction. On the other hand, an addition of 0.5 gramme stannous chloride per litre is without appreciable effect, although one-tenth of this amount results in considerable improvement.

In all probability, a network of metal is deposited on the cathode, the active favourable factor being the complex system, electrode metal—deposited metal—adsorbed hydrogen. This contention is supported by the following experimental results: (1) With a copper cathode, the amount of reduction is unaffected by copper salts, but diminished by iron salts; (2) with an iron cathode, copper salts exercise an unfavourable influence; (3) there is much more reduction with an iron than with a copper cathode. The beneficial effect of iron salts is attributed to the extensive adsorption of hydrogen by the electrolytically deposited metal (more than 100 times its own volume of hydrogen). A stable system thus arises, in which, moreover, the hydrogen is comparatively inactive.

The Oxidation of Phenolic Compounds.

By the anodic oxidation of α-naphthol at about 20° C. in the presence of acetone and dilute sulphuric acid (20 per cent.), using a lead peroxide anode and a lead cathode, Ono (*J. Chem. Soc. Japan*, 1921) obtained, as principal products, α-naphthaquinone, the compound of this with α-naphthol, and phthalic acid. αα-dinaphthol and the naphthol-quinone compound gave, on further oxidation, α-naphthaquinone and a mixture of this with phthalic acid respectively.

Vanillin is claimed as the main product of the electrolytic oxidation, at 60° C., of a 15-per-cent. solution of eugenol in excess caustic soda at a lead peroxide anode. A recent examination of this process by Lowy and Moore (*J. Amer. Electrochem. Soc.*, 1922) failed to substantiate this claim, as these investigators obtained for the most part only resinous products. In this connection, the preparation of purpurogallin from pyrogallol by A. G. and F. M. Perkin may be mentioned. This dyestuff, which gives alizarin-like shades with mordants, is obtained by the electrolytic oxidation of the above phenol in presence of sodium sulphate.

Salts of hydroxy acids result from the electrolysis of a fused mixture of the cresols and caustic soda (Pomilio, *Brit. Pat.* 103,709 of 1916). Thus, to prepare salicylic acid, 1 part of *o*-cresol is treated at 120° C., with 5 parts of caustic soda containing a little water. The mixture is then heated to about 250° C., and electrolysed with a current of about 6 amps. per 100 sq. cms. between electrodes of nickel, nickel-steel, or iron.

Acetaldehyde from Acetylene.

Aldehydes can be prepared electrolytically from alcohols. An early example was the formation of formaldehyde, in 80 per cent. yield, by the oxidation of a sulphuric-acid-solution of methyl alcohol (Elbs and Brunner, 1900). The ultilisation of acetylene as raw material for the production of acetaldehyde, acetic acid, and the like, led to many developments in this field. One such application is the regeneration, by anodic oxidation, of the mercury catalyst used in the hydration of acetylene. To this end, the gas in passed into an acid bath containing the mercury salt, the reduced metal itself forming the anode, while the cathode consists of mercury, lead, or platinum. In this way it becomes possible to use an electrolyte containing more than 10 per cent. of catalyst, with a consequent increased rate of absorption (*Brit. Pat.* 143,891, of 1920).

Continuous operation is possible by passing the acetylene through a porous anode impregnated with the mercury catalyst. The electrolyte consists of phosphoric acid (25 per cent.), maintained at about 50° C., at which temperature the aldehyde immediately vapourises, so that resinification is prevented. An E.M.F. of 2 volts suffices for the regeneration of the catalyst (*Brit. Pat.* 156,147, of 1920). An electrolytic recovery process has also been applied to the mercury sludges formed in similar hydration processes. Fairly pure mercury can be obtained by electrolysing a mixture of the sludge with 10 per cent. caustic soda solution (*Brit. Pat.* 10,140, of 1915). On the large scale, lead vessels are used in these catalytic processes. To prevent their deterioration by metallic mercury, a protective coating of lead peroxide, prepared and deposited electrolytically, has been recommended.

Electrolytic Reduction and Oxidation of Acetaldehyde.

Alcohol can be prepared by cathodic reduction of a dilute sulphuric-acid solution of aldehyde or paraldehyde in a diaphragm cell. To prevent the formation of condensation products, the concentration of aldehyde is kept as low as possible. Such materials as lead, antimonial lead, or mercury may form the cathode, and the cell is kept at about 40° C. by the use of a current density of 2-3 amps. per 100 sq. cms. Direct conversion of acetylene to alcohol is also possible by simultaneous hydration and reduction in a catholyte containing a mercury catalyst. Under certain condition, as, for example, with rise in temperature, secondary products, such as 1.3-butandiol, crotonyl alcohols, butyl alcohol, and ethyl ether, make their appearance. Of these, the crotonyl derivatives may serve as suitable alcohol denaturants (*Brit. Pats.* 140,115 and 140,527, of 1919).

Acetic acid results from the anodic oxidation of aldehyde. To separate the acid, the cell is operated at about 85° C. under a partial vacuum, the strength of the phosphoric-acid electrolyte being so adjusted that its boiling-point is above 130° C. Respective yields of about 80 and 15 per cent. of acid and aldehyde are claimed (*Brit. Pat.* 156,147, of 1920). To oxidise paraldehyde, a 10-15 per cent. solution in sulphuric acid (10 per cent.) is electrolysed between a gas carbon cathode and an anode made of magnetite or platinum. The process is facilitated by the usual catalysts (salts of metals capable of several degrees of oxidation), and is arrested when the acetic acid reaches a concentration of 40 per cent. (*Brit. Pat.* 124,195, of 1919).

By distilling the cell-contents with the equivalent quantity of ethyl alcohol, ethyl acetate is obtained; while cells have been devised which permit of the formation of this ester by the simultaneous reduction and oxidation of aldehyde at the cathode and anode respectively (*Brit. Pats.* 131,600, of 1919 and 140,115, of 1918).

Isopropyl Alcohol, Pinacone, and Glyoxalic Acid.

As the potential energy of the hydrogen absorbed in the cathode will depend on the composition of the latter, it should be possible by suitably selecting the electrode material, to influence the nature of the reduction product. An instance of this occurs in the reduction of acetone in acid or alkaline solution. With a mercury cathode the product is predominantly isopropyl alcohol, with only traces of pinacone, while with graphite, in alkaline solution, the result is chiefly pinacone. Using a pure-lead cathode, the ratio pinacone: alcohol is of the order of 2:1, but according to the Bayer Company this ratio becomes 30:1 with a lead-copper alloy, containing 40 per cent. of the latter metal (*Ger. Pat.* 306,523, of 1917). A similar fall in isopropyl alcohol results from the use of a cathode of lead-tin alloy (10 per cent. tin), brass, or bronze; or the formation of the alcohol may be repressed by the addition of salts of bismuth, mercury, manganese, nickel, antimony, silver, or iron to the acid electrolyte (*Ger. Pat.* 306,304, of 1917).

Oxalic acid, on reduction, yields glyoxalic acid. A recent patent proposes to accomplish this conversion by electrolysing a solution of oxalic acid containing salt and hydrochloric acid. Mercury and graphite compose the cathode and anode respectively (*Brit. Pat.* 198,855, of 1922). Baekeland claims the conversion of glyoxalates into salts of racemic or meso-tartaric acid by further cathodic reduction (*U.S. Pat.* 1,190,845, of 1916).

Electrolytic Hydrogenation of Unsaturated Compounds.

Acetylene can be reduced to ethylene electrolytically in the presence of a chromous salt, the catalyst being regenerated automatically (*Ger. Pat.* 287,565, of 1913). According to a recent specification, oils and hydrocarbons can be hydrogenated by cathodic reduction under the catalytic influence of the nascent alkali metal or of lead, palladium, or nickel, liberated from added salts. A comparatively small cathode should be used, and should be maintained at 120° C. by adjusting the current density (*Brit. Pat.* 181,849, of 1921). Pomilio's experiments on cathodic hydrogenation, appear to indicate that the higher fatty acids (such as oleic) offer great resistance to reduction in alcohol containing sulphuric acid. A similar solution of maleic acid, however, is reduced with ease, but difficulty is experienced with citraconic acid and its homologues (*Z. Elecktrochem.*, 1915).

Acid Reduction of Aromatic Nitro-compounds.

In the presence of moderately dilute sulphuric acid, the primary products of the electrolytic reduction of nitrobenzene are nitrosobenzene, phenylhydroxylamine, and aniline. With concentrated acid, however, the main product is *p*-aminophenol, a result due to the intramolecular change of the initial hydroxylamine. For the preparation of aniline, the cathode medium consists of nitrobenzene (25), alcohol (100), and 25 per cent. sulphuric acid (200 parts), and this is emulsified during the electrolysis by a rotating lead cathode. After reduction, the alcohol and any unchanged nitrobenzene are removed by distillation and steam distillation respectively, leaving an 80 per cent. yield of aniline sulphate in solution.

To obtain *p*-aminophenol, a mixture of 30 parts nitro-compound and 220 parts strong sulphuric acid (Sp. Gr. 1.86) is electrolysed at the cathode, the anode solution consisting of less concentrated acid. On account of the strong acid, the cathode must be either of platinum or carbon, while sulphonation must be avoided by keeping the temperature below 80° C. A source of difficulty in this preparation is the weakening of the cathode acid owing to anion migration. According to Shoji (*J. Chem. Ind., Tokyo*, 1918), to obtain a yield of over 40 per cent., and nearly theoretical current efficiency, good agitation and a current density of 8-9 amps. per 100 sq. cms, at 6-8 volts are necessary. This investigator regards the process as a successful competitor of the chemical reduction method, both on account of its simplicity and the comparative cheapness of nitrobenzene over phenol. In the presence of strong hydrochloric acid, small yields of *o*- and *p*-chloraniline can be obtained, through the intermediate formation of phenylchloramine.

In order to avoid a strongly acid electrolyte in this preparation, the use of a composite cathode has been suggested (*Brit. Pat.* 18,081, of 1915). Suitable electrodes may be prepared by depositing bismuth on a lead cathode; or mercury, lead and arsenic, and tin and arsenic, on a copper cathode; or, again, alloys may be used, or the metals may be deposited on a carbon cathode. Thus, with an acid concentration little more than sufficient to combine with the base formed, it is claimed that reduction with a simple lead cathode will give *p*-aminophenol and aniline in the proportion 2:3, while with a lead-bismuth cathode the ratio will be of the order of 5:1.

Phenyl-hydroxylamine can be obtained by reducing nitrobenzene, at ordinary temperature, in an aqueous-alcoholic electrolyte containing ammonium chloride. Zinc electrodes are recommended, and a diaphragm is unnecessary. The yield, however, is only about 25 per cent., being less than that obtained by chemical reduction with zinc dust (Frederiksen, *J. Amer. Electrochem. Soc.*, 1915).

The sulphonic acids of nitro-naphthalene can be reduced electrochemically with varying facility. Thus, using lead electrodes, the 1.5 and 1.8 mono-nitro-sulphonic acids, and the 1.3.6.8 nitro-trisulphonic acid will readily yield the corresponding amino-acids in 10 per cent. sulphuric acid. The 1.6 and 1.7 acids, however, reduce only to the hydroxylamines, compounds which tend to form tarry products very readily (Fierz and Weissenbach, *Helv. Chim. Acta*, 1920).

Alkaline Reduction of Nitro-compounds.

To prepare azoxybenzene, 10 parts of nitrobenzene are reduced at about 100° C. in a catholyte consisting of 50 parts of 3 per cent. caustic soda, using a cathode of nickel gauze and a current density of 10 amps. per 100 sq. cms. Vigorous stirring is essential, while the alkalinity of the cathode solution increases owing to the migration of sodium ions. Unchanged nitro-compounds may be removed by steam distillation, or the product, containing 40 per cent. of azoxy-compound, may be utilised as such for further reduction to benzidine. To this end water (50 parts) and sulphuric acid (20 parts) are added, and acid electrolysis carried out at the ordinary temperature to yield benzidine sulphate. By a similar process, tolidine sulphate may be prepared from *o*-nitrotoluene, through the intermediate formation of *o*-azoxy-toluene. Another method is to prepare hydrazobenzene, and then to pour the product into hot sulphuric acid, when benzidine sulphate results.

Azobenzene is the product when the catholyte consists of an aqueous-alcoholic solution of sodium acetate and the anolyte is a solution of sodium carbonate. A current efficiency of about 75 per cent is attained. By similar methods, diamines may be prepared from *o*- and *p*-nitranilines, the meta-compound, however, yielding *m*-diamino-azobenzene. Meta-nitro-dimethylaniline, on reduction, gives first, tetramethyl-*m*-diamino-azobenzene, and then the corresponding hydrazo-compound.

According to an early specification of the Bayer Company (1901) for these reductions, a double cell is used. This comprises a cathode of zinc, tin, or lead, immersed in an alkaline emulsion of the nitro-compound containing the cathode metal in solution, and an anode of carbon or platinum in a solution of soda, salt, or sodium sulphate. In order to prevent the deterioration of the cathode surface, when this contains lead, by the accumulation of decomposition products, the cathode may be placed horizontally, with its active surface downwards. By this means, the so-called "lead oil" falls away, to be removed or oxidised to peroxide at the anode (*Ger. Pat.* 303,303, of 1917).

Another process dispenses with a diaphragm, an emulsion of nitrobenzene in dilute caustic soda, produced by means of a high-speed rotary pump, being fed continuously by the latter on to the cathode, which consists of an iron-gauze cylinder. The bottom of the cell is of concrete, and is funnel-shaped, so as to facilitate the separation and removal of the heavy nitrobenzene-azobenzene mixture. A benzene solution of azobenzene may be further reduced to hydrazobenzene in a concrete cell with an iron floor to form the anode. The electrolyte consists of a caustic-soda solution containing lead oxide, and on this the benzene solution floats. Emulsification is effected by revolving the cathode at the surface of separation of the two liquids (*Brit. Pat.* 15,750, of 1915). Similar methods can be applied to electrolytic oxidations, as, for example, the formation of camphor from isoborneol.

The Formation of Saccharin.

Under certain conditions, *o*-toluene sulphonamide will yield saccharin on oxidation. According to the results of Fichter and Löwe (*Helv. Chim. Acta*, 1922), it is advisable to work in a medium containing sodium carbonate or ammonia. For the most favourable results, they recommend 2N sodium-carbonate solution at 60° C. as electrolyte, and platinum gauze and lead as anodic and cathodic materials respectively. A diaphragm cell is unnecessary, but efficient stirring is essential for good results. The success of the

process is not dependent on the intermediate formation of sodium percarbonate. 4N ammonia, containing ammonium sulphate, may also be used; the percentage yield and current efficiency in this case being 44 and 9, while with the sodium-carbonate solution they were 75 and 43 respectively. Caustic soda and dilute sulphuric acid are unsuitable media, sodium sulphate constituting the sole product in the former case.

Fichter has also examined the anodic oxidation of alkylated anilines in sulphuric-acid solution (*Helv. Chim. Acta*, 1922). Dimethylaniline, at a lead peroxide anode, yields, among other products, formaldehyde, tetramethyl benzidine, and the compound of these two. With a platinum anode different products result. On the other hand, tetraethyl benzidine is the sole product of the oxidation of diethylaniline at a lead peroxide electrode.

Electrolytic Preparation of Azo Dyes.

If a mixture of aromatic amine, sodium-nitrite solution, and a "coupling agent" is subjected to anodic electrolysis, an azo dyestuff is formed (Löb, 1904). A slight excess of nitrite is advisable, and the presence of the "coupling agent" is essential, as otherwise, the diazo compound first formed undergoes decomposition. In order to maintain the strength of the anode nitrite solution, the use of sodium nitrite in the catholyte is recommended. Thus, Congo Red may be prepared by treating a mixture of benzidine (10), naphthionic acid (3.3), and sodium nitrite (9.3 parts). Other examples are Ponceau 2G from aniline, β-naphthol disulphonic acid (R acid) and nitrite, and Dianisidine Blue from dianisidine, β-naphthol and nitrite. By the electrolytic reduction of an acid solution of diamidotriphenyl methane, *p*-rosaniline has been prepared.

Electrolytic methods have also been applied to coagulate rubber latex. On passing a current through the latter, rubber is deposited on the cathode. Strangely enough, the process is not arrested by the non-conducting deposit on the positive electrode, while a reversal of the current causes the rubber layer to be detached. According to Clignet (*Le Caoutchouc et La Gutta Percha*, 1915), on the large scale, graphite-filled porous vessels form the electrodes, and a small low-tension dynamo (1H.P.) suffices to supply the current. In order to remove inorganic impurities from sugar solutions, these are electrolysed in the middle chamber of a three-compartment cell. The ions move to their respective electrodes, which are washed in running water (*U.S. Pat.* 1,256,758, of 1918).

The Mechanism of Electrolytic Oxidation.

Two hypotheses have been advanced. According to one, the process is one of pure chemical oxidation by the oxygen formed in the first instance, while the other formulates the formation of oxidation products by the discharge of the anions of intermediate hydroxy-compounds. Fichter, who supports the former explanation, also assumes the intermediate formation of peroxides, many of which have been isolated. It has been pointed out, however, that on decomposition, these do not yield the required cleavage products. There is also a close similarity between electrochemical and biochemical oxidation processes, a parallelism which is attributed to the intense activity of oxygen liberated at a platinum anode.

CHEMICAL MANUFACTURE IN RUSSIA.

REMARKABLE EXPANSION IN DYESTUFFS PRODUCTION.

A SOMEWHAT detailed account of the present position of the dyestuffs and intermediate products industry in Russia is given in a recent issue of the *Financier*. The particulars are stated to be obtained from the "Green Book of Russia's Trade Returns."

Extent of the Anil Zevod.

The Anil Zevod, or Aniline Dye Trust, embraces all the aniline dye works of Soviet Russia. The trust includes nine different organisations in Moscow, and also the factory at Dorogomilov, which used to belong to the Russian Chemical Society. All the works, save one, are at present working. Two only of the 10 produced dyes before 1914, and these they made out of intermediates imported from Germany. They were making explosives during the war and in the early days of the revolution, and it was only after that event that they turned to dye making.

As the supply of imported intermediates gradually diminished, the Russian factories turned their attention to the making of their own intermediates. The new products already on the market include benzidine, alpha-naphthylamine, ortho- and para-toluidine, para-nitraniline, metaphenylenediamine, H. acid, saccharin, acetic anhydride, crystal violet, antifebrin and silver salvarsan. The difficulties in the way have been enormous, and great credit is due, says the report, to the professional staff, engineers and chemists, as well as to the men of science, who have greatly contributed to the successful result. All, or nearly all, the chemical laboratories had to be rebuilt under difficult conditions, and with an extreme shortage of necessary material. The Kinishem works are now, after a long delay, again producing sulphuric acid; the Olgin works oleum and chlor-sulphonic acid, as well as bisulphate.

Raw Material Supplies.

The work of individual factories changes from time to time to conform with the general plans of the trust, and new works are being built and others put in condition. The Don coal basin is now beginning to supply coke benzol, and will satisfy the demand of the combine for benzol, naphthalene, and so on. Of phenol there is still a fair supply, and it can also be produced by the trust. Zinc dust was formerly received from abroad, and will probably have to be obtained again in a similar manner.

The number of workmen engaged during 1922 in the works of the combine was 740, as against 605 in the previous year, but, with the increased supply of raw material, the number engaged has increased. Prices obtained enable the trust not merely to pay its way, but also to increase the reserve of material

Financial Position of the Trust.

In view of the huge demand for dyes the disposal of the products is assured, and no fear of a crisis need be entertained. On the very lowest calculation the market demand is about 156 tons a month. Notwithstanding high duties, about 31 tons were imported legally over a period of six months, and a great deal was smuggled. The financial position of the combine is satisfactory. According to the balance-sheet, the profits for eight months equalled 51,196 gold roubles—about £5,300. sterling. This does not take into consideration the larger supplies of raw material and finished dyes on hand, as well as the much greater value of the assets and buildings, apparatus, machinery, and so on. The whole cost of rebuilding and remodelling, as well as new works constructed, has been charged to the expense account. The combine has naturally felt the shortage of funds for the huge programme in hand, and the absence of credit under the present system in Russia has severely handicapped the trust at various stages.

Needless to state, the work of the Aniline Trust is only in its elementary stages, and facilities for rapid developments are lacking. But still the facts are, that Russia has developed an independent dye industry, using Russian raw materials and by-products. The dye industry will have to be protected from foreign competition, particularly German, at least for some considerable time, to prevent dumping.

Unfavourable factors for the development of the industry are also the following Excise duties of the Government:—(1) High excise duty on salt; (2) high excise duty on alcohol. The further successful development of this important industry will greatly depend on the attitude of the higher Government authorities towards it.

British Views on the Report.

"Perhaps the most interesting of many interesting details in this report," said a British dyestuffs authority to a representative of the *Financier*, "is the figure of dyestuffs consumption in Russia to-day. Tsarist Russia, excluding Poland, used 8,000 tons of dyestuffs a year; Bolshevik Russia needs less than 2,000 tons in the same period. Before the war Russia had a high rate of duty on finished colours and a very low rate on intermediate products. One result was that the Germans promptly ran up a couple of factories, where they turned intermediates, imported at this low rate, into finished dyestuffs.

To-day great development work is apparently to be done in the way of manufacture by this Bolshevik combine of factories that have facilities for making dyes. British dyes are already going to Russia through second, third, and fourth parties in Germany. They are shipped to Dantzig and Hamburg, where there are Germans who arrange for their transport into Russia.

ORGANIC VULCANISATION ACCELERATORS.

THE NEW ACTIVITIES OF THE B.D.C.

THE policy adopted by the Institution of the Rubber Industry, of discussing technical problems with those connected with allied industries, is proving its value. This was clearly shown in the very interesting lecture delivered at a meeting of the London Section, on Monday of this week, by Major V. Lefebure (of the British Dyestuffs Corporation) on "Rubber Accelerators."

Between 2,000 and 3,000 tons of synthetic organic chemicals are now used annually for accelerating rubber vulcanisation, and it was surprising, commented the lecturer, that this development had attained such great dimensions with so little standardisation, central consideration, and with such great differences of opinion as exist between rubber manufacturers as to the value or otherwise of the use of organic accelerators. In Great Britain, the widespread practice of offering and using, as accelerators, compounds of unstated and often unknown composition and purity, had retarded progress.

Undesirability of "Fancy" Trade Names.

America is by far the biggest rubber-consuming country in the world, and Major Lefebure suggested the following as a rough approximation of the raw rubber consumption in the countries named for 1923:—U.S.A. and Canada, 300,000 tons; Great Britain, 30,000 tons; France, 20,000 tons; Germany and Austria, 20,000 tons. Dealing with accelerators as chemicals, he said that for the organic accelerator, it must be of constant chemical composition. Though rubber manufacturers had complained of and even ridiculed the long chemical names carried by organic accelerators, the frank disclosure of the nature of the chemical was the only guarantee of any value to the rubber manufacturer, and such disclosure could not be made without the use of the chemical names. Therefore, he deprecated offering accelerators under curious trade names. For example, about six months ago samples of diphenylguanidine were collected from all possible sources and examined, and were found to vary greatly as regards method of sale and quality of the product. The products, most of which were sold under trade names, varied in actual diphenylguanidine content from 97 to 86 per cent., but in this case the British-made product was at the top of the list.

Comparative Activity of the Better-known Accelerators.

Comparing various accelerators from the point of view of speed, Major Lefebure referred to work recently carried out by the British Dyestuffs Corporation. A standard mix (rubber 100, sulphur 10, accelerator ½ per cent.) was "cured" at 40lb. for 60 minutes, comparing in the same operation *p*-nitrosodimethylaniline, aldehyde-ammonia, thiocarbanilide, diphenylguanidine, triphenylguanidine, hexamethylenetramine and tetramethyl-thiuramdisulphide. The test was repeated for a hard rubber mix (rubber 100, sulphur 40) which was "cured" for three hours under the same conditions. In this way it was found that under the above conditions of cure the following quantities of accelerators were roughly equivalent in activity:—

Accelerator.	Parts.
p-Nitrosodimethylaniline	1
Diphenylguanidine	1½
Aldehyde-ammonia	1½
Triphenylguanidine	4½
Hexamethylenetetramine	4½
Thiocarbanilide	8—10
Tetramethyl-thiuramdisulphide	less than ½

Effects of Other Compounding Ingredients on Accelerators.

Passing to the behaviour of accelerators in the presence of zinc oxide—a matter of great practical importance,—Major Lefebure gave his own experiences which showed that the presence of zinc oxide did have an important influence on the behaviour of organic accelerators. Magnesium carbonate also seemed to exert a generalised, mild activating influence on most accelerators. High percentages of litharge seemed to reduce the speed of organic accelerators, but this did not matter much as it was inconsistent, in the majority of cases, to employ high percentages of litharge in the presence of such accelerators. Lead sulphide, on the other hand, did not appear to retard the activity of accelerators. White substitute seemed to be a violent enemy of most accelerators. A comparative test between *p*-nitrosodimethylaniline, diphenylguanidine and aldehyde-ammonia using the experimental mix:—rubber 100, sulphur 10, white sub. 10, showed that *p*-nitrosodimethylaniline remained quite an active accelerator under these conditions, but diphenylguanidine and aldehyde-ammonia gave very poor results. The comparative immunity of *p*-nitrosodimethylaniline in the presence of white sub. was due probably to its comparatively low basicity. Indeed, the much greater range of compatibility of *p*-nitrosodimethylaniline with other components of the rubber mix was due to the fact that its action was associated with the nitroso group, and did not depend entirely upon basicity.

Nitroso Dimethylaniline, the Best All-round Product.

Owing to the great interest of *p*-nitrosodimethylaniline as an all-round accelerator, the lecturer referred to its harmful effects. Although some firms were using *p*-nitrosodimethylaniline and hexamethylenetetramine continuously without any rash trouble, yet attempts had from time to time been made to obtain combinations giving all the advantages of the *p*-nitrosodimethylaniline accelerator without the incidental disadvantages. The most recent appeared very promising, and consisted in making molecular compounds with β-naphthol and other analogous products. These compounds possessed a greater activity than their actual *p*-nitrosodimethylaniline-content would signify, and appeared to be almost entirely free from skin-irritant action.

All the work published, coupled with the tests carried out by the British Dyestuffs Corporation, enabled a list to be made of comparative activities of the different commercial accelerators, as follows:—

p-Nitrosodimethylaniline.
Diphenylguanidine.
Aldehyde-ammonia.
p-Phenylenediamine.
Hexamethylenetetramine.
Triphenylguanidine.
Zinc sulphate-ammonia compounds.
Formaldehyde-aniline.
Thiocarbanilide.

This list omitted the so-called "super-accelerators," the dithiocarbamates and thiuram-disulphides, as they were a special type.

Stability of Accelerators in Transit and Use.

Regarding stability as chemicals in transit and in the drug room, Major Lefebure's experience was that practically all the products mentioned as standard commercial accelerators could be regarded as stable. There was one marked exception—namely, the zinc-sulphate-ammonia compounds which had recently come on to the market. Other products which might show slight traces of decomposition if held long in chemical stock were the aldehyde-amine compounds, of which a well-known example was aldehyde ammonia; also the thiocarbamate type—the so-called super-accelerators. In fairness, however, it was necessary to discriminate between the reliable well-made brands, in which every care had been taken to obtain a stable and pure product, and other highly impure, less carefully manufactured articles. For example, samples of foreign super-accelerators which he had examined, and which were being offered in this country, showed a marked decomposition, with evolution of dimethylamine or diethylamine. The guanidines had shown remarkable stability in bulk use. Stability on the mills was a more searching test, as temperatures there sometimes reached well over 80°, and his experience was that the accelerators which had shown the greatest stability—in fact, complete stability—under the most stringent milling conditions, were the guanidines and *p*-nitrosodimethylaniline. It was wiser in general to use a small percentage of a relatively active organic accelerator than a large percentage of a relatively slow one. Many cases of premature vulcanisation in the mixing rolls or "scorching" had occurred when thiocarbanilide and hexamethylenetetramine had been used. This was partly due to the fact that relatively high percentages were required to give appreciable acceleration. Probably the best product of all from this point of view was triphenylguanidine, which was an extremely safe and foolproof product. *p*-Nitrosodimethylaniline, and aldehyde ammonia were also very safe from the point of view of accelerating action on the rolls.

The bulk experience of a large number of rubber manufacturers over a long period of time, had proved that the proper use of accelerators not only did not harm ageing, but had led to improved ageing of a number of important lines of rubber goods. Theoretical considerations also confirmed this conclusion.

The "Super-Accelerators."

With regard to super-accelerators, the earliest products to be suggested and tested were the thiocarbamates, combinations obtained from amines and carbon bisulphide. These compounds had certain disadvantages. In general, they were fairly deliquescent, and, if allowed to take up water through carelessness in handling, they tended to decompose on warming. They had relatively low melting-points, and were difficult to present as dry, finely-divided, undecomposed powders. For this reason the oxidation products, the thiuram disulphides, and also the zinc salts of the thiocarbamates, were of considerable practical interest. Their behaviour in rubber was practically the same as that of the parent compounds, the thiocarbamates, but they possessed the additional advantage of a superior physical state, being capable of preparation as dry powders, insoluble in water. The cost of production of these super-accelerators was largely determined by the cost of the amine components of the reaction, and so far the secondary aliphatic amines involved had not proved cheap chemicals. An outstanding feature of the super-accelerators was that in the presence of zinc oxide they gave an optimum physical condition, not only in a very short time, and not only with very high tensile strengths, but also with very low percentages of combined sulphur—*i.e.*, with very low vulcanisation coefficients.

General Survey of Present Position.

In conclusion, Major Lefebure pointed out that, although much has to be done before we can be satisfied that we thoroughly understand the behaviour of accelerators in rubber mixes, yet the rubber manufacturer to-day has at his command a sufficient range of active, reliable products for the chief types of mixes and processes of the industry. On the Continent, bulk experience had proved the value of the aldehyde-amine type, notably aldehyde-ammonia. In England, the value of the Peachey product, *p*-nitrosodimethylaniline, had been proved to the hilt. Other features of British bulk practice were the successful use of aldehyde-ammonia, of the piperidine-piperidyl-dithiocarbamate product in its reduced form, as proposed by Dr. Schidrowitz, and the increasing interest in and use of the guanidines, especially diphenylguanidine. In America the outstanding feature was the successful and increasing bulk use of diphenylguanidine, whilst there was also the wide use of *p*-nitrosodimethylaniline, particularly in hard rubber work, and the much wider attention paid there than elsewhere to the more complex aldehyde-amine compounds. This might be due to the fact that the American chemical industry was a very important source of supply of formaldehyde and acetaldehyde. In 1913-14, Mr. S. J. Peachey had made his well known discoveries in the field of acceleration, and gave us advantages as good as, if not better than, those possessed by Germany or America at that time; yet, with one or two notable exceptions, we failed to hold these advantages, and for nearly 10 years had been well behind in the race to manufacture and use these products.

Dr. S. Pickles, opening the discussion which followed the paper, said that certain accelerators were comparatively inert in the absence of zinc oxide, and others were comparatively active, and it was a question of whether we were dealing with a zinc oxide mixture or not which made all the difference in considerations of activity. Then, if it were concluded that zinc oxide was necessary for a certain accelerator, the percentage made a considerable difference. He was also undecided with regard to the firming-up of the rubber molecule by means of accelerators, and while some accelerators produced, almost from the start, a stiffening-up effect, even in the unvulcanised condition, yet others seemed to cause depolymerisation.

Dr. H. P. Stevens said the lecturer had not referred to the stability of accelerators at vulcanising temperatures. He could name accelerators used in conjunction with certain other substances by which the field of temperature in which they were active was very limited. If we had an accelerator which, ordinarily, might vulcanise very rapidly at 40lb., we might add something to it and find that we got very little acceleration at 40lb., but quite good acceleration at 10lb.

Dr. P. Schidrowitz said that with some of the ultra-accelerators we could overcure to the extent of 100 or 200 per cent., and yet the product would age better than an unaccelerated mixing which was overcured only, say, 5 to 10 per cent.

Is the British Rubber Manufacturer Deserving of Censure?

Mr. H. Rogers defended the manufacturers, who knew more about accelerators than some would have us believe. The American manufacturers had better opportunities of trying-out accelerators than the British manufacturers, and also had a larger chemical industry handling the materials in a larger way. He imagined that the quantity of accelerators used in this country to-day compared favourably even with the American figure.

Dr. Schidrowitz emphasised the importance of the possibility of vulcanising at low temperatures, under the boiling-point of water, and he thought that in time we should arrive at vulcanising tyres, not, perhaps, in the cold, but certainly not in pressure vessels.

Major Lefebure, referring to his concluding remarks in the paper, said the position with regard to accelerators was exactly parallel to that with regard to mustard gas during the war. A few people in this country who had worked on mustard gas had the impression that they had saved the Empire by their work; those who did the work certainly deserved great credit, but this country was deplorably behind others. To-day, probably not 30 per cent. of the accelerators were used that would be used if we were parallel with America or the big firms in France.

THE CHEMISTRY OF RUBBER.

XANTHATES AS VULCANISATION ACCELERATORS.

THE members of the Birmingham and Midland Section of the Society of Chemical Industry had under consideration at the second meeting of the session, at the University of Birmingham, on Tuesday, November 27, questions relating to the chemistry of rubber, and in particular to the acceleration of vulcanisation by xanthates, and physical characteristics used in the testing of the quality of rubber. There were two contributions, both being by Dr. D. F Twiss (chief chemist at the Dunlop Rubber Co.), together with Mr. F. Thomas, B.Sc., and Mr. F. B. Jones, B.Sc., respectively. The first paper was: "The Acceleration of Vulcanisation by Xanthates and the Influence of Metallic Oxides as Promoters," by D. F. Twiss and F. Thomas.

Optimum Effects Obtained at Low Temperatures.

No record, stated the authors, has yet been made in the chemical literature of the characteristic features of vulcanisation with the aid of metallic xanthates. The activity of the zinc alkylxanthates is greatly influenced by the presence of a suitable metallic oxide, such as zinc oxide. At ordinary vulcanising temperatures, such as 148° C., vulcanisation in the presence of a zinc alkylxanthate gives no clear indication of anything exceptional. Below 130° C. however, vulcanisation is greatly expedited, the improvement being most noticeable in the presence of zinc oxide, as little as 1 per cent. sufficing for a striking improvement in the physical properties of the product.

A mixture of rubber (90), and sulphur (10), vulcanised at 148° C. required 110 minutes for the attainment of an elongation (at 0.5kgs/sp.mm.) of 650 per cent. or a tensile strength of approx. 1.7kgs. per sq.mm. Progressive vulcanisation in this case is attended by the normal rapid decrease in extensibility and the development of a marked maximum in the tensile strength. With the additional presence of 5 per cent. of zinc ethylxanthate and 1 per cent. of zinc oxide in a mixture of the same rubber and sulphur (95 : 5) at 98° C., a tensile strength exceeding 2kgs/sq.mm. and an elongation of 486 per cent. at a load of 0.5kgs/sq.mm. are attained in less than 20 minutes, and remain substantially unaltered even after vulcanising for 150 mins.

Metallic Oxides as "Promoters."

The zinc salts of the other alkylxanthic acids—*i.e.*, zinc normal and iso-propyl xanthates, zinc *n*-butylxanthate, and zinc iso-amylxanthate possess similar power. Zinc methylxanthate is less active than its immediate homologues, probably on account of its lower degree of stability.

Consideration of numerous results leads to the view that the alkylxanthate enters into two types of reaction. In one of these a rapid cyclic set of changes occurs with activation of sulphur. In the other the xanthate undergoes irreversible decomposition with consequent rapid reduction in the quantity of xanthate available for the former reaction.

The cadmium alkylxanthates possess similar power to the zinc compounds. Cadmium oxide is almost as effective as zinc oxide in promoting the activity of alkylxanthates and other organic accelerators of vulcanisation, such as hexamethylenetetramine and thiocarbanilide. Magnesium and mercuric oxides are practically valueless as "promoters."

THE TRADE AND INDUSTRY OF THE DUTCH EAST INDIES.

ECONOMIC SITUATION MUCH IMPROVED.

IN a report on the Netherlands East Indies up to June, 1923, published by H.M. Stationery Office (3s. net), Mr. H. A. N. Bluett, British Commercial Agent at Batavia, says that the commercial recovery of the country is remarkable. During the current year there has been a most marked increase in trade.

Cinchona Bark, Quinine, and Copra.

The total exports of cinchona bark from Java in 1922 were 6,617 tons against 4,636 tons in 1921. Holland bought 5,008 tons, Great Britain 245 tons, and British India 913 tons. Under the altered rules of the Kina Bureau combine, manufacturers must take over from the growers the equivalent in bark of the quantity of quinine sold by them, with a minimum of 300,000kg. of sulphate of quinine per year; of the minimum quantity, 84,300kg. of sulphate of quinine in bark was allotted for delivery to the Bandoeng quinine factory, the remainder being shared out among affiliated manufacturers in Holland. As the quantity taken up by the manufacturers was below the normal production of the associated estates, the latter were allowed to store their excess stock at the estates for so long as it was not required by the Amsterdam manufacturers or the Bandoeng factory. It is estimated that by the end of last year over 3,000 tons were so stored, or approximately six months' export; from this it would appear that there is now a danger of overproduction, and the rumour that many estates affiliated to the combine are dissatisfied with the present arrangement may be well founded.

Although the combine of manufacturers has reduced the exorbitant price charged for quinine, there can be no doubt that—under normal conditions—consumption will not equal the producing capacity of either estates growing the raw material or the factories making the finished article, therefore either a reduction in the wholesale price of quinine or an all round curtailment of production seems inevitable. The estates owned by Japanese interest that are not tied to any combine appear to be promising, and their output will in a few years' time be of some importance.

The export of quinine from the Bandoeng factory showed a heavy decrease in 1922, only 124,589kg. being exported against 281,578kg. in 1921 and 310,351kg. in 1920, Italy (30,067kg.) and India (30,954kg.) being the principal importers. A marked improvement is noticeable for the current year, 47,019kg. having been exported during the first 3 months against 25,424kg. for the same period last year.

No export commodity is so dependent on the purchasing power of Central European countries as copra. Price and price only governs the amount of copra harvested. But the price offering for copra during the past year did not allow of enough being paid to the natives to encourage them to harvest the nuts; and exports show an all round decrease. The total exports from Java were 53,233 metric tons as compared with 93,010 tons in 1921, and from the seven principal ports of the outer islands 169,845 metric tons as compared with 217,558 tons in 1921. For the current year the exports show a small increase on the corresponding period of 1922. For other oil-bearing products—*e.g.*, peanuts, kapok seeds, cotton seeds, kemiri nuts, sesamun seeds and tengkawang or illipe nuts, there was a fair demand.

Iodine is found as sodium iodide in a dissolved state in mineral springs which have been located in the residencies of Sourabaya, Semarang and Cheribon, and has been produced from this source since 1854. It is exported from this country as copper iodide, potassium iodide and pure iodine. Exports in 1922 were 25,431kg. of iodine, of which 7,891kg. were shipped to Holland, 14,400kg. to England, 2,540kg. to Germany and 600kg. to China. In addition 260kg. of potassium iodide and 46,286kg. of copper iodide were exported, Great Britain taking 44,922kg. of the last named product.

Manganese ore is produced in two mines in Java and shipped from the port of Tjilatjap. The shipment amounted to 5,825 tons in 1920, 895 tons in 1921 and 2,551 tons in 1922. Exports went entirely to Holland for orders.

Review of the Import Trade.

For importers the period under review was not generally favourable. The import statistics for Java show that the decrease on 1921 is considerable in both volume and value, and that almost all lines forming the staple import trade of the country were adversely affected. The better export trade of the latter months of 1922 and the early months of this year is already reflected in the import statistics for the first quarter of the current year. It is not safe, however, to expect that the present revival will continue indefinitely, and in face of the present chaotic conditions in Central European countries it is impossible to forecast the trade possibilities of Netherlands India. It was particularly noticeable that importers mostly refrained from importing goods bearing trade marks not previously known in this market. On the other hand, importers were desirous to obtain the sole representation for well known manufactures whose registered trade marks are known throughout the world. There is now a particularly good demand for chemicals, cement, tin plates, galvanised sheeting, matches and soap.

The fact that the Netherlands East Indies is a considerable consumer of chemicals and chemical manures is now fully realised by British manufacturers, and exports to this country from the United Kingdom have been well maintained. For several of the principal lines consumed there is an increased import which has largely favoured Great Britain. Many home manufacturers previously not represented in this market have during the past two years established trade relations with leading importing firms, so that if our competitive prices are maintained there is now every indication that in future the United Kingdom will be the principal supplier of heavy chemicals. In addition to heavy chemicals there is a good demand for refined chemicals, medicines, patent medicinal foods and photographic chemicals, also chemicals required for the manufacture of aerated waters, syrups and cordials.

The import of dyestuffs, which are much needed for the batik industry, remains steady although with the exception of synthetic indigo the imports for 1922 show a decrease on 1921. It should be noted, however, that stocks at the end of December, 1922, were much lower than at the beginning of that year, and as the present demand for the batik industry is good, it is expected that imports for the current year will show an increase on 1922. Germany has re-established her position as the principal supplier of artificial dyestuffs, and most of the imports shown in the official statistics as direct shipments from Holland are of German origin.

The import of paints shows an all round increase; there is a fair demand and the competition which was expected from a local factory established in Sourabaya has proved negligible. Although Great Britain still enjoys only a small share of this trade she improved her position during 1922. The principal supplying countries are Germany and Holland.

The following table shows the quantity figures of the imports of certain chemical products into Java and Madura.

—		1921.	1922.	Jan. to March.

Chemical Trade of Chile.—The monthly circular of the British Chamber of Commerce in the Republic of Chile (Incorporated) contains statistics on the value of the principal exports from and imports into Chile during the first six months of 1923. Among the exports are sodium nitrate, valued at 109,000,000 gold pesos (one gold peso equals 1s. 6d.); copper, 48,000,000 pesos; borate of lime, 7,000,000 pesos; iodine, 4,000,000 pesos; and copper ore, 4,000,000 pesos. Among the imports are mentioned edible oils, 2,000,000 pesos; dynamite, 1,670,000 pesos; coke, 1,280,000 pesos; and cement, 1,050,000 pesos.

CONCENTRATED HYDROGEN PEROXIDE.

ADVANTAGES AS A BLEACHING AGENT.

By J. R. Boger, B.Sc., F.I.C.

THE advantages of the hydrogen-peroxide bleach have been the subject of much correspondence and discussion, and it is now generally accepted that hydrogen peroxide is the best bleaching agent available for many classes of materials. Recent reductions in price have made it possible to bleach wool with hydrogen peroxide at a cost comparable with the cost of sulphur stoving. Hydrogen peroxide in the bleaching of straw and silk has been an accepted fact for many years, and its application to cotton and linen goods is on the increase. Outside the textile industry, hydrogen peroxide is used in large quantities for bleaching materials, such as glue, bone, ivory, wax, and fur, and very considerable amounts are also used for medical and surgical purposes.

Preparation of the Concentrated Product.

Concentrated hydrogen peroxide testing 30 per cent. H_2O_2 or 100 volume strength is still regarded by many people as a chemical curiosity, but as a matter of fact it is now playing a very important part in industry. It is prepared by the electrolysis of a solution of sulphuric acid the reactions which take place being indicated by the following equations:

$$2H_2SO_4 = H_2S_2O_8 + H_2.$$
$$H_2S_2O_8 + H_2O = H_2SO_5 + H_2SO_4.$$
$$H_2SO_5 + H_2O = H_2O_2 + H_2SO_4.$$

The sulphuric acid is first converted into persulphuric acid which then reacts with water to form monopersulphuric acid (Caro's acid). The latter is hydrolysed giving hydrogen peroxide, which is recovered in the concentrated state by distillation under vacuum. The material thus produced possesses a high degree of purity. This point is of the utmost importance, for it is well known that the stability of hydrogen peroxide is largely a question of purity, and in consequence the concentrated product is far more stable than the lower strength and more familiar material. Instances are known to the writer of carboys which have been in stock for more than two years, the contents of which have been found to contain practically the same percentage of concentrated peroxide as when they were first bottled. This point is of great importance to the user since in the production of uniform results it is essential that the bleaching agent shall be of regular composition.

Concentrated hydrogen peroxide contains 30 per cent. by weight of real H_2O_2, which means that 100lb. of concentrated peroxide contains 30lb. of real H_2O_2. The more familiar 12 volumes material contains only 3.6 per cent. real H_2O_2. This means that the purchaser has to pay carriage on $8\frac{1}{2}$ times the amount to obtain the same quantity of real H_2O_2, and it must not be overlooked that whether the goods are sold ex works or carriage paid, it is the consumer who pays the carriage in the end.

Disadvantages of Sodium Peroxide.

Sodium peroxide possesses many of the advantages of concentrated hydrogen peroxide, but it also possesses many disadvantages which are not encountered with the latter. Sodium peroxide decomposes when exposed to the atmosphere, and may be explosive in contact with certain classes of organic matter. In the preparation of a bleaching bath, sodium peroxide is dissolved in a dilute solution of sulphuric acid and great care has to be taken that the whole of the sodium peroxide is dissolved, for if undissolved particles are allowed to come into contact with the goods, holes or yellow stains will be produced. Again, some grades of sodium peroxide leave a residue which remains on the surface of the bath and has to be removed by skimming.

Concentrated Peroxide in Continuous Bleaching Processes.

Concentrated hydrogen peroxide is particularly valuable in batching and continuous bleaching processes where the goods are entered into the bleaching bath in the damp state, and after being impregnated with the bleaching liquor are removed and wrung out, leaving the bath with approximately the same amount of water as when they entered. The amount of liquid in the bath in such processes remains approximately constant, and it is merely necessary to add the small amount of concentrated hydrogen peroxide equivalent to the peroxide removed by the goods to maintain the bath at a uniform strength. This is a very difficult matter if the weak peroxide is used as the amount of liquid in the bath has a tendency to increase considerably.

In the ordinary steeping process where the goods are allowed to remain in soak for a number of hours and the bath is only partially exhausted, when the bleach is complete concentrated hydrogen peroxide can be used with great advantage in restoring the bath to its original strength since the amount of material to be added is so small that its volume may be neglected in making the calculation, and further it raises the strength of the bath without any appreciable increase in the total volume.

In view of the advantages of concentrated hydrogen peroxide, it is surely a proposition worthy of the serious consideration of all connected with the bleaching trade.

THE CHINESE DYESTUFFS MARKET.*

RESUMPTION OF BRITISH INDIGO TRADE.

THE countries principally concerned in the imports of dyestuffs into China are Germany, Switzerland, the U.S.A., Japan and Great Britain. Since their alliance with the Badische Anilin und Soda Fabrik, the French Compagnie Nationale has practically dropped out of the indigo trade in China and imports from France have been negligible.

As indicated by imports into Shanghai, which form an important proportion of the total imports into China, increases over the previous years' (1921) figures are shown by Germany, France, and Great Britain, whereas imports from Switzerland, the U.S.A., and Japan were lower than those of the corresponding period of the previous year. The German position in the aniline dye trade remains exceedingly strong, due largely to the powerful advantage among "up country" dyers derived from their old-established "chops." Amongst the more enlightened Chinese consumers in and around the treaty ports, the situation is different in that it is possible for the manufacturer's representative to discuss and demonstrate his firm's products to the individual consumer. The leading British manufacturers offer to their customers a technical service similar to that maintained for many years past by the German firms and have been enabled by its aid to make progress, particularly amongst those consumers to whom "chop" is not a prime consideration.

Indigo imports into China during the period July, 1922/June, 1923, were considerably greater than those of the corresponding period of the previous year, these increases being shared by Germany, Switzerland, and America. The withdrawal of the French manufacturers from the China market is reflected in the fall in imports from France almost to vanishing point. Imports of indigo from Great Britain were negligible since prices up to the close of 1922 were unremunerative and British manufacturers were still holding considerable stocks which it was considered wise to liquidate. These stocks having now been completely disposed of, the importation of synthetic indigo from Great Britain has been resumed and will presumably by continued.

Effects of the Ruhr Occupation.

The occupation of the Ruhr by the French in January last was followed almost immediately by brisk speculation in dyes, based on a belief amongst dealers that war between France and Germany was imminent. Large stocks of dyes, particularly those of German manufacture, were eagerly bought up by dealers, who immediately advanced their prices up to, and in some cases exceeding, 100 per cent. This gamble in dyes, however, suddenly fell away and has not since been resumed. Market prices have also receded to levels not much above those prevailing before this short boom. The dyestuff business, in common with almost all branches of foreign trade, suffers from the general lawlessness is prevailing in China.

Chemical Workers' Strike.—The employees of Thomas Tyrer and Co., Ltd., Stirling Chemical Works, Stratford, London, E., came out on strike on November 19, in consequence, it was alleged, of the dismissal of a man who was discharged with a week's pay on account of the lessened demand for certain work. The strike was unofficial, and the employees' Union, after some negotiation, admitted that the directors of the company had acted within their legal rights. Work was resumed two days after the strike had begun.

* From D.O.T. Report on China (to July, 1923), by H. J. Brett, Commercial Secretary to H.M. Legation, Shanghai.

NOTES ON THE ITALIAN CHEMICAL INDUSTRY.

(From Our Own Correspondent.)

Genoa, November 30.

General News. — A Congress recently held at Trieste discussed the present conditions of the Italian export trade, and the possibility of and means to be adopted for extending it. The Government has sent an industrial commission to the Ruhr to examine closely the position of Italian interests in that region, and to discover possible means of defending these better than at present. The principal Italian interests to be safeguarded are those of the iron industry and of the industries using synthetic colours.

A new Government decree makes it illegal for all gas-works producing more than one million cubic metres of illuminating gas per annum to sell the gas unless it has been first scrubbed free from its light oils to an extent not higher than 15 grammes per cubic metre of gas. This obligation to extract the light oils is also enforced upon coke-oven establishments, the quantity to be extracted in the latter case being a matter to be arranged with each individual works.

Nitrogenous Fertilisers.—In pre-war years about 55,000 tons of nitrate of soda were annually imported into Italy. During the war this figure rose to 100,000 tons, but, of course, included nitrate needed for the manufacture of explosives. After the Armistice, as a consequence of the great confusion in all financial and agricultural activities, and of the existence of large stocks of nitrogen products in the country itself, the importations of Chile nitrate declined; but as soon as liberty was given to agricultural enterprise, and financial conditions became fairly stabilised, the consumption of nitrate of soda rose again, in spite of its price being higher than that of other nitrogenous products and of the fluctuations of the exchange creating obstacles to the trade. From import statistics compiled at the various Italian ports, it is seen that in the season 1920-1921 23,000 tons of nitrate of soda were consumed, in 1921-1922 31,000 tons, and in 1922-1923 51,000 tons. For the fertiliser season 1923-24, every sign points to the nitrate consumption being at least as great as before the war. At present there are in Italy about 12,000 tons of nitrate of soda available for delivery, and from now to June, 1924, there should arrive another 40,000 tons. The production of synthetic ammonia by the Casale process is giving very good results at the Terni works.

Overseas Chemical Trade. — Imports of chemicals, drugs, resins, dyewares, and pigments reached 903,000,000 lire during the first nine months of this year, as against 905,730,255 lire during the same months of 1922. During the period, imports of oils and fats declined from 243,500,000 lire in 1922 to 159,300,000 lire in 1923; and the imports of inorganic chemicals from 136,300,000 lire in 1922 to 90,500,000 lire; whereas exports of oils and fats increased to 210,900,000 lire in 1923 from 67,400,000 lire in 1922, and exports of inorganic chemicals to 47,500,000 lire from 27,100,000 lire. During the first three months of this year Italy exported to Argentina tartaric acid valued at 2,477,850 lire, natural essential oils at 632,560 lire, magnesia at 688,210 lire, olive oil at 439,865 lire, pharmaceutical products at 613,863 lire, and sulphur at 980,700 lire.

Company News.—The report of the Vercelli fertiliser works, Prodotti Chimici Superfosfati, for the last financial year showed a net profit of 276,145.53 lire on a capital of three million lire. A new firm, A. Nebuloni e C. has been established at Milan with a capital of 150,000 lire for the production of hydrofluoric acid, fluorides, and fluosilicates. The Società Anonima Tartari ed Affini of Catania (Sicily) is to increase its capital from 300,000 to 600,000 lire. At S. Maria Maggiore, near Domodossola, there has been established the new firm of Società Ceramica Vigezzina, with a capital of 150,000 lire, for the exploitation of deposits of feldspar and other raw materials for the production of porcelain.

The Fabbrica di Prodotti Sintetici Società Dott. E. Baslini and C., of Milan, is doing considerable business with synthetic acetaldehyde; calcium carbide; paral, a substitute for methylated spirit for power purposes, derived from acetaldehyde, etc. The Società Siciliana di Prodotti e Concimi Chimici, of Palermo, is increasing its capital from 6,000,000 to 10,000,000 lire by the issue of 40,000 shares of 100 lire. The Società Anonima Lorenzo Cammarata per il Commercio e la Distillazione del Catrame has been formed at Naples with a capital of 10,000 lire, with the objects of both distilling and trading in coal tar. The 17th year of the Società Anonima Bolognese per l'Industria dei Concimi e Prodotti Chimici, già Giuseppe Masotti Qm. Luigi, of Bologna, closed with a net profit of 404,988.66 lire on a capital of 2,000,000 lire, a dividend of 7.50 lire per share of 50 lire being declared. It has now been decided to increase the capital from two to three million lire.

The Chemical Market.—The Italian chemical market remains active, and fairly extensive contracts have been placed for caustic soda, sulphate of soda, and nitric acid. There is a rather inexplicable decline in the demand for super phosphate, although prices in Italy, allowing for exchange complications, are much below those quoted abroad. What may be termed comparative stagnation also characterises the demand for sulphate of ammonia, the price of which is slowly and steadily falling. In spite of this, the nitrate-of-soda market is by no means dull. As regards copper sulphate, present prices do not encourage business. Certain activity prevails in the basic-slag market, and imports from France have recovered. The prices of shellac remain firm, and the spot demand for the product is great. Stocks of leaf quality are low, and the holders are not inclined to sell at present prices.

THE DECAY OF BUILDING STONE.

CHEMICAL PRESERVATIVES AND THEIR VALUE.

MR. B. DYER, Chairman of the London Section of the Society of Chemical Industry, presided at the monthly meeting on December 3 when two papers were read as follows:—"The Use and Preservation of Building Stone," by J. Allen Howe; and "The Chemical Aspects of Building Stone Decay," by Dr. J. J. Fox and T. W. Harrison.

Mr. Howe, who is of the Geological Survey of Great Britain, dealt with the purely geological aspect of the subject. He touched upon the controversy as to whether the decay of natural building stone is caused by nitrifying organisms, and said that in towns like London, at any rate, these organisms have very little chance of doing damage in view of the sulphur in the atmosphere.

Sulphur Dioxide the Main Agent of Decay.

Dr. J. J. Fox gave some information gathered in work at the Government Laboratory, and said that so far as London is concerned, there is ample evidence that bacterial action does not come into play. It has been ascertained that the most serious decaying agent in large towns is sulphurous acid, and bacterial action is not of primary importance. Experiments proved that the most potent agent is water, because it carries sulphur compounds down from the atmosphere on to the stone. The problem of preservatives is not an easy problem, said Dr. Fox, nor can we expect to get one preservative which can be applied to all kinds of stone under all conditions. The time had come, however, when the whole problem of stone preservatives should be tried on a large scale. The 1861 Commissioners recommended that this should be done, and at that time there existed practically all the preservatives we now have. The reason why the Commissioners recommendation was not acted upon, however, was that the cost—£150.—was too high!

Inorganic Colloids as Stone Preservatives.

The most promising direction seemed to be in the use of inorganic bodies, because organic materials were liable to oxidise and cause trouble. The most likely materials were inorganic colloids, but even these were liable to dry up and leave the original pores. Another point in connection with preservatives was the formation of a hard surface to the stone. Was that desirable? Some people urged that these kinds of preservatives should be applied again and again until there was a perfectly hard surface to the stone, which, of course, would be of an entirely different composition from the general body of the stone. Personally, he doubted the advisability of this method of preservation.

In the discussion, Mr. Noel Heaton said there had been practically no progress made in preservatives for stone work for the last 50 years. The failure of the different preservatives had been demonstrated time after time and yet we had people continually coming forward and offering products under preparatory names, which it was claimed would solve the problem; nevertheless, they were the same old things over again.

ITEMS OF INTEREST.

Low-temperature Carbonisation. — Arrangements have been made by Low Temperature Carbonisation, Limited, to provide fresh capital through the Trade Facilities Act for the extension of works

Northampton Polytechnic Institute.—The annual prize distribution and students' conversazione will be held on Friday, December 7 (to-day), when Sir W. Martin Conway will distribute the prizes and certificates. The conversazione for members and students will be continued on Saturday.

The Colloid Mill in America.—Research and commercial development work on the Premier colloid mill, colloid processes and colloid products is to be undertaken by the Premier Mill Corporation of Geneva, New York. This company is the American branch of the British Premier Filter Press Co., Ltd.

Agwi Petroleum Finances.—A meeting of the Agwi Petroleum Corporation is called for the 28th inst. to consider a resolution for increasing the capital to £1,500,000. by the creation of 500,000 new shares. It is also proposed to create £300,000. 5 per cent. debentures, repayable at 135, at the option of the company, at any time within six months or in five years.

Australian Chemistry Professorship.—The Senate of the University of Sydney invites applications for the position of Professor of Organic Chemistry (Pure and Applied) in the University. The salary attached to the appointment is £1,100. per annum. Fuller particulars of the appointment may be obtained from the Agent-General for New South Wales, Australia House, Strand, London, W.C. 2.

The Theory of Colloids.—In the course of an interesting lecture on "Recent Advances in Colloid Chemistry," delivered before the Hull Chemical and Engineering Society on November 27, Mr. A. V. Slater, of the research laboratories of Reckitt and Sons, Ltd., stated that, in his view, the theory of colloids could be explained satisfactorily neither by the purely chemical nor by the physical adsorption concept, but that a correlation of the two by the light of recent research on surfaces and interfaces was necessary.

Obituary.—We regret to announce the death, on Saturday, of Mr. Sydney Knowles Muspratt, aged 74. Mr. Muspratt was a nephew of Dr. E. K. Muspratt, and a first cousin of Sir Max Muspratt, Bt. Mr. S. K. Muspratt was an alderman of Flint Town Council, and was mayor in 1896-7. In 1908 he served the office of High Sheriff of Flintshire, which had been held by his father and by his brother, the late Mr. James Liebig Muspratt.—It is with deep regret that we learn as we go to press of the sudden death of Mr. John Wilkie, B.Sc., F.I.C., the chairman of the Nottingham Section of the Society of Chemical Industry.

The British Empire Exhibition.—We have received an advance copy of a new folder on the subject of the 1924 Exhibition, which gives the latest available information of the many attractions the great Exhibition is to contain. Especially interesting is the reference to the British Government Pavilion, the description of which is the first that has been authorised for publication. In this Pavilion, the Ministry of Health, the Ministry of Agriculture, the Mines Department, the Imperial Mineral Resources Bureau, the Royal Botanical Gardens, and the Geological and Ordnance Survey will all be attractively represented.

Personal.—We are advised of the retirement of Mr. Alex. Fraser, who since 1869 has been actively connected with the heavy chemical industry, first as a process worker, and subsequently as a foreman. Mr. Fraser started work at a chemical works in the Widnes district. He then was foreman at Norris's, of Sowerby Bridge, and afterwards acted in a similar capacity at Dan Dawson and Sons, of Milnsbridge; Read, Holliday and Sons, Ltd., of Huddersfield; and J. Brown and Co., Ltd., of Dewsbury. For the last ten years Mr. Fraser has been with the West Norfolk Farmers' Chemical Manure Company, Ltd., of King's Lynn. Always shrewd, and with an intuitive knowledge of the requirements of the heavy-chemical trade in the matter of the erection of plant, and its subsequent operation, he has been peculiarly successful, and has done excellent work for the many firms with whom he has been associated during the last fifty years. It need hardly be said that Mr. Fraser, who is seventy-four years of age, carries with him the good wishes and esteem of many friends in his well-merited retirement.

British Coal Output.—During the week ending November 24 the coal output from the mines of Great Britain was 5,726,000 tons, compared with 5,574,100 during the previous week and 5,471,800 in the corresponding week of last year.

Sugar Beet in Lincolnshire.—The Holland (Lincolnshire) Farmers' Union, which has 1,000 members, has decided that it cannot recommend farmers in South Lincolnshire to grow sugar beet next year unless the factories offer a more reasonable contract than the one operating this year.

Atmospheric Corrosion.—The first experimental report to the Atmospheric Corrosion Committee of the British Non-Ferrous Metals Research Association will be discussed at a meeting of the Faraday Society, on the 17th inst. at 8 o'clock, in the rooms of the Chemical Society, Burlington House.

Explosion on British Steamer.—With regard to the explosion on the s.s. Otterburn, referred to in these columns last week, we are now informed by Mr. W. J. U. Woolcock, of the Association of British Chemical Manufacturers, that there was no chlorate of potash in the cargo, but that there was a parcel of potassium chloride.

The Imperial Institute.—On the retirement of Professor Wyndham R. Dunstan, Mr. H. M. Lidderdale, Secretary to the Executive Council, has been appointed Acting Director of the Imperial Institute from December 1, pending the reorganisation of the Institute. All communications on the business of the Institute should be addressed to the Acting Director, Imperial Institute, South Kensington, S.W. 7.

Danish Industry and Trade.—We have received from the Central Institute for Audit and Trade Organisation in Commerce, Industry, and Agriculture, Ltd., of "Copenhagen, B. Glydenlovesgadi," copy of a pamphlet (in English) descriptive of the activities of the Audit. The information contained should be of considerable practical interest to British firms concerned with Danish industry and trade. Copies will be forwarded to readers on request to the Copenhagen address given above.

New High Commissioner for India.—On Friday of last week, Mr. J. W. Bhore made over charge of the Secretaryship to the High Commissioner for India to Sir Edward Cook, late Financial Secretary to the Government of India, as an acting appointment. The High Commissioner will be responsible to the Government of India for the placing of contracts for a large part of the expenditure of £70,000,000., which will have to be spent by the Indian Governments and railways on public works developments and renewals within the next few years.

University News.—The Council of Leeds University has appointed Mr. Wilfred H. Hoffert to the post of research chemist to the Joint Research Committee of the National Benzol Association and the University, in succession to Professor E. C. Williams, who resigned his appointment on his election to the Ramsay Memorial chair of Chemical Engineering in the University of London.—At Manchester, Professor Bragg has been elected Dean of the Faculty of Science; Mr. R. Forsyth has been appointed demonstrator in Technological Chemistry in the Faculty of Technology. —Professor Arthur Smithells, F.R.S., who formerly occupied the chair of Chemistry at Leeds University, has had the title of Emeritus Professor conferred upon him by the Council.

The Royal Society.—At the 261st anniversary meeting of the Royal Society, at Burlington House, on Friday afternoon last, reference was made to Sir Alfred Yarrow's gift of £100,000., to mark his sense of the value of research to the community, and it was announced that Professor Fowler and Mr. G. I. Taylor had been appointed to the Yarrow Professorships. The President (Sir Charles Sherrington) said that Professor Alfred Fowler was known the world over as a spectroscopist whose researches had been of the greatest value to astronomy, physics, and chemistry. Mathematics, engineering, and geophysics had formed the field of research of Professor Taylor. The following officers and members of Council were elected:—President, Sir Charles Sherrington; Treasurer, Sir David Prain; Secretaries, Mr. W. B. Hardy and Mr. J. H. Jeans; Foreign Secretary, Sir Arthur Schuster. Other members of Council:—Sir Frederick Andrewes, Professor C. G. Barkla, Sir William Bragg, Professor W. E. Dalby, Professor A. S. Eddington, Professor T. R. Elliott, Professor E. S. Goodrich, Sir Sidney Harmer, Sir Thomas Holland, Sir Frederick Keeble, Professor T. R. Merton, Professor H. F. Newall, Professor D. Noel Pator, Dr. A. Scott, Mr. F. E. Smith, and Professor J. F. Thorpe.

U.S. WOOD PRODUCTS OUTPUT.—Figures just published by the U.S. Department of Commerce, show that the total American production of lime acetate during the first nine months of the present year was 122,869,828lb., and that the production of methanol (methyl alcohol) during the same period was 6,499,172 gallons.

EXTENSIONS OF PATENTS.—In the *Illustrated Official Journal* (*Patents*) of November 28, it is announced that the Société d'Exploitation de Procédés Evaporatoires (Système Prache and Bouillon) have applied for extensions in the terms of British Patent No. 10,413, of 1909 ("Improvements in or relating to Injector Apparatus for Compressing Steam or other Elastic Fluid"), and British Patent 9,276, of 1909 ("Improvements relating to Apparatus for Concentrating Liquids"). It is also announced that the Chemical Engineering and Wilton's Patent Furnace Company, Limited, have applied for an extension in the term of British Patent 26,910, of 1907 ("Improvements in or relating to the Distillation of Tar.")

POTASH RECOVERY AT SWEDISH CEMENT WORKS.—According to *Swedish Export*, the Swedish Board of Trade has recommended that the Slite Cement Works on the island of Gotland be granted a Government loan for extending its plant for production of potash on the Jungner method. The Board says that, in view of the large Swedish importation of German Stassfurt salts for fertiliser purposes, amounting to 10,000,000 kroner, it is of importance to ascertain how far the Swedish raw material can be utilised to compensate for this import. The conditions at Slite for recovery of potash from the clay according to the Jungner method seem to be very favourable, and the Board therefore thinks it probable that the results will prove encouraging.—*Engineering.*

TAR MARKET IN FINLAND.—Sales of tar in Finland during November have been sluggish. In consequence of the uncertain political situation, foreign buyers are not eager to purchase, and both Poland and Czecho-Slovakia have now appeared on the scene as competitors, whilst a tar industry is developing within the importing countries themselves, where there is always a considerable demand for this article. Fluctuations in the rate of exchange have kept France out of the market, and Holland, Germany and Great Britain have purchased only small quantities of late. From the beginning of the year up to the end of September exports of tar did not amount to more than 670 tons, whilst last year at the same time the quantities totalled 1,944 tons, and in 1913 were 1,812 tons.

PURIFICATION OF ALUMINIUM-SULPHATE SOLUTIONS.—The success of experimental work on the purification of copper-sulphate solutions and zinc-sulphate solutions, made by the Department of the Interior at the Pacific experiment station of the U.S. Bureau of Mines, suggested that possibly aluminium-sulphate solutions could be purified of iron compounds and thus provide a much needed cheap process of producing iron-free alum and other aluminium salts, which are now twice as costly as the less pure salts and yet are used in large tonnages by the baking powder makers and the paper mills, and for water purification. Three different modifications of a laboratory method for hydrolytic removal of iron from aluminium-sulphate solutions were worked out. Further experimentation is being conducted by the Bureau of Mines with a view to developing this method into a practical process for preparing pure alumina direct from clays for use in the aluminium industry.

THE STRENGTH OF CONCRETE.—The question of how to proportion the ingredients in designing concrete mixtures is an important one. Bulletin No. 137, just issued by the Engineering Experiment Station of the University of Illinois, enunciates relations between the compressive strength of the concrete and the amount of the cement and voids contained therein. It develops methods for studying the concrete-making properties of fine and coarse aggregates. Means are suggested for estimating the effect upon the strength and density of concrete that accompanies an increase in the amount of mixing water beyond that which would give minimum volume to the concrete. Analytical relations are developed and the technique for the proposed tests are described. The results of tests of mortars and concretes made up with a variety of fine aggregates are recorded and the accuracy and applicability of the methods discussed. Copies of the Bulletin may be obtained without charge by applying to the Engineering Experiment Station, Urbana, Illinois.

COMING EVENTS.

Society of Chemical Industry (Manchester Section).—Joint meeting with the Institution of the Rubber Industry, **Friday, December 7,** at **7 p.m.,** at the Textile Institute, 16, St. Mary's Parsonage. Papers: "Methods to be Adopted in Comparing the Activity of Various Accelerators," by S. Martin; "The Analysis of Rubber Vulcanisation Accelerators," by Dr. T. Callan and N. Strafford.—(**South Wales Section**): Meeting, **Friday, December 7,** at **7.30 p.m.,** at the Technical College, Cathays Park, Cardiff. Paper: "Coke Ovens," by T. G. Watts, to be followed later by a visit to the Maritime Coke Works, Pontypridd.

Institute of Chemistry. — Annual dinner, **Monday, December 10,** at **7.30 p.m.,** at the Hotel Victoria, Northumberland Avenue.—(**Manchester Section**): Meeting, **Monday, December 10,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage, Deansgate.

Institute of Metals (Scottish Section).—Meeting, **Monday, December 10,** at **7.30 p.m.,** at 39, Elmbank Crescent, Glasgow. Paper: "Cold Working of Metals and Its Influence on the Properties and Uses," by A. T. Adam.—(**N.-E. Coast Section**): Meeting, **Tuesday, December 11,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Paper: "Admiralty Gunmetal," by S. G. Homfray and F. Adam.—(**Birmingham Section**): Meeting, **Tuesday, December 11,** at **7 p.m.,** at the Chamber of Commerce, New Street. Paper: "Extrusion Problems" by Major R. M. Sheppard.—(**London Section**): Meeting, **Thursday, December 13,** at **8 p.m.,** at 85-88, The Minories, Tower Hill, E. 1. Paper: "Some Foundry Problems," by A. H. Mundey.—(**Sheffield Section**): Meeting, **Friday, December 14,** at **7.30 p.m.,** at the University, St. Georges' Square. Paper: "The Metallurgical Microscope," by J. H. G. Monypenny.—(**Swansea Section**): Meeting, **Friday, December 14,** at **7.15 p.m.,** at University College, Singleton Park. Paper: "The Brinell Hardness Test," by A. L. Norbury.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, December 11,** at **7.45 p.m.,** at the Photographic Society, Grey Street. Paper: "Recent Advances in the Study of Corrosion," by Dr. J. Newton Friend.

Society of Chemical Industry (Edinburgh Section).—Meeting, **Tuesday, December 11,** with the Institute of Chemistry. Paper: "H.M. Factory, Gretna," by Allin Cottrell.—(**Newcastle Section**): Meeting, **Wednesday, December 12,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Paper: "The Sterilisation of Preserved Foods," Miss C. M. Dugdale.—(**Chemical Engineering Group**): Joint meeting with the Liverpool Section on **Wednesday, December 12,** at **6 p.m.,** at 14, Elliott Street, Liverpool. Paper: "Extraction of Oils from Seeds Nuts, and Kernels," by J. T. Brewis. Visit to the African Oil Mills during the afternoon.

Institute of Chemistry (South Wales Section).—Visit on **Wednesday, December 12,** to the Chemical Department of University College, Swansea.—(**Leeds Section**): Meeting, **Thursday, December 13,** at **7 p.m.** Paper: "Practice Under Modern Patent Law," by Griffith Brewer.

Society of Dyers and Colourists (West Riding Section).—Meeting, **Thursday, December 13.** Paper: "The Dyeing of Artificial Silks," by W. E Sanderson.—(**Manchester Junior Branch**): Meeting, **Friday, December 14.** Paper: "Artificial Silk from the Chemist's View-point," by J. W. Shuttleworth.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, December 14,** at **7 p.m.,** at 36, George Street.

West of Scotland Iron and Steel Institute.—Meeting, **Friday, December 14,** at Glasgow. Paper: "The Sulphur Content of the Acid Charge," by J. H. Whiteley.

Society of Chemical Industry (Birmingham Section).—Joint dinner with the Institute of Chemistry on **Saturday, December 15,** at **7.15 p.m.,** at the Queen's Hotel.—(**Glasgow Section**): Ramsay Chemical Dinner on **Thursday, December 20,** at the Ca'doro Restaurant.

Institution of the Rubber Industry. — Meeting, **Monday, December 17,** at **8 p.m.,** at the Engineers' Club, Coventry Street, Piccadilly, W. Paper: "The Position of the Rubber Tyre Industry," by Col. Sealy Clarke.

Chemical Society.—Meeting, **Thursday, December 20,** at **8 p.m.,** at Burlington House, Piccadilly, W. 1.

CORRESPONDENCE.

*** *We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE INSTITUTE OF CHEMISTRY.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—It may interest your readers, and especially the Fellows and Associates of the Institute of Chemistry and the members of the British Association of Chemists, as well as employers of chemists, to know that it is common knowledge in Liverpool, if not in other sections, that the Council of the Institute of Chemistry is admitting a candidate to a "sort" of examination for the Fellowship of the Institute, apparently contrary to the Charter. We should like to know why this candidate is given special treatment, and we would also like to be convinced that the examination is a fair one. While I was a Member of Council I had dozens of letters complaining that candidates had asked the Council of the Institute to let them sit for the examination, but they were told they had not complied with the preliminaries and would have to do so before they could be admitted. This treatment was most unfair because in the past it had been done. Personally, I do not mind the present candidate being admitted to the examination if the Charter permits, and providing the Council will give the rejected candidates during these last six years the same privilege if they will consent to accept, but I know many who will not do so now.—Yours, etc.,

C. Watson Gray,
Ex-Member of Council of the Institute of Chemistry.

Liverpool,
December 1, 1923.

CHEMISTS AND THE ELECTION.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Once again the British Association of Chemists has taken the opportunity of placing before the candidates for election a questionnaire covering matters affecting vitally the welfare of the chemists of the country. Replies have, so far, been received from over 20 per cent. of the candidates, and among the large number of replies (over 90 per cent.) in support of our programme are to be found the following:—*Conservative*: Rt. Hon. L. C. S. Amery, Rt. Hon. Sir Douglas Hogg, Sir F. Sykes, Sir P. Sassoon, and and C. S. Garland. *Liberal*: E. Brotherton Ratcliffe, Cdr. Kenworthy, Rt. Hon. J. M. Hogge, and F. Briant, L.C.C. *Labour*: Rt. Hon. A. Henderson, W. Thorne, G. Lansbury, H. G. Wells, C. W. Bowerman, and E. G. Hemmerde.

Considering the strenuous conditions under which candidates live at election times, and especially the more prominent ones, we consider the response to our questionnaire extremely satisfactory.—Yours, etc.,

I. Boodson,
Hon. General Secretary,
British Association of Chemists.

London, W. 1,
December 4, 1923.

CHEMICAL ENGINEERING AND HYDROCHLORIC-ACID TREATMENT.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir. — It is obvious that the writer of the letter signed "Guthrie and Co.," in your issue of November 30, was not present at the meeting of the Chemical Engineering Group at which this subject arose. Although the handling of hot hydrochloric-acid solutions (such as occur in the hydrochloric-acid treatment of leucite) presents no terrors to the chemical engineer, this is not true of the chemical manufacturer.

The question of pumping such solutions is only a small part of the difficulties which occur in some factories. The loss of hydrochloric acid as vapour is usually increased by the means taken to avoid the nuisance of its presence in the factory itself. The treatment of leucite by hydrochloric or nitric acid in practically sealed plant presents no serious difficulty, but involves a departure from the methods we find in works "not very far" from my "lecture room."—Yours, etc.,

J. W. Hinchley.

South Kensington, London, S.W. 7.

German Use of Wrong Measures.—The London Chamber of Commerce is informed that the complaints of short measure which have recently been made by oversea buyers, more especially in South American countries and Japan, have been found to be due to the use of German tape-measures, accurately marked with metre measurements on one side and with the old German yard or "elle" of 37 inches on the other. The London Chamber of Commerce has already taken steps to warn its correspondents abroad, as well as the Board of Trade and the Department of Overseas Trade, of the injury which will result to British commercial prestige, unless foreign buyers use measures of British standard and manufacture.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Frater (Geo. A.) and Co., Ltd., Gateshead, paint manufacturers.—Registered November 14, £6,000. mortgage, to South Shields Commercial Permanent Building Society.

Kennedy's Glass Works, Ltd., Boscombe.—Registered October 22, two mortgages, to National Provincial and Union Bank of England, Ltd., securing all moneys due or to become due to the Bank.

Morris (P.) and Co., Ltd., Liverpool, paint manufacturers, etc.—Registered November 20, £5,008. mortgage, to Leeds Provincial Building Society.

Petroleum Products, Ltd., Liverpool.—Registered November 16, second debenture securing all moneys advanced by or owing to the holders, Bickersteth Baker and Co., Tower Building, Liverpool.

Shardlow Chemical Company, Ltd., Beeston.—Registered November 17, £7,250. debenture, to F. W. Chambers, High Street, Long Eaton, paper merchant, and another.

Walker (J. B.) and Co., Ltd., Hull, oil refiners.—Registered November 20, £1,000. debentures, part of £8,000.

SATISFACTIONS.

Rolls and Co., Ltd., London, N., paint manufacturers.—Satisfaction registered November 19, £150., balance of amounts registered October 13, 1902, and February 11, 1903.

Somerset Oxide and Ochre Company, Ltd., Bristol.—Satisfaction registered November 15, all moneys, etc., registered June 20, 1921.

Synthetic Products Company, Ltd., London, E.C.—Satisfaction registered November 16, £7,500., etc., registered April 23, 1915; £6,000. (not ex.), registered January 15, 1916; £2,500., registered October 2, 1917; £3,050., registered September 21, 1918; £5,000. (not ex.), registered December 24, 1918; £1,000. (not ex.), registered August 4, 1920; and £500., registered December 18, 1922.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

United Chemical Manure Company, Ltd., London, E.C.—Resolved October 30, confirmed November 15. H. H. Keddell, liquidator.

DISSOLUTIONS OF PARTNERSHIP.

(*Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.*)

Allied Chemical Company (Ernest Chas. Tyler and Alf. Thos. Holloway), 66, Bownend Road, Fishponds, Bristol. October 12. Debts by A. T. Holloway, who continues under same style at 77, Thingwall Park, Fishponds, Bristol. (November 20.)

Hayton and Co. (Matthew Hayton, Wilfred Hayton, and Geo. Stanley Hayton), 99, Gilesgate, Durham, wholesale druggists. May 7, 1923. Debts by W. Hayton and G. S. Hayton, who continue. (November 20.)

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Booth, T. A., Idle; wholesale manufacturing druggist; £89. 14s. October 3.

Britonia Polish Company, Ltd., 7, Isabella Street, Preston; manufacturers; £19. 16s. 6d. September 25.

Cheshire Feeding Meals and Fertilisers, Ltd. (registered office, Prince Chambers, 16, John Dalton Street, Manchester); manufacturers; £17. 3s. 1d. October 23.

Hall, Harry H., Sladen Dye Works, Littleborough; dyer; £15. 13s. 10d. October 22.

Jones (Evan) Son and Co., Ltd., registered office, The Red House, Cowell Street, Llanelly; manufacturing chemists; £22. 1s. 4d. October 24.

Kendall, Chas., and Co., Gildersome, cod liver oil manufacturers; £39. 5s. 6d. October 10.

Niblett Brothers, No. 16 Wharf, Hertford Road, Kingsland; solder manufacturers; £13. 2s. 6d. October 22.

Ridley, J. F., Scholars Green; chemical manufacturer; £28. 8s. 11d. October 23.

Shuttleworth, J. W. W., 21, Lloyd Street, Manchester; artificial silk manufacturer; £10. 17s. 3d. October 25.

Wenning Paint Works, Bentham; £13. 11s. 2d. October 27.

Silver Badge Polish Company, 49, Abbotts Road, Southall; polish manufacturers; £18. 3s. 4d. October 23.

FERTILISER NEWS.

Nitrate of Soda.—Shipments during November, amounting to about 163,000 tons, were lower than they might have been had not the labourers' strike at Iquique adversely affected loading at that port. Efforts have been made to cope with the situation by enlisting the aid of any labour available, but progress under such conditions is very slow. On the basis of last year's figures, exports to Europe and Egypt are fairly well maintained at 102,000 tons, against 106,000 tons for November of last year. The extent to which the European market is depreciated by the absence of Germany as a buyer is shown by comparison with the 1913 figure, amounting to 221,000 tons. America, and other countries, accounted for some 61,000 tons, against 93,000 tons a year ago. In the f.o.b. market further business has been done by the Producers' Association, which reports about 50,000 tons sold during the later half of November. Total sales for shipment during the current fertiliser year, therefore, reach between 1,430,000 and 1,440,000 tons—a considerable improvement compared with the position at the same date in 1922, when 1,100,000 tons were reported as disposed of. It is stated that most of the business has been transacted on American account, giving rise to confident expectations that the lack of interest in the Chilean product on "the other side" is diminishing. Stocks in the United States are low at the present time, the visible supply at the end of November being 98,000 tons, against 177,000 tons last year. According to American advices, however, the market is very quiet, and buyers are endeavouring to shade prices wherever possible. The weakening of the English exchange, a fact which affects the price in America to a slight extent, is disturbing the market somewhat. Stocks in Europe and Egypt are rising, imports at 63,500 tons exceeding deliveries inland from ports by 25,000 tons, increasing the visible supply, which includes nearly 180,000 tons now afloat, to about 468,000 tons. Some perturbation is caused by the announcement of the latest tax-raising measure of the Chilean Government. Under the provisions of a Bill which has been passed by the Senate, and sent to the other Chamber, it is proposed to tax the profits of foreign companies operating in Chile. This tax, which amounts to 3 per cent, is likely to impose a heavy burden on the nitrate industry.

Sulphate of Ammonia.—The report presented at the annual meeting of the Sulphate of Ammonia Federation, held recently in London, contains statistics of a very interesting nature. Production of ammonia in all forms calculated in terms of 25 per cent. sulphate in 1922 totalled 361,675 tons in the United Kingdom and 466,070 tons in the United States, compared with 260,850 tons and 320,090 tons respectively in 1921 and 409,875 tons and 445,950 tons in 1920. Provisional estimates for 1923 indicate that the total reached in 1920 will be slightly exceeded. In the United Kingdom during the fertiliser year ending May 31, 1923, there was a steady recovery in output, chiefly at coke-oven plants, and the total production of sulphate of ammonia is estimated at about 340,000 tons, compared with 229,390 tons for the previous twelve months. Consumption in the United Kingdom during the period is stated to be about 140,000 tons, an increase of some 4,000 tons. The Board of Trade returns covering the same months give the exports as 187,600 tons. The increase in the domestic consumption is considered to be more favourable than the actual figures would warrant, as it is accompanied by a corresponding increase in the consumption of nitrate of soda, while Norwegian nitrate of lime to the extent of 10,000 tons was imported during the year. The amount of sulphate used in the United Kingdom has been steadily diminishing since the peak year 1918-19, when 269,000 tons were absorbed, followed by 233,500 tons in 1919-20, 166,920 tons in 1920-21, and 136,000 tons in 1921-22, so that the turn of the tide is certainly a matter for gratification. Compared with the pre-war figure of 40,000 tons, the present position is certainly satisfactory.

REPORTS OF COMPANIES.

Huelva Copper and Sulphur Mines, Ltd.

It is reported that a somewhat decreased tonnage of ore was extracted during the year to June 30 last, the amount being 45,870 tons, as against 47,492 tons in the previous year, and 50,189 tons in 1920-21. In addition, 3,749 tons of higher grade ore were purchased from other mines and contributed to the output of copper, which was 1,853 metric tons, an increase over those of the two previous years. The total receipts for the year amounted to £161,845.; after deducting Spanish and London expenses and loss on exchange, the net profit was £11,463., comparing with £6,001. in 1921-22 and £20,601. in 1920-21. The directors have applied £3,094. in increasing the provision for depreciation to £40,000., and now recommend a dividend of 8d. per share (3⅓ per cent.), as a year ago. The balance forward is £1,024. against £1,978. brought in.

North Broken Hill, Ltd.

During the year ended June 30 the profit, after allowing for mine expenditure, taxation, etc., and reserve for depreciation, was £284,780., to which is added £30,000. brought forward. During the year three dividends of 2s. per share (or 30 per cent.) have been paid (against 10 per cent.); £13,333. has been placed to debenture sinking fund reserve, while £52,000. has been appropriated for plant expenditure, leaving a balance of £69,447. The assets at June 30 last show a surplus over liabilities of £532,454. (exclusive of shares and debentures in other companies).

DIVIDENDS.

Cassel Cyanide Company, Ltd.—The net profit for the year to September 30 last, together with the balance from last year, amounted to £67,388. The interim dividend of 3d. per share absorbed £17,625., and the directors have recommended a final dividend of 6d. per share, less tax, requiring £35,250., leaving £14,513., to be carried forward.

British Oxygen Company, Ltd.—Directors have declared an interim dividend on account of year ending March 31, 1924, of 9d. per share, equivalent to 3¾ per cent. actual, free of tax.

Scottish Oils Company, Ltd.—No interim dividend will be paid on the 7 per cent. non-cumulative participating preference shares.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

Interest has been aroused by the announcement that the coke makers in West Cumberland are considering the installation of a new type of washer for the purpose of producing a coke as hard and as low in phosphorus as East Coast coke. It is recognised that if the coke makers can make good their claim that the low-phosphorus iron smelters will be enabled to dispense with the East Coast coke, it will not take them more than two years to recoup themselves for their outlay. The cost of the local coke to smelters of ordinary iron at present is between 25s. and 26s. per ton. The cost of the new coke, it is stated, would be at least 9s. per ton less than that of the East Coast coke. If, as is believed, the coke makers embark on this project they not only improve their own collieries and coking plants, but they put the smelters in the way of competing on much more favourable terms with the smelters of hematite pig-iron in Scotland and on the East Coast. There is little that is new to say concerning the movement in trade at the moment. The improvement in the pig-iron trade is maintained, and as the local consumption of metal is growing, it is evident that an additional furnace or two will within a few weeks have to be put into blast. The coal trade is very busy, and the whole of the make of coke is going into consumption. Residuals are in slow demand. East Coast coke supplies this week are 9,900 tons.

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," December 8, 1888.)

The Spanish Mineral Trade.—The exportation of iron ore from Spain continues to be very active, and would be even more important if it were not partly checked by the want of steamers. It amounted, however, to upwards of 3,000,000 tons from January 1 to October 20 last, this figure being only a little below the returns for the corresponding period of 1887. The decision of the Spanish Government to lay an export duty on iron ore, towards defraying the cost of the Bilbao harbour works, has caused considerable dissatisfaction in commercial circles in Spain and other countries, still the prices are firmly maintained at 8s. to 8s. 4d. for Campanil, and 7s. to 7s. 6d. for red ore.

CHEMICAL TRADE OF THE NETHERLANDS.

OCTOBER IMPORTS AND EXPORTS.

The following statistics, which have been furnished by the Bureau voor Buitenlandsche Bedrijfsberichten, of The Hague, show the amount and value of Holland's trade in chemicals during the month of October, 1923.

	Egypt	44,000	1,000
	Argentina	47,000	2,000
	Mexico	447,000	16,000
Nitric acid	Total	6,000	1,000
Hydrochloric acid	Total	40,000	12,000
Liquid carbonic acid	Total	10,000	11,000
Salammoniac	Total	7,000	2,000

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

British India.

The Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E. 1, requires tenders for the supply of 4,956lb. of potassium iodide crystals B.P., due on December 18, 1923.

Egypt.

A merchant and commission agent in Cairo desires to be placed in touch with British manufacturers of linseed oil substitutes. (Ref. No. 594.)

Lithuania.

A firm of merchants and agents in Kovno desire to secure the representation for Lithuania of British manufacturers of caustic soda, talc, and fats for soap factories; brewing machinery, filters, etc., for breweries; coal tar, impregnating materials for railway sleepers, etc. (Ref. No. 593.)

South Africa.

A firm of agents in Cape Town desire to handle an agency for disinfectants, preferably for a firm who would carry stocks in South Africa, on a consignment basis, and pay for propaganda. (Ref. No. 574.)

Spain.

A Spanish commission agent of Vigo desires to secure the representation of a British firm exporting copper sulphate. (Ref. No. 589.)

Sweden.

A firm of commission agents in Stockholm desire to secure the representation for Sweden of British manufacturers of heavy chemicals, soya oil, and other vegetable oils, etc. (Ref. No. 591.)

A firm of commission agents in Gothenburg desire to secure the representation for Sweden of a British firm manufacturing and exporting linseed oil, boiled and raw. (Ref. No. 592.)

Switzerland.

A Swiss firm at Basle desire to enter into relations with United Kingdom exporters of mineral lubricating oils, gas oils, benzene, petrol, animal oils, vegetable oils, and rosin, with a view to acting as agent or to purchase on their own account. (Ref. No. 593.)

United States of America.

A firm of agents in Reading, Pa., wish to communicate with British producers and exporters of whiting and china-clay, with a view to obtaining agencies, on a commission basis, for the States of Pennsylvania, New Jersey, and New York. (Ref. No. 596.)

NEW COMPANIES.

Anglo-Spanish Oilfields, Ltd.—Private company. Capital £2,000. Office: 18, Sackville Street, Piccadilly, W.

British Mineral Oil Products, Ltd. — Private company. Capital £10,000. Solicitors: Slaughter and May, 18, Austin Friars, E.C.

Cleeneeze, Ltd.—Private company. Capital 2,000., in £1. shares (1,000 7 per cent. cumulative preference). Manufacturers of and dealers in powders, compounds, pastes, blocks, tablets, and creams, etc. Solicitor: C. A. Thompson, 61-2, Chancery Lane, W.C.

Danish Soap Industry, Ltd.—Private company. Capital £5,000. Soap manufacturers, perfumers, etc. Office: 49A, Old Bailey, E.C.

Phosaline (1923), Ltd.—Private company. Capital £200. Wholesale, retail, and manufacturing chemists, etc Office: Provident Chambers, 51, Wardwick, Derby.

Razip Manufacturing Company, Ltd. — Private company. Capital £1,000. Manufacturers of and dealers in Razip paint, enamel, etc. Office: 38, Deansgate, Manchester.

Silver Drug Supply Company, Ltd.—Private company. Capital £1,000. Manufacturers of and dealers in drugs and pharmaceutical chemicals, etc. Secretary: H. Warburton, 1, Lords Avenue, Weaste, Manchester.

Unit Pasteuriser and Chiller, Ltd.—Private company. Capital £2,000. Office: Sentinel House, Southampton Row, W.C.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 19 to 24 (inclusive).

Synthesis of Rubber Compounds. Benson, M. 29,469.
Products from Rubber. Benson, M. 29 6.5.
Removing Odoriferous Substances from Oils and Fats. Bollmann, H. 29 210.
Pure Carbazol. Chemische Fabrik in Billwärder vorm. Hell and Sthamer Akt.-Ges.; and Weil, L. 29 312.
Pure Anthracene and Carbazol. Chemische Fabrik in Billwärder vorm. Hell and Sthamer Akt.-Ges.; and Weil, L. 29,313 and 29 314.
Generation of Gases Cruse, H. 29,121.
Gas Analysis Apparatus. Daynes, H. A. 29 597.
Dehydration of Air Containing Volatile Substances. Delpech, J. 29 628.
Treatment of Diatomaceous Earth. Golby, F. W. (*Celite Co.*) 29 492.
Holders for Chemical Apparatus Hossack, A. 29,526
Insecticides. Howles, F.; and McDougall, I. 29,512.
Sodium. Hulin, P. L. 29,289.
Water Gas. Humphreys and Glasgow, Ltd.; and Shelfox, J. C. 29,503.
Distillation. Lamplough and Co., Ltd., F.; and Lamplough, F. 29 401.
Separating Liquids. Lemale, P. C. 29 376.
Operating Evaporating Apparatus. Metallbank- und Metallurgische Ges. Akt.-Ges.; and Gensencke, W. 29,481.
Bituminous Emulsions. Montgomerie, J. A. 29 568.
Reactivating Adsorption Media with Simultaneous Recovery of the Adsorbed Products. Naamlooze Vennootschap Montaan Metaalhandel. 29 591.
Styrol. Nuyatuck Chemical Co. 29,286.
Paints. Schindelmeiser, J. 29,290.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C. 2.

1922.

Compounds of Silver Iodide and Protein Substances. Marks, E. C. R. (*Parke, Davis, and Co.*). 23 443. **206,954**
Scrubbers for Use in Gas-producer Plants. Ruston and Hornsby, Ltd.; Livens, F. H.; and Grieve, F. J. 26 783. **206,982**
Dyestuffs. Thomas, J.; and Scottish Dyes, Ltd. 28,596. **207,000**

1923.

Utilisation of Vegetable Materials Containing Pentosans. La Forge, F. B.; Tooke, C. W.; Mains, G. H.; and Clarke, W. F. 9,661. **207,116**
New Barbituric Acid Compounds. Chemische Fabrik Auf Actien vorm. E. Schering. 14 079. **198,379**
Manufacturing from Cyanamide Fertilisers Containing Soluble Organic Nitrogen. Soc. d'Etudes Chimiques pour l'Industrie. 22,076. **203,683**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Treating Ammonium-chloride Lyes in Iron Vessels. Henkel et Cie; and Weber, Dr. W. 6,597. **207,142**
Naphthalene Derivatives and Dyestuffs Therefrom. Soc. of Chemical Industry in Basle. 25 043. **207,162**
Electrolytic Processes. Siemens and Halske Akt.-Ges. 28 463. **207,174**
Sulphur from Gas-containing Hydrogen Sulphide. Farbenfabriken vorm. F. Bayer and Co. 29 008. **207,196**
Electrolytic Tanks. Carrera, L. A. 29,097. **207,199**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Chromium Compounds. A. Mond, London. (Chemische Fabrik Griesheim-Elektron, Frankfort-on-Main, Germany.) British Patent **204,886**, of 1922.

Chrome iron ore is converted into ferrochromium in the known manner, the ferrochromium is dissolved in hydrochloric acid and the chromium precipitated as hydrated oxide by calcium or barium carbonate. The precipitate is separated and used to produce alkali chromate or chromium salts. The filtrate, if barium carbonate was used, is evaporated and cooled to separate barium chloride and the mother liquor may be evaporated to obtain ferrous chloride. In the precipitation of the chromium hydrate it is preferred to use granular limestone or witherite and hot chloride solution.

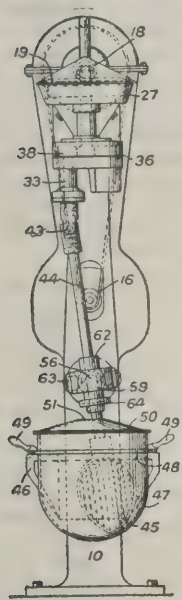
Vulcanising India-rubber. Dunlop Rubber Company, Ltd., London; D. F. Twiss, Sutton Coldfield, Warwickshire; and F. Thomas, Birmingham. British Patent **204,757**, of 1922.

Zinc or cadmium propyl xanthate or one of the alkyl series—namely, methyl, ethyl, butyl, amyl, is added to rubber mixings which are subsequently vulcanised at a temperature of 60-130° C. whereby over-vulcanisation is prevented however long the heating may be continued. According to an example, 51¼ parts of rubber, 5 parts of sulphur, 20 parts of zinc oxide, 1 part of magnesia, 18 parts of gas black, 3 parts of paraffin wax, and 1¾ parts of zinc propyl xanthate heated for 20 minutes at 98° C. gives a product having a coefficient of vulcanisation of about 3, which remains the same after a further 2½ hours' heating. *Reference has been directed by the Comptroller to Specification* 177,493.

Vulcanisation Accelerator. H. Skellon, Middleton, Lancashire; T. H. Roberts, Reigate, Surrey; and H. B. R. Clarke, Radlett, Hertfordshire. British Patent **204,902**, of 1922.

A vulcanising accelerator consists of the material formed by the reaction of zinc or cadmium sulphate and ammonia, with the addition, if not already present in the mixing, of zinc oxide. In an example, to a mixing consisting of 48 per cent. rubber, 49 per cent. fillers, and 3 per cent. sulphur is added 1-2 per cent. of the rubber of a mixture of equal proportions of penta amino zinc sulphate and zinc oxide, and the mixing is vulcanised in 20min. at 40lb. steam pressure. Specification 4955/14 is referred to.

Mixing-machines. F. Westerman, Chicago, U.S.A. British Patent **204,752**, of 1922



A stirrer 45 is mounted on a shaft 44 which describes a path of double-conical form and is simultaneously rotated, the shaft 44 sliding in a sleeve 62 which is mounted by pivots 63 in a ring 59 carried by a shaft 56 which revolves in bearings on the standard 10. The shaft 44 may have a universal joint 43 to connect it to a shaft 33 carrying a pinion 38 in mesh with a wheel 36 driven by bevel gear 18, 19 and belt 16 from an electromotor carried on the standard 10. Oil pans 27, 64 are provided. The container has a cover 50 provided with a small central opening 51 and a flange 48 which rests on a bracket 46 and is secured by clamps 49.

Acid Treatment of Coal Tar. W. E. W. Richards, and Siluminite Insulator Company, Ltd., London. British Patent **204,976**, of 1922.

Coal tar is heated to about 100° C., sulphuric acid is added and air is blown in; heating is then discontinued and the blowing maintained until the mixture has thickened when pitch separates at the bottom and oils at the top, these being separated. The oils are distilled at about 400° C., a pitch-like residue and a distillate suitable for use as fuel oil being obtained. Specification 3008/12 is referred to.

Distilling Alcoholic Liquids. H. F. Harris, Atlanta, Georgia, U.S.A. British Patent **204,775**, of 1922.

The separation of alcohol from fermented liquids by distillation is hastened by the addition to the liquid of sulphates of the alkali or alkaline earth metals, magnesium sulphate, a mixture of ferrous and ammonium sulphates, or of sodium phosphate, sodium thiosulphate or other salts. In using ammonium sulphate, 50-70 per cent. is added to the fermented mash and an acid is added, if necessary, to give the mixture an acid reaction. In using magnesium sulphate, 50-100 per cent. is added, and lime is added to the distillate to remove any magnesium sulphate which has been carried over.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Silica Gel. Farbenfabriken vorm. F. Bayer and Co., Leverkusen, near Cologne, Germany. British Patent **205,081**. Convention date, October 4, 1922.

Silica gel prepared in the usual manner is freed from a large proportion of its water by subjecting to pressure, there being no consequent diminution in its absorptive properties. In an example, water glass solution is treated with dilute hydrochloric acid and the gelation of the resulting hydrosol is assisted by heat. The jelly is then subjected to a pressure of 350 atmospheres for one hour and the mother liquor is washed out. The mass is dried preferably *in vacuo*. The jelly may be washed prior to applying the pressure. The product may be either granular or pulveruient according to the conditions of treatment.

Aromatic Amines. Farbwerke vorm, Meister, Lucius, and Brüning, Hoechst-on-Main, Germany. British Patent **204,722**. Convention date, September 29, 1922.

Diaminodiaryldialkylmethanes are produced by heating aniline, or a homologue thereof having an unoccupied para-position, with an aliphatic ketone. The aniline or its homologue is employed in the form of a salt and in aqueous solution. The products form starting materials for the preparation of dyes. According to the examples, a solution of aniline hydrochloride is heated with acetone in an autoclave and diaminodiphenyldimethylmethane isolated by making the solution alkaline, removing the excess of aniline by steam distillation, and crystallising the residue from boiling water; in a similar way diaminodi-*o*-tolyldimethylmethane is obtained from *o*-toluidine and acetone, and diaminodiphenylmethylethylmethane from aniline and methylethylketone.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. WEDNESDAY.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—The position of the spot heavy chemical market is very steady, and a tendency to firmer conditions is in evidence. **Acetic Acid**, 80% technical, £47.; 80% pure, about £48. 10s. to £49.; 98% glacial, £60. in casks and about £73. in glass demijohns, ex wharf London; the spot position keeps very steady, and, with a fair demand

being experienced, supplies are now rather limited; the position on the Continent supports the market. **Acetone,** British Government specification, about £124. per ton, in drums; spot prices are fully maintained, with inquiry good for the little material available. **Alum,** lump, £10. to £10. 10s. per ton, in casks; the spot position is quite steady, but dealers are not finding much business. **Arsenic,** Cornish, white powdered, about £70. per ton, f.o.b.; owing to the shortage of supplies and the continued good inquiry for export, prices are moving up and stand firm. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; dealers offering imported material at about this figure, with demand quiet. **Bleaching Powder,** 35—37%, £10. 5s. to £10. 10s. per ton; prices on spot are rather firmer, although business is still slow. **Barium Chloride,** 98½—100%, £14. 15s. to £15. per ton; dealers are quoting round about these figures, with occasional business being booked. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P., crystals, about 1s. 4½d. per lb., less 5%; spot values are a little unsteady, with the market almost idle. **Cream of Tartar,** B.P., 99—100%, 86s. to 87s. 6d. per cwt., less 2½%; dealers' prices are firming up here on account of the Continental position; the market keeps steady. **Epsom Salts,** commercial quality, about £4. 15s. per ton, in bags; dealers' prices are round about this figure, with some parcels perhaps a shade cheaper. **Formaldehyde,** 40%, £64. to £65. per ton; spot prices are fully maintained at these prices, and a fair volume of business has been done; the market has a rising tendency. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers' prices are level on the week; the demand has again been slow. **Lead Acetate,** brown, about £43.; white, about £44. per ton; spot supplies and Continental offerings are very limited; high prices are likely to rule for some time. **Litharge,** imported, about £37. 10s. per ton, on spot; dealers are doing a limited business at about this figure; the market is very steady. **Lithopone,** 30% Continental red seal, £23. 5s. to £24. per ton; this item is very firm, with material in short supply on spot, and offers from the Continent restricted and dear. **Ammonium Chloride,** grey galvanising, £31. per ton; this item keeps steady, with a fair demand for spot supplies, which are not large; fresh imports must be at high prices. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these prices. **Oxalic Acid,** about 5¾d. per lb.; at this quoted price the position is none too steady, with business still far from satisfactory. **Carbonate of Potash,** 90—92%, about £25. 10s.; 96—98%, about £27. 10s. to £28. per ton; this market is very steady, and any movement in prices is almost certain to be to higher levels on account of the stoppage of supplies from Germany. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; prices are rather steadier here, and tend to advance; the demand is still quiet. **Caustic Potash,** 88—92% solid, £31. 10s. to £32. 10s. per ton; this market continues to harden on spot, and still higher prices are expected. **Permanganate of Potash,** commercial quality, about 9d. per lb.; there has not been much demand of late; prices are supported by the firmer conditions on the Continent. **Prussiate of Potash,** yellow, about 10¼d. per lb.; dealers continue to offer British material at this figure, but the demand is not at all good; foreign material cannot compete at present. **Sulphate of Potash,** 90%, £11. per ton; prices are quoted unchanged on the week. **Mercury,** about £9. 17s. 6d. per bottle of 75—76lb., net; the spot position is rather easier this week, with the demand slow; supplies are rather free. **Red Lead,** imported, about £37. 10s. per ton, on spot; dealers are finding limited business at about this figure; prices are steady, and tend to harden. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; spot stocks are limited, and some fair business has been done; prices are firm, and tend to advance; fresh imports will have to be dearer. **Saltcake,** ground and unground, about £4. 10s. per ton, delivered, for home trade; makers are said to be sold up to the end of the year. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; merchants are offering at about these prices, with still but small inquiry. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in free bags; British makers quote at this price, for home trade only; dealers are competing at about level rates. **Bichromate of Soda,** home trade, 4½d. per lb.; British makers selling at this old figure; their prices for export are slightly dearer. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers' prices are maintained on a quiet market. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags; British makers' price for home consumers is unchanged at this figure; prices for export vary as to destination. **Hyposulphite of Soda,** pea crystals, about £15. to £15. 10s. per ton; commercial crystals, £10. to £10. 10s. per ton, in casks; dealers' prices are moving up on account of much firmer conditions on the Continent; British makers' prices are also reported as being at higher rates. **Nitrate of Soda,** 96%, about £13. 5s. per ton, f.o.r. or f.o.b.; quoted prices are level on the week, with the market quiet. **Nitrite of Soda,** 100%, about £28. 10s. per ton; there has been a big jump in prices, with the market very steady. **Prussiate of Soda,** about 5½d. per lb.; the demand for this product remains slow, with dealers offering British material at about this figure. **Sodium Sulphide,** 60—62% solid, £14. 15s.; solid, £15. 10s. per ton, in drums; dealers' prices are dearer this week; business slow. **Tin Crystals,** about 1s. 3½d. per lb.; prices are level on the week, with the market quiet. **Tartaric Acid,** B.P., crystals, about 1s. 1½d. per lb., less 5%; the spot market remains very quiet, and the tone is still weak. **White Lead,** imported, about £41. to £41. 10s. per ton; dealers are asking higher prices on account of the firmer conditions on the Continent. **Zinc Oxide,** B.P. £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' quotations are at about these rates.

Pharmaceutical Chemicals.—Prices continue to advance in many items, and the position generally is very firm indeed, and spot supplies are running short. **Acetanilid,** about 3s. 3d. per lb.; the spot price has again advanced, and supplies are very short indeed; the position is accentuated by the refusal of the Board of Trade to grant licences for imports sufficient to meet urgent demands. **Acetyl-Salicylic Acid,** B.P., 3s. 10d. to 3s. 11d. per lb.; spot prices are very firm at these further advanced values; supplies are keenly sought after, and fresh imports must be dearer. **Benzoic Acid,** B.P., about 3s 9d. to 4s. per lb.; these figures are more or less nominal, owing to lack of supplies. **Diethyl-barbituric Acid,** B.P. (barbitone), about 18s. per lb.; this item still shows but little life, and dealers' prices are unchanged. **Salicylic Acid,** B.P., fully 2s. 6d. per lb.; the spot position is strong, and the market has a rising tendency. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; dealers are keeping their prices very steady at these values, with a fair volume of business about. **Amidopyrin,** about 15s. per lb.; business is still quiet, and prices quoted are unchanged. **Ammonium Bromide,** B.P., fully 10d. per lb.; a further big jump in the spot price is recorded, and, owing to scarcity of supplies, still higher prices are expected. **Benzonaphthol,** about 5s. per lb.; the market is quiet, with prices quoted unaltered. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; spot material is quoted at this figure, with no great demand. **Benzaldehyde 03,** about 3s. per lb.; this market is very steady, and some fair business has been done. **Calcium Lactate,** about 2s. 6d. per lb.; this item has been rather quieter, but the spot value is maintained. **Chloral Hydrate,** duty paid, fully 4s. 3d. per lb.; a fair business has been done this week, and prices are very steady. **Creosote,** B.P., about 2s. 6d. per lb.; this market is quite steady, with business rather limited. **Creosote Carbonate,** about 8s. 3d. per lb.; there is still but little interest shown in this article. **Guaiacol Carbonate,** about 14s. per lb.; the price as quoted is very firm, and supplies are scarce; higher prices are expected

before long. **Hexamine**, fully 4s. 6d. per lb.; dealers are not selling below this figure, and some opinions favour further advances. **Hydroquinone**, 4s. to 4s. 3d. per lb.; this seems to be about the price levels now quoted; business is fair. **Methyl Salicylate**, 3s. to 3s. 2d. per lb.; a further good advance in spot prices is recorded, with the market exceedingly firm; supplies are not large. **Methyl Sulphonal**, about 25s. per lb.; most dealers holding spot supplies are quoting close up to this figure. **Paraformaldehyde**, about 3s. 9d. per lb.; this market keeps very steady, and a fair volume of business is being done. **Paraldehyde**, 1s. 7d. to 1s. 8d. per lb.; holders are firm at these prices for spot supplies, which are not very large. **Phenacetin**, about 8s. per lb.; business has been good here, and dealers' quotations are firm. **Phenazone**, fully 8s. 9d. to 9s. per lb.; last week's higher prices are maintained on a strong market; fresh imports will cost more. **Phenolphthalein**, 8s. 6d. to 8s. 9d. per lb.; dealers have again advanced their prices, and supplies on spot are difficult to locate. **Potassium Bromide**, B.P., crystals and granular, fully 9d. per lb.; a further big jump in spot values is recorded, with the market almost bare of big supplies; Continental rates are much higher. **Potassium Permanganate**, B.P., about 9¾d. to 10¼d. per lb.; dealers have advanced their prices, with the market firm. **Potassium Sulphoguaiacolate**, about 7s. per lb.; this market remains neglected, with quoted values unchanged. **Resorcin**, about 6s. 6d. per lb.; spot supplies are quoted at this rate on a firm market. **Salol**, 4s. 3d. to 4s. 6d. per lb.; the market is gradually firming up to the higher rate quoted. **Sodium Benzoate**, about 3s. 3d. to 3s. 6d. per lb., nominal; supplies on spot cannot be traced, and, although there is a big demand, the Board of Trade still refuse to grant licences to allow the import of acid. **Sodium Bromide**, B.P., crystals and granular, about 10d. per lb.; this market continues to advance, with supplies on spot now getting low, and fresh imports must be at still higher rates. **Sodium Diethylbarbiturate**, about 18s. per lb.; quoted price unchanged, with market dull. **Sodium Salicylate**, B.P., crystals, 3s. 1d. to 3s. 2d.; powder, about 3s. per lb.; dealers holding spot stocks notify further advances in their prices, with the market very firm. **Sulphonal**, about 20s. per lb.; there is not much doing here; supplies are very limited, and prices are firmly held. **Terpin Hydrate**, about 1s. 9d. per lb.; dealers continue to offer at this price, with business restricted. **Thymol**, 15s. 6d. to 16s. per lb.; this item is steady, but business is not brisk. **Vanillin**, 100%, 26s. 3d. to 26s. 6d. per lb.; spot supplies are offering at these rates.

Coal-tar Products, Etc.—Pitch continues to find little business, and the price is still moving to lower levels. Other products show little or no alteration in values, and the general tone is steady. Business has not been of any great importance. **Aniline Oil**, 9d. to 9¼d. per lb., naked at works; values continue steady, with business quiet. **Betanaphthol**, 1s. 1d. to 1s. 2d. per lb.; business remains slow, with prices unchanged. **Benzol**, crude, 65's, 8d. to 10d.; standard motor, 1s. 1d. to 1s. 4d.; pure, 1s. 6¼d. to 1s. 8d. per gallon, in tank wagons; British makers continue to quote at these rates. **Carbolic Acid**, crystals, 1s. to 1s. 0½d. per lb.; still but little inquiry here, and prices are not at all steady. **Cresylic Acid**, 97—99%, 2s. to 2s. 2d. per gallon; this market keeps quite steady, and a fair volume of business has been done. **Toluol**, 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; 90%, about 1s. 4d. per gallon; prices are fairly steady, with business limited. **Xylol**, pure, 2s. 3d. per gallon; prices are steady, but the market is dull. **Creosote Oil** is steady, with occasional inquiry being dealt with; quoted in the region of 9¼d. per gallon, f.o.b. **Naphtha**, crude, 8¼d. to 8¾d. per gallon; this item remains dull; prices are unaltered. **Solvent Naphtha**, 90/160, 1s. 2d. to 1s. 3d. per gallon; some little business has been done here, and prices are steady. **Heavy Solvent Naphtha**, 90/190, 1s. 2d. per gallon; this item has again been neglected, with values unsteady. **Naphthalene**, £19. 10s. per ton; the market is keeping up to its recent improved level, with business moderate. **Pyridine**, about 22s. per gallon; supplies are very limited, and prices hold very firm. **Hexamethylene**, 3s. 9d. to 4s. per gallon; spot offers are fully maintained at these rates, with not much material offering. **Pure Methyl Alcohol**, £90. per ton, in drums, ex wharf London; this item is now very firm, and the market has a rising tendency; supplies are restricted. **Pitch**, about 117s. 6d. per ton, f.o.b. East Coast; a further material reduction in prices is recorded; the market has again suffered from lack of interest, and the tone is far from good. **Wood Tar**, £4. 15s. to £6. per ton, according to quality; quoted prices are unchanged on the week.

ITALIAN CHEMICAL MARKET. November 30.

Quotations during November were as follows, prices being per 100kilos, at Milan, unless otherwise stated: **Caustic Soda**, 70—72%, Italian, 180 lire; American, 76—78%, 200 lire; English, 185 lire; French, 175 lire. **Carbonate of Soda**, 98—100%, Italian, 85 lire (Genoa); English, 86 lire (Genoa); American, 86 lire (Genoa); demand continues good. **Soda Crystals**, steady at 40 lire. **Alum**, crystals, steady at 85 lire. **Bicarbonate of Soda**, powder, kegs, 175 lire (Genoa); in fair demand. **Bichromate of Soda**, 445 lire (Genoa). **Bichromate of Potash**, crystals, 590 lire; in fair request. **Borax Crystals**, 99%, in kegs, 380 lire; in good call. **Carbonate of Ammonia**, lump, 430 lire; powder, 370 lire; not in much demand. **Chlorate of Potash**, crystals, in good call at 310 lire. **Acetone**, pure, 98—99%, steady at 1,300 lire. **Glacial Acetic Acid**, 99%, 1,200 lire. **Boric Acid**, crystals, in good call at 800 lire. **Lactic Acid**, 80%, 300 lire; not much doing. **Bisulphite of Soda**, crystals, 350 lire; in small demand. **Formaldehyde**, 40%, in good demand at 780 lire. **Phosphate of Soda**, steady at 160 lire. **Hyposulphite of Soda**, crystals, unchanged at 130 lire. **Metabisulphite of Potash**, 400 lire. **Nitrite of Soda**, 96—98%, in fair demand at 300 lire. **Permanganate of Potash**, crystals, in limited demand at 800 lire. **Sulphate of Alumina**, crystals, 18%, 110 lire. **Sulphate of Zinc**, in fair request at 180 lire. **Citric Acid**, crystals, in fair request at 1,900 lire. **Sulphate of Iron**, still slow at 50 lire. **Hydrofluoric Acid**, 50%, in fair call at 600 lire. **Oxalic Acid**, crystals, in good call at 660 lire. **Tartaric Acid**, crystals, in fair request at 1,350 lire. **Chloride of Ammonia**, lump, 98—100%, in little demand at 550 lire (Milan); powder, 95—96%, in fair request at 315 lire (Genoa). **Chloride of Calcium**, 75—80%, in little demand at 65 lire. **Bleaching Powder**, French, 110—115%, 90 lire; electrolytic, 100 lire. **Cream of Tartar**, 89—99%, powder, in good demand at 930 lire. **Yellow Prussiate of Potash**, crystals, in fair call at 2,000 lire. **Yellow Prussiate of Soda**, crystals, 1,400 lire. **Silicate of Soda**, crystals, 85 lire; Italian, 38—45%, 65 lire; English, 140° Tw., 100 lire. **Sulphate of Soda**, crystals, 45 lire; powder, 65 lire. **Sulphate of Magnesia**, crystals, in fair request at 48 lire. **Chloride of Magnesia**, solid, 70 lire. **Hydrochloric Acid**, 20—21° Bé., 17 lire. **Sulphuric Acid**, 50° Bé., 19 lire; 66° Bé., 43 lire. **Nitric Acid**, 36° Bé., 155 lire; 42° Bé., 190 lire. **Benzaldehyde**, 3,500 lire. **Tannic Acid**, 80%, 2,000 lire. **Aluminium Acetate**, quiet at 162 lire. **Lead Acetate**, brown, 560 lire; white, 575 lire. **Betanaphthol**, in better demand at 2,800 lire. **Barium Peroxide**, 1,000 lire. **Sodium Peroxide**, in fair request at 1,800 lire. **Red Prussiate of Potash**, little doing at 3,150 lire. **Caustic Potash**, 88—92%, 380 lire. **Tartar Emetic**, powder, 1,200 lire. **Mineral Superphosphate**, 27 lire. **Bone Superphosphate**, in good call at 52 lire. **Basic Slag**, 16—18%, in better demand at 35 lire. **Nitrate of Soda**, 15—16%, in fair demand at 136 lire. **Nitrate of Ammonia**, in fair request at 125 lire. **Nitrate of Lime**, 12—13%, in little request at 110 lire. **Sulphate of Ammonia**, 20—21° Bé., quotations fell from 165 to 160 lire through smaller demand and larger supplies. **Sulphate of Copper**, 98—99%, Italian, 228 lire; foreign, 230 lire. **Chloride of Potash**, quiet at 75 lire. **Sulphate of Potash**, little business at 85 lire. **Calcium Cyanamide**, 15—16%, in little call at 98 lire. **Sulphur**, refined, in blocks, 54.50 lire (Catania, Sicily), 70 lire (Milan). **Sulphur**, sublimed, 71.50 lire (Catania, Sicily), 87 lire (Genoa). **Crude Tartar**, 269 lire.

LONDON METAL MARKET. WEDNESDAY.

Copper: Standard brands, £62. to £62. 2s. 6d., cash; £62. 15s. to £62. 17s. 6d., three months; electrolytic, £67. 15s. to £68. 5s. **Tin**: Standard, £236. 15s. to £237., cash; £237. 15s. to £238., three months; Straits, £238. 5s.; English, £237. 10s. **Lead**, soft foreign, £31. 15s., prompt; English, £32. 15s.; chemical sheet, 37s. per cwt. for 2-ton lots, delivered. **Spelter**, prompt, £32. 10s.; hard, £27. 10s. **Antimony**, English regulus, 99%, £36.; special brands, £42. to £42. 10s. **Aluminium**, 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 15s. to £9. 17s. 6d. **Bismuth**, 10s. **Platinum**, £29. per oz.; scrap, £27. **Wolfram**, spot,

12s. per unit, c.i.f. U.K. or Continent. **Zinc Dust** has shown much increased activity; Beaver brand, 90—92%, £48.; American, 92—94%, £48.; Continental, 83—88%, £42. to £46. per ton, delivered.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand generally for heavy chemicals continues on the quiet side, owing to the unsettled conditions, and there does not seem much prospect of improvement before the New Year. The quotations for alkali products have not yet been fixed for forward contracts, and current quotations remain unaltered. **Bleaching Powder,** softwood casks, quiet at £11. 5s. on rails, with foreign supplies offering at lower rates. **Chlorates** have a hardening tendency at 3d. to 3¼d. for **Potash,** and 2¾d. to 3d. for **Soda. Bichromates** are unaltered. There is only small inquiry for **Glauber's Salt,** and prices are easy at £3. 10s., carriage paid. Roasted **Saltcake** maintained for home trade at £4. 10s., in bulk, carriage paid. Imported American **Sulphur,** steady at £5. 5s., ex store. **Copper Sulphate** shows no improvement, and quotations remain nominal at £25. to £25. 10s., f.o.b. Liverpool. **Phosphate** and commercial **Hyposulphite of Soda** are neglected at recent rates, and prices are weak. **Nitrite of Soda** is dearer at £28. 10s. Concentrated **Sodium Sulphide,** 60—62%, £14. to £14. 10s., carriage paid. White powdered **Arsenic** is again lower at £68., delivered, for best Cornish make. **Yellow Prussiates** weak; **Potash** at 9½d., **Soda** 5½d., per lb., with only small inquiry. **Carbonate** and **Caustic Potash** are scarce, and values have an upward tendency. **Acetic Acid** and **Acetate of Soda** remain unaltered. **Acetates of Lime** are firmly maintained, owing to short supplies; grey at £22., brown £14. 10s., carriage paid. Miscible **Wood Naphtha,** easy at 5s. 9d. per gallon. **Acetone,** quiet at £124. per ton. **Lead Salts** are scarce, and prices are firm; white and brown **Acetate** at £45. per ton delivered, and **Nitrate** £44., net, carriage paid. **Barium Chloride,** steady at £14. 10s. per ton. **Ammonia Salts** are in good request, and values are improving. Green **Copperas** is moving off fairly well, and stocks are low. **Oxalic Acid,** dull at 5½d. to 5¾d. per lb. **Permanganate of Potash,** commercial grade, unchanged at 8¼d. per lb., carriage paid.

SWANSEA MARKET REPORT. Wednesday.

Tinplate prices very firm, with premiums on the fixed quotation of £1. 3s. 6d. per standard box, f.o.b. **Galvanised Sheets,** quiet but steady on the basis of £19. 2s. 6d. per ton. **Copper** firmer, with prompt at £62. 7s. 6d. per ton, and three months £63. 2s. 6d. **Tin** very firm at £236. 17s. 6d. per ton cash, and £237. 12s. 6d. three months. **Lead** easier; prompt £29. 12s. 6d. per ton, and three months £29. 2s. 6d.; English, £32. 10s. **Spelter,** steady at £33. per ton prompt, and £33. 2s. 6d. three months. **Zinc Sheets** in good demand at £39. 7s. 6d. per ton. **Sulphate of Copper** dull at £25. 7s. 6d. per ton, less 5%, in casks, f.o.b. **Sulphate of Ammonia** steady, with better home demand at £14. 16s. per ton. **Nitrate of Soda,** rather slow at £13. 7s. 6d. per ton. **Bone Meal** in little demand, with prompt Indian £9. 2s. 6d. per ton. **Pitch** in quiet demand, and quotations much easier at £5. 17s. 6d. per ton. **Creosote** active, orders being placed for delivery over next half year at 8½d. to 9¾d. per gallon on rail. **Benzol** in strong demand at 1s. 3¼d. per gallon. **Tars** active, with refined at £1. 14s. 6d. per 40-gallon casks, with crude up to £4. 15s. 3d. **Arsenic** quiet, with firm prices at £67. 17s. 6d. per ton for white powdered. **Oxalic Acid** dull at 6¼d. per lb. on rails. **Sulphuric Acid** not so active, but quotations firm and unchanged. **Copperas** remains dull at £2. 2s. 6d. per ton for 4-ton lots, delivered London or equal. **Seed Oils** very firmly held, with raw **Linseed** at £2. 5s. 9d. per cwt., and boiled £2. 7s. 9d., net, in barrels. **Cottonseed Oil,** common edible £2. 5s. 6d. per cwt., and deodorised £2. 7s. 6d., net, in casks. **Rape Oil** very firm, with best refined at £2. 7s. 4d. per cwt., net, in barrels. **Cod Oil** scarce, with Newfoundland at £2. 5s. 6d. per cwt., and English £1. 13s. 9d. **Castor Oil** dearer, with best at £3. 3s. 6d., and seconds at £2. 17s. 6d. per cwt., net, in barrels. **Coconut Oil** steady, with Ceylon, prompt, at £2. 7s. 6d. per cwt., f.o.b. **Olive Oil** very steady, and fair business at £66. 7s. 6d. per ton, net. **Palm Oil** not so active, but firmly held at £38. 5s. 6d. prompt, and £38. 2s. 6d. forward, for Lagos; softs, £38. 2s. 6d.; mediums, £37. 17s. 6d. prompt, and £37. 12s. 6d. forward; and hards, £37. 17s. 6d. per ton. **Turpentine** easier at £3. 14s. 3d. per cwt. for prompt American. The tone of the **Coal** market was firm, with better buying: Best Admiralty smokeless £1. 8s. 6d., seconds £1. 7s.; ordinaries, £1. 5s.; Monmouthshire black vein, £1. 7s.; coking smalls, £1., all per ton, f.o.b. **Anthracite,** best large £2. 1s. 6d., seconds £1. 15s.; Paris and French nuts, £2. 11s. 6d., all per ton, f.o.b. **Coke** prices were very firm, with export qualities at £2. 7s. 6d. to £2. 16s. 6d. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks at ovens. **Patent Fuel** very steady from £1. 9s. to £1. 11s 9d. per ton, f.o.b.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for chemicals of the heavier class for use in the United Kingdom continue to be made to an extent that represents a very fair amount of business being done. The general trade situation has improved through the cessation of the boiler-makers' stoppage, which had checked business in different industries in the North for weeks past. An increased demand for chemicals must result from the resumption of work by boiler-makers and by increases of work in industries that have been hindered by the stoppage. **Bleaching Powder** has again been in quietly steady demand for use in the U.K., and has been shipped more freely for export; for "spot" lots and for export, £11. 5s. per ton is asked; special quotations being given for contracts. **Chloride of Calcium** has been quiet for home-trade uses, and has had a moderate shipment for foreign ports; it is £5. 12s. 6d. per ton. **Caustic Soda** has had a very fair inquiry for use in the U.K., and has moved freely in the export branch; it is £19. 7s. 6d. per ton, carriage paid in Great Britain, varying according to destination for export lots; for contracts special prices are quoted, according to requirements. **Bicarbonate of Soda** has sold with some freedom for use in the U.K., but has been quieter in the export branch of the trade; the price for home-trade use is £10. 10s. per ton, in bags, carriage paid in Great Britain. **Soda Crystals** have had a fair sale for use in the U.K. and for export; they are £5. 5s. per ton, carriage paid to home-trade users. **Nitrate of Soda** has had a small sale, and is £13. 5s. to £13. 10s. per ton. **Borax** has had a steady inquiry from the home trade, but has been quiet in the export branch; commercial crystals are £25. per ton, and powdered is £26; higher grades are—crystals £29. per ton, powdered £30., and superfine £31. per ton, in 2cwt. bags, carriage paid to home-trade users. **Saltcake** has been in very fair demand for use in the U.K.; it is £4. 10s. to £5. per ton for the home trade, and £5. to £6. per ton for export. **Bichromate of Soda** has been in moderate demand, and is 4½d. to 4¾d. per lb. **Ammonia Alkali** has had a rather free sale for use in the U.K., and has had a fair shipment for export; it is £7. 10s. per ton for home-trade use, and £8. per ton for export, varying according to destination; special prices are quoted for contracts, according to requirements. **Hyposulphite of Soda** has been rather more in demand, it is £10. per ton, in 2cwt. bags, for commercial, and £15. per ton for photographic. **Sulphide of Soda** has been quiet, and is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has been but little in demand, and is 3d. per lb. **Phosphate of Soda** has had a very limited inquiry, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been but little in demand, and is 6d. per lb. **Yellow Prussiate of Potash** has had a moderate sale, and is 10½d. to 11d. per lb. **Red Prussiate** continues quiet, and is 2s. 9d. per lb. **Carbonate of Potash** has had a fair inquiry, and prices are somewhat higher through the German repudiation of the Reparations levy; they may be given as £25. 10s. to £28. 10s. per ton, according to test. **Nitrate of Potash** has been more in demand, and is £29. to £30. per ton. **Chlorate of Potash** has had a limited inquiry, and is 3½d. to 4d. per lb. **Caustic Potash** has been in fair request, and the price has advanced; it may be given as £32. to £34. per ton. **Permanganate of Potash** has been rather more in demand, and is 9d. to 9¼d. per lb. **Bichromate of Potash** has had a slightly freer inquiry, and is 5¼d. to 5½d. per lb. **Salammoniac** has again been in fair demand; first quality is £56. per ton, and second quality £53. per ton. **Sulphate of Ammonia** has had a quietly steady sale for use in the United Kingdom, and has moved rather freely in the export branch of the trade; the price has been fixed for December at £14. 16s. per ton for neutral of 25¾%, and £13. 13s. per ton for ordinary; the price of neutral for January will be £15. 2s. per ton, for February £15. 3s. per ton, and for March to May £15. 5s.

per ton, the price of ordinary being increased proportionately for home-trade uses. **Carbonate of Ammonia** has been more in demand, and is 4d. per lb. **Muriate of Ammonia** continues quiet, and is £32. per ton. **Magnesia** has been in good request. **Carbonate** is £2. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been but little called for; it is £11. per ton for home-trade use, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been in fair request, and is £8. to £11. per ton, according to quality. **Sulphur** has had a steady and very fair inquiry; flowers are £10. per ton; roll is £8. 10s. per ton; rock, £8. to £8. 10s. per ton; and American, £5. 10s. per ton. **Tartaric Acid** has been quiet, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has been in rather good request; it is £4. 6s. to £4. 8s. per cwt. **Boric Acid** has been quiet; commercial is £48. per ton, and powdered £51.; B.P. grades are £54. to £60. per ton, carriage paid in Great Britain. **Citric Acid** continues quiet, and the price has been weak; it may be given as 1s. 5d. per lb. **Oxalic Acid** has been but little in demand, and is 6d. per lb. White **Acetate of Lead** has been rather more in demand; it is £44. to £44. 10s. per ton. **Sulphate of Copper** has been inactive for use in the U.K., but has had a fair shipment to foreign ports; it is £25. to £25. 10s. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been but little in demand; the price is still high, though variable; it is from £64. to £69. per ton for white powdered.

WEST OF SCOTLAND CHEMICALS.

WEDNESDAY.

Business in chemical products in the home market continues to be fairly brisk, but the recent improvement in export inquiry has fallen off somewhat. Continental supplies are hardening in price, otherwise there is little to record in price alterations except in barium chloride, which has advanced. **Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, scarce and still dearer at £70. 10s. per ton on spot; an improving market. **Barium Chloride,** £15. 5s. per ton; at this stronger price the market remains steady; foreign imported material offered round £14. to £14. 5s. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, carriage paid in the U.K., makers' prices. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid,** 1s. 5d. per lb., less 5%; a little business about. **Copper Sulphate,** £26. 5s. per ton, less 5%; a rather neglected market. **Cream of Tartar,** £4. 1s. 6d. per cwt. for 99% at Glasgow, quotation steady, and inquiry small. **Lead Acetate,** white, £42. 15s. per ton on spot; brown, more export inquiry at £45. per ton; Continental material offering at slightly cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign supplies now arriving are quoted at much under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., deliverd; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** 1s. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £55. and £52. 10s. per ton respectively; crystals, £48. 10s. per ton; at these reduced quotations the market is rather inactive. **Saltpetre,** £1. 12s. 6d. per cwt., net; a better market, with price unaltered; fresh arrivals are cheaper. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 5s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid,** 1s. 0¾d. per lb., less 5%, at Glasgow; a quiet tendency still noticeable in this market.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

LIST OF CONTRACTIONS USED IN THE IMPORT AND EXPORT LIST.

Blns.	Balloons.	Cbys.	Carboys.	Gals., Gls., or Glns.	Gallons.	Qnty.	Quantity (otherwise undeclared).	qr.	Quarters.

OFFICIAL AMENDMENTS.

From return for week ending September 26, 1923, deduct—

DISINFECTANTS (*otherwise undes.*)
Bergen, 2 c., £10.

In return for week ending November 7, 1923

TARTARIC ACID—
Yokohama, 12 t., £960.
should read—
TARTARIC ACID—
Yokohama, 12 t., £1,440.

Week ending November 28.

ACETIC ACID—
Auckland, 4 cs., £14. ; Christchurch, 2 cs., £17. ; Jamaica, 1 cs., £6. ; Sekondi, 4 cs., £7. ; Switzerland, 2 cs., £5. ; Trinidad, 2 cs., £5.

ACETONE—
Sydney 1 drm., £8.

ACETYL SALICYLIC ACID
Colombo, 1 cs. (pt.), £5. ; Irish Free State, 3 cs. (pt.), £40. ; Montreal, 4 cs. (pt.), £47. ; Shanghai, 2 cs. (pt.), £17. ; Wellington, 2 cs. (pt.), £33.

ALUM—
Calcutta, 1 cs., £7.

AMMONIA—
Buenos Ayres, 25 cs., £45. ; Cape Town, 18 cs., £31. ; Delagoa Bay, 2 pkgs., £22. ; Durban, 31 cs., £55. ; Irish Free State, 26 pkgs., £54. ; Leghorn, 16 cs., £28. ; Penang, 4 cs., £7. ; Pernambuco, 4 cs., £7. ; Pt. Elizabeth, 13 cs., £26. ; Rangoon, 2 cs., £7. ; Sandakan, 3 cs., £7. ; Shanghai, 5 cs., £9. ; Trinidad, 6 cs., £11.

AMMONIA (ANHYDROUS)—
Irish Free State, 2 cylds., £18. ; Kilindini, 1 cs., £5. ; Lisbon, 8 cylds., £40. ; Pt. Said, 10 cylds., £80.

AMMONIUM ACETATE—
Pt. Elizabeth, 3 cs., £10.

AMMONIUM BICHROMATE—
Adelaide, 2 cs. (pt.), £7.

AMMONIUM BIFLUORIDE—
Paris, 2 cks., £26.

AMMONIUM CARBONATE—
Amsterdam, 6 c., £7. ; Antwerp, 1 t., £26. ; Auckland, 5 c., £8. ; Bangkok, 3 c., £11. ; Brussels, 1 t. 6 c., £36. ; Calcutta, 2 c., £9. ; Cape Town, 3 c., £7. ; Ceuta, 2 c., £5. ; Copenhagen, 1 t. 10 c., £42. ; Genoa, 2 t. 9 c., £64. ; Hamburg, 1 t. 9 c., £39. ; Hong Kong, 1 t. 10 c., £84. ; Kobe, 5 t., £126. ; Madras, 2 c., £7. ; Monte Video, 1 t. 8 c., £74. ; Paris, 4 t. 19 c., £144. ; Penang, 9 c., £5. ; Shanghai, 10 c., £17. ; Sydney, 3 c., £25. ; Tokio, 6 t., £166. ; Yokohama, 5 t., £138.

AMMONIUM CHLORIDE—
Antwerp, 2 cks., £18. ; Auckland, 6 cks., £50. ; Rouen, 14 cks., £190.

AMMONIUM NITRATE—
Harlingen, 49 t. 12 c., £1,100.

AMMONIUM SULPHATE—
Madeira, 20 t., £280.
Teneriffe, 50 t., £700.

ANTIMONY OXIDE—
Barcelona, 10 cks., £106. ; Paris, 15 cks., £194. ; Rouen, 3 cks., £40.

ANTIMONY SULPHIDE—
Budapest, 8 cks., £190.

ARSENIC—
Cape Town, 2 drms., £7. ; Otago, 5 drms., £16. ; Pt. Elizabeth, 3 d rms., £10. ; Sao Paulo, 20 drms. £65 ; Penang, 5 drms., £18.

BARIUM NITRATE—
Buenos Ayres, 2 brls., £8.

BARIUM SULPHATE—
Kobe, 42 cks., £150.

BARIUM SULPHATE (BLANC FIXE)—
Sydney, 12 bgs., £18.

BENZENE—
Singapore, 4 drms., £7.

BISMUTH AMMONIUM CITRATE
Sydney, 1 cs. (pt.), £8.

BISMUTH CARBONATE—
Auckland, 1 cs., £72. ; Brisbane, 1 cs., £38. ; Buenos Ayres, 1 cs., £179. ; Kilindini, 3 cs., £136. ; Melbourne, 2 cs., £143.

BISMUTH SALICYLATE—
Bombay, 4 cs. (pt.), £32.

BISMUTH SUBCARBONATE—
Sydney, 2 cs., £147.

BISMUTH SUBNITRATE—
Auckland, 1 cs., £16. ; Bombay, 4 cs. (pt.), £33. ; Sydney, 1 cs. (pt.), £8.

BISULPHITE OF LIME—
Durban, 5 hhds., £8.

BLEACHING POWDER—
Ascension, 7 brls., £8.

BONE FLOUR—
Channel Islands, 3 t., £18.

BORATE OF LIME—
Petrograd, 31 t., £517.

BORAX—
Amsterdam (F.), 4 t., £104. ; Mauritius, 15 c., £34. ; Rangoon, 10 c., £14.

BORIC ACID—
Alexandria, 13 c., £42. ; Bombay, 5 c., £17. ; Calcutta, 5 c., £15. ; Cape Town, 1 t. (F.), £50. ; Channel Islands, 2 c., £6. ; Durban, 15 c. (F.), £39. ; Durban, 2 c., £8. ; East London, 1 c., £5. ; Hong Kong, 2 c., £7. ; Mauritius, 2 c., £5. ; New Plymouth, 1 c., £7. ; Trujillo, 2 c., £14. ; Wanganui, 1 c., £8.

BROMINE—
New York, 1 cs., £7.

CALCIUM CARBIDE—
Cape Town (F.), 1 t., £12. ; Colombo (F.), 6 c., £13. ; Madras, 19 c., £15. ; Mauritius, 1 t., £16. ; Penang, 5 c., £7. ; Pt. Elizabeth, 3 c., £5. ; Pt. Harcourt, 10 c., £7. ; Sydney (F.), 10 c., £6.

CALCIUM CHLORIDE—
Buenos Ayres, 9 cs., £23.

CALCIUM GLYCEROPHOSPHATE
Melbourne (F.), 1 cs. (pt.), £9.

CALCIUM HYPOPHOSPHITE—
Adelaide, 1 cs., £7.
Calcutta, 1 cs. (pt.), £6.

CARBON BISULPHIDE—
Delagoa Bay, 5 drms., £11.

CARBON TETRACHLORIDE—
Sydney, 1 drm., £6.

CAUSTIC SODA—
Beira, 2 c., £5 ; Comodore, a qty.

CHEMICALS (*otherwise undescribed*)
Adelaide, 36 pkgs., £98. ; Alexandria, 3 cs., £5. ; Alicante, 10 pkgs., £25. ; Antigua, 2 cs. (pt.), £7. ; Antwerp, 50 pkgs., £133. ; Asuncion, 3 pkgs., £9. ; Bangkok, 3 cs., £40. ; Barbados, 2 cs. (pt.), £5. ; Barcelona, 230 pkgs., £595. ; Batavia, 20 pkgs., £26. ; Beira, 59 pkgs. (pt.), £202. ; Bombay, 6 pkgs. (pt.), £21. ; Brisbane, 39 pkgs., £115. ; Calcutta, 15 pkgs. (pt.), £40. ; Canton, 2 kgs., £6. ; Cape Town, 3 pkgs., (F.), £6. ; Cape Town, 7 pkgs., £11. ; Colombo, 2 cs., £20. ; Danzig, 250 pkgs., £625. ; Durban, 18 pkgs., £35. ; East London, 4 pkgs., £8. ; Freetown, 7 cs., £44. ; Galatz, 30 pkgs., £75. ; Gijon, 250 pkgs., £650. ; Gustafsberg, 150 pkgs., £375. ; Hong Kong, 6 cks., £8. ; Irish Free State, 6 pkgs., £112. ; Jaffa, 2 cs. (pt.), £5. ; Madras, 2 cs. (pt.), £42. ; Melbourne, 19 pkgs. (pt.), £78. ; Melbourne, 3 pkgs. (pt.), (F.), £7. ; Milan, 3 cs. (pt.), £8. ; Montreal, 5 cs. (pt.), £51. ; Moscow, 20 pkgs. (F.), £116. ; Otago, 4 cs., £30. ; Penang, 17 pkgs. (pt.), £23. ; Pernambuco, 4 cs., £6. ; Perth, 15 pkgs. (pt.), £18. ; Pt. Elizabeth 4 cs. (pt.), £9. ; Pt. Said, 1 cs., £17. ; Pt. Sudan, 1 cs., £18. ; Pt. Swettenham, 1 cs., £6. ; Rangoon, 12 cs. (pt.), £51. ; Rockhampton, 10 pkgs., £25. ; Rotterdam, 110 pkgs., £286. ; Santos, 250 pkgs., £640. ; Shanghai, 9 pkgs. (pt.), £27. ; Sydney, 47 pkgs. (pt.), £222. ; Tarragona, 200 pkgs., £700. ; Trinidad, 23 pkgs. (pt.), £27. ; Trujillo, 2 cks., £9. ; Wellington, 4 cs., £8. ; Mauritius, 2 cs. (pt.), ; £5. ; Wellington, 2 cs. (F.), £8.

CITRIC ACID—
Antwerp, 10 c., £69. ; Asuncion, 1 c., £6. ; Auckland, 12 c., £84. ; Bangkok, 3 c. (F.), £25. ; Calcutta, 2 c., £26. ; Cape Town, 1 t. (F.), £161. ; Cape Town, 8 c., £55. ; Colombo, 2 c., £17. ; Delagoa Bay, 4 c., £39. ; Demerara, 1 c., £8. ; Dunedin, 10 c., £69. ; Hong Kong, 10 c., £90.

CITRIC ACID—
Pt. Elizabeth, 4 c., £28. ; Singapore, 1 c., £10. ; Sydney, 1 t., £139. ; Tampico, 6 c., £51. ; Toronto, 2 c., £25. ; Wellington, 12 c., £87.

COAL TAR PRODUCTS—
Carbolic Acid
Channel Islands, 4 drms., £34. ; Colombo, 8 cs., £69. ; Hong Kong, 1 cs., £8. ; Toronto, 2 drms., £9.

Creosote
Melbourne, 200 drms., £150.
Oamaru, 5 cs., £67.

Mirbane Oil
Alexandria, 1 drm., £10.

Naphthalene
Adelaide, 11 cks., £38. ; Medan, 2 cks., £10. ; Melbourne, 4 cs., £13. ; Perth, 8 cks., £27.

Pitch
Alexandria, 280 brls., £359. ; Antofagasta, 10 cks., £25. ; Dunkirk (bulk), 1,200 t., £7,650.

Pyridine
Cape Town, 2 drms., £110. ; Durban, 30 drms., £171. ; Rotterdam, 12 drms., £520.

Tar
Alexandria, 116 pkgs., £240. ; Cape Town, 78 drms., £9. ; Delagoa Bay, 50 drms., £13. ; Durban, 935 drms., £150. ; East London, 25 drms., £11. ; Mauritius, 15 runlets., £45. ; Pt. Elizabeth, 275 drms., £38. ; Singapore, 40 cks., ; £171. ; Wellington, 5 cs., £6.

Toluol
Genoa, 6 drms., £36.

COBALT ACETATE—
Branford, 1 kg., £13.

COBALT CHLORIDE—
Penang (F.), 1 ck., £97.

COBALT OXIDE—
Genoa (F.), 2 pkgs., £462. ; Paris, 10 cs., £607. ; Switzerland, 1 ck., £53.

COBALT SULPHATE—
Bilbao, 1 cs., £33.
Brussels (F.), 1 cs., £50.

COLOURS (*otherwise undescribed*)—
Hong Kong, 3 cs., £16. ; Madras, 4 cs. (pt.), £72. ; Montreal, 2 cs. (pt.), £13.

COPPER CARBONATE—
Adelaide, 1 kg., £5.

COPPER SULPHATE—
Bathurst, 11 c., £17.
Bonny, 2 c., £9.

CREAM OF TARTAR—
Adelaide, 4 t., £334. ; Brisbane, 1 t., £84. ; Calcutta, 1 c. (F.), £6. ; Cape Town, 1 t. (F.), £82. ; Dunedin, 7 c., £30. ; Halifax, 12 t. 13 c. (F.), £757. ; Kobe, 5 t., £418. ; Lyttleton, 20 t. 1 c., £1,685. ; Mossel Bay, 1 c. (F.), £6. ; New Plymouth, 2 t., £167. ; Sydney, 12 t., £1,003. ; Wellington, 2 c., £9.

DISINFECTANTS (*otherwise undes.*)
Antigua, 7 c., £17. ; Antofagasta, 2 c., £5. ; Barbados, 2 t. 9 c., £111. ; Beira, 8 c., £30. ; Bombay, 1 c., £16. ; Calabar, 2 c., £6. , Canton, 18 c., £34. ; Christchurch, 2 t. 5 c., £481. ; Colombo, 3 t. 10 c., £125. ; Dar-es-Salaam, 2 t. 8 c., £144. ; Durban, 9 c., £13. ; East London, 9 c., £45. ; Haifa, 5 c., £6. ; Irish Free State, 11 c., £33. ; Jamaica, 4 t. 6 c., £119. ; Karachi, 13 c., £23. ; Montserrat, 1 cs., £6. ; Penang, 1 t. 11 c., £45. ; Pt. Elizabeth, 2 c., £11. ; Pt. Said, 9 c., £12. ; Pt. Swettenham, 2 t. 3 c., £41. ; Sekondi, 6 c., £17. ; Shanghai, 1 c., £11. ; Singapore, 1 t. 5 c., £26. ; Teluk Anson, 2 c., £6, ; Teneriffe, 8 c., £22. ; Trinidad, 9 c., £21. ; Victoria, 1 c., £6.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Auckland, 1 cs., £5. ; Boulogne, 1 cs., £41. ; Cochin, 3 cs., £126. ; Durban, 1 cs. (pt.), £5. ; Madras, 5 pkgs., £169. ; Mauritius, 1 cs., £20. ; Melbourne, 20 pkgs., £454. ; New York, 1 cs. (pt.), £17.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Pt. Elizabeth, 1 cs., £9. ; Sao Paulo 1 ck., £27. ; Singapore, 4 cs., £47. ; Sydney, 9 pkgs., (pt.), £162. ; Wellington, 1 cs., £35.

ETHYL CHLORIDE—
Bangkok, 1 cs., £23.

FERTILISER (DRIED BLOOD)
Teneriffe, 14 t., £250.

FERTILISERS (*otherwise undes.*)—
Channel Islands, 35 t. 19 c., £277. ; Christiania, 10 c., £13. ; Halifax, N.S., 20 t., £345. ; Madeira, 1 t. 9 c., £14. ; Philadelphia, 3 t., £77. ; Wellington, 2 c., £9.

FORMALDEHYDE—
Cape Town (F.), 3 bls., £28.
Pernambuco, 1 cs., £5.

GALLIC ACID—
Brisbane, 1 cs., £8.
Sydney, 1 kg., £15.

GLYCERINE—
Amsterdam, 10 t. 6 c., £505. ; New York, 24 t. 17 c., £1,288. ; Trujillo, 2 c., £13.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
Shanghai, 3 cs. (pt.), £7.

GLYCEROPHOSPHORIC ACID—
Melbourne, 1 cs. (pt.), £5.

HYDROCHLORIC ACID—
Antofagasta, 5 c., £24. ; Colombo, 1 c., £5. ; Penang, 2 c., £7. ; Pt. Elizabeth, 4 c., £12.

HYDROFLUORIC ACID—
Pt. Elizabeth, 2 cs., £21.

HYDROGEN PEROXIDE—
Alexandria, 2 cs., £14. ; Antofagasta, 7 cs., £17. ; Delagoa Bay (F.), 1 crby., £11. ; Iddo, 1 cs., £6.

HYPOPHOSPHITES (*otherwise undescribed*)—
Oamaru, 4 cs., £58.

HYPOPHOSPHOROUS ACID—
Paris, 2 demijhns., £30.

IODIDES (*otherwise undescribed*)—
Copenhagen, 1 cs., £48.

IODINE—
Asuncion, 1 cs. (pt.), £35. ; Calcutta, 2 cs. (pt.), £79. ; Melbourne, 1 cs., 3 cs. (pt.), £78. ; Paris, 40 kgs., £3,835. ; Perth, 1 cs. (pt.), £53.

IODINE (RESUBLIMED)—
Bombay, 5 cs. (pt.), £165. ; Launceston, 1 cs. (pt.), £26. ; Petrograd, 14 cs. (pt.), £2,012. ; Sydney, 2 cs. (pt.), £108.

IRON AMMONIUM CITRATE—
Buenos Ayres, 1 cs. (pt.), £5.
Sydney, 2 cs. (pt.), £13.

LEAD ACETATE—
Madras, 10 kgs., £21.

LEAD ARSENATE—
East London, 2 cs., £7. ; Pt. Elizabeth, 1 cs., £6. ; Supe, 50 cs., £240.

LEAD CARBONATE—
Monte Video, 2 bls., £8.

MAGNESIA—
Auckland, 13 cs., £31. ; Hamilton, 2 cs., £5. ; New Plymouth, 10 cs., £24. ; Paris, 1 cs., £6. ; Sydney, 90 cs., £216. ; Wellington, 30 cs. £72.

MAGNESIA (CALCINED)—
Buenos Aires, 6 brls., £21.

MAGNESIUM CARBONATE—
Buenos Ayres, 5 cs., £38. ; Colombo, 4 cs., £22. ; Launceston, 3 cs. (pt.), £9. ; Melbourne, 2 cs., 2 cks. (pt.), £34.

MAGNESIUM CITRATE—
Rangoon, 1 cs., £12.

MAGNESIUM SULPHATE—
Bombay, 12 c., £18. ; Brisbane, 3 t. 1 c., £68. ; Durban, 1 t., £24. ; Irish Free State, 9 c., £7. ; Melbourne, 6 t. 3 c., £139. ; Newcastle, 2 t. 9 c., £55. ; Otago, 3 c., £6. ; Pt. Elizabeth, 14 c., £18. ; St. Vinceng, 3 c., £5. ; Sydney, 1 t. 3 c., £26. ; Trinidad, 10 c., £7.

MERCURIALS (*otherwise undes.*)—
Bombay, 2 cs. (pt.), £7.

MERCURY AMMONIUM CHLORIDE—
Melbourne, 1 cs. (pt.), £6.

MERCURY BICHLORIDE—
East London, 1 cs., £10.

METHYL ACETATE—
Paris (F.), 9 drms., £168.

NICKEL SALTS (*otherwise undes.*)—
Sydney, 1 cs., £38.

NICKEL SULPHATE—
Hamburg, 8 brls., £37.

NITRIC ACID—
Antofagasta, 3 c., £17. ; Mauritius, 5 c., £7. ; Pt. Elizabeth, 5 c., £22.

OXALIC ACID—
Durban, 1 kg., £10.

PHOSPHORIC ACID—
Otago, 5 cs., £13. ; Sydney, 48 cs., £140. ; Wellington, 2 cs., £6.

PHOSPHORUS—
Napier, 1 cs., £9.
Sydney, 22 cs., £191.

POTASSIUM BROMIDE—
Sydney, 1 ck., £12.

POTASSIUM CARBONATE—
Cape Town (F.), 3 kgs., £7.

POTASSIUM CHLORIDE—
Tobago (F.), 5 t., £45.

POTASSIUM CITRATE—
Brisbane, 1 cs., £12. ; Calcutta, 4 cs. (pt.), £33. ; Cape Town, 1 cs., £5. ; Melbourne, 3 cs., £28.

POTASSIUM CYANIDE—
Canton, 3 cs., £40. ; Launceston, 1 cs., £5. ; Penang, 2 cs., £11. ; Wellington, 2 cs., £19.

POTASSIUM IODIDE—
Asuncion, 1 cs. (pt.), £28. ; Axim, 1 cs., £10. ; Bombay, 2 cs., £91. ; Brisbane, 1 cs., £88. ; Calcutta, 3 cs., £263. ; Colombo, 18 cs., £1,125. ; Durban, 1 cs. (pt.), £44. ; Grand Bassam, 2 cs., £38. ; Melbourne, 2 cs., £175. ; Pt. Elizabeth, 1 cs., £43. ; Rangoon, 3 cs. (pt.), £21. ; Rotterdam, 2 cs., £180. ; Shanghai, 2 cs., £88. ; Singapore, 4 cs. (pt.), £164. ; Sydney, 7 cs. (pt.), £644.

POTASSIUM NITRATE—
Adelaide, 2 cks., £6.

POTASSIUM PERMANGANATE—
Havana, 10 kgs., £28.
Sydney, £5.

POTASSIUM PRUSSIATE—
Colombo, 1 ck., £7. ; Kobe, 10 t., £490. ; Melbourne, 1 kg., £6. ; Monte Video, 2 cs., £23.

PRUSSIAN BLUE—
Rangoon, 3 cs., £19.

ROCHELLE SALTS—
Irish Free State, 1 ck., £21.

SALAMMONIAC—
Adelaide, 1 ck., £8. ; Asuncion, 1 cs., £6. ; Auckland, 1 ck., £16. ; Brisbane, 1 cs., £13. ; Perth, 1 cs., £9. ; Shanghai, 1 ck., £16. ; Wellington, 1 ck., £11.

SALICYLATES (*otherwise undes.*)—
Montreal, 1 cs. (pt.), £12.

SALICYLIC ACID—
Adelaide, 1 cs., £14.
Brisbane, 1 cs., £6.

SALTPETRE—
Irish Free State, 6 t. 15 c., £265. ; Madras, 5 c., £10. ; Melbourne, 1 t., £14. ; New Plymouth, 10 c. (F.), £17. ; Wanganui, 5 c. (F.), £8.

SHEEP DIP—
Beira, 2 t. 13 c., £210.

SODA CRYSTALS—
Cape Town, 6 c., £7. ; Hong Kong, 15 c., £6. ; Malta, 3 c., £8. ; Mauritius, 1 t. 10 c., £20. ; Trinidad, 1 t., £8.

SODIUM ACETATE—
Adelaide (F.), 1 cs. (pt.), £8.

SODIUM ACID PYROPHOSPHATE
Cape Town, 5 c., £18.

SODIUM BENZOATE—
Cape Town, 1 cs., £26.
Paris, 10 cs., £140.

SODIUM BICARBONATE—
Bombay, 2 c., £6. ; Buenos Ayres, 14 c., £10. ; Constantinople, 10 c., £50. ; Durban, 9 c., £12. ; Melbourne, 4 c., £8. ; Mossel Bay, 4 c., £6. ; Pt. Elizabeth, 1 c., £7. ; Sierra Leone, 12 c., £8. ; Smyrna, 7 c., £30.

SODIUM BISULPHITE—
Buenos Ayres, 5 t., £92.
Trujillo, 1 c., £6.

SODIUM CITRATE—
Calcutta, 2 c., £12.
Montreal, 1 t. 10 c., £294.

SODIUM FERROCYANIDE—
East London, 10 c., £27.

SODIUM FLUORIDE—
Delagoa Bay, 10 c., £25.

SODIUM GLYCEROPHOSPHATE—
Adelaide, 1 cs. (pt.), £7.
Melbourne, 1 c., £14.

SODIUM HYPOSULPHITE—
Penang, 1 t., £19.

SODIUM IODIDE—
Bombay, 1 cs. (pt.), £13. ; Melbourne, 1 cs. (pt.), £13. ; Otago, 5 cs. (pt.), £6. ; Rotterdam 1 cs., £102. ; Sydney, 1 cs. (pt.), £7.

SODIUM PHOSPHATE—
Adelaide, 1 t. 1 c., £85.
Cape Town, 1 t., £68.

SODIUM PRUSSIATE—
Kobe, 10 t., £490.

SODIUM PYROPHOSPHATE—
Sydney, 10 c., £23.

SODIUM SALICYLATE—
Calcutta, 3 cs. (pt.), £10. ; Melbourne, 7 cs., £10. ; Sydney, 1 cs., £14.

SODIUM SULPHATE—
Auckland, 1 ck., £7.
Sydney (F.), 15 cks., £34.

SODIUM SULPHIDE—
Dunedin, 8 t. 11 c., £108. ; Lyttleton, 25 t. 17 c., £330. ; Perth, 2 t. 3 c., £30. ; Rotterdam, 5 t. 5 c., £79. ; Timaru, 5 t. 5 c., £66.

SODIUM SULPHITE—
Auckland, 1 t. 2 c., £29.
Durban, 10 c., £8.

SPENT OXIDE—
Amsterdam, 190 t. 12 c., £493.

SULPHUR—
New York, 3 t., £105.
Sydney, 2 c., £7.

SULPHUR (FLOWERS)—
Cape Town, 2 t. 5 c., £32.

SULPHURIC ACID—
Auckland, 2 c., £5. ; Buenos Ayres, 1 c., £6. ; Colombo, 17 c., £30. ; Dar-es-Salaam, 1 t. 5 c., £41. ; Durban, 2 c., £12. ; Mauritius, 2 c., £9. ; Sekondi, 8 c., £8. ; Penang, 3 c., £38. ; Pt. Elizabeth, 2 c., £5. ; Sierra Leone, 5 c., £8. ; Singapore, 8 c., £38. ; Wellington, 11 c., £26.

SUPERPHOSPHATE—
Channel Islands, 120 t., £330.
Las Palmas, 5 t., £35.

TANNIC ACID—
Brisbane (F.), 2 cs., £20.
Melbourne (F.), 1 ck., £8.

TARTARIC ACID—
Adelaide, 2 t., £290. ; Auckland, 9 c., £54. ; Calcutta, 1 c. (F.), £8. ; Calcutta, 3 cks., 2 c., £41. ; Irish Free State, 8 c., £51. ; Kobe, 5 t., £600. ; Larnaca, 3 c. (F.), £18. ; Madras, 2 c., £12. ; Melbourne, 5 t. 10 c., £660. ; Reval, 10 c. (F.), £60. ; Sydney, 3 t., £360. ; Toronto, 4 c., £31. ; Wanganui, 1 c., £6. ; Wellington, 3 c., £13. ; Yokohama, 5 t., £600.

TIN CHLORIDE—
Sydney, 1 cs., £5.

TURPENTINE—
Durban, 1 brl., £8.
Gefle, 1 cs., £6.

ZINC OXIDE—
Amsterdam, 16 bgs., £48.
Trujillo, 1 ck., £8.

ZINC SULPHIDE—
New York, 2 cks., £98.

Week ending December 1.

ANTIMONY—
Calcutta, 2 t. 10 c.

FERRO TUNGSTEN—
Stavanger, 5 t.

FERRO VANADIUM—
Paris, £950.

FULLER'S EARTH—
Hamburg, 87 t. ; Seville, 10 t.

GLUE, SIZE, AND GELATINE—
Auckland, 3 c. ; Calcutta, 4 t. 4 c. ; Cape Town, 12 c. ; Dairen, 1 t. 2 c. ; Durban, 11 c. ; East London 1 c. ; Karachi, 1 c. ; Kilindini, 2 c. ; Libau, 1 t. ; Kobe, 10 t. ; Madras, 1 c. ; Melbourne, 1 t. 10 c. ; Newcastle, 1 t. 3 c. ; Paris, 5 c. ; Perth, 10 c. ; Pt. Elizabeth, 1 c. ; Rouen, 5 t. ; Sydney, 4 t. 19 c. ; Wiborg, 19 c.

LEAD RESIDUE—
Antwerp, 27 t.

MINERAL WAX—
New York, 1 t. 10 c.

PLUMBAGO—
Adelaide, 5 c. ; Alicante, 4 t. 18 c. ; Antwerp, 1 t. ; Bilbao, 3 t. 13 c. ; Brussels, 15 c. ; Cartagena, 6 c. ; Lourenco Marques, 10 c. ; Pt. Said, 1 t. 2 c. ; Pt. Swettenham, 1 t. ; Santos, 2 t. 7 c. ; Valparaiso, 11 c.

QUININE—
Calcutta, 18,184 oz. ; Melbourne, 1,600 oz. ; New York, 10,000 oz. ; Piraeus, 6,250 oz. ; Rio de Janeiro 356 oz.

ROSIN—
Dunkirk, 10 t. 13 c.

SALT—
Bombay, 1 t. 6 c. ; Colombo, 3 c. ; Dairen, 9 c. ; Durban, 3 t. 7 c. ; Karachi, 1 c. ; Madras, 16 c. ; Sekondi, 2 c. ; Trinidad, 13 c.

SOAP—
Accra, 2 t. 11 c. ; Addah, 2 t. 16 c. ; Alexandria, 1 t. ; Amsterdam, 6 c. ; Antofagasta, 2 c. ; Antwerp, 12 c. ; Auckland, 17 c. ; Bagdad, 1 c. ; Bahamas, 9 c. ; Barbados, 2 c. ; Basra, 2 c. ; Bombay, 1 t. 5 c. ; Boston, 1 t. 19 c. ; Bluff, 9 c. ; Boulogne, 16 c. ; Brussels, 1 c. ; Buenos Ayres, 8 c. ; Calcutta, 10 c. ; Canary Islands, 18 c. ; Cape Town, 14 c. ; Channel Islands, 1 c. ; Christchurch, 1 c. ; Cologne, 2 t. 18 c. ; Cuba, 5 c. ; Dar-es-Salaam, 6 c. ; Durban, 9 c. ; Hong Kong, 4 c. ; Irish Free State, 1 t. 8 c. ; Jamaica, 2 c. ; Karachi, 1 c. ; La Libertad, 1 c. ; Lyttleton, 2 c. ; Madras, 1 t. 7 c. ; Malta, 14 c. ; Melbourne, 13 c. ; Messina, 1 c. ; Monte Video, 3 c. ; New York, 2 c. ; Paris, 1 c. ; Panama, 1 c. ; Penang, 5 c. ; Pt. Elizabeth, 2 c. ; Pt. Said, 6 c. ; Rotterdam, 2 c. ; St. Helena, 15 c. ; Sekondi, 14 t. 4 c. ; Singapore, 8 c. ; Tanga, 8 c. ; Valparaiso, 1 t. 11 c. ; Wellington, 1 c. ; Zanzibar, 8 c.

SPERMACETTI WAX—
Kobe, 7 c.

TALLOW—

Antwerp,	1 t.	1 c.
Hamburg,	57	1
Harlingen,	124	
Nantes,	10	3
Pasages,	30	
Rotterdam,	8	7

TAR (STOCKHOLM)—
Durban, 16 c.

WAX (*otherwise undescribed*)—
Osaka, 5 c.

WHITE LEAD—
Adelaide, £42. ; Auckland, £619. ; Barbados, £28 ; Bombay, £13. ; Calcutta, £91. ; Cape Town, £41. ; Channel Islands, £59. ; Christchurch, £44. ; Durban, £44. ; Invercargill, £44. ; Lyttleton, £477. ; Melbourne, £1,314. ; Napier, £64. ; Newcastle, £173. ; New Plymouth, £396. ; New York, £31. ; Pt. Elizabeth, £128. ; Rangoon, £78. ; Sydney, £250. ; Timaru, £215. ; Wellington, £206.

MANCHESTER.

Week ending November 30.

AMMONIUM SALTS (*otherwise undescribed*)—
Copenhagen, 5 cks.
Rouen, 10 kgs.

BITUMEN—
Switzerland, 6 cks.

CARBON BLACK—
Switzerland, 21 cs.

CHROME ALUM—
Holland, 95 cks.

COAL TAR PRODUCTS
Aniline Salt
Limassol, 2 cs.
Anthraquinone
Basle, 12 cks.
Creosote
Holland, 150 drms.
Tar
Alexandria, 469 drms.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Adelaide, 1 kg. ; Australia, 2 cks., 43 kgs., 40 drms. ; Basle, 8 kgs. ; Melbourne, 2 kgs. ; Rouen, 15 cks., 3 kgs., 2 cs., 1 bx. ; Switzerland, 25 cks., 55 drms. ; Sydney, 1 kg., 18 drms.

GLUE—
Alexandria, 2 cs.

LEAD NITRATE—
Sydney, 8 cks.

LEAD SULPHATE—
Belgium, 3 cks.

POTASSIUM BICHROMATE—
Limassol, 1 cs.

SALT—
Calcutta, 1,521 t. ; Holland, 14 kgs. ; St. John, N.B., 400 sks.

SIZE—
Holland, 10 brls.

SODIUM BICHROMATE—
Canada, 250 bgs.

TALLOW—
Holland, 10 cks.

TANNING MATERIALS—
Unspecified
Melbourne, 45 cks.

VERDIGRIS—
Melbourne, 6 cks.

ZINC CHLORIDE—
Bombay, 18 drms.

NEWCASTLE-ON-TYNE

Week ending December 1.

ALUMINA—
Barcelona, 200 bgs.

AMMONIA—
Barcelona, 1,541 bgs. ; Bergen, 10 kgs. ; Copenhagen, 10 brls.

ANTIMONY—
Bremen, 2 cks.
Copenhagen, 6 cks.

CAUSTIC SODA—
Bergen, 16 drms. ; Copenhagen, 107 drms. ; Christiania, 64 drms.

CHEMICALS (*otherwise undescribed*)
Savanda, 10 drms.

COAL TAR PRODUCTS—
Benzol
Dunkirk, 192 t.

COPPER SULPHOCYANIDE—
Copenhagen, 2 cks.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Bergen, 1 kg.

LITHARGE—
Christiania, 4 cks., 2 kgs.

RED LEAD—
Christiania, 26 cks.

SOAP—
Christiania, 2 cs.

WHITE LEAD—
Copenhagen, 5 cks.

N. & S. SHIELDS.

Week ending December 1.

NIL.

PRICES CURRENT.

WEDNESDAY, DEC. 5, 1923.

PREPARED BY MESSRS. HIGGINBOTTOM & CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, but it must be understood that the prices in different localities may vary.

	£	s.	d.
ACIDS.			
Acetic, 40% and 80% ..*cwt.	23- / & 46/-		
Acetic, (Glacial, B.P.) in carboys ..*ton	70	0	0
Arsenic, S.G. 2.000 .. ton	90	0	0
Boric (crystals) ..†ton	48	0	0
Citric .. lb.	0	1	5
Formic, 80/85% ..*ton	51	0	0
Hydrofluoric, 59/60% ..*lb.	0	0	7½
Lactic, 50% .. ton	43	0	0
Muriatic (Tower Salts), 28° Tw. ..*carboy	0	4	0
Nitric, 80° Tw. ..*ton	21	10	0
Oxalic .. lb.	0	0	5¾
Phosphoric, 1,500° tech. ..*ton	33	0	0
Sulphuric (168°) ..*ton	7	10	0
Sulphuric (140°) ..*ton	3	15	0
Sulphuric (free from Arsenic, 144°) ..*ton	4	10	0
Tannic (commercial) .. lb.	0	1	6
Tarteric (crystals) .. lb.	0	1	1½
COAL TAR PRODUCTS.			
Aniline Oil ..*lb.	0	0	9
Aniline Salt ..*lb.	0	0	9
Anthracene, 40/45%, "A" .. unit	0	0	4
Benzol, 90% ..*gallon	0	1	3
Carbolic Acid (crude 60%) .. gallon	0	3	4
Carbolic Acid (crystals 40°) .. lb.	0	1	1
Creosote ..*gallon	0	0	9¼
Cresylic Acid, 97/99% ..*gallon	0	2	1
Naphtha, crude, 30% ..*gallon	0	0	8½
Naphtha, solvent (90/160) ..*gallon	0	1	3
Naphthalene, refined .. ton	17	10	0
Pitch (f.a.s. Liverpool) .. ton	6	2	6
Pyridin .. gallon	1	2	0
Tar, crude .. ton	4	10	0
Tar, refined .. barrel	2	4	6
Toluol ..*gallon	0	1	9
Xylol, (pure) ..*gallon	0	2	3
GENERAL CHEMICALS.			
Acetone ..*ton	124	0	0
Alum, loose lump (delivered) ..*ton	10	10	0
Aluminium Sulphate, 17/18% .. ton	10	10	0
Aluminium Sulphocyanide .. lb.	0	0	7
Aluminoferric (in slabs) 20° Tw. .. ton	7	0	0
Ammonia, anhydrous ..*lb.	0	1	4
Ammonia, .880 ..*ton	22	10	0
Ammonia, .920 ..*ton	14	10	0
Ammonium Carbonate (lump) .. lb.	0	0	4
Ammonium Muriate (grey) ..†ton	30	0	0
Ammonium Nitrate .. ton	35	0	0
Ammonium Phosphate .. ton	60	0	0
Ammonium Sulphate, 25¾% delivered ..†ton	14	15	0
Ammonium Sulphocyanide, 95% .. lb.	0	1	3
Antimony (Golden Sulphide) .. lb.	0	0	9
Arsenic (Cornish White) .. ton	68	0	0
Barium Carbonate (native), 92/94% .. ton	5	15	0
Barium Chlorate .. lb.	0	0	7
Barium Chloride (in casks) .. ton	14	10	0
Barium Sulphate .. ton	£5	to	£7
Barium Sulphocyanide, 95% .. lb.	0	0	9½
Bleaching Powder, 35% ..*†ton	11	5	0
Bleaching Liquor, 7% ..*ton	4	5	0
Calcium Chloride ..†ton	5	10	0
Carbon Bisulphide ..*ton	26	0	0
Casein (commercial) .. ton	81	0	0
China Clay (at Runcorn), in bulk .. ton	50/- to 90/-		
Chromium Acetate (crystals) .. lb.	0	0	8
Copper Sulphate .. ton	25	0	0
Formaldehyde, 40% .. ton	62	10	0
Glycerine (chemically pure, S.G. 1,260) ..*ton	85	0	0
Glycerine (crude), 80% ..*ton	60	0	0
Iodine ..*oz.	0	1	0
Iron Nitrate, 80° Tw. ..*ton	6	5	0
Iron Sulphate (copperas), delivered in bulk*ton	2	2	6
Iron Sulphide (lumps) .. ton	6	0	0
Lead Acetate (white) .. ton	45	0	0
Lead Acetate (brown) .. ton	45	0	0
Lead Carbonate (White Lead) .. ton	47	0	0
Lead Nitrate .. ton	44	0	0
Lime Acetate (brown) ..*ton	14	10	0
Lime Acetate (grey), 80% ..*ton	22	0	0
Lime Bisulphite (S.G. 1,070) ..*ton	8	0	0
Lime Superphosphate, 30% .. ton	3	5	0
Litharge (British) .. ton	45	0	0
Magnesite, Calcined (delivered) .. ton	11	0	0
Magnesite, Raw .. ton	3	0	0
Magnesium Carbonate (light) .. cwt.	1	16	0
Magnesium Chloride (solid) .. ton	3	0	0
Magnesium Sulphate (Epsom Salts, coml.) ton	4	0	0
Magnesium Sulphate, B.P. .. ton	6	0	0
Manganese Borate, 85% .. ton	112	0	0
Manganese Sulphate, 90% .. ton	45	0	0
Methylated Alcohol, 64° (industrial) .. gallon	0	3	1
Naphtha (Wood), Solvent ..*gallon	0	5	9
Naphtha (Wood), Miscible, 60° .. gallon	0	5	9
Potassium Bichromate .. lb.	0	0	5½
Potassium Carbonate, 90% .. ton	30	0	0
Potassium Chlorate .. lb.	0	0	3¼
Potassium Hydrate (Caustic Potash), 88/90% ton	35	0	0
Potassium Hydrate (Caustic Potash), 75/80% ton	31	0	0
Potassium Hydrate (liquid), 50° Tw. .. ton	19	0	0
Potassium Chloride 80% .. ton	8	10	0
Potassium Nitrate (refined) .. ton	25	0	0
Potassium Permanganate (commercial) .. lb.	0	0	8½
Potassium Prussiate (yellow) .. lb.	0	0	9½
Potassium Prussiate (red) .. lb.	0	2	6
Potassium Sulphate, 90% (ex ship) .. ton	11	0	0
Potassium Sulphocyanide .. lb.	0	1	6
Salammoniac, lump (sublimed) 1st & 2nd cwt.	55/- & 52/6		
Sodium Acetate .. ton	24	0	0
Sodium Arsenate, 45% .. ton	45	0	0
Sodium Borate (Borax), Crystals ..†ton	25	0	0
Sodium Bicarbonate (2 cwt. bags) ..†ton	10	10	0
Sodium Bichromate .. lb.	0	0	4½
Sodium Carb. (Alkali), 58% bags ..†ton	7	10	0
Sodium Carb. (Soda Crystals), bags, car. pd. †ton	5	5	0
Sodium Chlorate .. lb.	0	0	3
Sodium Cyanide (100% basis) for export lb.	8d. to 8½d.		
Sodium Hydrate (76% C. Soda), f.o.r. ..†ton	19	7	6
Sodium Hydrate (70% C. Soda) ..†ton	17	17	6
Sodium Hydrate (60% C. Soda) ..†ton	16	17	6
Sodium Hydrate (Liquid, 90° Tw.) ..†ton	8	5	0
Sodium Hydrate, 77/78% powdered (99%) †ton	22	0	0
Sodium Hyposulphite (commercial) ..†ton	9	10	0
Sodium Hyposulphite (photographic) .. ton	15	10	0
Sodium Manganate (basis 25%) .. ton	45	0	0
Sodium Nitrate, 96% ref'd, f.o.r. L'pool .. ton	13	5	0
Sodium Nitrite, 100% basis .. ton	28	10	0
Sodium Perborate .. lb.	0	0	11½
Sodium Phosphate .. ton	14	10	0
Sodium Prussiate .. lb.	0	0	5½
Sodium Silicate (glass), Alkaline ..†ton	11	5	0
Sodium Silicate (liquid, 140° Tw.) ..†ton	9	0	0
Sodium Sulphate (Saltcake) ..†ton	4	10	0
Sodium Sulphate (Glauber's Salt) .. ton	3	10	0
Sodium Sulphide (conc.), 60/65% .. ton	14	10	0
Sodium Sulphide Crystals (casks) ..†ton	9	0	0
Sodium Sulphocyanide (liquid) .. lb.	0	0	6
Sulphur (Flowers) ex ship, Sicilian .. ton	8	0	0
Sulphur (Roll Brimstone) .. ton	8	0	0
Sulphur (Texas Gulf) .. ton	5	5	0
Tartar Emetic, 43/44% .. lb.	0	1	1
Tin Crystals .. lb.	0	1	3½
Tin Perchloride fused .. lb.	0	1	10
Titanous Chloride .. lb.	0	1	0
Zinc Chloride (solution, 102° Tw.) ..*ton	20	0	0
Zinc Sulphate, Crystals .. ton	13	10	0
METALS.			
Aluminium (Ingot Metal 98/99%) .. ton	115	0	0
Antimony .. ton	42	0	0
Copper .. ton	62	5	0
Lead (Chemical Sheet), delivered .. cwt.	1	17	6
Lead (Foreign Pig) .. ton	31	10	0
Nickel .. ton	130	0	0
Silver .. oz.	0	2	9¼
Tin, English Ingots .. ton	237	0	0
Zinc (Spelter) .. ton	32	17	6
Zinc Dust, 90/92% .. ton	46	0	0
OILS.			
Cottonseed ..*ton	45	0	0
Linseed, Raw ..*ton	45	0	0
Stearine, 115-120° M.P. .. ton	48	0	0
Tallow .. ton	40	0	0
Turpentine .. cwt	3	13	3

CURRENT TOPICS.

NITROGEN FIXATION IN GREAT BRITAIN.

WE were rather surprised the other day, when reading through an article in one of our most important morning newspapers, dealing with "Synthetic Nitrogen," to come across the statement: "Great Britain alone, among the leading commercial and agricultural nations, is neglecting an inexhaustible source of supply. We are neither manufacturing 'synthetic nitrogen' from the air nor conducting any systematic research into processes whereby the manufacture may be accomplished." The statement itself seemed positive enough to leave little room for doubt as to what the writer really meant, but any lingering doubt that might have existed in our minds was completely dispelled by the following further statement which occurred at the end of the article: "Naturally, they (the nitrogen fixation processes) can be further improved; in Germany, the United States, Norway, France, and Japan, research on the development of one or other of the processes is being conducted on a large scale. In Great Britain there is no manufacture; the researches instituted during the war have been allowed to lapse, and save possibly in a few private small-scale laboratories, nothing is being done." The article itself was evidently based upon Mr. Kilburn Scott's Cantor Lectures to the Royal Society of Arts last year, and on the technical side the facts, although somewhat scanty, are sound enough. We should be rather interested, however, to learn further particulars about the plant for the manufacture of cyanamide, on the erection of which very "large expenditure was incurred in this country" and which "has now been scrapped." As is well known, the work of the Nitrogen Products Committee of the Munitions Inventions Department was discontinued after the war, and to this extent there is some justification for the writer's statements; but in view of the remarkable progress made by Synthetic Ammonia and Nitrates, Ltd., in the manufacture of synthetic ammonia by the Haber Process at their works at Billingham-on-Tees, and the progress made by the British Cyanides Company at Oldbury towards the manufacture of cyanides and of ammonia from atmospheric nitrogen, sweeping assertions that this country is doing nothing towards the establishment of a nitrogen-fixation industry are obviously unfounded. At the same time, it must be admitted that very little has been done on the part of those now engaged in the development of the new British

nitrogen-fixation industry to inform the general public of their activities, and although such developments are now entirely in the hands of private undertakings, we are of the opinion that a little more publicity would be as much in the interests of the firms engaged as in those of the public. Brunner, Mond and Company, in their recently issued jubilee commemorative volume, did lift the corner of the veil of mystery covering their Billingham enterprise, and the glimpse one was able to obtain showed clearly the enormous amount of progress that has been made. A general policy of judicious publicity would at least prevent the broadcasting of unreliable if not of absolutely misleading information.

THE FIFTH REPORT ON COLLOID CHEMISTRY.

The fifth Report on Colloid Chemistry and its General and Industrial Applications has just been published for the British Association by the Department of Scientific and Industrial Research (London, H.M. Stationery Office; price 2s. 6d. net). The preparation of this Report (the last of the series), like that of its predecessors, has been the work of the special committee of the Association of which Professor F. G. Donnan is chairman and Dr. W. Clayton secretary. Six valuable papers are included, namely: "The Measurement of Surface Tension," by Dr. Allan Ferguson; "Collagen and Gelatin," by Professor H. R. Procter and Mr. J. A. Wilson; "Colloid Phenomena in Bacteriology," by Dr. E. K. Rideal; "Industrial Applications of Wetting Power," by Mr. W. H. Nuttall; "Colloids in Relation to the Manufacture of Inks," by Mr. C. A. Mitchell; and "The Manufacture of Artificial Silk in Relation to Colloid Chemistry," by E. Wheeler. It is interesting to note the remarkable fact pointed out by Mr. Ainsworth Mitchell that the first application of colloid phenomena to industrial processes should have been in connection with the manufacture of ink. In the preparation of Chinese and Indian ink—an account of which, dating back to about 2600 B.C., is extant—lampblack is obtained by burning an oil such as Chinese wood oil with a limited supply of air, and is then pounded with a solution of glue or gum and made into sticks which are dried. The utility of the five reports is enhanced considerably by the publication of a comprehensive author-and-subject index with the final report. The Association has done valuable work both for pure and applied chemistry in gathering together the most important data on colloid phenomena. With the rapid progress now being made on the subject, however, we are afraid the necessity for a new series of reports will be realised at no very distant date.

A COSTLY VICTORY.

For the time being, the country has rejected definitely the proposals put forward by Mr. Baldwin for ameliorating our unemployment problem and for protecting our manufacturers against unfair foreign competition. Whatever be the form of Government ultimately adopted, whether a Liberal-Labour Coalition or a Conservative-Liberal Coalition, this much is certain, that the issue of Protection will not be raised in the lifetime of the present Parliament. Yet we venture to predict that the issue has not been settled once and for all, but has only been postponed, and that the necessity for the fiscal change advocated by Mr. Baldwin will be realised with increasing intensity as the months go by. For the moment the forces of *laissez-faire* are triumphant. There is little doubt that the dominant factor making towards the defeat of what in our opinion is the only logical policy that the nation can at present adopt, has been the manner in which both the "progressive" parties have exploited the "dear food" bogey and have attributed to the Premier intentions which he has never expressed either by mouth or in print. Whether the next general election will occur within the next six months or the next twelve months, we are unable to prophesy, but whatever be the period intervening we are afraid that it is destined to produce in the shape of continued unemployment and in steady reduction of the activities of our manufacturers even more powerful arguments in favour of Protection than have been advanced during the last three weeks.

RIVER POLLUTION.

We understand that the Standing Committee appointed by the Ministry of Agriculture and Fisheries to deal with the problem of river pollution is to issue a report within the next few days. Largely because it has adopted in its work a policy of conciliation and co-operation in respect of the local authorities with whom it has had to deal, the committee believes that definite progress has been made towards the object in view. Legislation for the avoidance of this social evil has failed in the past, and in any case financial considerations would to-day prevent drastic legislation to compel local authorities thoroughly to purify effluents before their discharge into rivers and streams. The committee has, therefore, set itself to try and improve the condition of the rivers by directing the attention of the authorities in those areas where the discharge of sewage is killing fish, to the existence of the problem, and to encourage them to adopt more efficient methods of disposal. It has also discussed with manufacturers various methods of treatment whereby the effluents may be purified at a reasonable cost. Whether this conviction of the committee that an educative policy alone will secure the avoidance of pollution is correct, the future alone can show, but we are at one with the committee in believing that river pollution consequent wholly upon the callous negligence by local authorities can now only apply in a very small number of cases.

OVERSEAS TRADE IN NOVEMBER.

The Board of Trade Returns for November, which reach us as we go to press, show that imports during the month were valued at £101,585,000, against £99,915,000 in October. British exports amounted to £65,768,000, compared with £71,323,000 for the previous month. Re-exports diminished by almost £1,000,000. Imports of chemicals, drugs, dyes, etc., were valued at £1,138,000, against £1,246,000 in October; exports reached £2,015,000 in November, a considerable reduction on the October figure of £2,573,000.

THE MANUFACTURE OF VINEGAR.

TECHNOLOGY OF THE FERMENTATION PROCESSES.

By "Biochemist."

GENUINE vinegar consists of the dilute aqueous solution of acetic acid resulting from the life-processes of certain oxidising bacteria in dilute alcoholic infusions. Its use for table purposes arose concurrently with that of wine, while attention was early directed to its solvent properties. Concentration by distillation and freezing were utilised by the alchemists in order to prepare "radical," "aromatic" or "Venus's" vinegar.

Although generally attributed to Schützenbach (1822), the modern "quick" vinegar processes are in reality development of the original French method, described in the *Transactions* of the Royal Society for 1670. In this country, malt or grain vinegar is mainly consumed; on the Continent, wine vinegar; while the American public inclines to the use of cider or apple vinegar. Very recently, the production of orange vinegar from the juice of spoilt or frozen oranges has received attention in the United States. Wood vinegar, prepared from pyroligneous acid free from tarry matter, is now an increasingly active competitor of alcohol vinegar. The absence of "bouquet bodies," however, results in an unpleasant, pungent odour, a defect not easily remedied by the addition of esters or essential oils.

The Mechanism of Acetification.

That the formation of acetic acid from alcohol is essentially an oxidation process was first recognised by Döbereiner. Later, Liebig formulated the acetic fermentation as a two-stage process with acetaldehyde ("light oxygenated ether") as the intermediate product. This view has recently received a measure of support as a result of the investigation of Neuberg and Nord (*Biochem. Zeits.*, 1919), who were able to "fix" the aldehyde by the formation of its compound with calcium sulphite. Liebig, however, regarded the acetic ferment as so much catalytic surface, and it remained for Pasteur to show that acetification resulted from the life-processes of the vinegar yeast." A modification of Pasteur's theory was that of Nägeli, according to whom the oxidation was a consequence of vibrations induced in the alcohol as a result of similar vibrations in the living organisms.

The isolation of the enzyme zymase from yeast led Buchner to the attempt at separating an enzyme from "mother-of-vinegar." His early efforts in this direction, by applying hydraulic pressure to the pellicle after disintegration by grinding with kieselguhr or quartz, were unsuccessful. In 1906, however, Buchner and Gaunt succeeded in obtaining stable enzyme preparations capable of oxidising not only ethyl alcohol to acetic acid but also propyl alcohol to propionic acid. The method finally adopted was to free the pellicle from water by centrifuging, and then to extract the residue with acetone in the presence of a trace of toluene as preservative. From experiments recorded by Wieland (*Berichte*, 1913), the acetifying enzymes appear to act by dehydrogenation. Thus, like palladium black, an enzyme prepared from *Bacterium aceti* will oxidise alcohol to acetic acid in the absence of free oxygen, provided substances like quinone and methylene blue are present.

The More-Important Vinegar Organisms.

The vinegar ferment was at first considered to be a species of mould, but later investigations demonstrated its bacterial nature. Of the many acetifying organisms described from time to time, the more important are *Bacterium aceti*, *B. Pasteurianum* and *B. Kützingianum* due to Hansen, the non-motile *Bacillus xylinus* due to A. J. Brown, and Henneberg's *Bacillus acetigenus*. The last named is the chief organism used by German vinegar brewers.

By the swelling and coalescence of the walls of adjacent cells, a mucilaginous surface-skin forms, and this zoogloeal structure constitutes "mother-of-vinegar." A similar formation, arising from Brown's *Bacillus xylinus*, is the so-called "vinegar-plant," a tough gelatinous pellicle which, if unchecked, may reach a thickness of several inches and cause operating difficulties. By treatment with starch it is possible to detect the presence of *B. Kützingianum* in a zoogloea of Hansen's three organisms. Thus, the gelatinous envelope of this species will be stained blue, while those of the two others remain unaffected, the cells themselves being stained yellow in every case. The acetic bacteria afford excellent examples of morphological change induced by temperature variations. In a particular case investigated by Hansen, the cells of a culture grown at 34° C. developed into long filaments (200$\mu\mu$ in length) when transferred to a light-beer medium at 40° C. On re-establishing the original conditions, occasional bulbous protuberances were induced on the filaments, but after 24 hours reversion to the original chain-form occurred.

For active development the acetic bacteria and bacilli require a well-aerated nutrient medium, comprising water, alcohol, nitrogenous substances and alkali salts. This should be maintained between the temperature limits 20° and 35° C. An alcohol concentration of more than 15 per cent. is fatal as are also temperatures above 50° C., while an abrupt change in conditions will retard development. Bright light has a deleterious effect on the vitality of these organisms. Thus, as a result of a series of experimental acetifications in vessels of coloured glass, it was found that violet light has the most and red light, the least retarding effect. However, owing to the very large scale on which modern vinegar processes are operated, this influence is of no great industrial importance.

Defective aeration results in the formation of acetaldehyde, which, in part, combines with alcohol to form acetal ("heavy oxygenated ether"). Ethyl acetate, one of the chief "bouquet bodies," is also formed. Both *B. aceti* and *B. xylinus* appear to be selective in their action on aliphatic alcohols, propyl alcohol being converted to propionic acid, while methyl and amyl alcohols are not oxidised. With glycerol, the oxidation products are water, carbon dioxide and a small quantity of an acid of doubtful constitution; glycol, however, yields glycollic acid. Small quantities of formic and succinic acids are present in wine and grain vinegars respectively, while spirit vinegar contains fusel oil. Although *B. aceti* is without action on cane sugar, glucose and mannitol yield gluconic acid and fructose respectively. Strangely enough, under the action of the vinegar plant (*B. xylinus*), cellulose is formed from fructose. The cause of the fall in acetic-acid content in prolonged acetifications has been elucidated by Pasteur, who found that the vinegar ferment could decompose acetic acid in the absence of alcohol with the formation of carbon dioxide, a process which bears some analogy to oxidation with palladium black.

In the case of wine vinegar, it has been established definitely that different acetic organisms will result in vinegars of different aroma and flavour. In English practice, the introduction of pure cultures would without doubt allow of much improvement both in the process and in the product.

The Preparation of the Wort.

Described in outline, the operations in vinegar manufacture are as follows: A wort containing fermentable substances is first prepared and this then undergoes consecutive alcoholic and acetic fermentations. The dilute alcoholic solution containing suitable bacterial nutrient substances is known as the gyle. In this country it is usual to prepare this from various malted and raw grains or from mixtures of the latter with fermentable sugars. On the Continent, however, diluted potato- and maize-spirit containing ammonium salts and phosphates constitute the acetification media.

The technique of the process for preparing a vinegar-wort (mashing), resembles that of spirit-distilling rather than that of beer-brewing. While in the case of the latter the aim is to leave a residue of unfermentable dextrins in the wort, in vinegar-brewing, the object is to obtain the highest possible concentration of fermentable sugars. With this view, a rather high temperature obtains during the mashing-process. For grains such as malted barley a malt of low diastatic power (about 30) is very serviceable, while the presence of raw grain will naturally necessitate a more powerful malt.

The mixture of grain and malt is crushed to form the grist, treated with hot water in a mashing-machine and then further extracted in the mash-tun. One form of mashing-machine consists of a cylindrical vessel provided with propellers and rakes. Another (Maitland's), is composed of a double cylinder, the grist being fed into the inner one, where it is subjected to fine sprays of hot water, entering from the outer cylinder through perforations. The early form of the mash-tun, stirred with oars, has given place to well-lagged vessels supplied with mechanical agitators. For heating, steam coils are provided beneath a false bottom, and a rotating sprinkler (the sparge) for wetting the mash uniformly.

From an initial temperature of about 49° C., the contents of the mash-tun are gradually raised to a temperature of

about 67° C. and maintained at this point until all the starch has been converted (no blue colour with iodine). Clean, live steam may be utilised, provided care is taken not to injure the malt-diastase. After draining, the mash is treated with a smaller quantity of water at about 68° C., and finally sparged with water at this temperature. The mixed extracts should have a specific gravity of 1.060 at 15.5° C. It is essential to maintain the correct temperature-range during mashing, as too low temperatures will result in cloudy worts containing uncoagulated albuminous matter, while if the wort is boiled the dextrins become unfermentable and a weak gyle is the consequence.

In an accelerated process, a temperature range of 55°-77° C. is first applied gradually, so as to convert a considerable proportion of the starch, the sugar formed initially serving to protect the diastase at the higher temperatures. After this preliminary treatment any residual starch is gelatinised by 50 minutes heating at above 90° C., and the conversion rapidly completed at 55°-68° C. in the presence of fresh malt.

The Use of Pre-treated Cereals.

To facilitate the action of the diastase, the grain may be subjected to a preliminary heat-treatment, when the starch granules swell. With this gelatinised grain, a much smaller proportion of malt can be used, or a malt of lower diastatic power will suffice. "Popped barley" is a similar slightly roasted product in which the starch granules have been ruptured. This treatment results in reduced moisture and fat contents, the presence of fatty matter being of no value for vinegar-making. "Flaked maize" and "flaked rice" are prepared by crushing, removing the germ and with it the bulk of the oil, and then gelatinising the germ-free products. These materials are frequently designated as "malts" owing to the conversion of the starch induced by heating.

Converted Grain and Glucose.

A wort suitable for the manufacture of vinegar may be prepared by treating maize or rice with dilute mineral acids in place of malt. For this purpose the material is treated with 3 per cent. sulphuric acid for 3 hours, under 10lb. steam pressure, in an iron "converter" capable of taking a charge of about 7 tons of grain. When all the starch has been converted, the product is neutralised with lime and chalk and filtered. For making strong vinegar, the liquor (Sp.Gr. 1.070) is fermented directly, but it is more usual to dilute it to a gravity of 1.055-1.060 before alcoholic fermentation. The product, unlike glucose, retains the phosphates and nitrogenous compounds of the original grain, and its use may lead to the presence of calcium sulphate in the finished vinegar.

In order to raise the strength of the wort and so to increase the output of any particular plant, glucose ("invert sugar") may be added. As worts containing the latter result in finished products lacking in "body," the glucose may be "doctored" with compositions containing unfermentable dextrins or molasses may be mixed with it.

Preparation of the "Gyle" and Yeast Culture.

Before "pitching" with yeast the wort is cooled to about 20° C. by passing over cold-water pipes (refrigerators). In one system, the liquor is distributed over a series of pipes, oval in section, so as to increase the effective cooling surface. In another, the pipes are laid in a horizontal trough, so partitioned that the wort travels over the whole cooling surface. It is advisable to use a fresh supply of the strain of yeast found by trial to be most suitable for each batch of wort. After pitching, there is, at first, a rise in temperature to about 34° C., followed by a fall to about 30° C. on the third day. When fermentation is at an end the yeast is separated and the gyle allowed to "brighten" spontaneously, when it deposits dead yeast cells and undergoes a preliminary acetification.

If yeast production is the main consideration, more efficient aeration, a much cooler wort (15° C.), and lower fermentation temperatures (21°-24° C.) are necessary than when vinegar is the end in view, as otherwise the yeast produced is slimy and difficult to filter. Vats equipped with internal cooling-coils ("attemperator") and "roses" for distributing the air are essential. To collect the yeast a "skimming-board" is rotated over the surface of the vat and the yeast driven into a "parachute." This contrivance is a funnel-ended tube leading through the floor of the vat, a valve operated from outside controlling the egress of the yeast. After separation, the latter is washed and filter-pressed.

Acetification by the Slow or Barrel Process.

As applied to fermented wort, this process, which occupied several months, is now obsolete. Rows of partly-filled casks ("the vinegar field") were exposed to the air, the whole process being known as "fielding." For the manufacture of wine vinegar, however, the slow (Orleans) process is still in vogue. It is advisable to use ripe wine, that is, wine free from albuminous matter—for unripe wine induces the growth of the organism *Saccharomyces mesembryanthemum*—which develops as a white surface-skin and may arrest the propagation of the vinegar ferment. Before use the wine is filtered through a mass of shavings ("wine-rape"), a process which is repeated after acetification. The casks or "mothers" are stacked in cellars maintained below 30° C.; the monthly output being of the order of 9 gallons per cask. It is usual to mature wine vinegar in oak casks. To avoid this lengthy process, a recent specification proposes to add extract of oak-wood to the vinegar. This is prepared by steeping the finely-divided wood in dilute alcohol (25 per cent.) followed by water and distilling off the solvents *in vacuo* (Brit. Pat. 148,829, of 1920).

Owing to the length of the acetification process, it is difficult to eliminate the development of the vinegar eel, mother-of-vinegar, and troublesome tartar deposits. One point in its favour, however, is the formation of "bouquet bodies" and odoriferous esters, the outstanding characteristics of French vinegar. Claudon has devised a substitute for the "mothers" which embody Pasteur's recommendations. This comprises a stack of superimposed shallow rectangular tanks, provided with adjustable air-vents and with a floating receptacle for the bacteria. Arrangements were made for sterilising both the raw material and the finished product. However, in spite of the efforts of Pasteur and his followers the original procedure still holds its ground. In a modification of the slow process, a mass of shavings is suspended above the surface of the liquor in the cask. From time to time the latter is rolled so that the shavings are saturated. This process has been applied principally, to the preparation of cider, orange and other fruit vinegars.

Quick or Generator Processes.

The modern generators consist of vats of from 4,000 to 5,000 gallons capacity, housed in chambers known as "stoves." About two-thirds of the way up is a perforated false-bottom, on which is spread a quantity of beechwood shavings or raisin stalks to promote bacterial development. Other materials such as maize-cobs, bunches of cord and wicker-work have been utilised for this purpose. Aeration proceeds through holes in the sides of the vat, below the bacterial medium. Very large plants are provided with internal steam coils in order to heat the gyle to about 20° C. to begin with. In English practice, the optimum operating temperatures have been found to be 40°-46° C., but frequently it is advantageous to work at more elevated temperatures, particularly to check the development of the vinegar eel.

This organism (*Leptodera oxophila*), which was originally supposed to impart the sourness to vinegar by pricking the tongue, varies in length from 1/25th to 1/16th of an inch. It thrives in dilute alcohol, dilute acetic acid and in vinegar, and may impede and even arrest acetification owing to the dearth of air resulting from its multiplication. In such cases resort is had to complete sterilisation of the vat at about 70° C., temperatures above 63° C. and below 5° C. being fatal to the eel. Another air-breathing organism is the vinegar mite, which appears in vinegar as fine white specks. To prevent their entry into the generator, it has been proposed to protect the air-vents with fine wire-gauze filters.

An intermittent shower of gyle is distributed over the shavings, previously innoculated with a vigorous growth of the ferment, by means of a sparge. The partially-acetified liquid is passed through the apparatus repeatedly until the alcohol is practically all oxidised, a matter of two or three weeks. To avoid contaminating the vinegar, sparges may be of vulcanite, block tin or wood, very large installations being equipped with mechanically-driven box-sparges made of wood. The latter are not liable to clog and can easily be cleaned. Intermittent operation can be secured by syphon action or by the tipping-trough system. Wicks of cotton or hemp serve to guide the gyle from the distributing-tray to the shavings.

(*To be continued.*)

ANALYSIS OF ORGANIC ACCELERATORS.

A NEW SYSTEMATIC METHOD.

A JOINT meeting of the Manchester Sections of the Society of Chemical Industry and the Institution of the Rubber Industry was held in the rooms of the Textile Institute on Friday, December 7. Dr. Levinstein occupied the chair and was supported by Mr. J. H. Mandelberg, chairman of the Manchester Section of the Institution of the Rubber Industry. The attendance was only moderate.

Mr. G. Martin, B.Sc., A.I.C., Superintendent of Rubber Investigations at the Imperial Institute, read a paper entitled "Methods to be Adopted in Comparing the Activities of Different Accelerators." He dealt mainly with the effects of the variable factors—*e.g.*, purity of the raw rubber, concentration of the fillers, of the zinc oxide, and of the accelerator itself in the interpretation of the "acceleration factor," and pointed out that the latter as usually adopted required modification in the majority of cases.

A very interesting paper was then read by Dr. T. Callan (Chief Analytical Chemist to the British Dyestuffs Corporation). This paper was compiled in collaboration with Mr. N. Strafford, B.Sc., A.I.C., and was entitled "The Analysis of Rubber Vulcanising Accelerators." Dr. Callan outlined a systematic scheme for the qualitative identification and quantitative estimation of the chief commercial organic rubber vulcanising accelerators. This is the first scheme that has been proposed and was worked out by the authors in the laboratories of the Dyestuffs Corporation. The accelerators dealt with were sodium phenolate and naphtholate, the nitroso compounds, the aryl guanidines and biguanides, thiocarbanilide, the metallic and alkyl ammonium salts of alkyl dithio-carbamic acids, and the alkyl thiuram disulphides.

Purification and Separation into Groups.

The procedure recommended by Dr Callan is briefly as follows:

First effect a preliminary examination of the product by heating it over the bunsen flame (*not* on platinum foil, since many of the accelerators contain zinc which would alloy with the platinum). Observe the odours evolved and the type of combustion and also examine the ash left, if any. It must be remembered that inorganic constituents may be valueless diluents or on the other hand they may be a fundamental part of the accelerator as in the zinc complex salts.

The second step is to extract the product in a Soxhlet apparatus successively with petroleum ether, ether, benzol, alcohol, and water—stopping, of course, when a suitable solvent is found. Petroleum-ether extraction is usually an important help, as the tarry organic impurities may be removed from the accelerator. The pure product is then prepared by crystallisation from the most suitable solvent and examined for nitrogen and sulphur, when four groups are possible—namely, compounds containing neither nitrogen nor sulphur, those containing nitrogen only, and sulphur only, and those containing both nitrogen and sulphur.

The most important compounds in the first group are sodium phenolate and sodium naphtholate. These are soluble in water and the solutions, if free NaOH be present, give a pronounced colouration with Thiazol-yellow paper. The former is estimated quantitatively by the tribromophenol method, and the latter by titration with a standard diazo solution.

The second group contains the simpler amines, the nitroso compounds, the aldehyde-amines and the guanidine derivatives. The simpler amines are recognised and estimated by ordinary well-known analytical methods.

Detection and Estimation of Nitroso-Compounds.

Of the nitroso compounds, the more important are para-nitroso-dimethylaniline, para-nitrosophenol, and α nitroso β naphthol. The first is recognised by reduction with zinc dust and acid to the corresponding para amino compound, which then gives the well-known methylene blue reaction with oxidising agents. The nitroso naphthol when dissolved in acetone gives a dark brown precipitate with ferric chloride solution. A method for the direct quantitative determination of nitroso compounds, based upon their reaction with phenylhydazine with the liberation of nitrogen gas was proposed by Clausen a few years ago. Dr. Callan has examined this method and found it unsatisfactory, as it consistently gives results 5 to 10 per cent. too low. He utilises the titanous-salt reduction method of Knecht, but stated that in the application of this method to nitroso compounds very gentle heating should be resorted to.

The Guanidine Compounds.

Dealing with the complex guanidine compounds, which are now being manufactured in large quantities and coming into great prominence as vulcanisation accelerators, Dr. Callan arrived at what was hitherto practically virgin territory in analytical chemistry. He pointed out that as regards the guanidines (of which diphenyl guanidine (D.P.G.) and triphenyl guanidine (T.P.G.) are at present the most important commercial members), these are all strong bases, soluble in alcohol and insoluble in water. A characteristic feature is that all the members of the guanidine family form sparingly soluble nitrates, picrates, thiocyanates, and perchlorates. These salts differ slightly in their solubility from one member of the family to another. In examining a suspected guanidine accelerator, the first step is to determine the neutralisation equivalent of the product by titration with standard acid using bromphenol blue as indicator.

The molecular weight is then determined, and in this connection Dr. Callan laid great stress on a method proposed by Rast (*Berichte*, 1922), as being exceptionally suitable to the needs of an industrial analytical laboratory. According to this method, the depression in the melting point of pure camphor by the admixture of a small percentage of the compound under investigation is found and from this the M.W. calculated. Under normal conditions a temperature difference of about 18-20° C. between the M.Pt. of pure camphor and the mixture is obtained, and the use of an expensive Beckmann thermometer is unnecessary. This method is of course not universally applicable, as some compounds decompose under the conditions of the test and others have a tendency to separate out from the camphor during the melting, but for a large number of cases, Dr. Callan has found the method of great value and pointed out that it can be carried out by an unskilled laboratory assistant. To confirm the identification and also quantitatively to estimate the compound, the picrate should be made. Dr. Callan and his staff have worked out a procedure for this purpose, which will be given when the paper is published *in extenso*, as will also the various physical constants of the purified accelerators and their derivatives

Suggested Specifications for D.P.G. and T.P.G.

As the result of his experience Dr. Callan recommends that commercial diphenyl guanidine should conform to the following specification: It should melt not lower than 143° C., it should contain not less than 94 per cent of alcohol soluble base, and it should contain not more than 10 per cent. of T.P.G. Commercial triphenyl guanidine should melt not lower than 142° C., and should contain not more than 1 per cent. of D.P.G. A simple test for differentiating between D.P.G. and T.P.G. consists in adding a 10 per cent. aqueous solution of ammonium perchlorate to a 5 per cent. aqueous solution of the hydrochloride of the base. In the case of D.P.G., no precipitate is formed, whilst in the case of T.P.G. a very heavy precipitate results.

With regard to the biguanides, the only compound investigated by Dr. Callan has been *o*-tolylbiguanide. Its distinguishing features were its solubility in water (giving a solution strongly alkaline to litmus), and the fact that its aqueous solution when treated with copper-sulphate solution gives a pink precipitate. The compound also forms a picrate containing two molecules of picric acid, but the second molecule is not firmly combined, for on recrystallising the original picrate, the picric-acid content progressively diminishes.

Dealing with aldehyde-ammonia, Dr. Callan pointed out that all commercial samples contained free lime, and that unless this were taken into account erroneous analytical results would follow.

The Thiocarbamates and Thiuram Sulphides.

Of those accelerators containing sulphur but no nitrogen, such as the thio- and dithio-acids, Dr. Callan had had no experience, and he went on to deal with those containing both sulphur and nitrogen in the molecule. These include thiocarbanilide and its homologues, the complex thiocarbamates and the thiuram sulphides. Thiocarbanilide is best estimated

by the bromate titration method, together with a determination of the total sulphur content. For the latter purpose, Dr. Callan recommended the use of a silica tube instead of the usual platinum crucibles. A procedure for the qualitative and quantitative estimation of the dithiocarbamate type of accelerator had been worked out, and was based on the fact that these bodies when heated with dilute sulphuric acid give off carbon bisulphide in quantitative yield. This CS_2 is distilled off, dissolved in alcoholic KOH and titrated with iodine. The base remaining in the distillation flask is liberated with alkali and separated by distillation. The thiuram disulphides are oxidation products of the dithiocarbamates, but their reduction to the parent bodies proved a very difficult matter. Finally, Dr. Callan worked out a method of reduction with magnesium powder and sulphuric acid. The resultant dithiocarbamates are, of course, examined in the manner described above.

THE MANUFACTURE OF MUSTARD GAS.

CLAIMS OF DR. LEVINSTEIN AND PROFESSOR GREEN.

IN the Law Courts, London, on Monday, Mr. Justice Tomlin, president of the War Inventions Commission, heard the claim of Dr. H. Levinstein and Professor A. G. Green in respect of mustard gas.

It was contended for the claimants that the gas was the only product of this class which was used by the British army. The invention was made on a large scale at the works of the British Dyestuffs Corporation, Ltd. At the request of the Government the applicants supplied all information at their disposal and their working drawings to the Government of the United States free of charge, and thus enabled their product to be manufactured on an immense scale without delay. In the same way the invention and drawings were placed at the disposal of the Italian Government. The applicants charged no manufacturing profit and no royalty in supplying the Government with the substance.

Sir Duncan Kerley (for the claimants) said no one would dispute that the claimants were two great chemists, but neither of them had received one penny or any acknowledgment in respect of the part they had played in the production of this gas. The British Dyestuffs Corporation, although they were paid, had made a loss on the whole transaction.

Mr. Hunter Gray said the Crown maintained that this invention was, in fact, covered by an existing patent. Sir Duncan Kerley said the process of the applicants differed chemically from the patented process invented by Professor Pope. At the first attempt (he said) to make a large quantity of the gas the whole potful bubbled up and got out of its container, and but for the fact that a covered catchpot had been provided, every man on the job would have been killed and the works themselves would have been unapproachable for weeks. In May, 1918, they were told that nothing could be of greater military importance than a quick supply of mustard gas, as our troops were being discouraged by the fact that the Germans had got this stuff, while we had none.

Levinstein Method Adopted at Avonmouth Factory.

Counsel went on to refer to the attempt of the Ministry of Munitions to make the gas at Avonmouth, and said there were 1,400 casualties there. As to the value of the product, Sir Duncan said it was used for the first time in the field in September, 1918, in the artillery preparation for the Fourth Army's attack on the Hindenburg Line. Two nights before the attack several villages near the line and many strong points and gun positions were shelled with mustard gas for six hours. In the latter case the effect of the gas was seen at once, as the hostile batteries ceased fire and remained silent for twenty-four hours or longer.

It was a long time, said counsel, before the Ministry of Munitions were convinced that their process was the proper one and that they were producing the proper stuff. But at last they were convinced, and Professor Gibson was sent to Avonmouth to install the Blackley process and to produce the identical product that they were preparing at Blackley. The Ministry were driven by their own want of success to adopt the Levinstein method. As to the question of compensation on the stuff produced at Avonmouth, which amounted to 545 tons. A royalty of one penny per pound on the total production would amount to £5,000. The Commission adjourned till next Monday.

DIRECT DETERMINATION OF GLYCERINE.

ITALIAN METHOD APPLICABLE TO THE CRUDE PRODUCT.

IN a recent issue (the *Chemical Trade Journal and Chemical Engineer*, August 3, 1923, page 127) a description of a method of direct determination of glycerine worked out by Professor Fachini and Somazzi at the Royal Experimental Station for the Oils and Fats Industry at Milan, was published. This method was based upon the oxidation of the glycerine by potassium bichromate, and the measurement of the quantity of carbon dioxide evolved by the oxidation. The amount of bichromate used in the oxidation is also determined, and, by a simple calculation, the quantities of glycerol and also of trimethylene glycol present in the sample can be determined. This method was originally worked out for distilled glycerines, but a later communication by the two authors (*Bolletino del Industria degli Olii e dei Grassi*, October, 1923) extends the use of the method to crude glycerines.

Crude glycerines, especially those recovered from soap lyes, contain generally from 80—82 per cent. of glycerol and a number of impurities, such as fatty acids, resin acids, proteins, chlorides, carbonates, and alkaline hydrates. It is therefore necessary to purify the samples before the bichromate oxidation method can be applied. All oxidisable materials naturally must be removed, and, in addition, carbonates, if present, interfere greatly with the accuracy of the results. The different methods of purification have been examined by the authors. The distillation method was tried and abandoned. Purification with zinc sulphate proved unsatisfactory, as all the carbonates were not eliminated. Finally, a method of purification with basic lead acetate was worked out.

Purification with Basic-Lead-Acetate Solution.

The basic acetate is prepared by boiling a 10 per cent. solution of lead acetate with excess of litharge for one hour. The hot solution is then filtered under conditions whereby contamination with carbon dioxide is avoided. It was found that even if the basic-acetate solution deposits a precipitate after standing for some time, its efficiency is in no way reduced. This solution is capable of eliminating the proteins and albuminoids by coagulation, the organic acids as insoluble salts, and the alkaline carbonates as insoluble carbonates. Again, if the purified mixture be cooled to 0° C. for one hour, practically all the chlorides are removed as insoluble lead chloride. To remove the final traces of chlorides, the addition of a slight excess of silver carbonate may be employed.

The presence of a slight excess of the basic lead acetate in the purified glycerine will not affect the accuracy of the results, for Vizern and Guillot have shown that at temperatures below 120° C. lead acetate is not oxidised by chromic acid. The author's own experience has confirmed this conclusion, for under the conditions of their method of analysis the acetic acid present (5 c.c. of a 10 per cent. solution for every 250 c.c.) cannot modify the results as shown by the tests below:—

Sample	Purity of the Glycerine Found.
A. Pure glycerine No. 1	88.02 per cent.
B. Mixture of 4.2315 grammes of glycerine No. 1 with water and 5 c.c. of the basic acetate solution...	88.04 per cent.
C Mixture of 3.8335 grammes of glycerine No. 1 with water, 0.15 gramme of NaCl, and 0.05 gramme of Na_2CO_3	88.00 per cent.

It is thus established that the carbon dioxide method is quite applicable to crude glycerines when they have been well purified and freed from carbonates. The details of the estimation are as follows:—

Details of the Estimation.

About 20 grammes of lye or 2 grammes of the crude glycerine itself are weighed out accurately and transferred to a 250 c.c. graduated flask. Water is added until a volume of 50 c.c. is obtained, and 5 c.c. of the basic-lead-acetate solution, prepared as described above, are introduced. The flask is well shaken, and the contents left at rest for 30 minutes. A further small quantity of the lead acetate solution is then added cautiously. If a further amount of pre-

cipitate is formed, it is necessary to recommence the analysis, weighing out less of the sample. If no further precipitate is produced, the contents of the flask are made up with water to 250 c.c. at 15° C. The flask and its contents are then cooled in ice to 0° C. for at least one hour. The liquid is then filtered through a dry, cool filter. When the filtrate has reached a temperature of 15° C., 25 c.c. are removed with a pipette and transferred to the oxidation flask, and the analysis continued as described in the previous article for the case of pure glycerine. It is necessary, however, to add 12 c.c. of sulphuric acid (66° Bé.) to provide the necessary acidity, which, as has been shown previously, must be constant. Thus the method for the analysis of glycerines is complete. It is divided into three parts: (1) Purification of the sample; (2) determination of glycerol; (3) estimation of glycerol and trimethylene glycol.

Determining the Origin of a Glycerine.

The practical applications of this method are very important. It permits a much better control of the distillation process, and greater accuracy in the analysis of commercial samples. It was shown in Italy during the war that even in the case of highly purified glycerines, the properties of explosives made from them varied to some extent with the origin of the glycerine. It was found that glycerines of animal origin were composed almost entirely of glycerol, whereas glycerines of vegetable origin always contained varying amounts of trimethylene glycol. The new method of Fachini and Somazzi should thus prove highly serviceable in determining the origin of a glycerine. The Italian War Ministry has taken a great interest in the work.

SOCIETY OF PUBLIC ANALYSTS.

AT the ordinary meeting held at the Chemical Society's Rooms, Burlington House, on Wednesday, December 5, 1923—Mr. P. A. Ellis Richards, President, in the chair—certificates were read for the first time in favour of F. Knowles, A. Knox, C. R. Middleton, H. R. Read, G. Hogan, and T. F. Doyle. Certificates were read for the second time in favour of:—R. C. Frederick, and H. T. S. Britton.

The following were elected members of the Society:—L. E. Campbell, J. T. Hannen, C. L. Hinton, D. W. Kent-Jones, T. W. A. Shaw, W. H. Simmons, K. E. N. Williams, and P. N. Williams.

The Crystalline Bromides of Linseed Oil.

In a paper read by Harold Toms, M.Sc., A.I.C., on this subject, it was stated that the "insoluble bromide" of linseed oil, first described by Hehner and Mitchell, appears to consist of mixtures in varying proportions of two crystalline bromides—viz.: (1) a linolic-dilinolenic bromo-glyceride; and (2) the trilinolic bromo-glyceride or the oleic-linolic-linolenic bromo-glyceride. These two bromo-glycerides have been obtained in pure condition by crystallisation from ethyl acetate. They melt at 153° C. (corr.) and 117° C. (corr.), respectively. The solubility of the more insoluble bromide in ethyl acetate lies between 0.15 and 0.20 grammes per 100 c.c. at 15° to 20° C. The methods of estimating the bromine in these compounds have been studied, and it is shown that theoretical results can be obtained by the method of Carius and by a modification of the method of Stephanow, but not by the lime method. Various methods of estimating the more insoluble crystalline bromides are described, the yields of the purest product varying from 9.39 to 11.6 per cent. in the case of different oils. The results obtained suggest that there is some relationship between the yield of this crystalline bromide and the iodine value of the original oil.

A Plea for Standardisation.

M. S. Salamon, M.Sc., speaking on standardisation, emphasised the fact that in every field of analytical chemistry instances are continually occurring where different, although well-recognised methods of analysis yield varying results. He referred in particular to the case of dried milks, and instanced one example where one sample of dried milk was sent to four well-known analysts and a considerable divergence of figures resulted according to the methods used, particularly in the case of the fat and lactose estimations.

Referring next to essential oils, the need for standardisation seem to be urgent, for in many cases minute modifications in detail cause substantial differences in results. The same remarks apply to the case of inorganic materials of simpler composition, and the author saw a recognition of the difficulties in the details laid down for analyses under the Fertilisers and Feeding Stuffs Act, and he strongly advocated the formation of a Committee to consider the whole question.

The Volumetric Estimation of Chromium.

H. T. S. Britton, M.Sc., F.I.C., in a note on this subject, discussed the gravimetric methods of estimating chromium as oxide. Whatever precautions are taken to use only the purest reagents and salts and platinum crucibles, the ignited oxide is always found to contain some chromate. Hence, such methods lead to high results. It has been found that chromium can be quickly and accurately estimated volumetrically. The procedure is to add to an approximately neutral solution of a chromium salt an excess of sodium peroxide—about a gramme—and boil for ten minutes to complete the oxidation to chromate and to decompose the unused peroxide. After acidification with either sulphuric or hydrochloric acid, excess of potassium iodide is added and the liberated iodine titrated in the usual way.

Estimation of Lead in Cream of Tartar.

Mr. R. L. Andrews, who discussed this subject, stated that during 1921-22 all importations of cream of tartar to New Zealand were examined for lead, and the following colourimetric method was found to give concordant results and to be less cumbersome than the B.P. method. One c.c. of 5 per cent. potassium-cyanide solution, 1 c.c. of ammonia, and 40 c.c. of water are added to 2 grammes of cream of tartar, and solution effected by warming and shaking. After cooling and filtering, any tint is matched in the standards by the addition of very dilute caramel. These standards are prepared in a similar way from 2 grammes of lead free from cream of tartar, with the addition of requisite amounts of lead-nitrate solution containing 0.01 per cent. of lead. A few drops of 10 per cent. sodium-sulphide solution are added, and the solutions are all made up to the mark and the amount of lead estimated by comparison. If a standard water solution of lead is used a serious error is introduced as the colour is only about half the depth of that produced with a tartrate solution.

THE LATE MR. J. M. WILKIE

A WELL-KNOWN ANALYTICAL CHEMIST.

IN our last issue we referred briefly to the sudden death, on November 29, of Mr. J. M. Wilkie, chairman of the Nottingham Section of the Society of Chemical Industry. The following biographical details concerning the late Mr. Wilkie are published in the December 7 issue of the *Journal* of the Society:

John Matthew Wilkie was born at Montrose in 1876, and was educated as a pharmaceutical chemist. After passing his minor in Edinburgh he came to Derby as assistant to Mr. Frost, a high-class pharmacist of the old school. Later he went to London, and in 1900 was appointed as an assistant analyst in the laboratory of Boots Pure Drug Co., where he remained till his death. For many years past he was the deputy chief analyst, and was largely responsible for the work of the laboratory. By indomitable energy and by studying after a hard day's work he took the B.Sc. degree of the London University and the Associateship of the Institute of Chemistry by examination, taking the Fellowship in due course.

Mr. Wilkie was always a keen investigator and numerous methods are known by his name. Perhaps the best known of his researches are the paper on the estimation of small quantities of lead, published with Mr. Harvey, the silver methods for the determination of phosphoric acid and the alkaline iodine oxidation of phenols. He also devised a most ingenious method for the estimation of sulphur and oxidised sulphur compounds, which depended on the formation of acid by the bromine oxidation, but this research has only been published in abstract. These sulphur oxidation methods have, however, been in use at Boots' laboratory for some years with most satisfactory results. The last four years of his life was devoted to an almost monumental research on the determination of minimal quantities of arsenic. The late Mr. Wilkie was always a keen supporter of the Society, and as secretary to the Nottingham Section from 1914 to the present year he was largely responsible for the success of that Section and the great increase in the membership.

ELECTROLYTIC OXYGEN AND HYDROGEN.

FEATURES OF THE KNOWLES PATENT PLANT.

FOR many years, the attention of numerous inventors on the Continent, in America, and to a lesser degree, in this country, has been devoted to evolving an efficient type of electrolytic oxygen and hydrogen producing plant, and the patents covering this subject are very numerous. The majority of the new types suggested have never been carried beyond the experimental stage, and very few of those manufactured on a commercial scale have been entirely satisfactory in practice and stood the test of time. The reason for so many failures may be traced in the majority of cases to a fundamental lack of knowledge of the essentials of a satisfactory electrolytic cell. These may be briefly summarised as follows:—(*a*) simplicity, (*b*) low or moderate cost, (*c*) high efficiency, (*d*) safety in operation, (*e*) durability, (*f*) generation of pure gases, (*g*) flexibility.

Battery of Knowles Cells at the Erith Oil Works.

Among those plants that have evolved from the experimental to the commercial stage may be mentioned, the Knowles patent plant (made by the International Electrolytic Plant Co., Ltd., City Electricity Works, New Crane Street, Chester), which has had its practical efficiency demonstrated clearly. Plants on this system, the outcome of a large amount of experimental work carried on over a long period combined with over thirty year's practical experience, have been installed in this country and abroad of an aggregate capacity of over 100 million cubic feet of hydrogen per annum, and have been operating for a number of years safely at high efficiency and very low upkeep charges.

General Design of the Multipolar Cell.

The cell consists of a tank containing the electrolyte, in which are suspended alternately anodes and cathodes, each covered by a collecting bell. Alternate plates in each cell are connected in parallel, and copper links at both ends of the cell couple each set of electrodes in series with those of opposite polarity in the cells at both ends. The number of cells employed is controlled by the supply voltage and the number of bells per cell by the current necessary with this voltage to produce the output of gas required. Asbestos diaphragms separate the electrodes and effectually prevent mixing of the gases. Each electrode and collecting bell is a complete unit in itself, but all the bells in one cell are rigidly connected together, and may be lifted from the cell, complete with connections, in one operation.

Current is led to the electrode plates by staggered bolts with terminals on the tops of the bells. Oxygen and hydrogen are carried off from the bells by two pipes, one for each gas, running across the top of the cells, and these in turn connect with common offtake pipes for each bank of cells. The gas evolved by the cells carries with it a certain amount of electrolyte in the form of a fine spray. This is collected in the offtake pipes which are of a special form to assist in returning it to the cells. Each bank of cells is supplied with distilled water by a feed tank placed at the end of the row, and the distilled water flows to the cells by gravity. The inlet to the feed tank is controlled by a ball valve so that the level of the electrolyte remains constant, independent of the quantity of gas being evolved. The electrolyte consists of a 15 per cent. solution of the highest quality caustic soda in pure distilled water. Once a solution of the right strength is made up, the only addition required is distilled water. It is, however, of the utmost importance that this shall be absolutely pure, as the durability of the cells is very largely dependent on the quality of the water supplied to them.

A dominant factor in the Knowles cell is its simplicity of construction. All the bells are welded together to form one solid block, and by simply disconnecting the offtake pipes and electrical connections, they may be lifted from the tank with the electrodes for inspection, adjustment or overhauling, or by simply unscrewing the nuts forming the terminals of the electrode bolts, the electrodes and insulators are readily accessible for examination or replacement.

Durability and Efficiency.

Apart from the asbestos diaphragms, the only materials entering into the construction of the cell are steel, ebonite, and copper. Both the steel and ebonite are of special quality, and the asbestos cloth used for the diaphragms is specially chosen for its durability and requires renewal at very infrequent intervals, its average life being 6 years. In all electrolytic cells, the anodes are more liable to corrosion than any other part, and some makers admit that their

anodes are gradually eaten away and have to be renewed periodically. By specially treating the anodes in the Knowles cell, corrosive action is eliminated, and plates examined after 5 years continuous operation are stated to show no signs of wear.

Several distinctive features in the design of the cell contribute to its efficiency. All electrical connections are calculated to run at a low current density and the volt drop over them thereby reduced to a minimum. There are no current-carrying joints subjected to the action of the electrolyte to corrode and set up a high resistance in the electrical circuit. Each electrode has its current leading-in bolts solid welded to it and the leads are staggered and connected in such a manner as to ensure an equal distribution of current, and consequent evolution of gas over the whole surface of the electrodes. The asbestos diaphragm is of a special texture to permit complete saturation by the electrolyte and thus to minimise its electrical resistance. The electrodes, off-take pipes and feed water pipes are insulated in a thoroughly effective manner, ensuring that the whole of the current applied to the cells is utilised in electrolysing the water. Further, to guard against leakage of current, every cell is mounted on porcelain insulators.

Purity of Gases Produced.

The gases are generated under a fixed pressure which is kept constant by the unvarying height of the electrolyte in the cell. If for any reason whatever the pressure in the gas bells increases beyond a predetermined limit, the seal formed by the electrolyte round the tubes carrying the leading-in bolts is broken and the gases are released to atmosphere before any mixing can take place. As an additional precaution, two safety tubes, one for each gas, are fitted in each cell. It must not be assumed that the plant does not require reasonable and systematic attention to guard against unforseen contingencies, and no claim is made that it may be safely run without attention, but it is claimed that it is safer and more fool proof than the majority of electrolytic plants in operation to-day.

The exceptionally high purity of the gases produced by the Knowles cell is largely due to the low depth of the electrodes and the large volume of electrolyte between them. Knowles generators are guaranteed to produce gases of a minimum purity of oxygen 99 per cent. and hydrogen 99.5 per cent. Prolonged tests on cells are, however, stated by the makers to show an average purity of oxygen 99.5 per cent. and hydrogen 99.8 per cent. Where higher purities are required, special purifying plant, as described below, can be installed.

Where cost of current is relatively low, the generating plant can be run above the normal amperage, the increased production per hour thus realised giving the requisite gas capacity with a small number of cells. Here the lower current cost justifies the slightly lower electrical efficiency. Where the price of current is high, it will be advantageous to use a current of less than normal amperage, thus taking advantage of the higher electrical efficiency. But a larger plant will be needed to give the gas capacity sought. Tests carried out over long periods show it is claimed that Knowles cells can be run at the maximum output without damage to the plant and at no increased cost for upkeep.

Purifying Plant.

The gases evolved by the cells are sufficiently pure without further treatment for welding and cutting work, but in a number of special cases it is essential that the oxygen or hydrogen, as the case may be, should be practically 100 per cent. pure, and to attain this, special plant must be installed. The Knowles plant has been designed to meet cases of this description, and a number are now working in connection with oil hardening processes in various parts of the world.

Before the gas is passed through the purifiers, it is essential that any traces of electrolyte which have not been returned to the cells, either by the sloping off-take pipes or with the feed water, should be washed from the gas. To accomplish this, the gas is passed through scrubbers packed with hard coke, and in its ascent is washed by a descending stream of water. The number and size of the washers depends on the quantity of gas per hour being purified, but they are always of ample size to ensure a low gas velocity, and the entire elimination of the last traces of electrolyte.

The Knowles Patent Furnace.

The hydrogen or oxygen is passed through the furnace over a heated catalyst, and the impurity consisting of a very small percentage of the other gas is ignited to form water vapour. The furnace is designed on a reverse current system, so that the hot gas leaving it heats up the cold incoming gas. Due to the large surface area of the catalyst and the low velocity at which the gas passes through it, the impurity is almost completely ignited and the gas on leaving the furnace is 99.98 percent. to 100 per cent. pure. The action is started and maintained by means of an electrically-heated resistance secured on the inside of the furnace cover, the temperature being controlled by a variable rheostat and indicating pyrometer on the switchboard. Slag wool is packed between the furnace and outer case to conserve the heat evolved and render the action largely self-supporting, the current used being negligible.

The constructional details of the Knowles furnace are shown in the accompanying diagram (Figure 4). Gas enters the furnace at A and rises into the chamber B where it is deflected by the baffle plate C, and flows at a much decreased

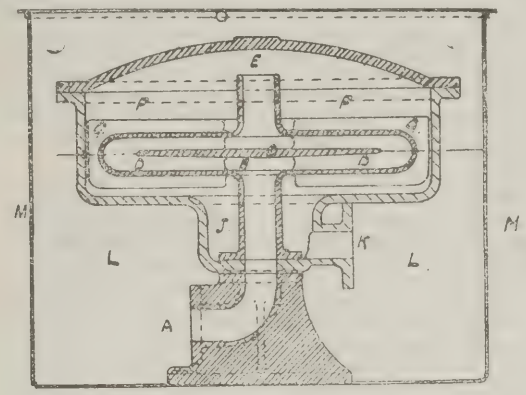

Fig 4.

velocity between a series of radial ribs DD over the edge of C, and through more ribs into the top chamber of the furnace at E. Here it is heated by an electrical resistance and passes down through the catalyst FF into the outer chamber GG. By means of more ribs, the flow is directed radially over the periphery of the inner chamber back to the centre at J, and away through the outlet pipe at K. A large number of heat units in the purified gas are transferred to the incoming gas through the ribs and the walls of DD. The whole furnace is placed in an outer case MM, lagged with slag wool LL. The catalyst is practically everlasting and retains its efficiency, providing that none but thoroughly washed gas is passed through it. In the event of carelessness, the catalyst only requires washing with distilled water to recover its efficiency.

Before and after the furnace, the gas passes through water seals to ensure that the effects of a possible explosion due to careless handling, shall not reach either the washers, cells or coolers. Any increase of gas pressure in the furnace immediately breaks the water seals and releases the gas to atmosphere before it can enter the pipe lines connecting the seals to the washers or coolers. A feature of these seals is that after they have once been filled with water, the level is maintained by water formed in the furnace, and separated from the gas in the coolers. The water flows by gravity through the two seals in series. The coolers are of the usual pattern, consisting of tubes welded into tube plates at both ends.

Description of Knowles Plant at Erith Oil Works.

The first plant to be built under the Knowles patents was erected at Bromborough, Port Sunlight, for the supply of hydrogen to Lever Bros., Ltd., for oil hardening. This plant consisted of 200 cells in series, each designed to carry a current of 2,200 ampères, but on completion it was found to be capable of running economically up to 3,000 ampères.

The most recent plant erected is one at Erith for the Erith Oil Works, Ltd., and is particularly interesting as, although not the largest battery constructed under the Knowles patents, the size and conditions are such that the layout includes every detail necessary for plants of the largest capacity. The plant is intended to run normally at 2,000 ampères, but is guaranteed capable of running continuously at 3,000 ampères. The capacity of the cells in the two installations is therefore the same, and the improvement in

design (all the original features being retained) is indicated by the fact that the cells at Erith have only 14 electrodes in each, against 42 in the original cells at Bromborough. In other words, the floor space had been reduced to one-third, and as this has been done without increasing materially the current density on the electrodes, the extraordinary life of the electrodes realised with the original plants has not been jeopardised in any way in the later design. The question is often asked whether the plant can be installed on an upper floor. The Erith plant is so placed, as were earlier plants at Durban and Sydney. The weight in running order is moderate, and involves no unusual floor construction.

Buildings and Electric Supply.

The plant is installed in two rooms on an upper floor of a two-storey building. This is of ferro-concrete with ferro-concrete floor. One room contains the battery, distilling plant, distilled water storage tank and the automatic feed tanks. This room has a floor space of about 2,700 sq. feet, which provides ample gangways and spare floor space on which to deal with cells during overhaul. The adjoining room has a floor area of about 1,300 sq. feet, and accommodates the switchboard, gas boosters and governors for both gases, washer traps, meters and test boards for both gases, also purifying plant for the oxygen and three compressors for hydrogen.

The supply of electricity is obtained from the works power station situated at some little distance from the battery room. No separate generating plant has been installed for the electrolytic plant and the voltage of 210 to 220 D.C., which is common to the whole works, cannot therefore be varied. Provision has, however, been made for cutting out cells when it is desired to run the battery at maximum output. The cables from the power station feed the battery through a main incoming supply panel and battery panel on the switchboard in the auxiliary plant room. Paper insulated lead covered cables run between the switchboard and the positive and negative busbars on the battery at opposite sides of the cell room.

Production Efficiency and Purity of the Gases.

The 104 cells are arranged in eight rows of thirteen each, while two spare cells are provided so that overhauling may be carried out without reducing the capacity of the plant. The wood benches supporting the cells carry steam pipes to maintain the temperature of the cells when the battery is temporarily shut down or run at outputs lower than normal.

An important new feature in this plant is the automatic feed to the cells, the water for which is first used for washing the outgoing gases, thus eliminating practically the only source of loss of electrolyte. The chief advantages, however, of the automatic feed are the great reduction in labour required to run the plant and the certainty that the level of the electrolyte will remain constant under all conditions.

The guaranteed production of the battery was 7.22 cubic feet of hydrogen and 3.61 cubic feet of oxygen per KWH at a current of 2,000 amperes, equivalent to a voltage of 2.25 per cell, and 6.5 cubic feet of hydrogen and 3.25 cubic feet of oxygen per KWH at 3,000 amperes, equivalent to 2.5 volts per cell. The actual results obtained on test were 5 per cent. to 8 per cent. better than the guarantees. Hydrogen direct from the cells was guaranteed to be 99.5 per cent. pure and oxygen 99 per cent. pure. Since the plant was first started, the hydrogen has been consistently 100 per cent. pure and the oxygen almost continually 99.6 to 99.8 per cent. pure.

A double distilling plant is installed on the gallery at the end of the cell room to ensure a supply of perfectly pure distilled water to the cells. The purity of this water is indicated on an instrument on the main switchboard so that any variation in the quality is immediately noted by the attendant in charge. Special attention has been paid to effectively insulating the gas offtake pipes both on the inlet to and outlet from the automatic feed washing tanks. Oxygen and hydrogen gas bus mains, which collect the gas from each bank of cells, run across the top of the cell room under the gallery and carry the gases to the auxiliary plant room.

Auxiliary Plant.

A positive type booster driven through gearing by a motor has been installed for raising the pressure of the hydrogen. From the booster, the hydrogen passes through a special safety seal and gas meter to the gasometer situated at some distance from the plant building. The oxygen pressure is similarly raised by means of a motor driven centrifugal booster, also equipped with a governing gas holder. After leaving the booster, the oxygen is washed in a coke scrubber to remove any traces of electrolyte that may still remain in the gas, and then passes through a special seal to the purifying furnace. The reverse current system, by which the hot gas leaving the furnace heats up the cold incoming gas, renders the action practically self-supporting once it has been started. The gas is next cooled to about atmospheric temperature in a combined tubular cooler and water seal, and is finally metered before entering the pipe line to the gasholder.

A small auxiliary panel mounted apart from the main switchboard is equipped with oxygen and hydrogen gas testing sets and a special multiple arm water pressure gauge. By means of a number of small pipes run to this panel from various points on both oxygen and hydrogen gas mains, the gas purities before and after the boosters, before and after the furnace, etc., may very conveniently be tested. These gas test pipes are permanently coupled to the multiple arm water gauge already mentioned, enabling the attendant to see at a glance whether undue pressure is occurring at any point in the installation.

THE NEW PARLIAMENT.

REPRESENTATION OF CHEMICAL AND ALLIED INTERESTS.

ALTHOUGH many well-known figures in the chemical and allied industries have not been successful in securing election or re-election to the present Parliament, yet the successful candidates embrace within their numbers representatives of almost every branch of the industries. The victory of Sir Sydney H. Henn, the chairman of Lankshear, Wickstead and Co., tartaric acid manufacturers, as one of the members for Blackburn, which seat he also held in the last Parliament, should lend appreciable weight to the support chemical interests will receive in the new House of Commons.

The explosives industries will receive representation in the person of Colonel J. W. Weston, who was returned as the unopposed Unionist member for Westmoreland. Colonel Weston is a director of W. H. Wakefield and Co., explosives manufacturers, Kendal, and of Nobel Industries, Ltd. Sir Leonard Lyle, managing director of Tate and Lyle, Ltd., sugar refiners of Silvertown and Liverpool, who was an unsuccessful candidate last year has now secured a seat in the House as the Unionist representative for Epping.

Sir William Alexander, A New M.P.

The choice of Brigadier-General Sir William Alexander by the electors of Central Glasgow means that one of the greatest leaders of our chemical industry will be in a position to voice his views in the auditorium, where they should command most attention. We need hardly recall to our readers that in addition to his other activities Sir William is the managing director of Charles Tennant and Co., Ltd., Glasgow, and of the British Dyestuffs Corporation. The re-election of Dr. G. C. Clayton as the Unionist member for Widnes is a matter upon which the whole chemical industry has reason to congratulate itself. During the short life of the last Parliament, Dr. Clayton proved convincingly his worth as a skilful marshaller of telling fact and as a speaker of no mean ability. Mr. H. Hogbin, who unsuccessfully contested North Battersea in the Liberal interests last year, has now reversed the situation and defeated the Labour candidate by a narrow majority. Mr. Hogbin is a member of the firm of Lawe's Chemical Manure Company. Lieut.-Colonel K. Vaughan-Morgan, a director of the Morgan Crucible Company, has succeeded in securing re-election for East Fulham in the Conservative cause. Among the other members of the new House may be mentioned Sir Robert Bird (U., West Wolverhampton), the head of the well-known business, founded by his father; Major A. G. Church (lab., East Leyton), the General Secretary of the National Union of Scientific Workers; Mr. E. D. Simon (L., Withington), an ex-Lord Mayor of Manchester, and member of the well-known chemical engineering firm Simon-Carves, Ltd.; Sir John Brunner (L., Southport), a director of Brunner, Mond and Co.; and Sir Thomas Robinson (L., Stretford), a director of the Bradford Dyers' Association.

THE INSTITUTE OF CHEMISTRY.

DISTINGUISHED GATHERING AT ANNIVERSARY DINNER.

THE forty-sixth anniversary of the Institute of Chemistry was celebrated on Monday, December 10, when a dinner was held at the Hotel Victoria, London. Mr. A. Chaston Chapman, F.R.S., the President of the Institute, presided over a very distinguished gathering, which included Viscount Haldane, Viscount Milner, Viscount Burnham, Lord Clinton, Sir Charles Sherrington, Sir Herbert Jackson, Professor J. Millar-Thomson, Sir John Anderson (Home Office), Sir William Duke (Indian Office), Sir Sidney Chapman (Board of Trade), Sir Bertram Cubitt (War Office), Sir L. Amherst Selby-Bigge (Board of Education), Sir Daniel Hall (Ministry of Agriculture and Fisheries), Sir Arthur Robinson (Ministry of Health), Sir Frank Heath (Dept. of Scientific and Industrial Research), Sir Malcolm Delevingne (Home Office), Captain J. C. W. Henley, Lieut.-General Sir Noel Birch, Air Vice-Marshal Sir W. G. H. Salmond, Dean Inge, Dr. Alexander Russell, Mr. E. H. Moritz, Sir Charles Morgan, Professor E. C. C. Baly, Sir Joseph Petavel, Sir William Willcox, Sir Humphrey Rolleston, Sir William Pope, Colonel Sir Edward Brotherton, Lord Justice Sargant, Sir John Brunner, Sir Robert Hadfield, Sir Robert Robertson, Major A. Boyd-Carpenter, Professor F. G. Donnan, Professor Brönsted (Copenhagen), Dr. Ernest Barker, Sir Richard Redmayne, Sir Thomas Holland, Mr. R. C. Nesbitt, Sir John Dewrance, Mr. P. A. Ellis-Richards, Professor G. T. Morgan, Mr. W. Marshall, Mr. G. Keville-Davis, Mr. E. R. Bolton, Mr. P. H. Kirkaldy, Professor Arthur Smithells, Mr. W. Macnab, Professor J. C. Philip, Dr. T. Slater Price, Mr. G. Rudd Thompson, and many other distinguished members of the profession. There were also many ladies present.

Viscount Haldane on the Development of Science.

Viscount Haldane, K.T., O.M., F.R.S., proposed the toast of "The Institute of Chemistry of Great Britain and Ireland." There had, he said, been controversies about tariffs, but there was one thing that went far deeper, and that was the growth and prosperity of the British nation, which depended much more upon science and organisation than upon controversies which, however important they might seem, were bound to be ephemeral. The production of young men of science in this country had gone on with extraordinary vigour, and there was an extraordinary amount of new science in the country, but we had to take warning. If we did not develop science to the utmost, and, above all, see to its application to industry, we should fall far behind. The problem of the future was to see that more science was applied to industry, and that its application was organised in the best way.

The Chairman, responding, said the Institute was formed in 1877 for the purpose of formulating a scheme of training for professional chemists, and of instituting examinational tests whereby the proficiency of persons to practise chemistry could adequately be determined. Although not exempt from infantile troubles, the Institute made steady headway, and in 1885 it was granted a Royal Charter, in virtue of which it was authorised to examine, to grant certificates of competency, and to register persons qualified. To-day, there were on the Register 1,615 Fellows, 2,714 Associates, and 862 registered Students, totalling 5,191. One of the chief aims of the Institute was not only to maintain its very high standard, both in respect of the training it demanded of those who applied for admission to its examinations and in the character of the examinations themselves, but also to secure a high standard of conduct on the part of all its members.

The Post-war Decline in the Recognition of the Chemist.

He would not say that during the war the Institute was actually discovered, but, for the first time, the nature of its activities and its great usefulness was widely recognised; the Institute was the chief mobilising agency for all purposes in which chemistry was concerned, not only in relation to the active forces for offence and defence, but also in connection with the no less important matter of the production of munitions and other materials of war. Notwithstanding all this, could it be said that since the termination of the war the influence of chemists as a body had increased? He believed not, but rather the reverse. He asked the many distinguished guests present to do what they could to increase, in the interests of the nation, the general knowledge and better understanding of the services which chemistry was ever rendering to the community.

Professor Arthur Smithells, proposing "The Houses of Parliament," said that in addressing such a distinguished assembly of guests representing a great variety of institutions—not only the House of Legislature, but the Church, Army, Navy, Air Force, Civil Service, the Press, and other interests—it was impossible for a chemist not to feel conscious of the neglect which his science suffered at their hands, and to attempt to pronounce to each in turn a suitable homily on the importance of chemistry. It was eminently desirable that science should be more diffused amongst those who had to enact the laws of this country. He paid a tribute to Viscount Haldane and Mr. Robert C. Nesbitt, M.P., whose names he coupled with the toast.

Viscount Haldane replied on behalf of the House of Lords. Mr. Robert C. Nesbitt, M.P., responded for the House of Commons.

Chemistry and "The Forces."

Sir Robert Robertson proposed "The Forces." He emphasised the need for constant review by the Services of the chemical products of the country, not only at home, but Imperial and foreign, from the point of view of seeing that this country was well provided in respect of them. He coupled with the toast the names of Captain Henley (Director of Naval Ordnance), Lieut.-General Sir Noel Birch (Master-General of the Ordnance), and Air Vice-Marshal Sir W. G. H. Salmond. Captain J. C. W. Henley, R.N., responded for the Navy. Hitherto, perhaps, he said, they had failed to appreciate fully the value of science and research, but they had learned their lesson, and the policy of the Navy was now to encourage and to benefit by science and research to the very utmost. Lieut.-General Sir Noel Birch, K.C.B., K.C.M.G., for the Army, said no one would contradict the statement that the chemists saved this country from defeat in the Great War. As Master-General of the Ordnance, he would always do his best to get as much money as he possibly could applied to research. Vice-Marshal Sir W. G. H. Salmond, K.C.M.G., C.B., D.S.O., referred to the dependence of the Royal Air Force upon chemistry.

Science in Education and in Industry.

Sir Herbert Jackson, proposing "The Civil Service," referred to the cordial relations which had existed between the Institute of Chemistry and the various Government Departments with which it had come into contact. Sir L. Amherst Selby-Bigge, Bart., K.C.B. (Permanent Secretary, Board of Education), responding, said the Institute had, with admirable public spirit and considerable practical wisdom, been willing to take a responsible share in solving the problem which was always before the Board of Education—of getting better value for the public money spent on education. He believed the Institute and the Board were in agreement in believing that at the root of the application of science to industry there lay as an absolute essential a good general education, unprejudiced by premature specialisation. We had made a beginning in the last few years of that close co-operation which ought to exist between Government Departments and the great professional and scientific institutes of the country, and he saw no reason why it should not go further.

Viscount Burnham proposed the toast of "Science in Industry." There were, he said, no more convinced believers in technical education based on general knowledge than the enlightened captains of our industries to-day. Science had saved its cost in money a hundredfold. No works could be efficient or progressive without a works chemist; he knew what the works chemist meant in paper mills. Schopenhauer had said "Philosophy never saved me a sixpence," but he (Lord Burnham) could say unhesitatingly that science saved us all even more than we could possibly get from the Capital Levy. Sir John F. L. Brunner, Bart., M.P., responding, agreed that we were improving in the matter of the application of science to industry. The reason why the heads of businesses had hesitated in the past to engage highly trained chemists was because they would not have known what to do with him when they had got him. Having been elected a member of Parliament, he hoped to be of use to the profession.

Sir William Pope proposed the final toast, "The Guests," and said that the Institute was fortunate in being able to welcome such a distinguished list of guests. It was a very welcome sign that a chemical gathering should be able to collect together so many distinguished men, who had been in the forefront of the activities of the Empire during the last fifty years, and who had identified themselves with the "organism" of the British Empire. The toast was responded to by Dean Inge and Lord Justice Sargant.

THE THEORY OF THE FILTER PRESS.*

CONDITIONS FOR CONSTANT RATE OF FLOW.

In working a filter press there are, in general, four different methods of extracting the solid material from the filtrate —viz., (1) the constant-pressure method in which the pressure on the cake is kept constant during the run, and filtration is stopped when the volume of liquid delivered is too small; (2) the constant-rate method, in which the volume of liquid delivered is maintained constant by gradually increasing the pressure during the run until the maximum pressure is reached; and (3) and (4) methods with and without filter aids; in the former case, filter aids such as diatomaceous earth, etc., are used where the sludge is slimy and compressible. The paper describes some work done in the Practice School of the Imperial College, London, to investigate the applicability of an equation developed by Dr. W. K Lewis on a Sweetland press filtering "defecated" sugars and syrups at a constant rate of flow, using kieselguhr as a filter aid. The Lewis equation appears in a book by W. H. Walker, W. K. Lewis, and W. H. McAdams, "Principles of Chemical Engineering," published by the McGraw-Hill Co. in 1923.

The details of the equation are given in the paper, but they are too lengthy to be given in full. The authors' account of their experimental work, however, makes the position clear.

The work, as already stated, was done on some Sweetland filter presses at a sugar refinery. The sugar and syrup liquors are sent to "blow-ups" or defecators, where they are brought to the correct degree of blueness (litmus paper) by adding either lime or acid calcium phosphate. This brings down calcium phosphate, albuminous, and gummy materials, which have to be filtered off. The sugar liquors receive fresh kieselguhr as a filter aid, but the syrups use reclaimed sludge —which consists of used kieselguhr from the sugar presses— from a sludge-settling tank. The normal operation of the syrup press was to give the cloth a pre-coat of kieselguhr by running sugar through it for ten minuates, when the sugar was emptied out and the filter refilled with syrup from the blow-ups by gravity. This was then filtered for 90 minutes, gradually increasing the pressure to approximate to a constant-rate run.

Effect of Pre-coat of Kieselguhr.

Work done by previous groups on the same filters showed that the compression of the sludge was an irreversible effect— *i.e.*, on releasing the pressure the sludge does not return to its original porous state, so that in working a press at constant rate the pressure must be kept well in control. Previous work also showed that if clear solutions of syrup— which have been previously filtered free from suspended matter—were pumped through the press, the pressure rose with time, and that when coming down from a high rate to a low rate the pressure required for the low rate was much greater than that previously used. This shows that a very small amount of suspended matter is liable to clog up the holes of the filter cloth and act as a large resistance to the flow of the liquid through it. This principle is recognised in the case of the syrup liquors by giving the cloth a pre-coat of kieselguhr by means of the sugar liquor already referred to

Operation of the Experimental Sweetland Press.

In order to obtain data, one leaf, on which the cloth was fairly new, was chosen, instead of the whole filter press of 72 leaves. A hose was attached to the sight-glass coupling, and this was the source of the filtrate. The over-all pressure on the press was read by a mercury manometer up to 20lb. gauge, and by a calibrated steam gauge from 12lb. to the maximum. Pressure adjustment was obtained by means of a hand-valve in the feed line. The press was filled with syrup from the blow-up tank by gravity, so as not to disturb the kieselguhr pre-coat left by the sugar, and when full the gravity line was closed and the pump line opened. The effluent was measured in two ways. A rate was obtained at frequent intervals either by filling a graduated cylinder or by filling a calibrated beaker which rested on a scale pan, the time being measured in each case by a stop-watch. The integration of these rate data should give the total effluent, and this figure was checked by weighing the total effluent in pails. Constancy of flow was obtained by the use of a specially constructed rectangular weir. The hose from the leaf was led into the back compartment of this weir, and the liquor flowed out through a very narrow slit in front.

Lewis's Formula and Press Resistance.

The form of curves obtained for the constant rate should give a straight line according to theory, which, however, they by no means did, and this tended to show that the formula of Lewis would not apply to constant-rate filtration. This formula, however, was designed to disregard press resistance, and, therefore, the press resistance of the initial pre-coat of filter-aid deposited by the sugar solution must be considerable. The authors show, however, that press resistance must be taken into account, that it can be raised considerably by pumping more or less clear liquor through it, and that it can be modified by giving it a pre-coat of kieselguhr. These facts, they allege, indicate that more attention should be paid in investigations to the initial clogging up of the filter-cloth pores by the precipitate. One of the chief objects of dealing with the problem of filtration in the manner indicated in the paper was to obtain a table of values for the specific resistance for all kinds of materials, and also to ascertain in what way various changes in operation and in method of preparation can affect its value. In this way, it should be possible to design a filter press from a known constant of the substance to be filtered.

Cloth Resistance in the Ordinary Filter Press.

Mr. A. E. Alliott, opening a short discussion, said that in the ordinary filter press the conditions were hardly constant pressure, and there was hardly a constant rate of flow. The filtering began with a constant rate of flow and ended with a considerable period of constant pressure. As regards the scouring effect, in some cases that was very noticeable. He himself had observed that with such a simple cake as calcium carbonate, the finer particles were precipitated and, if filtering went on for a sufficiently long time, seemed to get washed forward to the filter cloth, and the resistance was gradually increased, due to the scouring of the cake by the velocity of the liquid passing through it. He had also noticed that the pre-coat is of importance. One had to go quite steadily in putting the first layers on to the cloth, or else the whole cycle of the filtration suffered disturbance. In an ordinary filter press he had found that with such a simple cake as calcium carbonate, the cloth resistance is appreciable, and the same applied to certain dyes, in which one would have thought that the resistance of a thickness of the dye, once a fair layer had been put on the cloth, would have swamped the resistance of the cloth. The fact was, however, with a somewhat difficult filtering material, that apparently the initial layer on the cloth presented a higher resistance.

The Value of Formulæ in Filter Press Work.

In the case of the plate and frame or recess type of filter press, one could not simplify the formulæ so much, because one had to bring in the end resistance in completing the cake, but one would probably get near enough in many cases with these formulæ. Personally, he was always very much against taking anything for granted in filtering problems. People were apt to suppose that because their particular precipitate had the same chemical formula as that of somebody else, therefore the filtering qualities would be the same. By doing that, however, one was very apt to get into trouble. Nevertheless, the existence of these formulæ in the paper ought to shorten the ordinary tests, because, having made one or two tests, one would be able to get any value that was required from the formulæ and be reasonably sure that they were sound values. The formulæ should assist considerably in the matter of calculating capital cost and labour cost. The great difficulty is that one has to be certain the stuff that is being filtered is not altering whilst one is waiting about experimenting with it, but that was a thing which could not be managed with a formula.

How a Magnesium-hydroxide Filtration Problem was Solved.

Mr. Donald said he would like to add one more thing to his remarks. Some work was done at Bangor (Maine) in a paper mill. There they had an electrolytic cell for producing chlorine for bleaching the pulp, and the salt used had a considerable amount of magnesium in it and a certain amount of other things. These had to be precipitated out as magnesium hydroxide. It was filtered without any

* Abstract of paper and discussion before the Institution of Chemical Engineers on November 14. By M. B. Donald and R. D. Hunneman. The Paper represents work done in partial fulfilment of the requirements for the degree of Master of Science in Chemical Engineering at the Massachusetts Institute of Technology.

filter aid, but it was found that they were getting very bad results. Not only was it found impossible to filter it out, but they used to break the cloths and got a very muddy filtrate which, once it had got into the cloths, used to cause a lot of trouble. The firm wrote to the filter-cell people, and asked what they could do as regards supplying kieselguhr for improving the product and also increasing the rate of flow. The kieselguhr people, as, perhaps, most firms would, said that a very large amount of kieselguhr was needed for every charge, but the firm worked it out and found that it would not pay them. Some of the students were put on to the problem to find out how the amount of kieselguhr needed could be reduced. It was a Kelly Leaf filter press, and it was found that by putting a pre-coat of kieselguhr—about 5lb.—on to the leaves, they could get a very clear filtrate. When Mr. Donald left the station the press had been going for three weeks and was still giving a clear filtrate, and generally very much better results were being obtained, using this very small amount of kieselguhr. This seemed to point again to the fact that the important factor in filtering has something to do with the initial coating on the filter cloth.

THE CHINA-WOOD OIL TRADE.

IMPORTANCE OF CORRECT SAMPLING.

By Charles V. Bacon (New York).

THE correct sampling of china wood oil is even more important than the accurate analysis of the sample obtained. It is an easier matter properly to analyse wood oil than to secure a representative sample, yet unfortunately, this very important factor is over-looked by the majority of buyers. It is only in recent years, since the system of tanking was installed in the Far East that china wood oil showed any reasonable tendency to uniformity in quality.

Some years ago the writer examined some two thousand individual barrels, alleged to be a uniform shipment. The results of this work disclosed some pure oil, but also some oil adulterated as high as 25 per cent., while there were also found some barrels that contained absolutely no wood oil, but tea-seed, tallow-seed, and peanut oils.

Whilst, as stated above, the tanking of oil has greatly increased the uniformity of arrivals, there are even to-day many deliveries that are not uniform. Recent examination of eighteen individual barrels, all alleged to be uniform, disclosed that only five barrels were pure, two contained an excessive amount of foots and the balance were adulterated from three to eight per cent. There seems to be a very decided tendency in the trade to under sample and improperly sample. This is no doubt occasioned by what may be termed false economy, as sampling, like everything else, takes time and requires certain experience and care. The writer has made it his business to be present on the docks and to observe methods of sampling, and unfortunately has witnessed conditions that are little short of criminal. The so-called sampler proceeds to drive out the bung, rolls a newspaper, sticks it in the bung-hole, tilts the barrels and fills possibly three cans, then he takes another barrel, goes through the same procedure and fills another three cans. These six samples from two different barrels, which may not be the same are then tendered as a representative sample of three or four hundred barrels.

Sampling Oil in Barrels.

If the oil in barrels or drums is to be sampled properly, there are two factors that must be given due consideration; firstly, the sample must be drawn from at least ten per cent. of the packages well distributed; secondly, the method of drawing the sample must be such that material representative of both the top and the bottom is secured. If the oil is liquid, the proper way to do this is by means of a cylindrical glass tube about 1½in. in diameter and sufficiently long to reach the bottom of the barrel. The lower and upper ends are constricted, and underneath the latter there is a brass band holding two rings through which the fingers are inserted. The tube is gradually lowered through the bung-hole until it strikes the bottom of the barrel. The thumb is now used to close the top opening, and prevent the oil from running out of the tube when withdrawn. Samples taken in this manner should be mixed into one large container, and the number of each barrel recorded and stated on the sampling certificate.

During the winter, when the oil is very often in a solid condition, the same procedure should be followed, replacing the glass tube however with a tallow trier, which is essentially a graduated piece of steel tubing semi-circular in form and about 3ft. long. This is pushed into the oil, turned a few times and withdrawn, when it brings out with a solid core of oil. During the last two years a very large amount of china wood oil has been imported from the Orient in bulk; this oil is generally loaded into a deep tank on regular freight-carrying vessels at Shanghai. The quantity varies, ranging from four hundred to a thousand tons.

The Sampling of Bulk Cargoes.

The writer has sampled bulk cargoes in excess of a hundred thousand tons, and in no instance knows of any complaint. The procedure followed is first to draw samples from the top and bottom of both port and starboard sections of the tank. These samples are visually examined and if the general appearance gives indications that the oil is "O.K.," pumping is started and samples are drawn from a bleeder in the discharge line every 30 minutes. These individual samples are mixed to make one uniform sample representative of the entire cargo.

The analysis is generally based on the bleeder sample, although many shippers also have the tank cars into which bulk cargo is to be loaded sampled. This is usually done as an additional precaution, in the event of any dispute arising relative to a specific tank car. It should also be noted that in all instances, the sample drawn shall be of sufficient quantity to enable it to be distributed as the owner of the commodity may direct. If the sample of the goods is delivered to the owner, as covered by instructions, it should also be under seal. In any event all samples should be held intact for a period of three months. If the purchasers of china wood oil will insist upon the aforesaid procedure when they are buying oil, they will better protect their interests and be in a position readily to interpret any differences in analysis.

THE CHLORINATION OF TOLUENE.

EFFECT OF LIGHT ON THE REACTION.

A COMPREHENSIVE study of the photochemical aspects of the reaction between toluene and chlorine has been carried out recently in the Photochemical Laboratories of the Akt.-Ges. für Anilin fabrikation, Berlin, under the guidance of Dr. Ollendorff, the director of the laboratories. The results have just been published in the *Zeitschrift für Elektrochemie* (November, 1923) in a paper by G. Book and J. Eggert. The results of the work may be summarised as follows:

(1) If toluene be chlorinated at a temperature of 105-110° C. in a regular current of chlorine, the fractionation of the resultant product shows that its composition is the same whether the chlorination be carried out in the dark or in ordinary daylight.

(2) If the chlorination as in (1) be carried out in the presence of a chlorine carrier—*e.g.*, ferric chloride, a mixture of ortho- and para- chlorotoluenes is formed, whereas without the carrier, the chlorination product is almost entirely benzyl chloride. At the high temperature employed, however, the presence or absence of ordinary daylight makes no difference to the course of the reaction.

(3) The spontaneous reaction between chlorine upon toluene is very greatly retarded if the reaction mixture be cooled to −80° C. In an experiment at this temperature and in the dark, which was continued over a period of 70 hours, practically no chlorination was found to have occurred.

(4) By suitable illumination of the cooled reaction mixture a distinct acceleration of the speed of reaction is recognisable. This acceleration has been measured and found for the particular light intensity employed to be in accordance with the photochemical equivalent law—namely, twenty-five times the speed of the reaction in the absence of light.

(5) The presence of small quantities of iodine in the system increases the tendency for spontaneous chlorination to occur at the low temperatures employed, and in the absence of light. In the presence of light, however, the presence of the iodine has no apparent effect upon the course of the reaction.

ITEMS OF INTEREST.

Belgian Radium Production.—It is announced that the production of radium from the works at Oelem, Campine, amounts this year to 12½ grammes.

Erratum.—In the article entitled "Concentrated Hydrogen Peroxide," published in our issue of December 7 (page 676), the name of the author should read "J. R. Booer, B.Sc., F.C.S.," and not "J. R. Booer, B.Sc., F.I.C."

Smokeless Fuel.—At a meeting of the Royal Scottish Society of Arts, on Monday, at Edinburgh, Mr. Robert Maclaurin gave a paper on the "Carbonisation of Coal." He pointed out that industrial gas could be produced by the Maclaurin process at a cost of ¾d. a therm.

Commission on Mining Subsidence.—The Royal Commission on Mining Subsidence will meet on Tuesday and Wednesday, December 18 and 19, at 10.30 a.m. each day, at 5, Old Palace Yard, Westminster, to resume their hearing of evidence. The fifth and sixth days of the Commission's public sittings will be January 22 and 23.

Asbestos Factory in Quebec.—One of the important industrial developments in the Province of Quebec is the establishment of a plant for the manufacture of asbestos products. The undertaking is of special interest, because it represents a new venture in the manufacture of asbestos products on a large scale in Canada.

Fatality at Ironworks.—Four men were gassed while engaged on a new gas dry-cleaning plant at the Blaenavon Coal and Iron Co.'s works at Blaenavon yesterday, and one of them, P. Harrington, an employee of Messrs. Fraser and Chalmers, Kent, died. The plant had only just been completed, and was put in commission for the first time yesterday after satisfactory tests.

Gretna Factory for Sale.—The Disposal and Liquidation Commission have decided to realise by public auction at an early date the whole of the real estate of the Government factory at Gretna, and they have appointed Messrs. W. L. Tiffin and Sons and Messrs. W. P. Gibbings and Sons, of Carlisle, joint auctioneers, to conduct the sale, which is expected to be held next spring.

Tariff Notes.—As from November 1, the following revised duties on products exported from Nigeria are in force: palm oil £2. per ton; palm kernel oil, £2. per ton; palm kernels, £1. 2s. 6d. per ton; and ground nuts, 10s. per ton.—The manufacturing tax and corresponding customs surtax on picric powders and other explosive products, excluding smokeless powders have been rescinded with certain conditions, by the Italian Government.

Ship Fumigation Fatality.—A scaler named William Hall was overcome by fumes of sulphur and cyanide, states a Press report, while down a hatch of the ss. Barrymore, berthed in the South Hornby Dock, Liverpool, recently. The Port Sanitary Authority had been fumigating the ship, and when subsequently the forepeak hatch was opened to allow the fumes to clear, Hall, not apprehending the danger, went down the hatch and was rendered unconscious and died later

South African Tariff Proposals.—The South African Board of Trade and Industries recommend that the duties on the following items be withdrawn or rebated:—Salt, under certain conditions; whiting, tin oxide, zinc oxide, copper oxide, cobalt oxide and coloured glazes used in pottery making; dry shellac; wax, turpentine, dyes and tinfoil for polishes; metabisulphite of potash; ammonium oxalate; soya bean oil, citronella oil, oil of mirbane, oxalic acid, oleine, hydrosulphite of soda, naphthalene crystals, perchloride of iron, whiting, zinc and iron oxides, nickel sulphate and fuller's earth for soap making.

Chemical Stocks in Japan.—The Acting British Consul at Osaka reports that stocks of drugs and chemicals, etc., destroyed in Tokyo and Yokohama in the recent earthquake and fire amounted in value to not far short of yen 90,000,000. Stocks of both heavy and fine chemicals in the Osaka district at the time of the disaster were very low, and the present drain on local supplies will cause an acute shortage. Large orders are reported to have already been placed in England and America. Prices at present are very high and there is naturally much activity in the trade. It should be noted however that, if present decisions are maintained, the import duty on chemicals and drugs which took effect from September 17 last, will be re-imposed after March 31 next.

British Coal Output.—The coal output at the mines of Great Britain for the week ended December 1 was 5,719,200 tons, against 5,726,300 tons for the preceding week and 5,573,300 tons for the corresponding week last year.

Change of Address.—As from December 10, the address of Vivian and Sons, Ltd., will be Bartlett House, 9-12, Basinghall Street, E.C. 2. Telegrams: "Vivians, Stock London"; telephone: "London Wall 4650."

Gas Company's War Memorial.—A memorial window to the employees of the South Metropolitan Gas Company who fell in the war, 386 in number, was formally unveiled in Southwark Cathedral on Saturday afternoon last at a service attended by directors, officials, and men of the company and relatives of the fallen.

Imported Dyestuffs in November. — During November, the total number of applications received by the Board of Trade under the Dyestuffs (Import Regulation) Act was 612, of which 485 were from merchants or importers. Of these 433 were granted, 119 referred to British makers of similar products, and 40 referred to Reparation supplies available.

U.S. Commercial Treaty with Germany.—The new commercial treaty between the United States and Germany was signed at Washington on Saturday last, states a Reuter message, by Mr. Hughes, Secretary of State, and Dr. Otto Wiedfeldt, the German Ambassador. This pact, which will take the place of that abrogated during the war, will be prepared for early submission to the Senate for ratification.

Beet Sugar in Suffolk.—Mr. F. H. Keeble Pearson, director of the East Suffolk Development Syndicate, Ltd., speaking at Halesworth, on Tuesday, said the syndicate was erecting a sugar-beet factory at Southwold Harbour in time for next season, and had also acquired the harbour, while a circular railway of about 45 miles in length and embracing about 200,000 acres was in contemplation.

Obituary.—We regret to state that Mr. Frederick Wardle, head of the firm of Rayner and Wardle, tanning material importers, of Leeds, died at his residence in Leeds yesterday, aged 74. He was a past president of Leeds Chamber of Commerce.—We regret to have to record the death, in his 63rd year, of Mr. Alfred Smith, formerly of Messrs. Alfred Smith, Ltd., rubber chemical manufacturers, of Manchester, from which he retired in 1919.

American Company Dividends.—The Texas Gulf Sulphur Corp. has declared an extra dividend of 50 cents and a regular quarterly dividend of 1.50 dollars. E. I. du Pont de Nemours and Co. have declared a quarterly dividend of 2 dollars on the common stock. This is an increase from previous rate of 1.50 dollars quarterly. The American Cyanamid Co. has declared a dividend of 1½ dollars per share on preferred stock, and 1 dollar per share, plus 50 cents extra, on common stock. The National Lead Co. has declared a quarterly dividend of 2 per cent. on its common stock. The Utah Copper Company announces a dividend of 1 dollar per share.

Poisoning Fatality at Liverpool.—The facts of a fatality of a rare kind were investigated by the Wallasey coroner on Monday last. A gang of men were unloading a cargo of iron drums of cyanide on Friday (December 7), when seven of them showed symptoms of poisoning and were taken to the Liscard Hospital. Six of them recovered quickly, but George Edward Jones, aged twenty, died three hours later without recovering consciousness. He was treated by the doctors for poisoning through inhalation, but it was found later that he had excoriations from burns on his arms and knees, and that the poison was absorbed from his clothing through the broken skin.

Chemical Manufacture in Mexico.—According to the U.S. Consul at Vera Cruz, Mexico, a plant for the manufacture of caustic soda, hydrochloric acid, and nitric acid is being established at Orizaba in the State of Vera Cruz. The salt used will be obtained from Salina Cruz and from Yucatan, the high duties prohibiting the use of New Orleans salt. The monthly output of the new factory is stated to be 2½ tons of caustic soda, 4 tons of hydrochloric acid, 3 tons of bleaching powder and considerable quantities of chlorine products. The hydroelectric equipment of 1,200H.P., purchased from the U.S., has already been installed. The capital of the company which is organised under Mexican laws is 300,000 pesos (1 peso = 0.482 dollars), and is under the control of American, Spanish, and Mexican interests. The plant, it is further reported, will not be in operation for six months.

German Bauxite Mining Industry.—It is reported that the bauxite mining industry in Germany is at a standstill. Before the war Germany obtained most of its bauxite from France, importing approximately 38,000 metric tons in 1913. During the war deposits in Upper Hessen were developed. The monthly output was about 1,200 tons, having an aluminium content a little less than that of the French.

Iron Ore Deposits in Lapland. — In 1913 the Swedish Riksdag decided to have a detailed investigation of the iron ore resources in Lapland. This has just been concluded and has proved that the amount is far greater than had been indicated by a previous examination. It is now estimated that 1,500,000,000 tons of iron ore of high quality are available. Over 2,000 samples have been tested for iron, sulphur, and phosphorus contents. As a result of this investigation, it is anticipated that large quantities of non-phosphorus ore of class "A" will be released for export purposes.

Institute of Chemistry Exhibition.—An exhibition has been arranged to take place on Wednesday, December 19, from 6 p.m.—10 p.m., at 30, Russell Square, W.C. 1, under the auspices of the Institute of Chemistry. The following firms have promised to send exhibits: Messrs. British Drug Houses, Evans Adlard, Balston, Ford, Allnut and Son, Becker, Baird and Tatlock, Gallenkamp, Hilger, Brown, Duroglass, Wood Bros., H. K. Lewis' Circulating Library. Apparatus and chemicals of a new and interesting type will be shown. Complete details will be available at the Institute on the day of the Exhibition.

Manufacture of Soda in China.—For nearly forty years the manufacture of soda has been carried on in Japan, and, more recently, factories have been started in China, although, up to the present, no very great degree of success has attended these enterprises. There is reason to suppose, however, that in future those factories favourably situated in the latter country will be able to reckon on a fair measure of success. According to *Finance and Commerce* (Shanghai), the production of soda in China is on the average about 50,000 or 60,000 piculs annually. Considerable quantities are produced in Harbin, Dairen, Suifenho, and other Manchurian towns.

Tasmanian Carbide Production.—The Tasmanian Government has placed a receiver in the works of the Carbide Company of Australia. The company owed the Government £96,854. on June 30 last, while the bill for electric power averages about £850. per month. Liquid assets amount to over £16,000., besides various stocks on hand. Nearly 400 tons of carbide are produced per month, and importations for July amounted to 322 tons. The latter are subject to a variable duty, the lowest amount being £7. 10s. per ton. The company had commenced operations for duplicating the plant so as to be in a position to meet the whole of Australian requirements, but after £10,000. had been spent, the lifting of the embargo, early in the year, resulted in the company being unable to meet foreign competition, and the works were closed for four months. However, production has continued since last July, when work was resumed. About £70,000. Australian and £40,000. London money is represented by the company. If the duplication of the plant was finished, the company officials estimate that the cost of production would be reduced by £5. a ton.

Pulverised Fuel and Efficient Steam Generation.—A paper presented by Mr. David Brownlie, B.Sc., F.C.S., A.I.Mech.E., before the Institution of Electrical Engineers last night (Thursday, December 13), gave a most detailed consideration of the whole question of the application of pulverised fuel to steam generation, more especially from the point of view of the "Lopulco" system for large water tube boilers and the efficient generation of electricity in power stations. Very extensive data were given, part of which has not before been published, relating to the pioneer large pulverised fuel-fired electricity station, the "Lakeside" station of Milwaukee, together also with a description of the River Rouge power plant of the Ford Motor Co. at Dearborn, Detroit, using pulverised fuel and blast-furnace gas, and which the author stated was the most remarkable power plant in the world. For comparison, there were given the figures of the Dalmarnock electricity station, Glasgow, one of the largest and most modern and efficient in Great Britain, of course working with mechanical stokers. The paper contained numerous statistics, figures, diagrams, and illustrations, the slides including 20 views of the Ford plant at Detroit and about a dozen of Lakeside, Milwaukee.

British Lead Mining Industry. — The directors of the Brimsdown Lead Co. state that negotiations for amalgamation with other important firms carrying on business similar to the company's own, referred to at last annual general meeting, have recently made further progress. In these circumstances the directors feel that it would be inadvisable there should be a public discussion of company's affairs until they are in a position to submit a definite proposition for the shareholders' consideration.

GERMAN FOREIGN TRADE IN CHEMICALS.

ALTERATIONS IN GOVERNMENT REGULATIONS.

A NUMBER of alterations have just been made in the conditions governing the export of chemical products from Germany. According to a notification issued by the Reichswirtschaft Minister on December 1, the following products, the export of which from Germany has hitherto been only permissible by special Government licence, may now be exported without restriction. (A selection of the more-important products only is here given): Gypsum (all forms), soda ash and soda crystals, sodium bicarbonate, caustic soda, cryolite, aluminium oxide and hydroxide, acetate and formate of lime, matches, and artificial silk.

The following products have been placed on the list of those the free exportation of which is prohibited: Lead, brass, metallic residues and oxides, radium, and meso-thorium and their salts and preparations. Modifications have also been made in the following products: Grape sugar and fruit sugar and caramelised sugar products may be exported wthout licence, provided the net weight of the consignment does not exceed 10 kilogrammes. A similar ruling as to the maximum quantity permissible for export applies also to benzol and other coal-tar hydrocarbons, anthracene and other heavy coal-tar products, salt (all grades), sodium nitrate, and ammonium sulphate.

Removal of Import Restrictions.

Unrestricted import into Germany of the following products (among others) is now allowed, until further notice: Vegetable waxes, dyewoods, kauri and other similar gums, dammar and similar gums, shellac (except ruby and bleached shellac), gum acacia, gum tragacanth, camphor, beeswax, agar-agar, wood oil, talc, borate of lime, monazite sand, pyrites, asphalt, wood tar, crude iodine, argols, citrate of lime, turpentine, and citrus fruit essential oils.

COMING EVENTS.

Oil and Colour Chemists' Association.—Meeting, **Friday, December 14,** at **7.30 p.m.,** at Birkbeck College, Fetter Lane, London, E.C. Paper: "The Colloidal Theory of Corrosion," by Dr. J. Newton Friend.

Physical Society. — Meeting on **Friday, December 14,** at **5 p.m.,** at the Imperial College of Science, South Kensington, S.W. The papers include: "X-Ray Analysis of Zinc-Copper Alloys," by Dr. E. A. Owen and G. D. Preston.

Manchester Literary and Philosophical Society (Chemical Section).—Meeting, **Friday, December 14,** at **7 p.m.,** at 36, George Street.

West of Scotland Iron and Steel Institute.—Meeting, **Friday, December 14,** at Glasgow. Paper: "The Sulphur Content of the Acid Charge," by J. H. Whiteley.

Society of Chemical Industry (Birmingham Section).—Joint dinner with the Institute of Chemistry on **Saturday, December 15,** at **7.15 p.m.,** at the Queen's Hotel.—**(Glasgow Section):** Ramsay Chemical Dinner on **Thursday, December 20,** at the Ca'doro Restaurant.

Institution of the Rubber Industry. — Meeting, **Monday, December 17,** at **8 p.m.,** at the Engineers' Club, Coventry Street, Piccadilly, W. Paper: "The Position of the Rubber Tyre Industry," by Col. Sealy Clarke.

Chemical Society.—Meeting, **Thursday, December 20,** at **8 p.m.,** at Burlington House, Piccadilly, W. 1.

Society of Dyers and Colourists (Manchester Section).—Meeting, **Friday, December 21.** Paper: "The Dyeing of Cellulose Acetate," by L. G. Laurie.

CORRESPONDENCE.

*** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

BLEACHING WITH PEROXIDES.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We were very interested in the account of the lecture to the Society of Dyers and Colourists in London, on October 25, by Mr. I. E. Weber (chief chemist to B. Laporte, Ltd., of Luton and Bradford), given in your issue of November 2, pages 515 and 516. Mr. Weber suggests (on page 516, col. 2) that the method of making appreciable saving is to make the bleach bath not with sodium peroxide—"sulphuric acid and ammonia being used to neutralise"—but to make it with "hydrogen peroxide, using silicate of soda." On the opposite side of the same page, under the heading "Neutralising the Acidity of Hydrogen Peroxide," Mr. Weber said: "One-third the cost of hydrogen peroxide used in bleaching can be saved by neutralising with silicate of soda," instead of with ammonia. It is therefore quite illogical, in the comparison between bleaching with sodium peroxide, sulphuric acid, and ammonia on the one hand, and bleaching with hydrogen peroxide and sodium silicate on the other hand, to ascribe the improvement to the use of hydrogen peroxide as against sodium peroxide, when Mr. Weber himself shows that an even larger improvement is due to sodium silicate, as against ammonia for the final neutralisation.

We can, however, make the comparison between sodium peroxide, sulphuric acid and ammonia, and hydrogen peroxide and ammonia by using Mr. Weber's own statement concerning the savings due to the use of sodium silicate in place of ammonia. Mr. Weber says that a bleaching with hydrogen peroxide, using sodium silicate to neutralise, cost 0.9d. per lb.; therefore, a bleaching with hydrogen peroxide, using *ammonia*, would cost 1.35d. per lb., which cost can now be compared with the 1.23d. per lb., using sodium peroxide, sulphuric acid, and ammonia.

It is a fact, however, that bleachers using sodium peroxide and sulphuric acid may, and do, use sodium silicate for neutralising the acidity of the hydrogen peroxide they produce, and assuming the correctness of Mr. Weber's statement as to the advantages to be derived from the use of silicate of soda for neutralising the bath, similar results will obviously be obtained if sodium peroxide be used instead of hydrogen peroxide. The use of sodium silicate in preparing the bleaching bath is not confined to those bleachers who use Messrs. B. Laporte's hydrogen peroxide, but is the common practice of all bleachers working on products which are best bleached by means of peroxides.—Yours, etc.,

Harry Baker
(Chemist to the Castner-Kellner Alkali Co., Ltd.)

Weston Point, Runcorn, December 11, 1923.

[Mr. Baker also points out that the figure of £4,000. given by Mr. Weber as the annual saving effected by a bleacher who bleaches 6,000lb. of material per week, and who, by using hydrogen peroxide and sodium silicate instead of sodium peroxide, sulphuric acid and ammonia in his bleach liquor, cuts the costs of bleach per pound of material treated from 1.23d. to 0.9d., is erroneous. By a simple calculation, and assuming a 52-week year, Mr. Baker shows that the total saving can only be just over £400.—Ed., *C.T.J. and C.E.*]

CONCENTRATED HYDROGEN PEROXIDE.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—Referring to the article on "Concentrated Hydrogen Peroxide" in your issue of December 7, we are in perfect agreement with your contributor's opening remarks as to the value of hydrogen peroxide as a bleaching agent. We join issue with him, however, in regard to his contention that the 100 volume (30 per cent.) peroxide possesses any preponderating advantages over the usual 12 to 20 volumes.

In most technical and other applications of peroxide, the 12 or 20 volumes is considerably diluted before use, and, it is only in certain special cases that higher strengths are required. When necessary we have manufactured and supplied peroxide of 50, 100 and even 120 volumes, and are prepared to take steps to deal with any demand that may arise for these or still more concentrated solutions.

During the war, and for some time after, various Government Departments and many firms engaged in the textile and other staple trades had every reason for satisfaction that Britain was absolutely independent of foreign supplies of hydrogen peroxide as well as the raw materials necessary to its production.

It may not be generally known that the production of hydrogen peroxide is linked up with a very important series of manufactures. The chief requirement is barium peroxide, and the manufacture of this from mineral barytes and its conversion into hydrogen peroxide involves the production of a number of other barium compounds and sundry by-products for which there is an active demand for home consumption and, what is of still greater importance at the moment, for export. Moreover, as practically all the raw materials required in this industry—namely, barytes, fuel, alkali, sulphuric acid and other acids, fireclay goods, lead, iron, engineers' stores, etc., are indigenous, it follows that all disbursements in respect of such wares and for labour, direct and *indirect*, rates, taxes and all charges connected with the running and upkeep of the various works concerned, are a direct benefit to the country in which the industry is established.

In view of the existing unemployment and the desirability, for many reasons, of maintaining "key industries," we are inclined to believe that consumers of hydrogen peroxide will continue to support the home producers as loyally as hitherto.—Yours, etc., (for B. Laporte, Limited),

Luton, R. Stewart, Director.

December 10, 1923.

GLYCERINE PRICES.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—I was surprised to hear that the U.K. Glycerine Producers' Association confirmed your price of £60. per ton for the crude product as correct. I take it that this price refers to crude soap-lye glycerine, 80 per cent., and if so, might I inform you that there is no such price for that quality of glycerine? After all, the Glycerine Association are not the only sellers of glycerine in this country, and I take it that the purpose of your quotations in your review is to inform readers as to the prices at which they are in a position to buy either crude soap-lye, 80 per cent.; crude saponification, 88 per cent.; and dynamite glycerine.

The price of crude soap-lye glycerine to-day, delivered in this country, would be £50. per ton, drums included; that of crude saponification, 88 per cent., B.S.S., £55. 10s.; and dynamite glycerine, Nobel's test D21, can be supplied to any buyer in the U.K. at £74 10s. per ton, free on rail London.

If anybody in the trade likes to challenge these prices, I am prepared to take up the challenge.—Yours, etc.,

Fl. Bourgeois.

London, E.C. 3, December 11, 1923.

[Our correspondent originally communicated with us on Nov. 27 with reference to the letter from Mr. Geo. W. Phillips, of Messrs. Haller and Phillips, published in our issue of November 23, Mr. Bourgeois supported the prices as given by Mr. Phillips, and criticised our statement in the footnote to Mr. Phillip's letter. We then referred the matter to the U.K. Glycerine Producers' Association, and were assured that our price of £60. per ton for crude 80 per cent. glycerine was a correct average, although, of course, a lower price might be fixed for a large contract. The controversy appears to be between the importer of foreign material, on the one hand, and the British producer on the other. In view of present conditions of employment in this country, one's sympathies are strongly in favour of the home production.—Ed., *C.T.J. and C.E.*]

Celanese in France.—It will be remembered that some months ago it was announced that a leading Belgian artificial silk concern, the Soie Artificielle de Tubize had decided to take an interest in the manufacturing process which is being used by the British Celanese Company. At a recent general meeting of the Belgian company the chairman informed the shareholders that the extensive trials made with this new textile material had proved satisfactory. Owing to the large sale which it already enjoyed in France, he further stated that a French company with a capital of 50,000,000f. was to be constituted shortly. It was to have a producing capacity of between 3 and 4 tons per day. Lyons firms, which had taken up this article, were to have a financial interest in the undertaking.

FERTILISER NEWS.

Nitrate of Soda.—Production of nitrate in Chile continues to improve in spite of several obstacles to progress, the output for July-November, 1923, reaching about 830,000 tons, compared with 507,000 tons in the corresponding period of last year. The announcement a day or two ago, of the resignation of the Chilean Government, may give the quietus to the revenue-raising scheme referred to last week. A tax of 3 per cent. on the profits of foreign companies operating in Chile would certainly hit the nitrate industry severely. Compensation in the direction of decreased export duties could hardly have been expected in view of the Chilean Government's proverbial shortage of ready money. With regard to a remark made in this column on September 28 last about the postponement by the Chilean Government of the export duty on certain quantities of unsold nitrate, a correspondent in Valparaiso writes that this statement is incorrect. He says it is untrue that the Chilean nitrate producers, in view of the support from the Chilean Government by means of the postponement of the export duties, have shipped large cargoes of unsold nitrate to consuming markets to await sale there. All the nitrate sold since the Producers' Association started in 1919, he continues, has been sold on usual f.a.s. terms, paying duty at time of shipment, in accordance with law. Our correspondent admits, however, that a bill was elaborated and presented to Congress with a view to giving facilities in the manner stated, but contends that, like many other official projects produced by successive finance ministers from time to time, nothing further was done. At Iquique, where the strike of union workmen has considerably affected the exportation of nitrate, the Government are taking a strong hand, and non-union labour is being utilised under police protection, while a warship has been stationed in the harbour. At the oficinas labour is scarce, and 200 workmen who arrived in the Tarapaca district were immediately absorbed. Sales by the Producers' Association lately have contracted somewhat, and according to a cable from Valparaiso, dated December 6, the quantity reached only 56,000 metric quintals during the week, compared with 221,000 quintals in the preceding week, and 490,000 quintals in the week previous.

Sulphate of Ammonia.—Shipments of this fertiliser to overseas customers are rather more satisfactory, and the export market appears to be largely in the hands of the British producers. The domestic demand, however, despite the moderate increase of 1s. per ton, making the current price £14. 16s. per ton delivered to consumer's station in 4-ton lots for neutral quality sulphate having 25¾% ammonia basis, is disappointing. Even the scheduled rise in the New Year has failed to produce any great interest amounting to inquiry among the British consumers. One result of the recent election may be the defeat of the Government's proposals in the matter of assistance to agriculture, and this would undoubtedly affect the farmer very adversely. As our premier industry, agriculture is at the point where support is absolutely essential. Undersold by foreign imported produce, handicapped by high rates and transport charges, and at the present time severely hurt by the great prevalence of foot-and-mouth disease, the farmer is hardly likely to increase his costs by purchasing fertilisers, however cheap. The necessity for propaganda and education in this matter was never more pronounced than it is to-day, and there is still much to be done to convince the consumer that the judicious application of artificial manures is bound to pay. The activity of the Sulphate of Ammonia Federation is revealed in the comparison of present consumption with pre-war figures. In the United States, certain farming and cotton interests in Congress are organising with a view to securing amendment of the tariff, particularly with respect to ammonium sulphate, which they wish to have placed on the free list. At the present time, the duty amounts to about £1. per ton. British exports during November, particulars of which are available at the time of going to press, have experienced a decrease compared with the October figures, but the total for November of last year is exceeded by 5,000 tons. Last month's total amounted to 19,005 tons, valued at £227,185.

General Notes.—The output of the Alsatian potash mines during the first eight months of 1923 amounted to 613,976 metric tons, compared with 501,948 tons during the corresponding period of last year. This is equivalent to 154,399 tons of pure potash against 123,301 tons in 1922.

It is reported from Prague that the draft of a law to encourage the establishment in Czecho-Slovakia of the nitrogenous fertiliser industry is to be presented by the Minister of Agriculture. The industry is to be assisted by reducing, or temporarily abolishing, the taxation. The increasing difficulty of obtaining supplies of nitrogen fertilisers from Germany is the main reason for desiring to develop the domestic production.

The October report of the American Cyanamid Company, states that at the New Jersey plant there was no production of ammo-phos., but there was continued during the month the manufacture of certain secondary products. At the phosphate mines in Florida operations were at the rate of approximately 60 p.c. of capacity, while at the Niagara Falls plant operations were upon the basis of full capacity.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

There is every reason to believe that in the course of a month or two there will be such an increase in the local requirements of coke that the ovens will have to be worked at their fullest capacity. So far no additional furnaces have been lighted to smelt ordinary iron, but it is plain that this step will have to be taken in January. Ironmasters have secured a substantial amount of forward business and as soon as their stocks, which are already sold, are cleared they will be compelled to put more furnaces into draught. The outlook in the iron and steel trade having improved, it becomes a question whether smelters will be able to get all the coke they want from the ovens that are attached to their works or whether they will have to buy more of the dearer East Coast coke. As far as the coal trade is concerned it also is very strong, and even now the production is inadequate to meet demand. The effects of the strike at Whitehaven, when a considerable body of the miners left for the Yorkshire, Durham, and Northumberland coalfields, are still being felt. Until these men all return the production, it is feared, will remain below the figure which it should easily reach. It is perhaps unnecessary to say that the whole of the make of coke is going to the smelters of ordinary iron, and these mainly in West Cumberland. What is going to the Furness district is an insignificant tonnage. Prices are maintained, the figure to the smelter being 25s. to 26s. per ton. For export it is 35s., but only small parcels have been sent this last quarter. East Coast coke supplies fall just short of 10,000 tons.

SOUTH WALES NOTES.

(Specially Contributed.)

Business in the tinplate industry is keeping up well, and the majority of the works have sufficient orders to last for the next three or four months. Buyers seem to have difficulty in getting early deliveries, and in some quarters premiums are being offered and taken for quick dispatch. The dispute with the auxiliary workers seems to have been settled. The patent fuel workers are fully employed, and with the reduction in the price of pitch some concessions can be given to purchasers of briquettes. Export trading is fairly good. There is a good call for coke and in consequence of the good demand for all residuals, by-product plants are working better time. At several collieries further ovens and plant are being installed. The galvanising industry is keeping in a satisfactory condition, particularly in corrugated sheets. Some good business is being done with the South of Ireland, while the Colonies are taking more tonnage. During the last few days large quantities of basic slag have been consigned to home counties, and there has also been a better export movement in sulphate of ammonia.

Among the imports for the week were 30cwt. zinc ashes from Dublin, 81 tons copper precipitate, 16 tons zinc matte from Havre, 60 tons copper precipitate from Seville to Swansea; 483 tons dried asphalt from Trinidad to Newport. Among the exports were 4½ tons zinc chloride to New York, 11 tons painters' colours, 3 tons laundry blue to Buenos Ayres from Newport; and 4 tons sulphate of ammonia, 10 tons superphosphate, 1½ tons muriate of potash to Lisbon from Port Talbot.

Phomene (Foam type) Fire Extinguisher, 2 gallons capacity

Pyrene TRADE MARK
FIRE APPLIANCES

Fight FIRE at the start

THE hazardous fire risks of the Chemical Industry demand the special forms of fire protection shown here. Water is useless on fires involving burning Oils, Spirits, Greases, Chemicals of a highly inflammable nature, and Electrical Apparatus.

With the "PHOMENE" Fire Extinguisher it is a simple matter to project a stream of foam on to the burning oil or spirit. This foam falls lightly on to the surface over which it spreads and "blankets" the fire. The "PHOMENE" Extinguisher is exceptionally simple to use, and is built to give long and satisfactory service.

The "great" little "PYRENE" Fire Extinguisher is always ready for instant use. It is efficient on all kinds of outbreaks of fire. It is particularly effective where there is danger of fire involving highly inflammable substances and electricity. It has become the universal protection for motor cars and lorries. In fact, no motor vehicle is complete without it.

Write for illustrated folder, "How to extinguish burning oils," and "Features of the 'PYRENE' Extinguisher."

REPORTS OF COMPANIES.

Tate and Lyle, Ltd.

The report states that, after making full provision for depreciation, for the estimated liability to taxation, and for the remuneration of the managing directors, the balance-sheet and profit and loss account show a net profit of £1,759,462. for the three years' working from October 1, 1920, to September 30, 1923. Out of this net profit dividends have already been authorised on the preference and the ordinary shares for the years 1921 and 1922, absorbing £1,015,033, leaving a disposable balance of £744,429., which the directors propose to appropriate as follows: To pay the preference shareholders a year's dividend at 6 per cent., absorbing £71,500.; to pay the ordinary shareholders of Henry Tate and Sons, Ltd., at the date immediately prior to amalgamation with Messrs. Abram Lyle and Sons, Ltd., the balance distributable to them under the terms of the agreement for amalgamation; to pay the ordinary shareholders of Tate and Lyle, Ltd., a final dividend of 7½ per cent., making with the interim dividend of 7½ per cent. paid June 1, 1923, a total of 15 per cent. per annum, free of tax, on their capital of £3,312,000., £496,800., and to carry forward £38,650.

Egyptian Salt and Soda Company, Ltd.

Report for the 12 months ending August 31 states that the gross profits earned are £E52,088., deducted for general administration expenses £E6,190., interest on debentures £E2,542., leaving a net profit of £E43,356. Directors have set aside for depreciation of various factories £E9,817., and provision for eventualities £E1,400., leaving £E32,138., and £E48,808. was brought in, making £E80,947. Directors propose dividend of 7½ per cent. on share capital (1s. 6d. per share), leaving to be carried forward £E44,546.

Sulphide Corporation, Ltd.

The report for the year ended June 30 last states that the net profit, after providing £57,324. for future taxation, amounted to £220,961. From this £105,000. was paid on July 12 as an interim dividend of 10 per cent. on the preference shares and 10 per cent. on the ordinary shares, leaving £115,961. at the credit of profit and loss account. The directors now recommend that a further dividend of 5 per cent. be paid on the preference and 5 per cent. on the ordinary shares, and that of the balance of £63,461. at the credit of profit and loss account £50,000. be placed to reserve for contingencies, and £13,461. be dealt with in the next accounts.

DIVIDENDS.

Pinchin, Johnson and Co., Ltd.—At a meeting of the board of directors, it was resolved that the usual dividend at the rate of 6½ per cent. per annum, less tax, on preference shares for six months to December 31 shall be payable on January 1.

South American Copper Syndicate, Ltd.—The accounts for the year ended June 30 show an adverse balance of £20,536., which has been written off share premiums account.

British Burmah Petroleum Company, Ltd.—Final dividend of 4½d. per share, making 7½d. per share, tax free, for the year ended July 31.

British Motor Spirit Co., Ltd.—The accounts show a loss of £12,233. (against £11,050.), no dividends being received from America. A debit of £70,960. was brought forward, so that there is now a total debit of £83,193. to profit and loss.

Boots Pure Drug Co., Ltd.—Interim dividend of 9 per cent., less tax, for quarter to December 31, 1923, payable on that date.

Unemployment Decreasing.—The number of persons on December 3, 1923, recorded on the live registers of the Employment Exchanges in Great Britain was 1,194,700. This was 23,524 less than in the preceding week, and 291,178 less than the figure recorded on January 1, 1923.

LEGAL INTELLIGENCE.

UNSUCCESSFUL DEAL IN SOAP.

W. Hewitt and G. Cowen.

On December 7 the public examination was held of William Hewitt and Godfrey Cowen (lately carrying on business as Reginald Godfrey and Co.), merchants, 110, Cannon Street, E.C. The joint statement of affairs showed liabilities £10,080, of which £6,352. was expected to rank for dividend. No realisable assets were disclosed. The debtor, Hewitt, said that in January, 1917, he entered into partnership with Cowen and they began business as merchants at Bush Lane House, E.C., removing in 1919 to 110, Cannon Street, E.C. In 1919 he and Cowen entered into a contract with Gossages to take up 300 tons of soap at prices varying from £85. to £95. a ton according to quality, delivery to take place in October and November, 1919, but when delivery was tendered the partnership was not in a position to take up the soap. Subsequently, they sent 50 tons to Italy for disposal there, and 200 tons were sent to a company styled the Techno Products Trading Co. On the remaining 50 tons they paid £750. damages in respect of breach of contract. They were introduced to the Techno Co. by their bankers who knew of the position regarding the contract. Apparently, the bankers advanced the company the money to pay as follows:—60 per cent. at port of arrival, Danzig, and 40 per cent. when the soap was sold. The soap was delivered at Danzig, but the Techno Company failed to pay the balance, and afterwards went into liquidation. Gossages account was paid by debtors with moneys advanced by the bank. Debtor considered that the firm's loss on the deal amounted to £9,750. He first realised the firm was insolvent in May, 1920, when the firm particularly felt the fall in the German mark, but they had not since contracted any liabilities.

The examination of both debtors was concluded.

NEW COMPANIES.

Artificial and Real Silk Company, Ltd.—Private company. Capital £300. Solicitors: Blyth, Dutton, Hartley and Blyth, 112, Gresham House, E.C.

British Synthetics, Ltd. — Private company. Capital £7,000., in £1. shares (6,000 preference). Chemical dye manufacturers, etc. Office: Imperial House, Kingsway, W.C.

Cement and Steel, Ltd.—Private company. Capital £1,000. Metallurgists, etc. Office: 147, Fenchurch Street, E.C.

Cockson's, Ltd. — Private company. Capital £1,000. Manufacturing, wholesale, and retail chemists, druggists, etc. Office: 32, Aldersgate Street, E.C.

J. M. Huber, Ltd. — Private company. Capital £2,000. Dealers in printing and other inks, etc. Office: 69, Southwark Street, S.E.

Normanby Park Tar Supply Company, Ltd.—Private company. Capital £15,000. Tar distillers, etc. Solicitors: Coburn and Co., 5, Drapers Gardens, E.C.

Standard Varnish Works (of Great Britain), Ltd.—Private company. Capital £2,000. Manufacturers of and dealers in varnish colours, paints, etc. Office: 34-35, Norfolk Street, Strand, W.C.

Tar Surfacing, Ltd.—Private company. Capital £1,000. Office: 46, Woodhouse Lane, Leeds.

Dundalk Chemicals, Ltd.—Private company. Capital £3,000. Office: 6, Francis Street, Dundalk.

OUR BOOKSHELF.

Mechanical Stoking. David Brownlie. London: Sir Isaac Pitman and Sons, Ltd.; 5s.

A liberally illustrated account of the various types of mechanical stoker in modern use, together with much information concerning their characteristic details and general efficiency. A useful account for all who are contemplating the overhaul of their boiler plant.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Brookhouse, Johnson, Ltd., Derby, cement manufacturers. —Registered November 27, deb., to Westminster Bank, Ltd., securing all moneys due or to become due to the bank.

Clement and Johnson, Ltd., London, W.C., chemists.—Registered November 27, £100., £200., £100., £200., and £100. debs., part of £60,000.

Cornish Meledor China Clay Company, Ltd., London, E.C. Registered November 22, £10,000. deb., to D. G. Collins, 118, Newgate-st., E.C., and others.

Wyke Dyeing Company, Ltd. — Registered November 26, £5,000. debs. (secured by Trust Deed dated November 23, 1923).

SATISFACTIONS.

Brooksbank (E.) and Co., Ltd., Manchester, soap makers. Satisfactions registered November 28, £12,000., registered December 5, 1908; and all moneys, etc., registered July 30, 1923.

India Rubber Gutta Percha and Telegraph Works Company, Ltd., London, E.C.—Satisfaction registered November 23, £250,000.; registered March 10, 1922.

Reynolds and Branson, Ltd., Leeds, chemists.—Satisfaction registered November 24, £1,250.; registered April 28, 1919.

Welsh Silica Company, Ltd., Connahs Quay. — Satisfactions registered November 22, £250., part of amount registered November 18, 1919, and £1,000., part of amount registered December 11, 1919.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Blunt, W. H., and Son, 69 and 70, Snow Hill, Birmingham; manufacturing chemists; £25. 19s. 3d. October 22.

Ex-Service Polish Company, 530, Ashton New Road, Clayton; polish manufacturers; £16. 14s. 10d. October 30.

Isis Chemicals and Dyes, Ltd., 87, Bishopgate, E.C.; £42. 18s. October 11.

Rockcastle Chemical Company, 94, Market Street, Manchester; £52. 4s. 7d. October 22.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Australia.

A Melbourne manufacturers' agent and importer and exporter desires to obtain the representation of British manufacturers of raw materials used in Australian industries such as aluminium, chemicals, oils, colours, tanners' supplies, etc. (Ref. No. 600.)

A Melbourne manufacturers' agent and importer and exporter is prepared to accept buying commissions for Australian products, such as tallow, etc., on behalf of British importers. (Ref. No. 601.)

Norway.

A firm of commission agents in Christiania desire to secure the representation for Norway of British manufacturers of lead sheets and tubes. (Ref. No. 618.)

Egypt.

Tenders are invited for the supply of miscellaneous drugs, chemicals, etc., required by the Egyptian Department of Public Health during 1924-25. Tenders will be received by the Director of Stores, Department of Public Health, Cairo, up to January 14, 1924. (Ref. No. 11,945/F.E./G.C.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

November 26 to December 1 (inclusive).

Adhesive Paste from Rubber Latex. Braund, E. T., and Peachey Process Co., Ltd. 29,925.
Cyanide Compounds. Bredig, G., and Elod, E. 30,305.
Oxidation of Naphthalene. Coke, B. E., and Maxted, E. B. 29,800.
Oxidation of Aromatic Hydrocarbons. Coke, B. E., and Maxted, E. B. 29,801.
Fertiliser and Insecticide. Duckworth, H. H., and Illingworth, C. 30,047.
Dyeing Cellulose Acetate. Frank, G. H., and British Dyestuffs Corporation, Ltd. 30,186.
Albumen Products. Haco Ges. Akt.-Ges. Bern. 30,193.
Albumen Dyestuff Compounds. Haco Ges. Akt.-Ges. Bern. 30,202.
Dyes for Dyeing Cellulose-acetate Products. Hall, A. J., and Silver Springs Bleaching and Dyeing Co., Ltd. 29,797.
Vat Dyestuff. Imray, O. Y. (*Soc. of Chemical Industry in Basle*). 30,102.
Hydrogen or Gases containing Hydrogen. Johnson, J. Y. (*Badische Anilin- and Soda-Fabrik*). 29,748.
Electrical Precipitation of Suspended Particles from Gaseous Fluids. Lodge-Cottrell, Ltd. (*Metallbank-und Metallurgische Ges.*). 30,063
Insecticides. McDougall and Yalding, Ltd. 30,304.
Hypochlorites. Mathieson Alkali Works, Inc. 29,972.
Synthetic Cocaine. Merck, E., [Firm of]. 30,087.
Alkyl Resorcinols. Sharp and Dohme, Inc. 29,970.
Aralkyl Resorcinols. Sharpe and Dohme, Inc. 29,975.
Vertical Evaporators. Soc. Anon. Appareils et Evaporateurs Kestner. 29,784.
Acetyl Cellulose. Stevenson, W. J. 29,737.
Metal Oxides. Wiskemann, Smith, and Co., Ltd. (*Plantz*). 29,766.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1*s. in stamps to the Comptroller, Patent Office Sales Branch,* 25, *Southampton Buildings, Chancery Lane, W.C.*

1922.

Paints and Varnishes. Lytton, E. 13,958. **207,209**
Separating Dissolved Substances for Crystallisation. Marsh, H. S., and Cochran, R. S. 19,738. **184,166**
Recovery of Caustic Soda from Mercerised Fabrics. Farrell, E. 20,100. **207,224**
Iron and Titanium Compounds from Titanium Ores. Gardner, D., and Taverner, L. 22,728. **207,247**
Treating Liquids with Chemical Reagents. Paterson, W. 23,063. **207,267**
Oil Colours and Printers' Inks. Plauson's (Parent Co.), Ltd. (*Plauson Dr. H.*). 23,262. **207,275**
Paper from Peat. Plauson's (Parent Co.), Ltd. (*Plauson, Dr. H.*). 28,327 **207,337**
Imitation Gutta-percha and Leather Hydroloid, Ltd. (*Exportingenieure fur Papier und Zellstofftechnik Ges.*) 29,056. **207,352**
Liquid Fuel Mixtures containing Alcohol. Loriette, P. 30,106. **188,336**
Distillation. Thermal Industrial and Chemical (T.I.C.) Research Co., Ltd., and Morgan, J. S. 31,012. **207,366**

1923.

Distillation of Solid Materials. Piron, E., and Caracristi, V. Z. 7,997. **207,460**
Active Charcoal. Farbenfabriken vorm. F. Bayer and Co. 8,119. **195,390**
Vat Dyestuffs from Anthraquinone. Imray, O. Y. (*Soc. of Chemical Industry in Basle*). 11,617. **207,476**
Producing Intimate Mixture between Gases and Liquids. Farbenfabriken vorm. F. Bayer and Co. 15,547. **199,718**
Sulphonation of Fatty Substances of Animal Origin. Guilleminot, P. L. 16,479. **199,743**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Purifying Gases. Koppers Co. 780. **207,488**
Oxalic Acid. Bhopal Produce Trust, Ltd. 1,775. **207,489**
Formaldehyde Condensation Products of Aliphatic Amines. Naugatuck Chemical Co. 19,595. **207,499**
Re-activating Adsorption Media. Naamlooze Vennootschap Montaan Metaalhandel. 29,591. **207,547**
Vat Colouring Matters. Kalle and Co. Akt.-Ges. 29,730. **207,553**
Titanic and Zinc Compounds. Pipereaut, P., and Helbronner, A. 29,774. **207,555**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Cellulose Products. H. Dreyfus, London. British Patent **205,195**, of 1922.

Trichlor-tertiary butyl alcohol is employed as the solvent or plastifying-agent in the preparation of celluloid-like materials, dopes, varnishes, films or sheets, etc., from methyl, ethyl, benzyl or other ethers of cellulose.

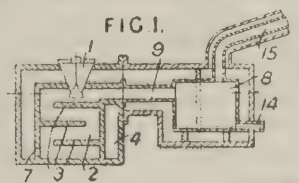
Producing Colloidal Dispersions. J. W. Hinchley and Plauson's (Parent Company), Ltd., London. British Patent **205,220,** of 1922.

In a process for the dispersion of a solid in a liquid medium, the mixture is subjected to disintegration substantially entirely by shearing of the liquid, and dispersion of a solid or liquid in a liquid medium is effected by shearing between members moving with a relative velocity of 6,000 feet per minute or over. The apparatus employed consists of two preferably apertured surfaces in very close proximity, but not in actual contact, and the relative movement may be rotary.

Refining Sulphur. C. S. Robinson, Cape of Good Hope, South Africa. British Patent **205,141,** of 1922.

To obtain sulphur free from the impurities which prevent satisfactory combustion, the sulphur is volatilised from materials containing it in the free state, the necessary heat being provided by the combustion of the minimum proportion of the sulphur. Preferably the sulphur-containing material is maintained in continuous motion counter-current to the gas for effecting combustion. In an example, the crude sulphur is fed by the device 1 into a chamber 2, provided with shelves 3 over which it travels in counter-

FIG.1.



current to an air-supply entering from the flues 4 within the walls of the chamber by an opening 7. The volatilised sulphur passes by way of a passage 9 to a condensing chamber 8 also air-jacketed and fitted with a condenser 15. By passage through the jackets the air-supply is pre-heated. Molten sulphur is tapped off by a pipe 14. If the plant is associated with a sulphuric acid plant, the jackets may be omitted. Instead of the above described apparatus, ordinary sulphur burners, such as the Herreshoff or Wedge furnaces, may be employed, but in all cases a condenser must be fitted.

Casein Distempers. H. O. Weller, London. British Patent **205,262,** of 1922.

In distempers of the kind comprising casein and slaked lime, waterproofing qualities are conferred by adding slaked lime in excess of that required to combine with the casein, together with a balsam or gum-resin and a fatty acid of high molecular weight. There may also be added alkali fluorides, phosphates, arsenates, sulphites or borates to act as antiseptics, etc. The usual extenders and pigments are employed. In an example, 8 parts by weight of casein, 2 parts of slaked lime, 40 parts of powdered chalk, 4 parts of lithopone, 4 parts of "gum thus," 1 part of stearic acid, and 1 part of sodium carbonate are mixed with 64 parts of water.

Synthetic Resins. G. Petroff, Moscow. British Patent **205,167,** of 1922.

In the production of phenol-formaldehyde condensation products, the initial condensation, carried out with a portion only of the total formaldehyde necessary for the complete reaction, is conducted under reduced pressure in the presence of coal-tar or mineral oils, or both, with or without emulsifying agents such as aromatic sulphonic acids of high molecular weight, sulphonated castor oil or alkali metal salts of the oxyacids obtained by the oxidation of drying oils. The barium, calcium, or strontium derivatives of phenols may be present as catalysts.

Drying-agents. P. S. Moyer, Chicago, U.S.A. British Patent **205,173,** of 1922.

A dehydrating composition moulded into a brick consists of inorganic porous material such as infusorial earth, a fibrous heat resistant such as asbestos, calcium chloride, or similar hygroscopic substance, lime or the like for neutralising acids, and a gas absorbent such as charcoal. Alternatively, it may consist of non-fibrous moisture absorbing material, hygroscopic material, and fibrous binding material, for example, infusorial earth, calcium chloride and asbestos. The ingredients are intimately mixed and moistened to form a paste which is moulded into bricks, cakes, wafers, etc., and dried by baking. After use, the bricks, etc., may be restored to the original condition by baking, etc.

Sulphur Dioxide. C. R. Houseman, North Wembley; and British Oxygen Company, Ltd., Upper Edmonton, London. British Patent **205,224,** of 1922.

Sulphur dioxide is produced by burning a film of sulphur in oxygen in such manner that the film of sulphur is kept in contact with the gases after passing the point at which the oxygen is supplied, while heat is removed so that fumes of sulphur vapour are avoided. The apparatus shown comprises a drum A which rotates so as to dip into molten sulphur D in a casing C, the space x at the top between the casing and drum being narrow. Oxygen is supplied by

FIG.1.

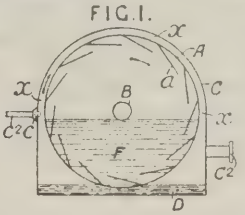


FIG.2.

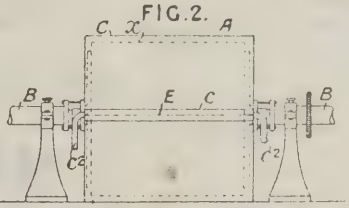

pipes c^2 and escapes by a long slit or row of perforations E, the supply pipe being covered by a cover c. A cooling agent such as water F is provided inside the drum A, which is provided with vanes a to facilitate the cooling effect. Vapour generated within the drum escapes through the hollow shaft B upon which it is mounted. The sulphur dioxide escapes by a pipe C^2. The speed of rotation of the drum is arranged so that the film of sulphur is just molten when it reaches the liquid sulphur again. The sulphur dioxide may be purified from sulphur trioxide by passing it over carbon.

Diaminoanthraquinone. O. Y. Imray, London. (Soc. of Chemical Industry in Basle, Basle, Switzerland.) British Patent, **203,051,** of 1922.

2:3-Diaminoanthraquinone is obtained by heating 2-amino-3-bromanthraquinone in a closed vessel with ammonia or a liquid containing ammonia; aqueous and alcoholic solutions are mentioned; a catalyst such as a copper compound may be present.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Ammonia Synthesis. Norsk Hydro-Elektrisk Kvaelstofaktieselskab, Christiania. British Patent **205,477.** Convention date, October 12, 1922.

The mixture of hydrogen and nitrogen to be used in the catalytic synthesis of ammonia is freed from impurities by treatment with a solution of an alkali or alkaline earth metal in liquid ammonia. Oxygen, water vapour, carbon dioxide, carbon monoxide and the like are thereby eliminated. According to the examples, the mixture of hydrogen and nitrogen is passed at a temperature of −20° C. and a pressure of 100 atmospheres through a solution of sodium in liquid ammonia, or at a temperature of 20° C. and a pressure of 150 atmospheres over calcium ribbon kept moist with liquid ammonia.

Fire-Extinguishing Agents. J. L. Fohlen, Paris. British Patent **205,110.** Convention date, October 7, 1922.

Halogen hydrocarbons, as carbon tetrachloride or perchlorethylene, used for fire-extinguishing, have added to them ammonia, an amine, aniline, or an organic base, or a compound or derivative of these substances in order to prevent formation of poisonous gases as phosgene. Ammonia may serve also to project the liquid.

Pure Salt from Electrolysis of Brine. E. G. R. Angel, Hudiksvall, Sweden. British Patent **205,103.** Convention date, October 6, 1922.

In the separation of sodium chloride from the caustic soda lyes obtained by the electrolysis of brine by evaporation, the evaporation is interrupted when the specific gravity reaches 1.25—1.3 and the coarse crystals of salt are separated and washed. The evaporation is then continued to remove the remainder of the salt which is in the form of fine crystals that cannot be washed satisfactorily. These fine crystals, without washing, are added to fresh liquor to be evaporated, and dissolve in it so that the contained alkali is not lost, and coarse crystals are again separated during the evaporation of this liquor to a specific gravity of 1.25—1.3 as above described. Alternatively the alkali liquor is evaporated in the usual manner in one stage, and the fine crystals of salt which separate are added to pure saturated brine which is then slowly evaporated, when the small crystals grow to a larger size to ensure that the salt separated shall be pure, the brine used for the electrolysis should be purified by adding sodium carbonate (or caustic soda and carbonic acid) and then tri-sodium phosphate. One of the claims is for a process in which crude salt is used to prepare the electrolyte, and pure salt is separated by the evaporation of the alkali liquor.

Sulphur Dyestuffs. Soc. of Chemical Industry in Basle, Basle, Switzerland. British Patent, **201,540.** Convention date, July 28, 1922.

Monosulphonic acids of 1-monoalkylamino-4-p-oxyarylnaphthylamines are prepared by treating an indophenol from a monoalkyl-α-naphthylamine and *p*-aminophenol with a salt of sulphurous acid. Sulphuretted dyes which dye cotton in green shades are obtained by heating the above-described sulphonic acids with polysulphides in the presence of copper.

Distilling. A. Cabrier, Florence, Italy. British Patent, **201,935.** Convention date, August 5, 1922.

Liquors obtained in gas works, such as tar, oils, washing liquors, ammoniacal liquors, etc., are distilled in a long tubular retort placed either in the main flue leading from the furnaces of the gas producers to a stack or in a branch flue. The retort is of rectangular cross section and is formed preferably of two U-bars welded together. Liquid is supplied through a siphon tube and flows in a thin layer through the still. Residual liquid is withdrawn through another siphon tube. Vapours pass along a pipe of undulating form the lower points of the bends of which are connected by siphon discharges to receiving vessels in which the distillates collect.

Sulphonated Oils. P. L. Guilleminot, Chantilly, Seine-et-Oise, France. British Patent, **199,743.** Convention date, June 26, 1922.

Animal oils are sulphonated in the presence of a metal of the iron group or an alloy or compound thereof. According to the example, iron filings are suspended in fish oil and concentrated sulphuric acid added while stirring; when the reaction is complete, water is introduced and the product neutralised, if desired, and washed. The sulphonated animal oils are useful in tanning, dyeing and soap manufacture.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—Business has been very restricted during the past week. Prices, however, are being maintained, and the general tone of the market is quite steady. One or two items show a tendency to advance, particularly those usually imported from the Continent. **Acetic Acid,** 80% technical, £47.; 80% pure, £48. 10s. to £49.; 98% glacial, £60. in casks and about £73. in glass demijohns, ex wharf London; prices quoted by spot holders are kept very steady, and the market has a rising tendency; business has again been satisfactory. **Acetone,** British Government specification, about £124. per ton; this product keeps very steady on spot, with supplies always limited. **Alum,** lump, £10. to £10. 10s. per ton, in casks; prices are fully maintained, with business still slow. **Arsenic,** Cornish white powdered, £68. per ton, spot; prices are fully maintained on a firm market; supplies are scarce, while there is good inquiry from America, but they have not reached our price. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; at this time of year the demand is slow. **Bleaching Powder,** 35—37%, £10. to £10. 10s. per ton; there is only a small call for this product, and prices are steady. **Barium Chloride,** 98—100%, £14. 10s. to £15. per ton; buying is restricted to small quantities; prices are firm as quoted. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P. crystals, about 1s. 4½d. per lb., less 5%; the demand for the spot supplies offering remains very poor; market weak. **Cream of Tartar,** B.P., 99—100%, 86s. to 87s. 6d. per cwt., less 2½%; dealers are quoting at about these figures, and slightly less for good quantities; the demand is limited. **Epsom Salts,** commercial quality, about £4. 15s. per ton, in bags; dealers continue to quote close up to this figure, but business is not at all brisk. **Formaldehyde,** 40% volume, £64. to £65. per ton; spot supplies are quoted at about these figures, but any business would probably be at slightly cheaper rates. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; business remains slow and small; dealers quoting at these unchanged rates. **Lead Acetate,** brown, about £43.; white, £44. per ton; spot supplies are perhaps a little freer, but are still restricted; demand limited; market firm; Continental rates dearer. **Litharge,** imported, about £37. 10s. per ton, on spot; dealers are finding a little business at about this figure. **Lithopone,** 30% Continental red seal, £23. to £24. per ton; dealers offering spot supplies are finding a fair volume of business; the market is very steady. **Ammonium Chloride,** grey galvanising, £31. to £31. 10s. per ton; as the spot supplies are cleared prices are gradually hardening here, with the market very firm. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these figures. **Oxalic Acid,** about 5¾d. per lb.; dealers' prices are unchanged on the week, and market remains dull. **Carbonate of Potash,** 90—92%, about £25. to £26.; 96—98%, £28. to £28. 10s. per ton; dealers' prices are firmer this week, and tend to advance to the higher figures quoted; supplies are now limited. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; this market is very steady, although there is little doing. **Caustic Potash,** 88—92%, solid, fully £33. per ton; prices have advanced here, and the market tends to go still higher in values; spot supplies appear to be limited. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers' prices are firm at this figure; the demand has been fairly good. **Prussiate of Potash,** yellow, about 10¼d. per lb.; dealers offering British material continue to quote at this figure, but the demand is only for

small quantities. **Sulphate of Potash,** 90%, £11. per ton; the market shows no change on the week. **Mercury,** about £9. 17s. 6d. to £10. per bottle of 75—76lb.; dealers are quoting at about these figures, but business has not been of any great volume. **Red Lead,** imported, about £37. 10s. per ton, on spot; dealers are offering at about this figure, with some little business being done. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; spot supplies are offering at about these figures, and a fair volume of business has been done; the market is firm. **Saltcake,** ground and unground, about £4. 10s. per ton, delivered, for home trade; this price is likely to be maintained up to the end of the year. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; merchants are offering at about these prices, with still but small inquiry. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; British makers continue to quote at this figure for home trade only, carriage paid. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers' offering at this figure; dealers are offering foreign material at slightly easier rates. **Cyanide of Soda,** export, about 8d. to 8½d. per lb.; British makers' prices are unchanged on the week. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags; British makers continue to quote at this price for home home trade only, packages free, carriage paid to destination; their prices for export vary as to destination. **Hyposulphite of Soda,** pea crystals, about £15. to £15. 10s. per ton; commercial quality, £10. to £10. 10s. per ton, in casks; dealers' prices are firm at these rates, and the market tends to harden. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b.; this market is steadily maintained at unchanged values. **Nitrite of Soda,** 100%, £28. 10s. per ton; the higher prices quoted last week are steadily maintained. **Prussiate of Soda,** about 5½d. per lb.; dealers offering British material continue to quote at about this figure, with business slow. **Sodium Sulphide,** 60—62%, solid, £14. 10s.; broken, £15. 10s. per ton, in drums; dealers' prices are at about these figures, with the market dull. **Tin Crystals,** about 1s. 3½d. per lb.; prices quoted are level on the week. **Tartaric Acid,** B.P. crystals, about 1s. 1½d. per lb., less 5%; there is still but little demand for the spot supplies offering, the market remains weak. **White Lead,** imported, about £41. to £42. per ton, in spot; dealers are doing a little business at about these figures. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers continue to quote at about these figures.

Pharmaceutical Chemicals.—The few alterations in prices are all moves to still higher spot values. Throughout this market is very firm, and there is no sign of a break. Supplies in some items are now at a low level. Business continues to be quite satisfactory. Except for further advances in spot values, no material change is looked for up to the end of the year. **Acetanilid,** crystals and powder, 3s. 3d. to 3s. 6d. per lb.; the spot position stands firm, and prices are moving up to the higher prices quoted; supplies are very short. **Acetyl-Salicylic Acid,** B.P., 3s. 9d. to 3s. 11d. per lb.; business is well sustained, and prices as quoted govern a firm market. **Benzoic Acid,** B.P., 4s. to 4s. 3d. per lb.; owing to acute shortage and continued refusal of the Board of Trade to grant import permits, the price of this product is being forced up. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. 9d. to 19s. per lb.; although in but little demand, prices are firmer here. **Salicylic Acid,** B.P., 2s. 6d. per lb.; at unchanged values on the week, this market keeps very steady. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; inquiry is limited, and the market is steady. **Amidopyrin,** about 15s. per lb.; there is still little doing here, but values are steady. **Ammonium Bromide,** B.P., 9d. to 10d. per lb.; this market is irregular on spot quotations. **Benzonaphthol,** about 5s. per lb.; the market is neglected; dealers quote at unchanged rates. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; this figure is quoted on a steady but quiet market. **Benzaldehyde 03,** 3s. to 3s. 3d. per lb.; prices are gradually firming up to the higher figure quoted. **Calcium Lactate,** about 2s. 6d. per lb.; the market is quite steady, but remains quiet. **Chloral Hydrate,** duty paid, 4s. 3d. per lb.; very little spot material is offering below this figure; the tendency is for higher prices. **Creosote,** B.P., about 2s. 6d. per lb.; dealers continue to quote at this figure, but business is only occasional. **Creosote Carbonate,** about 8s. 3d. per lb.; the call for this product keeps very small. **Guaiacol Carbonate,** about 14s. per lb.; the spot position is fully maintained at this value, with material offering limited. **Hexamine,** fully 4s. 6d. per lb.; spot values are well maintained here, and inquiry has again been good. **Hydroquinone,** 4s. to 4s. 3d. per lb.; the market is now steady at these values, but business is slow. **Methyl Salicylate,** 3s. to 3s. 3d. per lb.; there is a firmer tone here, and spot values are moving up to the higher figure quoted. **Methyl Sulphonal,** about 25s. per lb.; dealers are quoting close up to this figure. **Paraformaldehyde,** about 3s. 9d. per lb.; the spot position is very steady at this figure, and business has been fair. **Paraldehyde,** 1s. 7d. to 1s. 8d. per lb.; dealers are offering at these prices, with occasional business passing. **Phenacetin,** about 8s. per lb.; holders of spot supplies are looking for this figure; market steady. **Phenazone,** fully 8s. 9d. per lb.; supplies offering on spot are not large; demand is fairly brisk; market firm. **Phenolphthalein,** 8s. 6d. to 8s. 9d. per lb.; the little material available is fully worth the figure mentioned. **Potassium Bromide,** B.P. crystals and granular, about 8d. per lb.; prices are a little easier this week, but the market is now very firm, and may advance. **Potassium Permanganate,** B.P., about 9½d. to 9¾d. per lb.; a good deal of inquiry has been dealt with, and at the prices quoted the market is very steady. **Potassium Sulphoguaiacolate,** about 7s. per lb.; business remains quiet, with quoted values unchanged. **Resorcin,** about 6s. 6d. per lb.; spot offers are close up to this figure, with a fair inquiry on hand. **Salol,** 4s. 3d. to 4s. 6d. per lb.; this item keeps very steady, and good business has been done. **Sodium Benzoate,** 3s. 3d. to 3s. 6d. per lb.; nominal; it is difficult to any spot supplies. **Sodium Bromide,** B.P., crystals and granular, 9d. to 9½d. per lb.; the spot position has steadied up at this slightly easier figure, and the market is now firm, with a rising tendency. **Sodium Diethylbarbiturate,** about 20s. per lb.; higher prices are being quoted this week, and any business passing is close up to this figure. **Sodium Salicylate,** B.P., crystals, 3s. to 3s. 1d.; powder, about 2s. 11d. per lb.; dealers holding spot supplies are firm at these rates, with a fair volume of business passing. **Sulphonal,** about 20s. per lb.; the spot position shows no change on the week; business has been slow. **Terpin Hydrate,** about 1s. 9d. per lb.; this item keeps very steady, with business fairly good. **Vanillin,** 100%, about 26s. 6d. to 27s. per lb.; rather higher prices are being quoted here, with the market steady.

Coal-tar Products, Etc.—Pitch continues to fall in value, with the market still very quiet. Carbolic-acid crystals are also on the downward grade. Other products show little or no change. Business throughout has been limited in volume. **Anilin Oil,** 9d. to 9½d. per lb., naked, ex works; this item is steady, with the demand slow. **Aniline Salt,** 9½d. to 10d. per lb., naked, at works; prices show no change on the week; market quiet. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; prices are rather unsteady, with demand poor. **Benzol,** crude 65's, 8d. to 10d. per gallon; standard motor, 1s. 1d. to 1s. 4d.; pure, 1s. 6½d. to 1s. 8d. per gallon, in tank wagons; British makers continue to quote at these prices. **Carbolic Acid,** crystals, 11½d. per lb.; a further reduction in price is recorded this week, with the market still neglected. **Cresylic Acid,** 97—99%, 2s. per gallon; makers are offering at about these figures, but business is still quiet. **Toluol,** 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; the little business about would probably be at slightly easier rates than that quoted. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon; this item is unchanged in value on the week, with the market quiet. **Creosote Oil,** 9¼d. per gallon, f.o.b.; dealers are offering at this figure, with the demand only occasional, and limited in volume. **Naphtha,** crude, 8½d. to 8¾d. per gallon; there has been little doing here, and quoted rates are unchanged. **Solvent Naphtha,** 90/160, 1s. 2d. to 1s. 3d. per gallon; inquiry has been moderate, and prices are steady. **Heavy Solvent Naphtha,** 90/190, 1s. 2d. per gallon; there has been but small inquiry here; market rather unsteady. **Naphthalene,** £19. 10s. per ton; dealers are quoting at this figure on a dull market; values are not firm. **Pyridine,** 22s. to 23s. per gallon; owing to scarcity of supplies values tend to move up to the higher figure quoted. **Hexamethylene,** 3s. 9d. to 4s. per gallon; dealers holding spot supplies are firm at these rates. **Pure Methyl Alcohol,** £90. per ton in drums, ex wharf London; this article is fully maintained on spot, and the market tends to advance. **Pitch,** about 110s. per ton, f.o.b. East Coast; a further big decline in value is recorded, and as quoted the market is far from steady; business has again been very

poor indeed. **Wood Tar**, £4. 15s. to £6. per ton, according to quality; values are level on the week.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £62. 5s. to £62. 7s. 6d., cash; £63. to £63. 2s. 6d., three months; electrolytic, £67. 10s. to £68. **Tin**: Standard, £237. 5s. to £237. 10s., cash; £238. 10s. to £238. 15s., three months; Straits, £239. 5s.; English, £238. 5s. **Lead**, soft foreign, £31. 7s. 6d., prompt; English, £32. 10s.; chemical sheet, 37s. per cwt. for 2-ton lots, delivered. **Spelter**, prompt £32. 7s. 6d.; hard, £27. **Antimony**, English regulus, 99%, £36.; special brands, £44. to £44. 10s. **Aluminium**, 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 12s. 6d. to £9. 17s. 6d. **Bismuth**, 10s. **Platinum**, £29. per oz.; scrap, £27. **Wolfram**, spot, 12s. per unit, c.i.f. U.K. or Continent. **Zinc Dust** has shown much increased activity; Beaver brand, 90—92%, £48.; American, 92—94%, £48.; Continental, 83—88%, £42. to £46. per ton, delivered.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand for heavy chemicals during the past week has again been on the dull side, and values all round are easy. For alkali products the prices have now been fixed for 1924 contracts on the same basis as this year, with the exception of 58 **Alkali**, which is not yet settled. **Bleaching Powder** is reduced by 5s. per ton to £10. per ton, carriage paid 4-ton lots. Roasted **Saltcake** remains at £4. 10s. per ton, carriage paid. **Chlorates** are firm at 3d. per lb. **Bichromates** unaltered. **Sulphate of Copper** only moves off slowly, and quotation nominal at £25., f.o.b. Imported **Sulphur**, steady at £5. 5s. on rails. **Phosphate of Soda**, £14. 10s. per ton. Commercial **Hyposulphite of Soda**, £9. 10s. on rails. **Nitrite of Soda**, higher at £28. 10s., ex store. **Glauber's Salt**, weak at 70s. per ton, carriage paid. White powdered Cornish **Arsenic**, firm at £69. per ton, delivered. Yellow **Prussiates** are weak; **Potash** at 9½d., and **Soda** 5¼d., per lb., delivered Prices for **Carbonate** and **Caustic Potash** are well maintained at recent advance. **Barium Chloride**, steady at £14. 10s. per ton **Acetic Acid**, in steady inquiry. **Acetate of Soda**, quiet at £24., delivered. Grey and brown **Acetate of Lime** continue in short supply. Miscible Wood **Naphtha**, lower at 5s. 6d. per gallon. **Acetone**, unchanged at £124. per ton. **Formaldehyde**, 40%, easy at £63. per ton. **Lead Salts** are scarce, and quotations firm: White **Acetate** £46., brown £45.; **Nitrate**, £44., delivered. Green **Copperas** in good inquiry, and stocks are low. **Oxalic Acid**, dull at 5¾d. per lb. **Permanganate of Potash**, commercial, 8½d. to 9d. per lb., delivered

SWANSEA MARKET REPORT. Wednesday.

Tinplate prices were very firm on the basis of £1. 3s. 6d. per standard box, f.o.b. **Galvanised Sheets**, in fair demand at £19. 2s. 6d. **Copper**, firmer at £62. 7s. 6d. per ton cash, and £63. 2s. 6d. three months. **Tin**, easier at £230. 7s. 6d. per ton prompt, and £231. 7s. 6d. three months. **Lead** very firm. with soft prompt at £31. 2s. 6d., and forward £30. 7s. 6d. per ton; English, £32. 2s. 6d. **Spelter**, easier at £32. 7s. 6d. prompt and £32. 12s. 6d. per ton three months. **Zinc Sheets** in fair demand at £39. 7s. 6d. per ton. **Pitch** better sought after, and small business transacted at £5. 17s. 6d. up to £6. 2s. 6d. per ton, delivered docks. **Creosote** very active; 9¼d. per gallon, on rail at works. **Tar** in good call at about £1. 13s. 6d. per 40-gallon cask for refined, and crude £4. to £4. 12s. 6d. per ton, f.o.r., at ovens. **Sulphate of Ammonia** very steady, with home prices at £14. 16s. per ton. **Sulphate of Copper**, dull at £25. 7s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda** quiet, with prompt at £13. 7s. 6d., and forward £13. 12s. 6d. per ton. **Bone Meal** met with poor demand, with Indian at £9. 2s. 6d. per ton. **Seed Oils** not so active, with raw **Linseed**, prompt, at £2. 5s. 3d., and boiled £2. 7s. 3d. per cwt., in barrels, net. **Cottonseed Oil** firm, common edible £2. 5s. 3d., and deodorised £2. 7s. 3d. per cwt., ex ship. **Rape Oil** firm, with prompt refined at £2. 7s. 3d. per cwt., net, in barrels. **Cod Oil**, better inquiry; Newfoundland, £2. 5s. 4½d., and English £1. 13s. 3d. per cwt. **Castor Oil** scarce and dearer, with best at £3. 1s. 6d., and seconds at £3. 0s. 6d., per cwt., in barrels, prompt, and slight advances on these quotations for forward business. **Coconut Oil** in good demand, with prompt Ceylon at £2. 7s. 6d. per cwt., and forward £2. 7s. 4½d. **Olive Oil** in better demand at £66. 7s. 6d. per ton, net, ex ship. **Palm Oil**, steady demand; Lagos, £38. 2s. 6d. prompt, and £38. 7s. 6d. forward; softs, £38. 5s. 3d.; mediums, £38. 2s. 6d.; and hards, £38. 2s. 9d., all per ton at docks. **Oxalic Acid**, in little demand at 6½d. per lb., f.o.r. at works. **Arsenic** quiet, with firm quotations at £67. 17s. 6d. per ton for white powdered. **Sulphuric Acid** in good demand, with unaltered prices. **Copperas** dull at £2. 2s. 6d. per ton for 4-ton consignments, delivered London or equal. **Turpentine** quiet, with American prompt at £3. 13s. 6d. per cwt. **Coal** prices were firmly maintained, with upward tendency: Best Admiralty smokeless, £1. 9s. 6d. to £1. 10s. 6d.; seconds, £1. 8s. 6d. to £1. 9s. 6d.; ordinaries, £1. 7s.; Monmouthshire black vein, £1. 8s. 6d. per ton, f.o.b. **Anthracite**: Best large £2., seconds £1. 15s.; Paris and French nuts, £2. 12s. 6d. per ton, all f.o.b. **Patent Fuel** in good demand from £1. 9s. to £1. 11s. 9d. per ton, f.o.b. **Cokes** active at £2. 10s. per ton for export, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton, in trucks, at ovens.

LIVERPOOL CHEMICAL MARKET. Wednesday.

The demand for chemicals of the heavier class for use by the British home trade has improved slightly, the requirements from some trades, of late working on a restricted scale, having increased through the more settled labour conditions. Shipments to overseas ports have been fairly active, and continue so at date. **Bleaching Powder** has had a steady and fair inquiry for use by the home trade, and has had a moderate shipment on foreign account; it is £11. 5s. per ton for spot lots and for export; special quotations are given for contracts. **Chloride of Calcium** has been rather more in request, with a fair inquiry on export account; it is £5. 12s. 6d. per ton. **Caustic Soda** has again been in very fair demand for use in the U.K., and has had a heavy shipment; it is £19. 7s. 6d. per ton, carriage paid in Great Britain; in contracts special prices are quoted, according to requirements. **Bicarbonate of Soda** has been in good request for home-trade use, and has had a moderate shipment on export account; it is £10. 10s. per ton, in bags, carriage paid in Great Britain. **Soda Crystals** have had a steady inquiry for use in the U.K., but have been quiet in the export branch; they are £5. 5s. per ton, carriage paid, for home-trade use. **Nitrate of Soda** has been quiet, and is £13. 5s. to £13. 10s. per ton. **Borax** continues to sell steadily for use by the home trade; commercial crystals are £25. per ton, and powdered is £26; higher grades are—crystals £29. per ton, powdered £30. per ton, and superfine £31. per ton, in 2cwt. bags, carriage paid for use in Great Britain. **Saltcake** has been in rather good request, and stocks for early delivery are small; the price is £4. 10s. to £5. per ton for the home trade, and £5. to £6. per ton for export. **Bichromate of Soda** has been in slightly better request, and is 4½d. to 4¾d. per lb. **Ammonia Alkali** has been in very fair demand for home-trade use, and has had an active shipment for export; it is £7. 10s. per ton for use in Great Britain, and £8. per ton for export, varying according to destination; special prices are quoted in contracts, according to requirements. **Hyposulphite of Soda** has had a steady sale, and is £10. per ton, in 2cwt. bags, for commercial, and £15. per ton for photographic. **Sulphide of Soda** continues quiet; it is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has been very quiet, and is 3d. per lb. **Phosphate of Soda** has been inactive, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been neglected, and is 6d. per lb. **Yellow Prussiate of Potash** has been quiet, and is 10½d. to 11d. per lb. **Red Prussiate** has had a moderate sale, and is 2s. 9d. per lb. **Carbonate of Potash** has been rather more in demand, and is £25. 10s. to £28. per ton, according to test. **Nitrate of Potash** has had a steady inquiry, and is £29. to £30. per ton. **Chlorate of Potash** has been but little in demand, and is 3½d to 4d. per lb. **Caustic Potash** has had a rather good inquiry, and is £32. to £35. per ton. **Permanganate of Potash** has been quieter, and is 9d. to 9½d. per lb. **Bichromate of Potash** has been in fair demand, and is 5¼d. to 5½d. per lb. **Salammoniac** has been more inquired for, and the price has been very firm; it may be given as £56. per ton for first quality, and £53. per ton for second quality. **Sulphate of Ammonia** has had a moderate sale for use in the United Kingdom, but has had a large shipment on foreign account; prices are—neutral of 25¾% for

December, £14. 16s. per ton, and ordinary of 25¼% £13. 13s. per ton; for January neutral is £15. 2s. per ton, for February £15. 3s., and for March to May £15. 5s. per ton, ordinary being increased proportionately for use in Great Britain. **Carbonate of Ammonia** has been in good request, and is 4d. per lb. **Muriate of Ammonia** has been, but little called for; grey is £32. per ton. **Magnesia** has sold with some freedom; **Carbonate** is £2. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been in fair demand; it is £11. per ton for use by the home trade, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been rather more in request, and is £8. to £11. per ton, according to quality. **Sulphur** continues in very fair demand; flowers are £10. per ton, roll is £8. 10s. per ton, rock £8. to £8. 10s. per ton, and American £5. 10s. per ton. **Tartaric Acid** has been in moderate demand, and is 1s. 0½d. to 1s. 1d. per lb. **Cream of Tartar** has sold somewhat freely, and is £4. 6s. to £4. 8s. per cwt. **Boric Acid** has had a very fair inquiry; commercial is £48. per ton, and powdered £51.; B.P. grades are £54. to £60. per ton, carriage paid in Great Britain. **Citric Acid** has had a slow sale, and the price has shown a tendency to ease; it may be given as 1s. 5d. per lb. **Oxalic Acid** has moved but slowly, and the price has been fractionally lower; it is 6d. per lb. **White Acetate of Lead** has had a quietly steady sale; it is £44. to £44. 10s. per ton. **Sulphate of Copper** has been very quiet both for home-trade use and for export; it is £25. to £25. 10s. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been more in demand; white powdered is £66. to £68. per ton.

WEST OF SCOTLAND CHEMICALS. WEDNESDAY.

The demand for chemicals has been rather quiet during the week both on home and export account. A weakening of price is to be noted in the case of copper sulphate, but brown acetate of lead has strengthened, while tartaric acid is firmer and dearer. Prices otherwise are steady at about previous figures. **Alum,** lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic,** white powdered, scarce at £70. 10s. per ton on spot; an improving market. **Barium Chloride,** £15. per ton; at this price the market remains steady; foreign imported material offered round £14. to £14. 5s. **Bleaching Powder,** quiet at £11. 5s. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid,** crystals, £48. per ton, carriage paid in the U.K., makers' prices. **Borax,** crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities competing strongly. **Calcium Chloride,** 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid,** 1s. 5d. per lb., less 5%; business a little firmer at this figure. **Copper Sulphate,** £35. 15s. per ton, less 5%; a rather neglected market. **Cream of Tartar,** £4. 1s. per cwt. for 99% at Glasgow, quotation steady, and inquiry small. **Lead Acetate,** white, dearer at £43. 15s. per ton on spot; brown, good inquiry at £45. per ton; Continental material offering at slightly cheaper rates. **Magnesium Chloride,** £3. 5s. per ton, ex store; foreign material quoted at much under this figure. **Oxalic Acid,** quiet at about 6d. per lb.; little doing at this figure. **Paraffin Wax,** 2½d. per lb.; a steady export trade. **Potassium Bichromate,** 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate,** crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate,** crystals, 1s. per lb.; at this price there is a rather better inquiry, with some export business. **Salammoniac,** first and second lump, £55. and £52. 10s. per ton respectively; crystals, £48. 10s. per ton; at these reduced quotations the market is rather inactive. **Saltpetre,** £1. 12s. 6d. per cwt., net; a better market, with price unaltered; fresh arrivals are cheaper. **Sodium Bichromate,** 4½d. per lb.; unchanged. **Sodium Chlorate,** 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate,** 7d. per lb., ex store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate,** £9. 15s. per ton, in 2cwt. bags; £11. 5s. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic,** 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid,** 1s. 1d. per lb., less 5%, at Glasgow; the market is much firmer, with price slightly higher.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

Bremen, 33 cks., 150 bgs.

CALCIUM CARBIDE—
Christiania, 160 drms.

CARBON BLACK—
Antwerp, 40 cks.
New York, 1,530 cs.

CHEMICALS (*otherwise undescribed*)
Antwerp, 2 cs.
Hamburg, 6 brls., 42 cks.

COAL TAR PRODUCTS—
Creosote
Rotterdam, 1,870 t.

DEXTRINE—
Amsterdam, 525 bgs., 270 bls.
Newport News, 440 bgs.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Rotterdam, 7 brls.
Unspecified
Amsterdam, 4 cks.; Hamburg, 112 pcls., 151 cks., 10 crts., 3 cs.; Rotterdam, 6 brls., 2 cks., 1 cs.

FERRO SILICON—
Sarpsborg, 160 brls.

FORMALDEHYDE—
Bremen, 424 crbys.
Rotterdam, 38 cks.

GLUE AND GELATINE—
Amsterdam, 20 cks.; Antwerp, 60 bgs.; Bremen, 10 cs.; Rotterdam, 38 pkgs.

IRON OXIDE—
Malaga, 400 bxs.

LEAD ACETATE—
Hamburg, 100 bgs.

LEAD NITRATE—
Genoa, 55 cs.

LITHOPONE—
Danzig, 40 cks.
Rotterdam, 200 cks.

MAGNESITE—
Rotterdam, 237 bgs.

MAGNESIUM CHLORIDE—
Hamburg, 150 brls.

MINERAL COLOURS (*otherwise undescribed*)—
Bremen, 100 bgs.

OXALIC ACID—
Hamburg, 4 cks.
Rotterdam, 37 cks.

PARAFFIN WAX—
Baltimore, 432 brls.

PHOSPHORUS—
Montreal, 94 drms.

POTASH (*otherwise undescribed*)—
Bremen, 10 cs.
Hamburg, 5 kgs., 40 cks.

POTASSIUM NITRATE—
Antwerp, 40 sks.

POTASSIUM PERMANGANATE—
Hamburg, 39 cks.

POTASSIUM PRUSSIATE—
Rotterdam, 8 cks., 8 brls.

SALTPETRE—
Rotterdam, 20 kgs.

SOAP—
Catania, 50 cs.
Philadelphia, 600 bxs.

SODA—
Bremen, 10 cs.

SODIUM CHLORATE—
Rouen, 170 cks,

SODIUM NITRITE—
Hamburg, 70 cks.

SODIUM PHOSPHATE—
Antwerp, 13 cks.
Hamburg, 101 cks.

STEARINE—
Antwerp, 52 bgs.

SULPHUR—
Catania, 20 bgs.
Galveston, 2,005 t.

TALLOW—
Fredriksstad, 540 brls.

TANNING MATERIALS—
Sumac
Palermo, 20 bls., 550 bgs.
Unspecified
Baltimore, 55 brls.

TARTARIC ACID—
Amsterdam, 16 cks., 45 kgs.

TIN OXIDE—
Hamburg, 10 cks.

ULTRAMARINE—
Hamburg, 7 pcls.

WAX (*otherwise undescribed*)—
New Orleans, 3,167 brls., 156 bgs.
Norfolk and Newport News, 200 brls.
Philadelphia, 1,778 brls.

ZINC DUST—
Antwerp, 224 cs.
Galveston, 300 containers.

ZINC OXIDE—
Antwerp, 43 cks.
Rotterdam, 10 cks.

NEWCASTLE-ON-TYNE

Week ending December 8.

ACETIC ACID—
Rotterdam, 8 cks.

AMMONIA—
Hamburg, 40 cks.

BARYTES—
Hamburg, 76 cks.

CALCIUM CARBIDE—
Christiania, 410 drms.

MAGNESIUM (METALLIC)—
Hamburg, 36 drms.

SALTPETRE—
Rotterdam, 20 cks.

SOAP—
Montreal, 50 bxs.

SODA—
Bergen, 7 brls.

SODIUM ACETATE—
Antwerp, 20 kgs.

SODIUM HYPOSULPHITE—
Antwerp, 100 bgs.

SODIUM NITRATE—
Christiania, 103 bgs.

TURPENTINE—
Bremen, 2 cs.

WHITE LEAD—
Rotterdam, 20 cks.

ZINC OXIDE—
Rotterdam, 10 cks.

N. & S. SHIELDS.

Week ending December 8.

NIL.

EXPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending December 8.

BOILER COMPOSITION—
Gothenburg, 5 t.
Rangoon, £18.

CHEMICALS (*otherwise undescribed*)
Bangkok, 30 cs.; Boston, 250 pkgs.; Buenos Ayres, 10 pkgs.; Calcutta, 60 drms.; Delagoa Bay, 2,127 pkgs.; Helsingfors, 10 pkgs.; Mauritius, 50 pkgs.; Montreal, 226 pkgs.; Natal, 31 pkgs.; Rangoon, 55 pkgs.; Rio de Janeiro, 150 pkgs.; Shanghai, 610 pkgs.; Singapore, 330 pkgs.; Sumatra, 310 pkgs.; Vera Cruz, 500 pkgs.

COAL TAR PRODUCTS—
Creosote
Boston, 8 t. 10 c.
Durban, 13 t. 2 c.
Pitch
Antwerp, £1,430.
Tar
Durban, 4 t.; Gothenburg, 50 t.; Java, 6 t. 6 c.; Kingston (Ja.), £12.; Mauritius, 3 t.; Mombasa, 1 t.; Penang, 10 t. 4 c.; Rangoon, £423.; Singapore, £46.
Unspecified
Antwerp, £190.; Durban, 3 t. 10 c.; Helsingfors, 58 t. 8 c.; Madras, £490.; Mauritius, 2 t. 12 c.

FERRO CHROME—
Hamburg, 120 t.

GELATINE—
Montreal, 2 t.

LITHARGE—
Kingston (Ja.), 80 t.

PARAFFIN WAX—
Barcelona, £162.
Constantinople, 5 t.

PITCH (*otherwise undescribed*)—
Hamburg, £6.

POTASSIUM BICHROMATE—
Gothenburg, 16 c.
Rangoon, 1 t. 2 c.
Rio de Janeiro, 1 t. 14 c.

RED LEAD—
Balik Pappan, 9 t. 16 c.

SHEEP DIP—

SODIUM CYANIDE—
Cartagena (Col.), 77 cs.

SODIUM HYDROSULPHITE—
Rouen, 2 kgs.

SODIUM PRUSSIATE—
Genoa, 4 pkgs. ; Kobe, 102 pkgs.

SODIUM SILICATE—
Adelaide, 182 pkgs. ; Buenos Ayres, 153 pkgs., 227 cks. ; Catania, 33 pkgs. ; Durban, 158 pkgs. ; East London, 14 pkgs. ; Fremantle, 65 pkgs. ; Helsingfors, 5 pkgs. ; Lyttleton, 26 pkgs. ; Madras, 26 pkgs. ; Pt. Said, 20 pkgs. ; Shanghai, 50 cks. ; Sourabaya, 20 pkgs. ; Sydney, 16 cks. ; Zanzibar, 11 drms.

SODIUM SULPHIDE—
Alexandria, 21 drms. ; Genoa, 171 pkgs. ; Pt. Elizabeth, 6 drms. ; Rio de Janeiro, 24 pkgs.

STEARINE—
Cape Town, 38 pkgs.
Rouen, 7 bgs.

TALLOW—
Antwerp, 120 bxs.
Hamburg, 5 trcs.

ZINC ASHES—
Antwerp, 15 t.

LONDON.

OFFICIAL AMENDMENT.

From return for week ending Sept. 12, Deduct—

MAGNESIUM SULPHATE—
Auckland, 10 c., £13.

Week ending December 5.

ACETIC ACID—
Calcutta, 1 cs., £8.
Toronto, 1 cs., £6.

ACETONE—
Sydney, 2 cs., £16.

ACETYL SALICYLIC ACID—
Adelaide, 1 cs., £19.; Bombay, 3 cs. (pt.), £10.; Cape Town, 2 cs. (pt.), £11.; Irish Free State, 1 cs. (pt.), £7.; Launceston (F.), 1 cs. (pt.), £5.; Melbourne (F.), 1 cs. (pt.), £8.

ALUM—
Durban, 20 cs., £9.
Pt. Elizabeth, 25 cs., £11.

ALUMINIUM HYDRATE—
Sydney, 1 ck., £25.

AMMONIA—
Accra, 5 cs., £9.; Beira, 9 cs., £16.; Bombay, 5 cs., £9.; Calcutta, 37 cs., £73.; Delagoa Bay, 19 cs., £33.; Demerara, 8 cs., £14.; Durban, 15 cs., £30.; Hong Kong, 15 cs., £28.; Irish Free State, 24 cs., £44.; Jamaica, 4 cs., £7.; Karachi, 25 cs., £43.; Malta, 8 cs., £14.; Puerto Colombia, 2 cs., £6.; Tientsin, 5 cs., £17.; Trinidad, 5 cs., £9.

AMMONIA (ANHYDROUS)—
Durban, 3 cs., £5.; Gibraltar, 3 cs., £30.; Irish Free State, 6 cylds., £13.; Irish Free State, 1 cyld. (F.), £6.

AMMONIUM BROMIDE—
Melbourne, 1 cs. (pt.), £6.

AMMONIUM CARBONATE—
Antwerp, 1 t. 19 c., £67.; Bahia, 1 t. 16 c., £75.; Colombo, 2 c., £7.; Hamburg, 2 t. 19 c., £71.; Hong Kong, 16 c., £45.; Jaffa, 5 c., £15.; Melbourne, 11 c., £18.; Paris, 1 t. 19 c., £50.; Penang, 9 c., £22.; Singapore, 2 c., £6.; Sydney, 5 c., £9.; Trinidad, 2 c., £5.; Vera Cruz, 10 c., £12.; Yokohama, 6 t., £188.

AMMONIUM CHLORIDE—
Antwerp, 13 cks., £187.
Calcutta, 3 kgs., £6.
Sydney, 5 cks., £10.

AMMONIUM PHOSPHATE—
Pt. Swettenham, 1 cs., £6.

ANTIMONY NITRATE—
Sydney, 1 ck., £5.

ANTIMONY OXIDE—
Sao Paulo (F.), 55 pkgs., £222.

ANTIMONY SULPHIDE—
Bahia, 40 kgs., £56.; Budapest, 9 cks., £212.; Callao (F.), 5 kgs., £16.; Copenhagen, 4 cks., £83.; Melbourne, 7 cks., £156.; Portland, 5 cks., £36.

ARSENIC—
Alexandria, 8 drms., £38.; Antwerp, 28 cks., £310.; Antwerp, 115 pkgs. (F.), £858.; Cape Town, 2 cs., £10.; Rotterdam, 109 cks., £1,312.; Santos, 20 drms., £65.; Venice (F.), 2 cs., £170.

BARIUM CHLORIDE—
Rio de Janeiro, 6 cs., £23.

BASIC SLAG—
Channel Islands, 30 t., £54.

BISMUTH CARBONATE—
Melbourne, 2 cs. (pt.), £83.
Wellington, 1 cs. (pt.), £9.

BISMUTH CITRATE—
Melbourne, 1 cs. (pt.), £8.

BISMUTH SALTS (*otherwise undes.*)
Beyrout, 1 cs. (pt.), £7.
Brussels, 2 cs., £118.

BISMUTH SUBNITRATE—
Calcutta, 1 cs. (pt.), £16.

BISULPHITE OF LIME—
Colombo, 2 hhds., £7.

BITUMEN—
Gothenburg, 18 pkgs., £9.

BONE FERTILISER—
Channel Islands, 2 t., £15.

BORAX—
Cape Town, 2 c., £6.; Colombo, 5 c., £8.; Delagoa Bay, 6 c., £15.; Durban, 2 c., £5.; Genoa 3 t. 10 c. (F.), £77.; Melbourne, 3 c., £17.; Rotterdam, 1 t., £78.

BORIC ACID—
Acajutla, 1 c., £5.; Bangkok, 3 c., £31.; Bombay, 1 t. 10 c., £88.; Calcutta, 11 c., £43.; Colombo, 4 t. 5 c., £267.; Cuidad Bolivar, 4 c., £10.; Hong Kong, 3 c., £11.; Irish Free State, 2 c., £6.; Petrograd, 2 t. 5 c., £114.

BUTYRIC ACID—
Sydney, 5 cks., £126.

CADMIUM SULPHIDE—
Gothenburg, 1 cs., £20.

CALCIUM CARBIDE—
Calcutta, 5 c., £14.; Colombo, 5 c. (F.), £9.; Iddo, 5 c., £5.; Sekondi, 8 c., £8.

CALCIUM CARBONATE—
Calcutta, 8 cks., £36.
Perth, 2 cs., £11.

CALCIUM CHLORIDE—
Perth, 8 kgs., £9.

CALCIUM PHOSPHATE—
Sydney, 1 ck., £17.

CARBON TETRACHLORIDE—
Sydney, 3 drms., £18.

CARBONATE OF LIME—
Paris, 10 bgs., £11.

CAUSTIC SODA—
Shanghai, 6 c., £25.
Townsville, 10 t. 5 c., £192.

CHEMICALS (*otherwise undescribed*)
Acajutla, 2 cs., £6.; Adelaide, 5 cs., £83.; Alexandria, 4 cs., £437.; Amsterdam (F.), 5 pkgs., £25.; Amsterdam, 1 cs., £12.; Auckland, 66 pkgs., £223.; Bangkok, 9 cs., £15.; Barbados, 8 pkgs. (pt.), £18.; Barcelona, 1 bx., £10.; Batavia, 23 pkgs., £37.; Beyrout, 2 cs. (pt.), £5.; Bilbao, 20 pkgs., £50.; Bombay, 17 cs. (pt.), £92.; Buenos Ayres, 3 pkgs., £7.; Calcutta, 23 pkgs. (pt.), £86.; Callao, 3 cs., £8.; Cape Town, 4 cs. (pt.), £22.; Colombo, 8 cs., £231.; Cuidad Bolivar, 6 pkgs., £9.; Dalny, 8 pkgs. (pt.), £6.; Delagoa Bay, 8 cs., £5.; Demerara, 10 cs. CHROMIUM OXIDE—
Melbourne, 2 cks., £35.

CITRIC ACID—
Adelaide, 5 c., £35.; Calcutta, 11 c., £81.; Cartagena, 5 c., £36.; Delagoa Bay (F.), 1 c., £6.; Durban (F.), 3 c., £33.; Durban, 5 c., £36.; Malta, 2 c., £14.; Melbourne, 10 c., £69.; Pt. Said, 1 c., £8.; Rotterdam, 2 t., £302.; Seville, 5 c., £36.; Sydney, 1 t., £139.

COAL TAR PRODUCTS—
Carbolic Acid
Amsterdam, 10 brls., £50.; Bangkok, 2 cs., £5.; Barbados, 2 cs., £9.; Demerara, 1 drm., £8.; Genoa, 30 cks., £210.; Sandakan, 2 cs., £16.; Sydney, 1 cs., £60.
Creosote
Durban, 2 cks., £9.
Hong Kong, 1 cs., £7.
Naphthalene
East London (F.), 20 cs., £7.; Las Palmas, 2 cs., £7.; Rangoon, 10 cs., £12.; Sydney, 2 cks., £7.
Pitch
Cette, 990 t., £7,425.
Christchurch, 1 ck., £5.
Dunkirk, 252 t. 11 c., £1,740.
Tar
Alexandria, 92 cks., £200.; Beira, 30 drms., £23.; Chinde, 6 brls., £14.; Delagoa Bay, 305 drms., £44.; Durban, 200 drms., £19.; Durban (F.), 100 drms., £11.; East London, 100 drms., £11.

COPPER OXIDE—
Paris, 2 cks., £55.

COPPER SALTS (*otherwise undes.*)
Adelaide, 1 cs. (pt.), £9.

COPPER SULPHATE—
Cape Town, 10 cs., £7.; Durban, 9 cs., £14.; East London, 1 t. 2 c., £36.; Pt. Elizabeth, 11 c., £17.

CREAM OF TARTAR—
Bombay (F.), 1 c., £8.; Delagoa Bay (F.), 5 c., £32.; Delagoa Bay, 1 c., £5.; East London, 2 c., £12.; Hango (F.), 4 c., £18.; Hobart, 1 t. 10 c., £126.; Hong Kong (F.), 1 c., £6.; Launceston, 1 t., £86.; Pt. Elizabeth, 1 c., £6.; Pt. Elizabeth (F.), 5 c., £21.

DISINFECTANTS (*otherwise undes.*)
Antwerp, 4 c., £9.; Barranquilla, 10 c., £19.; Bombay, 1 t. 12 c., £86.; Calcutta, 3 c., £42.; Cape Town, 6 t. 2 c., £145.; Colombo, 12 t. 3 c., £444.; Corinto, 9 c., £13.; Curacao, 9 c., £17.; Durban, 9 t. 2 c., £340.; Hong Kong, 1 c., £12.; Irish Free State, 6 t. 6 c., £102.; Jamaica, 6 t. 16 c., £176.; Karachi, 1 t. 3 c., £35.; Kobe, 11 c., £29.; Lagos, 16 c., £60.; Las Palmas, 1 t. 14 c., £54.; Matadi, 1 t. 4 c., £66.; Paris, 3 c., £10.; Penang, 1 t. 1 c., £33.; Puerto Colombia, 6 c., £26.; Santa Cruz, 1 c., £5.; Singapore, 1 c., £7.; Tangiers, 3 c., £11.; Toronto, 3 c., £38.

DYESTUFFS (ARTIFICIAL)—
Nigrosine
Adelaide, 4 cs., £60.
Unspecified
Bombay, 7 cs. (pt.), £26.; Canton, 1 cs. (pt.), £10.; Cochin, 1 brl., £37.; Comodoro Rivadavia, 1 cs. (pt.), £6.; Iquique, 1 cs., £11.; Melbourne, 1 cs., £6.; New York, 1 cs. (pt.), £8.; Sydney, 9 pkgs., 6 cs. (pt.), £170.

ETHER—
Demerara, 3 cs., £11.
Jamaica, 1 cs., £20.

ETHER (BUTYRIC)—
Melbourne, 1 cs. (pt.), £10.

ETHYL CHLORIDE—
Cape Town, 1 cs., £16.
Durban, 1 cs., £21.

ETHYL IODIDE—
Santander, 1 cs. (pt.), £6.

FERTILISERS (*otherwise undes.*)—
Barbados, 20 t., £197.; Boston, 1 t. 2 c., £29.; Cape Town, 12 c., £24.; Gothenburg, 1 t., £25.
Irish Free State, 5 c., £14.
San Jose, 1 t., £17.

FORMALDEHYDE—
Jamaica, 4 pkgs., £16.
Paris, 10 cks., £119.

GLYCERINE—
Bombay, 2 cs., £7.
New York, 51 t. 6 c., £2,600.
Sandakan, 1 c., £6.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
New York, 1 cs. (pt.), £12.
Sydney, 1 cs. (pt.), £8.

HYDROBROMIC ACID—
Melbourne, 1 cs., £7.

HYDROCHLORIC ACID—
Demerara, 1 c., £6.
Trinidad, 2 t. 2 c., £61.
Jamaica, 1 t., £48.

HYDROGEN PEROXIDE—
Alexandria, 8 cs. (pt.), £56.
Colombo, 10 cs., £68.
Jamaica, 3 cs., £18.

HYPOPHOSPHITE OF LIME—
Milan, 2 cs., £39.

IODIDES (*otherwise undescribed*)—
Bombay, 1 cs., £56.
Calcutta, 1 ck., £114
Naples, 4 cs., £284.

IODINE—
Bombay, 2 cs. (pt.), £26.
Buenos Ayres, 2 cs., £207.
Paris (F.), 20 kgs., £2,000.

IODINE (RESUBLIMED)—
Alexandria, 10 pkgs. (pt.), £67.
Bilbao, 1 cs. (pt.), £21.
Melbourne, 1 cs. (pt.), £14.

IRON AMMONIUM CITRATE—
Alexandria, 10 pkgs. (pt.), £25.
Bombay, 12 cs. (pt.), £46.
Calcutta, 2 cs., £38.

IRON PERCHLORIDE—
Canton, 1 cs., £6.
Madras, 5 cs., £9.

IRON SULPHATE—
Calcutta, 3 cks., £14.

LACTIC ACID—
Mossel Bay (F.), 13 cks., £99.
Rotterdam (F.), 2 brls., £13.

LEAD ACETATE—
Bangkok, 1 cs., £6.; Beira (F.), 40 kgs., £86.; Boulogne, 15 brls., £160.; Delagoa Bay (F.), 60 kgs., £129.; Fremantle, 4 cks., £16.

LEAD ARSENATE—
Melbourne, 30 drms., £143.
Supe, 50 drms., £240.

LEAD CHROMATE—
Melbourne, 10 cks., £30.

LEAD HYPOSULPHITE—
Kuala Lumpur, 3 brls., £24.
Melbourne, 4 cks., £86.

LEAD NITRATE—
Rouen, 8 cks., £81.

LEAD SULPHATE—
Paris, 6 cks., £73.

MAGNESIA—
Beira, 2 cs., £5.; Calcutta, 1 cs., £6.; Sydney, 10 cs., £24.; Wellington, 30 cs., £72.

MAGNESIA (CALCINED)—
Vera Cruz, 1 cs., £15.

MAGNESIA (HYDRATED)—
Alexandria, 5 cs. (pt.), £12.

MAGNESIUM CARBONATE—
Beira, 2 cs., £13.
Vera, 5 cs., £21.

MAGNESIUM CHLORIDE—
Irish Free State, 58 bgs., £100.

MAGNESIUM CITRATE—
Calcutta, 2 cs. (pt.), £13.
Las Palmas, 1 cs., £6.
San Jose, 2 cs., £10.

MAGNESIUM SULPHATE—
Acajutla, 10 c., £11.; Accra, 10 c., £13.; Aden, 4 c., £5.; Beyrout, 4 c., £5.; Bombay, 13 c., £23.; Colon, 10 c., £14.; Cuidad Bolivar, 12 c., £10.; Delagoa Bay, 6 c., £8.; Durban, 14 c., £18.; East London, 1 t. 9 c., £42.; Jaffa, 10 c., £13.; Melbourne, 1 t. 2 c., £26.; Monte Video, 3 c., £9.; Mormugao, 11 c., £14.; Panama, 11 c., £20.; Pt. Elizabeth, 11 c., £24.; Puerto Colombia, 5 c., £7.

MANGANESE BORATE—
Paris, 7 c., £30.

MANGANESE HYPOPHOSPHITE
Melbourne, 4 cs. (pt.), £20.

MANGANESE SULPHATE—
Sydney, 4 cks., £57.

MERCURIALS—
Bombay, 2 cs. (pt.), £27.
Calcutta, 2 cs., £25.

MERCURY BICHLORIDE—
New York, 4 cs., £32.

MERCURY CHLORIDE—
Sydney, 5 cs., £200.

MERCURY OXIDE—
Sydney, 4 cs., £43.

METHYL SALICYLATE—
Auckland, 1 cs. (pt.), £8.
Sydney, 2 cs., £18.

NITRIC ACID—
Bombay, 3 c., £15. ; Shanghai, 7 c., £38. ; Smyrna, 2 c., £9.

OXALIC ACID—
Piraeus, 2 cks., £35.

PHOSPHORIC ACID—
Fremantle, 4 cs., £11.
Melbourne, 4 cs., £10.
Shanghai, 1 cs., £5.

POTASSIUM ACID PHTHALATE—
Calcutta, 1 cs., £7.

POTASSIUM BICARBONATE—
Colombo, 15 cks., £63.

POTASSIUM BROMIDE—
Melbourne, 1 kg., £6.

POTASSIUM CITRATE—
Alexandria, 10 pkgs. (pt.), £28. ; Bombay, 10 cs. (pt.), £50. ; Calcutta, 4 cs., £31. ; Melbourne, 1 cs. (pt.), £6.

POTASSIUM CYANIDE—
Calcutta, 3 cs., £45.

POTASSIUM HYDRATE—
Sydney (F.), 1 cs., £14.

POTASSIUM IODIDE—
Bombay, 4 cs. (pt.), £356. ; Brussels, 1 cs., £74. ; Calcutta, 3 cs., £263. ; Durban, 1 cs. (pt.), £6. ; Melbourne, 3 cs. (pt.), £202. ; Naples, 2 cs., £86. ; Sydney, 1 cs., £90. ; Tangier, 6 cs. (pt.), £5.

POTASSIUM NITRITE—
Sydney, 1 cs., £6.

POTASSIUM PERMANGANATE—
Colombo, 1 drm., £5.

POTASSIUM PRUSSIATE—
Antwerp, 5 cks., £95. ; Bilbao, 2 kgs., £32. ; Hamburg, 122 cks., £2,125. ; Paris, 5 kgs., £49. ; Piraeus, 3 cks., £58.

PRUSSIAN BLUE—
Irish Free State, 4 drms. (pt.), £6.

ROCHELLE SALTS—
Acajutla, 1 kg., £5.
Bangkok, 1 cs., £8.

SALAMMONIAC—
Hong Kong, 5 cks., £8.

SALICYLATES (*otherwise undes.*)—
Sydney, 6 cs. (pt.), £116.

SALICYLIC ACID—
Shanghai, 1 cs., £11.

SALTPETRE—
Beira, 6 c., £13. ; Colombo, 3 c., £6. ; Delagoa Bay, 3 c., £7. ; Durban, 5 c., £10. ; Fremantle, 1 t., £41. ; Irish Free State, 2 t. 6 c., £91. ; Rio de Janeiro, 2 t. 5 c., £99. ; Sydney, 7 t., £285.

SHEEP DIP—
Buenos Ayres, 23 t. 2 c., £800.
Irish Free State, 1 t. 4 c., £54.

SODA—
Mauritius, 15 c., £7.

SODA ASH—
Limbe, 9 c., £10.
Townsville, 20 t. 4 c., £162.

SODIUM ACID PYROPHOSPHATE
Fremantle, 2 t., £154.

SODIUM ARSENITE—
Durban, 4 t. 19 c., £343.

SODIUM BENZOATE—
Calcutta, 9 c., £117.
Paris, 10 c., £127.

SODIUM BICARBONATE—
Acajutla, 10 c., £15. ; Alexandria, 1 t. 13 c., £64. ; Bombay, 2 c., £6. ; Colombo, 2 c., £6. ; Cuidad Bolivar, 1 t., £11. ; Delagoa Bay, 8 c., £12. ; Durban, 18 c., £25. ; Monte Video, 3 c., £11. ; Panama, 5 c., £8. ; Pt. Elizabeth, 1 t. 10 c., £45. ; Puerto Colombia, 5 c., £7.

SODIUM BISULPHITE—
Monte Video, 1 t., £20.
Paris, 10 c., £10.

SODIUM BROMIDE—
Melbourne, 3 c., £15.

SODIUM CARBONATE—
Copenhagen, 1 t. 1 c., £20.
Hong Kong, 2 c., £8.
Osaka, 1 t., £18.

SODIUM CITRATE—
Bombay, 2 c., £20. ; Calcutta, 2 c., £16. ; Melbourne, 2 c., £19.

SODIUM FLUORIDE—
Durban, 2 c., £6.

SODIUM HYPOPHOSPHITE—
Milan, 2 c., £45.

SODIUM HYPOSULPHITE—
Irish Free State, 5 cs., £40.

SODIUM IODIDE—
Bilbao, 1 cs. (pt.), £29.
Naples, 3 c., £295.

SODIUM PRUSSIATE—
Antwerp, 1 t., £50.
New York, 10 t., £466.

SODIUM SALICYLATE—
Colombo, 2 t. 5 c., £221.

SODIUM SALTS (*otherwise undes.*)
Beyrout, 1 cs. (pt.), £9.
Perth, 10 c., £12.

SODIUM SILICATE—
Townsville, 3 t., £29.

SODIUM SULPHATE—
Barbados, 17 kgs., £6. ; Bombay, 6 cs., £8. ; Cuidad Bolivar, 10 kgs., £9. ; Colombo, qnty. ; Irish Free State, 9 pkgs., £45. ; Perth, 10 c., £9.

SODIUM SULPHIDE—
Brisbane, 5 t. 10 c., £74. ; Hobart, 2 t. 3 c., £30. ; Lyttleton, 4 t. 10 c., £60. ; Rotterdam, 5 t. 4 c., £78.

SODIUM SULPHITE—
Hong Kong, 3 c., £15. ; Norrkoping, 5 t., £123. ; Pt. Elizabeth, 10 c., £8. ; Sydney, 1 t., £26. ; Adelaide, 5 c., £17. Bombay, 4 c., £20.

SULPHUR—
Durban (F.), 2 c., £7. ; Irish Free State, 8 c., £7. ; New York, 2 t., £70. ; Puerto Colombia (F.), 8 c., £11.

SULPHUR (FLOWERS)—
Jamaica (F.), 5 c., £6.

SULPHURIC ACID—
Accra, 4 c., £12. ; Beira, 1 t., £21. ; Colombo, 7 c., £28. ; Demerara, 12 t. 4 c., £234. ; Gibraltar, 1 t., £17. ; Pt. Sudan, 1 t. 5 c., £25. ; Sekondi, 1 t. 18 c., £38.

SUPERPHOSPHATE—
Channel Islands, 115 t., £446.

TARTARIC ACID—
Acajutla, 1 c., £8. ; Aden (F.), 1 c., £6. ; Brisbane, 1 t. 10 c., £180. ; Delagoa Bay (F.), 2 c., £17. ; Demerara, 1 cs., £6. ; Hango (F.), 4 c., £28. ; Hobart, 1 t. 5 c., £150. ; Hong Kong, 1 c., £10. ; Irish Free State, 5 c., £29. ; Melbourne, 2 t. 10 c., £300. ; Pt. Elizabeth, 1 c., £8. ; Puerto Colombia, 1 c., £9. ; Shanghai, 3 c., £18. ; Sydney, 1 t. 10 c., £180. ; Yokohama, 5 t., £600.

ZINC OXIDE—
Hong Kong, 2 kgs., £6.
Petrograd, 10 t. 13 c., £444.

Week ending December 8.

BEESWAX—
Buenos Ayres, 1 t.
Montreal, 1 t. 10 c.

FERTILISER (DRIED BLOOD)—
Canary Islands, £238.

FULLER'S EARTH—
Christiania, 50 t. ; Danzig, 10 t. ; New Orleans, 425 t.

GELATINE—
Delagoa Bay, 1 c. ; Durban, 2 c. ; Karachi, 1 t. 1 c. ; Limon, 1 c. ; Madras, 15 c. ; New Plymouth, 1 c. ; Pt. Elizabeth, 1 c. ; Toronto, 1 t. ; Yokohama, 2 t. ;

GLUE AND SIZE—
Calcutta, 4 t. ; Copenhagen, 1 t. 10 c. ; Dar-es-Salaam, 5 c. ; Durban, 6 c. ; Helsingfors, 50 t. ; Irish Free State, 5 c. ; Karachi, 4 c. ; Lagos, 1 c. ; Lisbon, 3 c. ; Madras, 2 c. ; Mauritius, 1 c. ; Montreal, 5 t. ; Melbourne, 2 t. ; Nelson, 2 c. ; New York, 5 t. ; Paris, 53 t. 15 c. ; Pt. Elizabeth, 12 c. ; Riga, 1 t. ; Rotterdam, 11 c. ; Shanghai, 4 t. ; Sydney, 5 t. 6 c.

PITCH (STOCKHOLM)—
Durban, 10 c.

PLUMBAGO—
Abo, 1 t. ; Bombay, 4 c. ; Buenos Ayres, 11 c. ; Calcutta, 1 t. ; Gothenburg, 10 c. ; Iquique, 9 c. ; Madras, 15 c. ; Malaga, 14 c. ; Mauritius, 2 c. ; Naples, 6 c. ; Valencia, 1 t. 15 c.

QUININE—
Beyrout, 1,126 oz. ; Bombay, 3,715 oz. ; Calcutta, 1,000 oz. ; Melbourne, 200 oz. ; Rangoon, 104 oz. ; Sydney, 3,400 oz. ; East London, 1 t. 10 c. ; Hong Kong, 6 c. ; Jaffa, 3 c. ; Madras, 1 t. 2 c. ; Matadi, 6 c. ; Rangoon, 10 c.

SOAP—
Alexandria, 1 t. 11 c. ; Amsterdam, 6 c. ; Bilbao, 3 c. ; Brussels, 1 t. 3 c. ; Bombay, 16 t. 17 c. ; Buenos Ayres, 13 c. ; Calcutta, 14 t. 5 c. ; Colombo, 11 c. ; Cape Town, 6 c. ; Christiania, 2 c. ; Irish Free State, 1 c. ; Delagoa Bay, 4 c. ; Durban, 16 c. ; East London, 15 c. ; Italy, 2 c. ; Hong Kong, 6 c. ; Jamaica, 9 t. 11 c. ; Kilindini, 1 t. 9 c. ; Libau, 1 c. ; Madras, 13 c. ; Malta, 2 c. ; Mauritius, 5 t. 12 c. ; Melbourne, 10 c. ; Mahanoro, 5 c. ; Montreal, 3 c. ; Paris, 1 t. ; Pasages, 1 c. ; Penang, 2 c. ; Philadelphia, 1 c. ; Pt. Elizabeth, 2 t. ; Pt. Said, 4 c. ; Rangoon, 8 c. ; Riga, 3 c. ; Rotterdam, 6 c. ; St. John (N.B.), 1 c. ; Stockholm, 1 c. ; Shanghai, 17 c. ; Singapore, 16 c. ; Sydney, 2 t. ; Talcahuano, 11 c. ; Timaru, 1 t. 1 c. ; Toronto, 1 t. 6 c. ; Trinidad, 14 t. 4 c. ; Valparaiso, 9 c. ; Vancouver, 2 c. ; Victoria (B.C.), 1 c. ; Wellington, 19 c.

SUPERPHOSPHATE—
Canary Islands, 5 t.

TALLOW—
Genoa, 57 t. 11 c. ; Paris, 10 t. 3 c. ; Rotterdam, 87 t. 11 c.

WHITE LEAD—
Auckland, £272. ; Calcutta, £620. ; Colombo, £120. ; Dunedin, £407. ; Durban, £134. ; Irish Free State, £14. ; East London, £63. ; Lyttleton, £218. ; Manila, £14. ; Melbourne, £860. ; Napier, £84. ; Pt. Elizabeth, £120. ; New Plymouth, £137. ; Shanghai, £78. ; Sydney, £636. ; Timaru, £98. ; Wellington, £2,060.

WAX (MINERAL)—
Antwerp, 1 t. ; Sydney, 2 t.

WAX (VEGETABLE)—
Boulogne, 2 c. ; Valencia, 12 c.

WAX (*otherwise undescribed*)—
Petrograd, 5 t.

MANCHESTER.

Week ending December 6.

AMMONIUM SALTS (*otherwise undescribed*)—
Helsingborg, 24 pkgs.

AMMONIUM SULPHATE—
France, 3,859 bgs.

CHEMICALS (*otherwise undescribed*)
Abadan, 789 drms.
Bombay, 5 drms.
Copenhagen, 1 kg.

COAL TAR PRODUCTS—
Carbolic Acid
Denmark, 30 drms.
Mirbane Oil
Hamburg, 2 drms.
Pitch
St. Nazaire, 1,216 t.
Tar
Alexandria, 31 drms.

DYESTUFFS (ARTIFICIAL)—
Alizarine
France, 18 cks.

GELATINE—
Toronto, 20 bgs.

GLUE AND SIZE—
Alexandria, 100 bgs.
Gothenburg, 1 ck.
Haifa, 10 bgs.

MAGNESIUM SALTS (*otherwise undescribed*)—
France, 202 bgs.

SALT—
Gothenburg, 1,018 sks.
Helsingborg, 3,692 sks.
Malmo, 25 t., 35 brls., 2,800 sks.

SOAP—
Abadan, 28 cs. ; Baghdad, 169 cs. ; Basrah, 20 cs. ; Bushire, 10 cs. ; Holland, 25 cs. ; Jaffa, 25 bxs.

SODIUM SALTS (*otherwise undes.*)
Italy, 100 bgs.

TALLOW—
Holland, 4 cks., 1 brl.

NEWCASTLE-ON-TYNE

Week ending December 8.

AMMONIA—
San Francisco, 250 bgs.

BARYTES—
New York, 100 t.

BLEACHING POWDER—
Copenhagen, 3 cks. ; Gothenburg, 68 cks. ; Gothenburg, 97 cks. ; Rotterdam, 90 cks.

CAUSTIC SODA—
Bergen, 104 drms. ; Copenhagen, 147 drms. ; Christiania, 113 drms. Gothenburg, 94 drms.

CHEMICALS (*otherwise undescribed*)
Christiania, 1 cs.

COAL TAR PRODUCTS—
Tar
Bergen, 1,607 bgs.

GLUE—
Copenhagen, 10 bgs.

LITHARGE—
Antwerp, 10 cks. ; Christiania, 44 cks. ; Gothenburg, 1 ck. ; Hamburg, 200 kgs., 1 bx.

MAGNESIA—
Antwerp, 60 cs., 100 bgs.
Hamburg, 1 cs.
New York, 17 cs.

PITCH (*otherwise undescribed*)
Christiania, 3 cks.

RED LEAD—
Antwerp, 140 kgs. ; Christiania, 17 cks. ; Copenhagen, 24 cks. ; Gothenburg, 8 cks. ; Hamburg, 160 kgs. ; Rotterdam, 134 cks.

SOAP—
Christiania, 1 ck.

SODIUM HYPOSULPHITE—
Copenahgen, 10 bgs.

TALLOW—
Pomaron, 6 brls.

ULTRAMARINE—
Hamburg, 1 cs.

WHITE LEAD—
Antwerp, 100 kgs., 15 cks.
Rotterdam, 84 cks.

ZINC ASHES—
Antwerp, 230 bgs.

N. & S. SHIELDS.

Week ending December 8.

NIL.

PRICES CURRENT.

WEDNESDAY, DEC. 12, 1923.

Prepared by Messrs. Higginbottom & Co., 21, Spring Gardens, Manchester.

The values stated are f.o.r. at makers' works, but it must be understood that the prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."
Our Telephone Numbers are—

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CHRISTMAS HOLIDAYS.—Owing to the incidence of the Christmas holidays, the "Chemical Trade Journal and Chemical Engineer" will next week be published a day later.

CURRENT TOPICS.

PLATINUM IN THE TRANSVAAL.

THE recent discovery of platinum in lode form in the Waterberg district of the Transvaal has aroused a great deal of interest, both on account of the unique nature of the find and of the great economic possibilities that are opened up to the Union and to the British Empire in general. Ninety-nine per cent. of the world's output of platinum metals has in the past been recovered from alluvial placer deposits, and the occurrence of the metals in quartz lode, as is now found to be the case in the Transvaal, has not hitherto been recognised. Two principal lodes have been discovered, running, roughly, parallel, and at an average distance apart of 150ft. These lodes vary in width from 2ft. to 20ft., and intensive sampling of the outcrop has proved them to be continuous for a distance of 3,000yds. The first figures, showing the remarkable richness of the samples as given in the assayer's reports, were, naturally, received with scepticism. Repeated sampling at all parts of the outcrop has, however, proved the constant occurrence of platinum in varying, but always in commercially attractive amounts, and there is little doubt from the keen interest many of the Rand gold-mining houses are showing in the work, that capital for the development of the field will be forthcoming. Before the war the average annual production of platinum metals was 176,000 ounces, of which amount Russia was responsible for 89 per cent., and Colombia for 9 per cent. During the war, and mainly owing to the political state of Russia, the output dropped markedly, and in 1920 the world's total output was 73,435 ounces, to which Russia and Colombia each contributed 47½ per cent. The total output of the British Empire in 1920 was only 2,822 ounces, but since that date a small amount of by-product osmiridium has come from the Witwatersrand. The efforts that have been made during the past year to revive the Russian platinum industry have not led to any definite results, and recent information shows that considerable extension in Russian output can hardly be expected in the near future. Consequently, the prices of platinum and its allied metals remain very high. Thus, platinum itself, the price of which before the war averaged about 185s. per ounce, is now quoted at £29.

per ounce. If continued investigation and working confirm the results obtained in the Transvaal outcrop, an annual production of at least 100,000 ounces of the metal may be expected, and it is obvious that present prices cannot be maintained. One authority predicts a drop to the neighbourhood of £10. per ounce, and also states that even if the price fell to £5. per ounce there would still remain a high percentage of profit over mining costs. The exploitation of the Transvaal deposits will be followed with the greatest interest by the chemical industry, to which the prospects of cheaper and more plentiful platinum supplies are particularly important.

ROAD TRANSPORT OF DANGEROUS CHEMICALS.

In January of this year we directed attention in these columns to the necessity for the formulation of a code of regulations to govern the transport of dangerous chemicals by road, in a manner similar to that adopted for the rail transport of such goods. The matter arose in connection with a fire which broke out on a motor-lorry conveying a number of drums of carbon bisulphide from London to Manchester. Fortunately, the conflagration occurred in the open country, and the damage was confined to the destruction of the lorry and its contents; but, as we pointed out at the time, it is very probable that had the accident occurred in the streets of a town, the damage would have been very much greater. A sequel to this fire transpired in Manchester this week, when Mr. Commissioner Radcliffe, K.C., heard the claim of T. Paulding, Ltd., the owners of the bisulphide, against the Talbot Clearing House, the contractors to whom they entrusted the carriage of the bisulphide, for £260. damages for breach of contract and negligence. Judgment was given for the plaintiffs, and from the evidence brought forward at the hearing it is difficult to quarrel with the judgment. It appears that the plaintiffs instructed the defendants that the goods were of a dangerous nature, that the drums should be securely fastened, and that no drums should be accepted which showed any signs of leakage. It was then shown by the evidence that the defendants, although they may have given a similar warning to the sub-contractors they employed, did not take adequate measures to ensure the instructions being carried out, for on the day the bisulphide was loaded on the lorry two of the drums were leaking. The whole matter possesses a far wider interest, however, than the mere settlement of the differences between the litigants, and the fact that the issue in this instance was not complicated by extensive third-party claims must not be allowed to obscure the public-safety aspect of the incident. It is not sufficient that regulations for the road transport of such highly inflammable and toxic materials as carbon-bisulphide be left to the discretion of the consignors—although in this case it must be stated the latter did stipulate reasonable precautions,—but it is essential that official regulations, applicable to every case where dangerous chemicals have to be transported any distance by road, be promulgated without delay.

OVERSEAS TRADE IN NOVEMBER.

The outstanding feature of the Board of Trade returns for November is that the value of imports is the highest monthly figure since January, 1921. Compared with October, the increase amounts to less than £1,000,000., but analysis of the figures reveals that whereas imports of manufactured goods were lower, raw materials and food products increased. Total exports, on the other hand, fell from £82,470,000. in October to £75,939,000. in November, increasing the trade balance to £25,646,000., the highest "adverse" figure for the past twelve months. Many factors have contributed to the erratic nature of the returns for this year—the return to normal after the depression and succeeding activity due to the dockers' strike, the unsettling effects of the possibilities contained in the recent general election, the continued political unrest in Europe and the Far East, all have affected the flow of British foreign trade. Comparison with last year is somewhat difficult in view of the change in the status of Ireland, which places that state in the list of foreign countries. Unfavourable though the position is so far as it is indicated by the November statistics, a review of the trade during the year shows that the improvement observed during 1922, as compared with 1921, is not maintained. For the eleven months of 1923, imports increased by 8.8 per cent., compared with the corresponding period of 1922, while exports of British goods increased only by 6.3 per cent. Total exports, which includes transhipments of foreign and colonial merchandise, rose by 7.2 per cent. in the same period. The fact that we are exporting a greater percentage of raw materials than in former years appears to indicate that foreign countries are purchasing these materials in order to manufacture goods which could be produced in this country. Such a policy steadily pursued is bound ultimately to reduce us to the position of merely exporting capital, in the form of coal, etc., and of acting as merchants only in other branches of the world's commerce.

BANKRUPTCY LAW REFORM

For many years the conviction has been steadily growing among business men that the Bankruptcy Acts are in need of considerable amendment, and that the losses sustained by the trading community in connection with bankruptcy and other insolvency are swollen by fraudulent, hazardous, and speculative trading. Concrete expression has been given to this general opinion by the findings of a sub-committee of the executive council of the Association of British Chambers of Commerce. The members of this committee include many well-known leaders in the business world, and it is the intention of the body to draw up a case to be presented to the President of the Board of Trade. The principal alterations in the 1914 Act that the committee propose are the extension from 6 months to 12 months of the period within which a person, if he commits the offences set out in the sub-section of section 154 of the Act, shall be guilty of a misdemeanour, and the addition of a further number of misdemeanours under the section.

THE PROGRESS OF THE OPIUM INDUSTRY.

MODERN CONDITIONS AND NEW SOURCES OF SUPPLY.

By John Missenden.

POST-WAR statistics and investigations do not show any decline in the manufacture and quality of opium; on the contrary, there seems to be a general uplift for which it would be difficult readily to account. Not only has the industry improved on the points mentioned, but the sciences of growing, extraction, and preparation have, in the main, reached a higher degree.

The facts contained in this article are correlated from industrially recognised sources—home and foreign—and it will be seen that prominence has been accorded to those newer spheres of production whose finished results seem to supersede, in many respects, the materials which are now purchased for pharmacological manufacture at home.

Grading in the Indian Opium Trade.

These data are based upon the percentage of morphine contained in the raw product. Three grades of opium are recognised:—*prime*, which represents the high-grade substances used in medicinal preparations; *current*, which forms the greatest bulk of export qualities; and *chiqinti*, which is the cheapest grade, and which is almost confined to the manufacture of smoking opium.[1] The prime and the more important classes of current (*i.e.*, those suitable for pharmacy) will be dealt with here.

The "Malwa" Varieties.—Opium being one of India's most important products is now of fairly high grade. The two classes of poppy chiefly cultivated are the "Malwa" (purple flower) and the "Bengal" (white flower). The former is grown mainly on the slopes of the Vindhya Hills, in the Malwa district, and in Rajputana, where the climate is fairly uniform. The industry has developed greatly during the last few years owing to the recent establishment of railway communications between the markets of Indore, Bhopal, and Jodhpur, and the distributing firms in Karachi and Bombay. The latter class is grown in North Bengal and the Bautan district.

The main exports to England are of the "Malwa" class, and take the form of balls, each six inches in diameter and containing 30 per cent. of moisture. These balls are covered with prepared poppy-leaves made to adhere to the ball by an opium-containing liquid which is easily removed. A case consists of 40 balls with a net weight of 160lb., the whole being well packed in poppy waste. The other class which is exported from the Allahabad region ("Benares") is packed in paper bags, with a moisture content of 13.5 per cent. The cases, which contain 80 cakes, have also a net weight of 160lb. Discrimination should always be made between the standard product examined by Government officials and the poor-quality product manufactured in certain uncontrolled factories—the latter not being uniform, containing only 5 to 6 per cent. of moisture, and having an extremely low morphine value. This latter substance is known as "native Malwa," and really belongs to the chiqinti class. The morphine content for "Government Malwa" should be at least 7 per cent., while a fair average is 8 per cent. The official laboratories export small quantities of high-grade morphine salts at quite reasonable prices: the hydrochloride and sulphate at 4 rupees and the tartrate at 4¼ rupees per 10 grammes. Developments in this branch are anticipated.

Akmim Product.—This quality is somewhat inferior, and it is questionable whether even the lower price is sufficient to make its purchase profitable. Experts believe, however, that were the regulations now ruling in India generally adopted and were more earnest measures taken to render production truly scientific, considerable improvements would result. The poppy grown is of the white variety, and the districts under cultivation are Assiout, Akmim, and Kenneh. Undoubtedly the best grade is produced in the Akmim region, about 300 miles south of Cairo. Some idea of the possibilities of development may be gathered from the fact that an experimental crop grown in the neighbourhood of Assiout showed a morphine content of 13.3 per cent., while the usual commercial averages are: Assiout, 0.5 to 1.0 per cent.; Kenneh, 3.3 to 3.9 per cent.; and Akmim, 7.0 to 7.4 per cent.

Australian Opium.

The general tone of opium production in Australia is quite sound, and a wide range of specimens provided promising results. The oldest district is that of Bacchus Marsh (Victoria), which yields three successive crops each season. There is much room for improvement, however, as the output is comparatively low,[2] while the chemical analysis shows: morphine, 2.7 per cent.; and narcotine, 10.3 per cent. The commercial material from Queensland contains 11.2 per cent. of morphine, 2 per cent. of meconic acid, and 2.3 per cent. of narcotine.[3] An experimental crop gave 13 per cent. of morphine. Export is in balls, 35 to a case of 120lb., the packing being similar to the Indian Government "Malwa."

The Smyrna and Constantinople Markets.

From a commercial viewpoint the substance obtained from Asia Minor is probably the richest in the world, but its one great drawback is that there is little or no uniformity in the trade. Small areas of land are cultivated independently by thousands of the peasant population. Their open market is at Constantinople, and no attempt at co-ordination between the producers is made nor has any standard been fixed. The proposal has been put forward to form a trading-market at Tarsus (the one at Smyrna not now being used for heavy traffic), but no definite plans have been made.[4]

The product obtained from Smyrna and Constantinople is the familiar "Turkey opium," and is derived from a purplish-white flower which Boissier named *glabrum*[5]—which of all the opium poppies is probably the species demanding the greatest attention and skill in manipulation. The trading procedure in the Konia district may be of interest as illustrating the lack of organisation throughout the States. After the hardened juice has been scraped from the flowers, it is dried, and then made up into masses of any convenient size and shape for transport to the dealers. These people reduce the product and put it into bags for the market. At the market a public examiner is supposed to scrutinise the pieces carefully to give them their grading, but it is known that much of the opium does not come under the notice of these men; this accounts for the large number of complaints made both before and since the war.

The export product is generally made up into spheres of anything from ¼lb. to 4lb., and may be covered by poppy-leaves, a form of cheap absorbent paper, or chaff of extremely doubtful origin. Also, now that Constantinople has to deal with the bulk of the Smyrna trade, the less valuable products of Karahissar, Konia, Bulladan, and Afium often pass with the good. "Current Angora" and the old "prime Smyrna" (now called "prime Insparta," I understand) are good grades to purchase for medicinal purposes, although original "Tikvish and Yerli primes" are better if they can be obtained at a reasonable price. Tikvish contains 13.7 per cent. of morphine; Yerli, 13.4 per cent.; Konia, 10.5 per cent.; while the moisture varies from 10 to 25 per cent. Should any one specimen contain less than 9.5 per cent. of morphine adulteration may be suspected; in fact, it is wiser to suspect every piece until it has been proved genuine. One very reputable manufacturer—a man who has been in the trade over thirty years—once sent a consignment to England, each cake of which contained 15 per cent. of sand. The products from these districts must always be looked upon with suspicion.

Opium from China and Persia.

The opium production of China is wholly absorbed by the Chinese population, and export is practically nil as far as England is concerned. The opium is of low grade, containing 5.5 per cent of morphine and 20 per cent. of moisture.

Although Persia's reputation as an opium manufacturing country has not been a very good one, the quality of the drug has, in recent years, improved enormously. In the old days a considerable amount of adulteration took place, while cultivation was careless and generally unsatisfactory. Now, however, the industry has been put on a firmer basis, inasmuch as cultivation is along recognised scientific lines, adulteration is decreasing, and greater care is being exercised in the packing for export. On the subject of adulteration, it may be stated that quantities of the Persian drug sent to England were found to have a heavy content of grape-juice, and, in some cases, of tragacanth. It cannot be over-emphasised, therefore, that business should be solely confined to those exporters whose reputations are unquestionable.

If the "Kupa opium" can be obtained in sufficient quantities, so much the better, as it has an excellent name; but if this is found too scarce (the price is sure to be high, in any case), the "Balfarush" and "South Kerman" are quite good varieties, although the latter sometimes has an

admixture of *Penæa mucronata* resin and crushed poppy capsules. Some specimens from Kermanshah showed a grape-juice content of 53.6 per cent. The amount of moisture is remarkably uniform at 10 per cent., while morphine is usually present from 7.5 per cent. to 12.5 per cent. The original *Teriak-e-Arabistani* is now seldom heard of, although the name still covers most of the product from Persia.

European Efforts.

Production of opium in Europe has hardly passed the experimental stage as yet; but at the same time, some astonishingly good results have been obtained, especially in France and Germany. In England, there are hardly any manufactories and very few experimental stations, although the soil and weather conditions are good in some places. The experimental products of France compete most favourably with those of Asia Minor in morphine; the "affium" of Clermont-Ferrand being said to contain 10 per cent. morphine in the amorphous product.[6] A specimen examined by Gulborte[7] contained as much as 22.8 per cent., while averages as high as 17 per cent. are common. There seems to be great promise in this direction. The German specimens showed the following results: Wurtemburg, 12 to 15 per cent. morphine; Erfurt, 16 to 20 per cent. Some attention should be paid, also, to the possibilities in Russia. Specimens show a morphine content of about 8.2 per cent. (amorphous), produced in the Ssemiretschinsky district. Activities in other quarters are producing similar favourable results.

It should be added that as the poppy is a plant which does not manufacture either tannin or starch, the presence of these in an opium sample makes adulteration an established fact.

Practical Tests for Morphine.

Since the morphine content invariably exists in the form of morphine sulphate and morphine meconate, the usual practice is to extract these salts with water, the residue being the "opium dirt" recognised in China. A method described by Gregory is, perhaps, the best for purposes of separation, it being extraordinarily simple and certainly the cheapest for commercial purposes. The raw product is broken down as much as possible and mixed with water at a temperature of about 60° C. (the best proportions are: 6 pints of water to 4lb. of raw opium) and 1½lb. of precipitated chalk is added. The whole should now be violently agitated for a short time and evaporated until it becomes appreciably viscous. Calcium chloride to the extent, say, of 5 or 6 oz. can be added, and the whole is diluted with water until a temperature of 60° C. is again reached. Filtration will separate calcium meconate, "dross," and any adulterants, either as resins or calcium salts. Particular notice should be taken of the "dross," as this also may contain some impurities.

The concentrated filtrate will show morphine and codeine hydrochloride crystals, from which a mixture of morphine and codeine may be obtained by subsequent treatment with "ammoniated charcoal." Final separation may be effected by ether, codeine being more soluble therein than morphine. The residue so precipitated can be examined, and some idea of the raw product content be obtained. It is essential, however, that care be taken to remove *all* the codeine, while the "dross" should be subjected to expert analysis when a new batch of raw product is being broken down.

Several fluids can be used for the testing of samples. One is a solution of *pure* sulphuric acid, a little of which is added to about an ounce of the raw material. The mixture should then be warmed very gently, and a brownish liquid will result, the intensity of which (providing standard solutions are used) gives ample indication of the percentage morphine content. The author has used a card so coloured in sections that it corresponds to 2.5 per cent. increases, using one ounce of raw product and six ounces of five per cent. sulphuric acid solution (chemically pure), at a maximum temperature of 50° C. The error is seldom above one per cent., and, providing care has been taken, accuracy to within 0.5 per cent. is usual.

Similar results can be obtained by using C.P. nitric acid solution (ruby colouration which is not so easy to read, the colour having a narrow range), and C.P. ferric chloride solution (blue colouration which is generally too deep to be effective, even with artificial light). The iodine test which is so often used cannot be recommended for the joint purposes of detection and estimation.

Occasionally, owing to the liberation of hydrochloric acid through some cause, apomorphine (emetic) is produced. Should this be suspected, a small quantity of the material should be exposed to the air for a day or so, and then subjected to the fumes of ammonia. The presence of the emetic will be apparent upon the appearance of a green colouration which changes to red upon exposure to air. Pseudomorphine (inactive) is identified in a similar way.

Tincture of Opium and Codeine.

Where import is in liquid form, the morphine content may be obtained in the following way: Add five grammes of calcium hydroxide to 45 c.c. of concentrated tincture, and dilute to 20 c.c. with pure water. Filter, and add 100 c.c. of ether, 30 c.c. of 85-per-cent. alcohol, and 12 grammes of sal ammoniac (C.P.). Agitate the mixture for an hour or so, and allow to stand for several days. The morphine crystals can then be collected. Providing no losses have occurred, a good tincture would yield 1 gramme per 100 c.c. of resulting liquid after test. This method of import is not, however, to be recommended.

Codeine.

The preparation of codeine has been explained *ut sup.* A rough estimation of the codeine content may be made by a similar method to that applying to morphine. But whereas, in the morphine test, the colouration produced by ferric chloride is destroyed by the addition of sulphuric acid, a solution of codeine and sulphuric acid will give a medium blue colouration when a trace of ferric chloride is added. This is the only satisfactory test yet devised.

References:—

[1] These terms correspond with the "shipping," "druggists," and "manufacturing" grades respectively.

[2] Official estimates (for raw products) are as follows:—

Australia	15—25lb. per acre.
China	22—24lb. per acre.
India	30—40lb. per acre.
Europe	25—30lb. per acre.

[3] This is an improvement on the results shown in 1900, when the content was 1.9 per cent. of morphine and 9.3 per cent. of narcotine.

[4] A British firm advanced the idea last May, but certain Turkish industrialists opposed it, eventually causing their Government to withdraw a half-given consent.

THE HISTORY OF FERMENTATION.

S.C.I. DISCUSSION AT NOTTINGHAM.

At a meeting of the Nottingham Section of the Society of Chemical Industry on December 12, Professor A. R. Ling gave a lecture entitled "Some Points in the History of Fermentation, particularly as applied to the Brewing Industry."

Three Main Epochs.

It was shown that certain fermentations, such as the making of wine from rice and bread from wheat in China (2,000 B.C.), and the preparation of beer from barley in Egypt (4th Dynasty), had been known since the earliest times. The lecturer then dealt with the modern history of fermentation, and indicated three epochs, commencing with the chemical epoch in which Stahl propounded the theory that a ferment was a body in an active state of motion which it was capable of communicating to other bodies. Lavoisier, Gay Lussac, Leeuwenhoek, Schwann, Berzelius, Wöhler, and Liebig all made contributions to the theoretical and practical sides of fermentation. The three last-named chemists ridiculed the idea that yeast was a living organism, but were forced to admit this fact after Pasteur began his work. With Pasteur's classical researches commenced the second or biological epoch, and these showed that alcoholic fermentation was concerned with the life and not the death of yeast.

The third or biochemical epoch was opened in 1897 by the discovery by E. Buchner, who demonstrated that the alcoholic fermentation of sugar was brought about by the enzyme zymase present in the yeast. Professor Ling then described the essential features of malting and brewing; he mentioned that the finished malt contained very little maltose, but chiefly starch with some saccharose. Aeration of both steeping liquor and wort was important, and the fermentation of

wort by yeast proceeded in two stages—aerobic, followed by anaerobic fermentations.

Yeasts and the Brewing Industry.

In the discussion which followed, Professor Kipping inquired as to the cause of the production of saccharose in the finished malt; also as to the power of one yeast to take on the function of another species. Mr. Pentecost asked if there was any method for regulating the action of diastase on thick starch in the production of thin starch used in textile stiffening.

In reply, Professor Ling stated that as yet no chemical explanation had been found to account for the presence of saccharose in malt. In the case of the intraconvertibility of different yeasts, really every yeast was a product of its environment, and in the course of time could acquire different characteristics and functions. It should not be difficult to regulate the action of diastase on starch by making use of the polarimeter, Fehling's and iodine reactions. All enzymes in starch solution were destroyed at 212° F. (best by rapid heating), and also by addition of alkali.

THE MANUFACTURE OF VINEGAR.

TECHNOLOGY OF THE FERMENTATION PROCESSES.

By "Biochemist."

(*Continued from page 700.*)

CORRECT aeration is essential to efficient acetification, as losses as high as 40 per cent. have been incurred through non-uniform air supply. One result of under-aeration is the development of mother-of-vinegar ("tripe"), a growth which leads to channelling and so to irregular distribution and oxidation of the gyle with the formation of acetaldehyde and further oxidation of acetic acid in consequence. To avoid clogging, the shavings may advantageously be replaced by wicker-work while a host of devices have been suggested to prevent defective aeration. Thus, the better to aerate the interior of the bacterial mass, the air-holes may be provided with glass tubes projecting into the interior; or a central tube through the floor of the vat may be used. Another method is to support the shavings on a conical false-bottom, but according to the results of Janke and Bauer (*Centr. Bakt.*, 1916), better aeration is obtained by the use of a central, hollow, perforated cylinder, provided with glass inlet tubes. The spent air leaving the generator may be cooled with the incoming cooled gyle, in order to recover its content of acetic acid (*Brit Pat.* 144,693, of 1920).

For the preparation of strong vinegars (more than 12 per cent. acid), the acetifiers may be operated in series. For instance, potato- or grain-spirit may be added to a 6 per cent. vinegar and the product then acetified in a second generator, the process being continued until vinegar of the required concentration is reached. In a modification of the generator process, suitable for small-scale operation, the gyle percolates through a vertical series of aerated wooden tubes, packed with shavings or charcoal, the whole being enclosed in a glass receptacle (Singer). One disadvantage of such an arrangement would be the frequent cleaning necessary. A similar drawback occurs with the apparatus due to Berseh, which consists of superposed glass plates with narrow spaces between. The quick process cannot be used with success for producing wine vinegar, owing to the clogging of the bacterial medium by tartar deposits.

Treatment of the Acetified Gyle.

After maturing for some weeks, the crude vinegar is clarified by filtration through beech chips or spent raisin skins used in conjunction with shingle, sand or kieselguhr. In the case of crudes which brighten only with difficulty, resort is had to treatment with isinglass ("finings"), kieselguhr or potassium ferrocyanide. Paper pulp constitutes an excellent filtering-medium, but it clogs rather easily. To prevent the growth of *Mycoderma aceti* and other organisms, it is usual to sterilise the clear vinegar, without loss of strength, by passing it first through a hot coil at 63° C. and then through a cooling-coil, a process which also accelerates ester formation.

"White vinegar," "distilled malt vinegar," and "white wine vinegar" are made by distilling ordinary vinegar under reduced pressure in tin-lined gunmetal stills of about 100 galls. capacity. A 6 per cent. vinegar thus fractionated, will give equal parts of 3, 5½ and 9-10 per cent. acids. "Vinegar essence" is a German product containing about 12 per cent. acid, prepared by acetifying potato-spirit.

Vinegars from Fruit Juices and Other Sources.

Cider or "apple" vinegar is made from the second pressing of the "pomace," to which water and sugar are added. The liquor is clarified by storage or filtration, and then fermented first with yeast, then with acetic bacteria. The product contains malic acid. Recently, Poore (*J. Ind. Eng. Chem.*, December, 1920), has described the manufacture of vinegar from the juice of both sound and frozen oranges. The juice is fermented with bakers' yeast at 30° C., centrifuged or filtered, and then acetified by both the barrel and generator processes. Beechwood shavings or corn-cobs saturated with unpasteurised vinegar constitute the acetifying medium. Citric acid is present in the product. Vinegar has also been prepared from dates. Whey vinegar is the product of the successive alcoholic and acetic fermentation of neutralised skim-milk containing added sugar. It contains both lactic acid and lactose. A cheap substitute for wine vinegar, known as spirit vinegar, consists of fermented dilute alcohol enriched with malt extract, while "wood" vinegar is substantially dilute acetic acid, coloured with caramel and flavoured with acetic ester or with brewed vinegar.

The Testing of Vinegars.

According to Mitchell (*J. Soc. Chem. Ind.*, No. 8, 1918), the Trade Numbers of vinegar—22, 20, 18, and 16—do not denote the number of grains of anhydrous sodium carbonate required to neutralise one fluid oz., as is generally supposed, but have their origin in the old retail prices. The acidity is usually determined by titrating with standard NaOH and phenolphthalein. In the case of dark-coloured products, the caramel should first be removed by precipitation with fuller's earth. To detect free mineral acid, methyl violet, Congo red paper or thymolsulphophthalein may be used; or the electrometric method for H-ion determination may be applied (Kling and Lasseur, *Comptes rend.*, 1922).

For the determination of free sulphuric acid, the method depends on estimating the alkalinity of the ash of the neutralised vinegar. The required result is arrived at by deducting this value from the total acidity, care being taken, in titrating, to allow for the disturbing effect of phosphates. According to an official recommendation, vinegar with less than 4 per cent. acetic acid should not be retailed.

Phosphoric acid may be estimated by the usual molybdate reagent, nitrogen by the Kjeldahl method on 10-25 c.c., while oxalic acid, which may result from over-oxidation, can be detected and estimated by adding a solution of calcium acetate (Bau, *Chem. Zentr.*, 1920). To estimate caramel, it may be precipitated by fuller's earth, tannin, or alcoholic paraldehyde. Adulteration can frequently be detected by means of the polarimeter. According to Balcom and Yanovsky (*J. Assoc. Offic. Agric. Chem.*, 1921), it is advisable to use decolourising carbons such as "Eponite" and "Norit" to clarify the vinegar, as lead salts affect the optical rotation. The usual tests for metallic contamination by arsenic, tin, lead, copper and iron, should be applied. To determine the total solids, 100 c.c. are evaporated on the water-bath with frequent shaking, and a deduction made for the acid retained by the solids.

In the following table are collated some of the more-important analytical data for vinegars from various sources:

	Barley Malt.	Wine.	Cider.	Orange.	Date.	Whey.	Spirit.	Wood.
Sp. Gr. (60° F.)	1·021	1·0213	—	1·0240	—	1·0184	—	1·009
	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Acetic acid ..	5·4	6·55	4·8	3·9	5·4	6·4	7·6	4·9

THE CORROSION OF IRON AND STEEL.*

DR. NEWTON FRIEND'S COLLOID THEORY.

IT is generally recognised that when iron (or steel), air, and water are brought into contact, corrosion takes place. The iron, by virtue of traces of impurity in itself, in the air or in the water, passes into solution in minute quantities, which are renewed as rapidly as they are thrown out of solution in the form of rust. Thus, for example, carbon dioxide being one of the most prevalent impurities, the scheme in most cases would appear to be as follows:—

$$\text{(i)}\quad Fe + 2H_2O + 2CO_2 = \underset{\text{Soluble ferrous bicarbonate.}}{FeH_2(CO_3)_2} + \underset{\text{Nascent hydrogen}}{2H}$$

The nascent hydrogen combines readily with dissolved oxygen to form water. The remaining reactions proceed as follows:—

$$\text{(ii)}\quad FeH_2(CO_3)_2Aq = FeO.Aq + H_2O + CO_2$$

$$\text{(iii)}\quad 4FeO.Aq + O = \underset{\text{Rust.}}{2Fe_2O_3Aq}$$

The carbonic acid liberated in accordance with equation (ii), through the hydrolysis of ferrous bicarbonate, is free to attack more metal, and so the cycle continues.

Phenomena Inexplicable by Current Theories.

There are, however, many phenomena attendant upon the corrosion of iron that cannot satisfactorily be explained in the above manner, and it becomes evident that another supplementary theory is necessary. When a piece of iron is laid in a tube and water caused to flow over it, the first effect of increasing the rate of flow is to enhance the corrosion of the metal. But a critical velocity is soon reached—namely, approximately one-tenth of a mile per hour, at which the corrosive effect attains a maximum, further increase in velocity resulting in a decrease of corrosion, until with a rate of flow of about four miles per hour, corrosion ceases. The metal under these conditions loses only very slightly in weight, probably in consequence of direct solvent action coupled with mechanical erosion. This interesting phenomenon can neither be anticipated nor explained by any recognised theory of corrosion. It appears as if the moving water washes away from the surface of the metal, something that is needful to induce corrosion. The author therefore suggests that:—

The Rôle of Colloidal Ferric Hydroxide.

1. On coming into contact with ordinary air and water, iron slowly dissolves in minute quantities, ultimately yielding ferrous hydroxide sol—that is, colloidal ferrous hydroxide.

2. This sol oxidises in excess of air to form colloidal ferric hydroxide $Fe_2O_3Aq.$; in less favourable circumstances colloidal ferrosoferric hydroxide, $Fe_3O_4Aq.$, is produced.

3. This higher colloidal hydroxide now acts catalytically, accelerating the oxidation of the iron and simultaneously undergoing reduction to a lower colloidal hydroxide. It re-oxidises as the air diffuses towards it, and the cycle continues.

4. Rust is formed when the colloidal hydroxide precipitates out or "flocculates."

In ordinary cases, therefore, corrosion may proceed in two ways simultaneously—namely:—(1) By direct solution—a process rendered possible by the presence of dissolved electrolytes. (ii) By catalysis, this reaction being superimposed on the other, the colloidal iron hydroxide functioning in the presence of air as the active catalyst. In acid solution the former of these reactions takes place almost exclusively. In neutral solution, the second reaction plays an important part. This colloidal theory may be represented briefly by the following scheme:—

$$2Fe + \left[\underset{\text{colloidal}}{2Fe_2O_3Aq}\right] + Aq = 2FeOAq + \left[\underset{\text{colloidal}}{4FeO.Aq.}\right]$$

$$\uparrow \qquad \downarrow + \text{Air} \qquad | + \text{Air}$$

$$\text{Rust}$$

The Effects of Chromates and Radium Rays.

This theory enables explanations to be offered for many interesting phenomena that are otherwise anomalous. Thus, for example, it is evident that any factor, whether mechanical, chemical, or electrical, that is capable of destroying the colloidal forms of iron hydroxide, will tend to retard corrosion. That is precisely what is found in practice to be the case. Experiment shows that the relative precipitating powers of chromates, sulphates, and chlorides upon ferric hydroxide sol are as follows:—

Chromates and dichromates	100.0
Sulphates	67.0
Chlorides and nitrates	0.3

In other words, large quantities of nitrates and chlorides are required to precipitate the colloids, but only small quantities of chromates and dichromates, the sulphates occupying an intermediate position. It is to be anticipated therefore that small quantities of chromates will inhibit corrosion. This is known to be the case, and the addition of chromates to boiler feed waters, and to paints destined for the preservation of iron, has frequently been recommended. Another interesting phenomenon is the behaviour of iron towards radium rays, which usually tend to accelerate oxidation processes. If the corrosion of iron is purely an ionic effect, exposure to radium rays should lead to enhanced corrosion. On the other hand, the rays tend to precipitate colloidal iron hydroxide, and will therefore, according to the colloidal theory, tend to retard corrosion. Experiment has shown that radium rays, springing from an exceedingly feeble source, exert a decided retarding action upon the corrosion of iron.

* Abstract of paper, entitled "Recent Advances in the Study of Corrosion," read by Dr. J. Newton Friend to the Hull Chemical and Engineering Society on December 11.

THE LAW OF WORKMEN'S COMPENSATION.

IMPORTANT CHANGES IN THE NEW ACT.

A NEW Act (the Workmen's Compensation Act, 1923) will come into operation on January 1, 1924. The Act repeals the temporary War Addition Acts of 1917 and 1919 as at December 31, 1923. On and after this date the law of workmen's compensation in Great Britain will be governed by the Acts of 1906 and 1923. The changes introduced will not apply automatically on January 1, 1924, in all cases. The application of some of them will depend on whether or not the accident occurred on or before December 31, 1923 (see Section 1). Certain sections institute new benefits, but only so far as new accidents are concerned

Increase in Employer's Liability.

On and after January 1, 1924, the position as to minimum and maximum benefits will be as under:—

Fatal Accidents.—At present the maximum compensation payable to dependents is £300., minimum £150. Under the new Act the maximum liability of an employer respecting an accident resulting in the death of a workman will be £300. if there be no children under the age of 15, and £600. where there are children under 15. Minimum liability £200.

Total Incapacity.—Benefits are based on average weekly earnings, with a maximum compensation of £1. 10s. per week. The present maximum of 35s. per week will be continued in respect of accidents which have already occurred or may occur before January 1 next.

Partial Incapacity.—Under the new Act the maximum weekly benefit will be 30s. Existing benefits and those in respect of accidents which occur on or before December 31, 1923, will be based on the present maximum of 20s. per week.

As the law at present stands, compensation is not payable for the first week unless the incapacity is of two weeks' duration, or longer. The new Act provides for the payment of compensation from the fourth day of inability in all cases, except that where the incapacity lasts for four weeks, or more, compensation is also payable for the first three days. In accidents occurring after December 31, 1923, a workman will be entitled to compensation even though he has been injured through his acting in contravention of any regulation applicable to his employment (see Section 7). At present compensation is not payable to non-manual workers whose remuneration exceeds £250. per annum. Under the new Act all such persons whose remuneration does not exceed £350. will be brought within the scope of the workmen's compensation.

Certain duties will also be placed on employers on and after January 1, 1924, which materially affect the liability of employers. Copies of the Act can be obtained from booksellers, or direct from H.M. Stationery Office, price 6d.

THE VEGETABLE-OIL EXTRACTION INDUSTRY.

RECENT CHANGES IN MATERIALS AND METHODS.

A JOINT meeting of the Liverpool Section of the Society of Chemical Industry and of the Engineering Group of the Society, took place at the club rooms of the Overseas League, Elliot Street, Liverpool, on Wednesday week, Mr. Edwin Thompson presiding over a large attendance.

The Chairman, in opening the meeting, very cordially welcomed the members of the Engineering Group on behalf of the members of the Liverpool Section. Mr. J. T. Brewis read a paper on "The Extraction of Oil from Seeds, Nuts, and Kernels," as under the joint auspices of the Liverpool Section of the Society, and the Engineering Group.

The Introduction of Rich Oil Seeds.

There were few mills in this country, the author said, in a position to concentrate on the extraction of oil from one or two particular seeds. It might be necessary to extract the oil from cotton, or rape seeds, soya beans, ground nuts, babassu kernels, copra, palm kernels, shea nuts, linseed or castor seed, and as practically each of these seeds and nuts possessed some distinct peculiarity calling for special treatment, few mills were in a position to handle the complete range in the most efficient manner. The introduction of rich oil seeds and the demands for crude edible oils, had revolutionised the oil milling. The pressure applied to cake had increased enormously; from 0.6 tons to 4 tons per sq. inch, with a consequent increase in the cost of pressing plant. There was now no difficulty in producing with the Anglo press, having a gross pressure of approximately 500 tons, palm kernel cake containing only 5½ per cent. of oil.

The highest possible yield of oil was not the only consideration in seed crushing. The production of cake that would satisfy the requirements of the farmer must be taken into account. Cakes were now sold guaranteed to contain a certain percentage of oil, and actually the oil content was higher than the guarantee.

Progress in Solvent-extraction Methods.

Dealing with the extraction of oils by means of solvents, the author said that the solvent system had developed rapidly since the war. There were now several plants each dealing with close on 1,500 tons of seed per week. Undoubtedly, allowing for wage fluctuations, the cost of extraction by the solvent methods had been considerably reduced during the past few years. This had been brought about by increased production per unit, usually considered as 4 pots; reduced solvent losses, cheaper solvent and less consumption of steam. For the extraction of oil from seeds, a solvent should contain no trace of any compound capable of undergoing chemical change during the extraction process. It should have a close range of distillation, not too low to encourage loss, nor so high as to require a final temperature of evaporation injurious to the oil. It should not be soluble in water, and it should have a distinctly different gravity from water. The characteristics of some available solvents appear in the following table, which was shown on the screen:—

Solvent.	B.P. °C.	Sp. Heat.	Latest Heat Cal./Gram.	Price per Gall. s. d.
Ether	34.6	0.53	90	4 6
Carbon bisulphide	46.2	0.24	83.8	3 7
Chloroform	61.2	0.23	58.5	25 2
Alcohol—Methylated spirit	78.1	0.6	205	3 1
Carbon tetrachloride	76.7	0.2	51	6 2
Benzol (pure)	80.3	0.41	93.4	1 7
,, (commercial)	79–125	0.408	95	1 3
Trichlorethylene	87	0.233	56.6	5 3
Petroleum spirit	100–120	0.425	73.5	1 6
Toluol (pure)	110.8	0.404	—	1 10
Turpentine	0.59	0.41	74	4 10

The Ideal Solvent, Benzine or Trichlorethylene?

For general suitability there had, up to quite recently, been nothing comparable to the specially prepared petroleum spirit. It had a satisfactory boiling-point and a sufficient close range to place it on an equivalent with the constant boiling solvent. Further, the standard grade which had been proved to be suitable for the extraction of edible oils, could be obtained at a reasonable price. Unfortunately, it was inflammable and its use added considerably to the insurance charge on plant and buildings, especially in a congested district, and owing to special precautions which had to be taken in the arrangement of artificial lights, it was difficult to obtain good plant illumination.

Within recent time, trichlorethylene had come into prominence for the extraction of oil from seeds, and it would now appear to be conclusively proved that in addition to being non-inflammable, it possessed in use the following advantages compared with petroleum spirit (benzine). It had greater penetration, less solvent losses, increased production per plant unit, and lower steam consumption. The high cost of trichlorethylene compared with that of benzine was against its coming into rapid general use for oil seeds. The cost of solvent with plants using benzine was not now such a serious matter as formerly, when losses were anything up to 7 gallons per ton of seed, and solvent at 2s. 6d. per gallon. The modern plant with a solvent loss of 3 gallons (benzine) per ton of seed, and obtaining solvent at 1s. 6d. per gallon, was not likely, on the face of it, to look very favourably on trichlorethylene at 5s. 3d. per gallon. To arrive at a fair comparison the conditions appertaining to the particular plant likely to use it, must be taken into account.

The type of extractor pot used appeared to be fairly common, and had a capacity of 2 to 2½ tons of seed. It was stationary and the meal was agitated by means of stirrers fixed to a vertical shaft. A discussion followed the reading of the paper, in which Professor J. W. Hinchley, Messrs. W. W. Austin, W. Ramsay Sibbald, J. Savage, J. Arthur Reavell, and Colonel Briggs took part.

THE MANUFACTURE OF MUSTARD GAS.

CLAIMS OF DR. LEVINSTEIN AND PROFESSOR GREEN.

DR. H. LEVINSTEIN gave further evidence on Monday when the hearing of the claim made by him and Professor A. G. Green in regard to the invention of a mustard-gas process (see this *Journal*, December 14, page 762) was resumed by the Royal Commission on Awards to Inventors, at the Law Courts, London. The claimants' contention is that they first discovered a method of producing mustard gas on a large scale without danger to the workpeople, and that the Ministry of Munitions adopted this method after many unsuccessful experiments at their own works.

Dr. Levinstein was cross-examined at considerable length by Mr. Hunter-Gray, for the Crown, on the point whether the claimants' mustard gas was different from that of Professor Pope.

"Our process is, in my own opinion, entirely new," said Dr. Levinstein. He disputed the suggestion that his product was old by reason of the work of Professor Pope in 1916

Experiments, said Dr. Levinstein, were first carried out under his direction at the works of the British Dyestuffs Corporation at Blackley, Manchester, in April, 1918, and in May they had decided what process to adopt. At the end of May Professor Pope and Professor Gibson, who had also been carrying out experiments, visited the Blackley Works.

Mr. Hunter-Gray: They went to give you such information as you required?

The Witness: Nothing of the kind.

Do you say that they came to be taught by you and Professor Green?—I do.

Casualties at Blackley Works.

Mr. Gray: Were the casualties at the works at Blackley so numerous that the record of them, which was kept in the first instance, was relinquished?

The witness: I should say that statement was entirely untrue.

Were there deaths?—There was one death which I think was caused by mustard gas. It was the case of a man who was subject to bronchitis and had a dose of mustard gas which proved fatal.

Professor A. G. Green described the experiments that he carried out in order to find a satisfactory method of production. In his opinion the Pope process was not practicable. When the witness spoke to Professor Pope about the results he had obtained, the Professor was distinctly sceptical about it, and his collaborator, Professor Gibson, came to the witness's laboratory at Blackley to investigate the results. The witness denied that Professor Gibson was sent down to teach them. Professor Pope also visited the laboratory, but would not entirely accept the results. The witness knew nothing about Professor Pope's patent until nearly two years after the war, and it came rather as a shock to him.

The hearing was adjourned.

JAPAN'S CHEMICAL INDUSTRY.

DETAILED ACCOUNT OF EARTHQUAKE DAMAGE.

WE have received from the Department of Overseas Trade a detailed report (translated from "Osaka Mainichi," October 3) of investigations by the Industrial Bureau of the Japanese Ministry of Agriculture and Commerce, into the damage to factories caused by the earthquake of September 1. Those portions of the report which relate to the chemical and allied industries are reproduced below. Although the report is dated October 3, its publication is deemed advisable as it is by far the most detailed account that has yet been made available in this country.

Damage to Sulphuric Acid Plants.

The Japan Artificial Fertiliser Company has many factories throughout the country, those located in the earthquake area being at Oji, Kamayabori, Komatsugawa, Kinoshitagawa, Koyasu, and Yokohama. At the Oji factory one-tenth of the sulphuric acid plant was destroyed, and one-quarter of the electrolysis plant. Entire reconstruction of the factory will need six months. There are ample stocks of fertiliser on hand. The factory at Kamayabori was demolished by the earthquake and gutted by fire, but it is expected that 70 per cent. of the stocks of fertiliser are commercially saleable. At the Komatsugawa works three of the retorts (?) for making sulphuric acid collapsed and the roof fell in. It is hoped that reconstruction will be completed in two or three months. The amount of damage at the Kinoshitagawa works was comparatively small. The works at Koyasu and Yokohama were burnt to the ground, but at the latter the phosphorite and another storehouse as well as the office and factory remain. The total losses occasioned by the earthquake amount to 4,650,000 yen.

The Tokyo Sulphuric Acid Company manufactures concentrated and fuming sulphuric acid by synthetic processes. The damage sustained is almost nil, and given a supply of motive power operations can be resumed immediately. About a month's supply of raw material is in stock.

General Chemicals.

The Asahi Electric Industries are manufacturers of bleaching powder, caustic soda, solidified oils, hydrochloric acid, soap, etc. Damage is slight. A boiler-room and one shed partly collapsed, and a quantity of manufactured salt was washed away. It is anticipated that there will be no reduction in output. The Kameido works of the Japan Chemical Manufacturing Company which manufactures barium sulphate, iodides, cosmetics, fertilisers, etc., suffered little damage other than the collapse of one building, a brick chimney, and a water tank.

The Iriye Chemical Manufacturing Company possesses a factory at Sendagaya, Tokyo, and manufactures acids, brewing materials, ethyls, etc. No damage other than collapse of a store. There is a shortage of certain raw materials and an entire lack of stocks. Repairs necessary to a portion of the works of the Imperial Alloy Refinery, which collapsed, will have no serious effect on the factory's activities, and it is proposed to resume work as soon as there is a demand. As regards raw materials there is a shortage of ferro-silicon. In the case of the Mukojima (Tokyo) Plating Co., who are makers of zinc plates, the damage is slight. There is a shortage of ammonium chloride, but work can be resumed on receipt of supplies.

At the Central Rubber Company's Honjo works there was damage to boilers and chimneys. Owing to complete lack of materials like calcium carbonate, litharge, carbon black, sulphur, petrol, grease, machine oil, etc., it is impossible to resume for the present. At the Fujikura Company's Osaki-cho works, where waterproof cloth, and aeroplane dope are manufactured, in addition to the destruction by fire of the laboratory, part of the works were damaged, but when motive power becomes available it will be possible to resume without a decrease in output. Part of the drying-room at the Sasazuke factory of the Japan High-class Paint Company collapsed, and some raw and manufactured materials were lost, but general damage was small. Two or three months are necessary for repairs, but work is not interfered with, and the middle of October should see a resumption of activity.

The Taisho Turpentine Company at Shinagawa, manufacture turpentine and preservative chemicals. Laboratories were demolished, and no stocks of raw materials or manufactured goods are on hand. Resumption is not yet decided upon. At the Takata factory of the Japan Printing Ink Company, offices and sheds were burned. A stock of one month's supply of raw material is available.

Matches, Scientific Instruments, and Glass.

At the Maruyama Match Factory at Shirokane (Tokyo) no damage was sustained other than that to part of the pans, and work can be resumed immediately raw materials are received. There were four factories in Tokyo, three of which were gutted by fire, leaving only the one at Shirokane. No stocks exist. The Takachiho works at Hatagaya manufacture microscopes, microscopic slides, spectroscopes, etc. There has been practically no damage, and the factory's activities can readily be resumed. The greater part of the Asahi Glass Co.'s Tsurumi factory suffered severe damage and will have to be entirely rebuilt. Reconstruction will take from six months to a year. The Tachibana Glass Company (Shinagawa) are manufacturers of table ware, glass for electric lamps, etc. Damage is slight and early resumption probable. There is, however, a shortage of soda ash.

Great Losses to Cement Industry.

The Fukagawa works of the Asano Cement Company were utterly destroyed by fire. One-third of the Kawasaki works was damaged. Reconstruction of the former will take one year and of the latter three months. The capacity of the Fukagawa works was 60,000 barrels per month and of the Kawasaki works 150,000 barrels, but in a few months a capacity of 100,000 barrels should be developed by new equipment at the Tsurumi works. The stocks at both factories cannot be used. The company has also factories at Moji with a capacity of 220,000 barrels, in Hokkaido 120,000 barrels, and in Formosa 60,000 barrels. The Hokkaido factory is to be enlarged in the near future so as to have a capacity of 220,000 barrels. It is anticipated that the total capacity will then be 710,000 barrels and there is no fear of shortage.

Shortage of Cylinders at Oxygen Factories.

The Oshima Clay factory of the Tokyo Gas Company manufactures benzol, toluol, creosote, sulphate of ammonia, naphthalene, etc. Little damage was suffered and early resumption is anticipated.

At the Osaki factory of the Oriental Oxygen Manufacturing Company there was no damage to buildings or machinery, but there was a great loss of cylinders, and about 700 pumps were destroyed by fire. Every effort is being made for speedy reconstruction with no diminution of output. The Tanabe Oxygen Manufacturing Company's factory at Oshima was not damaged, but a large number of cylinders were lost. With regard to the Japan Oxygen Manufacturing Company's factories at Osaki and Kameido, there was practically no damage at the former and there is a possibility of early restoration, but at the Kameido factory wooden sheds were destroyed and 1,200 cylinders were lost. As soon as motive power is available work can be restarted, but in view of the shortage of containers there must be a decreased output.

THE STUDY OF CORROSION.

COMPARISON OF LABORATORY AND EXPOSURE TESTS.

AT the monthly meeting of the Oil and Colour Chemists' Association on Friday, December 14, Dr. J. Newton Friend, the President, stepped into the breach caused by the inability of Dr. Middleton to give a paper that had been arranged for, and gave a general review of the position as regards the theory of corrosion.

It may be mentioned that the Association—whose scheme for joining up with the Paint and Varnish Society, has definitely fallen through—has appointed a part-time paid secretary, and the address of the Association in future will be at the Institute of Chemistry, Russell Square, London.

Dr. Newton Friend gave a brief outline of his colloidal theory (see page 734 of this issue), and remarked upon the manner in which recent work by Professor Adeney in Dublin in 1922 confirmed some of the results he himself had achieved.

In regard to work now being carried out, Dr. Friend showed a lantern slide of a frame containing 52 different pieces of metal exposed to atmospheric corrosion. This frame has already been exposed at the Municipal Technical School, Birmingham, for 18 months, and it will continue to

be exposed for a further 5 years. The series consists of 12 pieces of wrought iron, 7 or 8 carbon steels, 8 or 9 special steels, comprising stainless steel, chrome steel, nickel-chromes, etc. There is also a selection of non-ferrous metals, including copper, zinc, lead, tin, aluminium, lead and antimony together, and a whole series of brasses and bronzes, etc. Another series of metals is being exposed at Weston-super-Mare, under water, in such a position that they are exposed to the air on two days per month during low spring tide. In course of time, these bars will be removed and examined, and an endeavour made to see whether these tests follow the line of laboratory tests which are being carried out simultaneously in the Birmingham Municipal Technical School laboratories. If the result of these field experiments do not agree with the laboratory tests, they offered a reason why extensive field researches should be carried out both by private individuals and by research associations.

Mr. H. J. Vernon (School of Mines) commented on the extraordinary difference he had found in the corrosion of ferrous and non-ferrous metals.* The theories current to explain these differences, before Dr. Newton Friend formulated his colloid theory, were quite inadequate. It was interesting to notice how beautifully the colloid theory fitted in with the facts.

ACID PUMPING AND ELEVATING PLANT.

RECENT BRITISH PROGRESS.

CHEMICAL plant made from acid-resisting metal, such as high silicon iron, has now been on the British market for over ten years, and the very considerable initial difficulties resultant upon the extreme hardness of the metal can now be stated to have been completely surmounted. The first articles manufactured consisted of simple parts, such as cascade basins, pipes, bends, etc., and so valuable did the articles prove themselves that effort had to be made to meet the numerous demands from the chemical trade for more intricate and difficult castings and machine parts. How far this effort has met with success may be gauged by the progress which one of the British firms—Meldrums, Ltd., of Timperley, near Manchester—has made in the manufacture of acid-resisting pumps of "Meldrum" metal.

Improved Design of Acid Pump.

In their previous design of pump, which has been described in earlier issues of this journal, the castings were split down the centre of the volute, which resulted, of course, in the delivery branch being divided. In the new pattern, however, the volute and delivery branch are made in the same casting, and a separate cover carrying the suction branch is bolted to it.

In view of the searching nature of many of the acids and liquors dealt with, this is certainly a distinct advantage. It also enables the whirlpool chamber and volute to be made of a more uniform shape, and considerably higher lifts at a given speed and diameter of impellor to be obtained than with any previous design. We have examined a set of curves for such a pump having 1½in. delivery, 2in. suction, the diameter of the impellor being 7in. The curves show the characteristics of the machine at four different speeds, and, in spite of the difficulties of manufacture of pumps made in "Meldrum" metal, these results compare favourably with a pump made in cast iron or bronze.

The metal is entirely proof against sulphuric, nitric, and acetic acids of any strength or temperature, and has been used for very searching copper and chlorine liquors which no other metal or material is able to withstand. In the belt-driven pumps the countershafts are provided with fast and loose pulleys and belt-shifting gear running on ball bearings. A flexible coupling connects the belt countershaft or motor, as the case may be, to the pump. These pumps are manufactured in standard sizes up to 8in. delivery and 120ft. head, and special plant has been put down to enable the makers to deal with the larger sizes with rapidity and accuracy.

Automatic Compressed-air Elevator.

Another method of raising acids is by means of the automatic compressed air elevator. This type of apparatus finds favour in acid plants, as high lifts are obtainable by a corresponding increase in the air pressure. A type of elevator made by Messrs. Meldrum works automatically—*i.e.*, when there is no acid running into the vessel, no air is used. The vessel works on the following principle: As the acid rises in the vessel it lifts a float which operates the air valve. As soon as the air enters the vessel it closes the inlet valve and also closes the air-bend valve. The vessel is now sealed, and the air pressure forces the acid out through the delivery pipe at the bottom of the reservoir. The air follows the acid up the pipe, and the pressure is at once reduced, and the float drops, closing the air valve. The inlet valve again opens, and a fresh supply of acid enters the vessel. The acid can be allowed to trickle in quite slowly, and the apparatus works with certainty as soon as the definite level of the acid in relation to the float is reached. All internal parts of the vessel, valves, etc., are made of "Meldrum" acid-resisting metal.

Messrs. Meldrum are also developing a further improvement in compressed-air elevators. In this case the acid is operated by a plunger, and the air does not come in contact with the acid. This type has the advantage that it is economical in air, as no more air is used than displaces the acid from the vessel. It works automatically, but requires a reservoir from which to draw as it keeps in operation, whether the acid is being pumped or not; consequently it should be used where there is a continuous supply of acid to draw from.

As a cheap means of raising acids, the steam-jet apparatus is useful in many cases. In this apparatus the steam dilutes the acid to some extent, and this is frequently, of course, a disadvantage; in other cases it does not matter. Standard lines of these acid elevators in "Meldrum" acid-resisting metal are now made.

PRESENTATION TO MR. A. CAMPBELL.

AT the works of the Derby-Oxide and Colour Co., Ltd., Rugeley, on Thursday, December 13, a presentation from the employees was made to Mr. Archibald Campbell, who has retired from the managership of the company. Mr. Campbell is in his 83rd year, and has been manager of this old-established business for upwards of 25 years. The presentation was made by Mr. W. H. Giles, the Chairman and Managing Director of the Company, in the presence of Mr. Arthur Campbell and Mrs. Wootton (son and daughter of Mr. Campbell), Mr. H. A. Wilson, Mr. F. P. Evans, of Derby (travelling representative), Messrs. S. Staton, H. B. Watkiss, J. Edwards, and about fifty of the employees.

At the close of the proceedings, the Managing Director announced that Mr. H. A. Wilson, who had acted as assistant manager for some time, had been appointed to succeed Mr. Campbell as manager of the company.

Mr. Campbell's Wide Experience.

Mr. Campbell commenced his career as a chemist in the works of Chas. Tennant and Co., Ltd., of St. Rollox, Glasgow. After remaining at Glasgow from 1872-1874, Mr. Campbell took up a position as chief chemist and assistant manager to superintend a works belonging to the same firm on the Tyne. He remained there for five years, and during that time he came in contact with the late Dr. Lunge. He was afterwards connected with the Runcorn Soap and Alkali Co. During his residence at Runcorn he attended (at Widnes) the first meeting called to form a Chemical Society which afterwards developed into the now well-known Society of Chemical Industry. Among those present at this meeting (held at the offices of Messrs. Gaskell Deacon and Co.) were Mr. Campbell, Mr. John Hargreaves, Mr. Douglas Herman, and Mr. George E. Davis (founder of the *Chemical Trade Journal and Chemical Engineer*). He later took over the management of a works at Southampton carrying on the manufacture of sulphuric acid, sulphate of alumina, tar distillation, etc. Contrary to the usual order of things, Mr. Campbell returned to Scotland, where he used his English experience in reconstructing vitriol and other works. He afterwards came in contact with an American firm which was endeavouring to make bleaching powder by the Weldon process, but had not been very successful. Mr. Campbell accepted an offer of this firm to control their works in Erie, Pennsylvania. It was while in America that Mr. Campbell received an offer to take over the managership of the Derby-Oxide and Colour Co., Ltd., at Rugeley, and he commenced his duties there in 1897. During his earlier years at Glasgow Mr. Campbell came into close and frequent contact with Mr. Ludwig Mond.

ITEMS OF INTEREST.

More Blast-furnaces to Operate.—It is stated that Pease and Partners, Ltd., are rekindling two blast-furnaces at their Normanby Ironworks, Middlesbrough. This will increase the number of furnaces in operation on the North-East Coast to 48, as against 70 in normal times.

Unemployment Relief in Birmingham.—The Lord Mayor of Birmingham has opened a fund for the relief of the unemployed. The first list of contributions includes the names of the Midland Vinegar Company, Ltd., £100.; Southall Bros. and Barclay, £100.; Mr. W. A. Albright, £25.; Mr. Thomas Barclay, £25.; and Alderman F. C. Clayton, £50.

British Trade with Chile.—The Department of Overseas Trade announces that Mr. W. F. Vaughan Scott, the Commercial Secretary for Chile, has now opened offices at Avenida Vicuna Mackenna 133, Santiago. All communications intended for the Commercial Secretary should be sent to this address. His telegraphic address is "Commintell," Santiago.

Committee on Artists' Materials.—The Royal Academy has formed a Committee of artists and scientists for the investigation of the qualities of artists' materials and of the various methods of cleaning old pictures. The Committee includes:—Professor A. P. Laurie, Sir H. Jackson, Sir A. Schuster, Dr. A. Scott, Mr. C. F. Cross, Dr. W. W. Taylor, Dr. R. S. Morrell.

Dyestuffs Labourer's Death from Cancer. — The Manchester City Coroner last week adjourned the inquest on the body of Cornelius Kennedy (52), who had been employed as a labourer by the British Dyestuffs Corporation. The man had died from cancer, the Coroner said, but there was some question as to whether that had been caused by the chemicals in which he worked, and it was desirable that the inquiry should be attended by representatives of the Home Office.

Lime in North Wales. — A lime product of remarkable purity is being quarried at Parc-y-Murch, St. George, near Abergele, states the *Liverpool Post*. The property has been taken on an extensive lease from the Kinmel estate by a wealthy South Wales firm, and later on employment will be found for some hundreds of quarrymen. It is reported that the lime is superior to anything yielded by any other rock formation in any part of the country, its purity being over 99 per cent.

Colour Merchants' Bankruptcy.—A meeting of creditors of J. Damant and Co., Ltd., 84, Rosebery Avenue, E.C., colour merchants, was held on December 17 at 9, Mincing Lane, E.C., when the liquidator, Mr. Wright, presented a statement of affairs which showed liabilities £277., of which £177. was due to unsecured creditors, and there were debentures for £100. The assets comprised stock estimated to realise £97., leaving a deficiency as regarded the creditors of £179. It was decided to leave the matter in the hands of Mr. Wright as liquidator.

Italian Citrate-of-lime Sales.—According to the U.S. Commercial Attaché at Rome, the operations of the Camera Agrumeria of Messina, which has had the monopoly of the sale of citrate of lime, have been decidedly unsuccessful. Large stocks have been accumulated, and on May 31 debts owing to the organisation amounted to 86,500,000 lire. As from December 1 of this year, sales of citrate are to be made by the Camera on behalf of the producers and not on its own account. Payment will be made for the product at the market price at the time the citrate is sold by the Camera, not at the time the latter body purchases it from the producer.

White Lead Purchasing Restrictions in Australia.—The first British firm of white lead manufacturers to start work in Australia was Lewis Berger and Sons (Australia), Ltd. Afterwards six or seven other firms commenced operations under the form of a combine known as the British Australian Lead Manufacturers' Proprietary, Ltd. (B.A.L.M.). According to a *Manchester Guardian Commercial* correspondent, the B.A.L.M., acting presumably in concert with the Berger firm, is offering specially favourable terms to wholesale white lead buyers on condition that the latter purchase 90 per cent. of their total requirements from the combine, and restrict their sales of imported white lead to 10 per cent. of their total sales. This step, it is stated, has caused considerable perturbation among wholesale oil and colour men.

Insulin Prices Reduced. — It is announced by British Drug Houses, Ltd., and Allen and Hanburys, Ltd., that in view of the anticipated reduction in the cost of production, a further reduction in their price of insulin from 1s. 9d. to 1s. 3d. per dose will come into effect on January 1.

Personal.—Dr. W. F. Faragher has been appointed the assistant director of the Mellon Institute of Industrial Research of the University of Pittsburgh. Dr. Faragher, who is an authority on petroleum refining, was selected by the late Dr. R. K. Duncan as the incumbent of the first industrial fellowship established at the University of Kansas in 1907.

Gasworks Explosion at Preston.—Some alarm was caused at Preston Gasworks on Friday of last week by the explosion of a cylinder filled with tar which formed part of the water-gas plant becoming overheated and taking fire. All the windows in that part of the works were blown out, but two men working near by escaped with nothing more than a shaking.

British Association Meeting. — The date of the British Association meeting in Toronto next year, provisionally announced for September 3-10, has now been altered to August 6-13, and the meeting will be followed by official excursions, not preceded by them, as originally proposed. The Association, which will meet in Southampton in 1925, has received from the University and city of Oxford an invitation to meet there in 1926.

Empire Zinc Combination.—Negotiations in connection with the association of interests in zinc smelting in Great Britain and Australia, and the two largest zinc deposits in the Empire—namely, at Broken Hill and in Burma,—have been completed. Sir Robert Horne, M.P., will be chairman of the National Smelting Company. The issue of £1,500,000. of seven per cent. first mortgage debentures of the new company will not be made until after the turn of the year.

Argentina Exhibition of Educational Materials.—The American Academy of History is organising an International Congress of History and Geography of America and Exhibition of Educational Materials to be held in Buenos Aires in 1924. The Academy invites manufacturers of and dealers in materials concerned in the supply of educational institutions, libraries, science laboratories, etc., to participate. Further particulars of the scheme may be obtained from the Secretary of the Academy, Dr. A. E. de la Guardia, Academia Americana de la Historia, Buenos Aires.

Tariff Notes.—The importation of artificial fertilisers into Bulgaria will be permitted without payment of import duty, provided that a certificate is obtained from the Bulgarian Ministry of Agriculture certifying to the nature of the fertilisers in each case,—Carbo lime is exempted from payment of import duty under the Indian Customs Tariff. Under certain conditions of export the duty on salt manufactured in the Madras Presidency is remitted.—The operation of certain deferred Customs duties on various explosives has been further postponed by the Australian Government to July 1, 1924.—The following products are included in the schedule of percentage reductions in the Polish Customs Duties, to be applied to British goods as soon as the Anglo-Polish Commercial Treaty comes into force: Cream of tartar, tartrate of lime, citrate of lime, certain fine chemicals and drugs, soap, olive oil, blacking and cleaning polishes, artificial silk yarns, glues and gelatines, etc.

Commercial Cream of Tartar.—Two magistrates at the Birkenhead Police Court, on Friday last, fixed a standard for commercial cream of tartar, and decided that up to fifty parts of lead per million was safe for ordinary purposes. The point arose in a prosecution against the Birkenhead and District Co-operative Society, Catherine Street, for selling cream of tartar which contained forty-four parts of lead per million, this being twenty-four parts in excess of the maximum fixed by the British Pharmacopœia. Mr. Goldie, for the defendants, submitted there were two standards—namely, purified (which was obtained in chemists' shops) and the ordinary cream of tartar (purchased at grocers for cooking and other purposes). Mr. W. H. Roberts (Liverpool City Analyst) stated that there was a distinct difference between the two standards. The sample in the case was genuine cream of tartar, and the amount of lead was not injurious to health. He would require the amount to be over 100 parts to the million before he would condemn it. The case against the Co-operative Society was dismissed.

Dictionary of Specifications.—Work on the compilation of material for a dictionary or handbook of specifications for supplies purchased by Federal, State, and municipal governments and public institutions has been started at the Bureau of Standards, Washington, U.S.A. All the available specifications prepared by the various departments and independent establishments of the Federal Government and those used by State and municipal governments, public institutions, and the important national trade associations and technical societies, are being collected, card-indexed, and classified.

Disposal of Zinc Concentrates.—The full report of the Electrolytic Zinc Company of Australasia, for the year ended June 30 last, with reference to the supply of raw material for the company's operations which has been drawn from Broken Hill under the contract with the British Board of Trade, states that during the recent visit of the Chairman of Directors to England, negotiations were successfully concluded with the British Government for the purchase, on terms satisfactory to this company, of an additional 400,000 tons of Broken Hill zinc concentrates, making the total quantity so purchased 1,150,000 tons.

British Empire Exhibition.—The Prince of Wales has consented to become president and first member of the Fellowship of the British Empire Exhibition, a non-party organisation formed to assist Empire trade and industry. The subscription of two guineas, which is the full extent of every member's liability, will entitle the member to receive a parchment certificate of membership signed by the Prince of Wales, a badge of the Fellowship, and a ticket giving admission to the British Empire Exhibition at all times. The funds thus raised will be used to grant scholarships, each to the value of £1,000., to Fellows or their nominees, for university or technical education

Obituary.—We regret to announce the death of Professor Frank Clowes, D.Sc., F.I.C., F.C.S., at his residence in Dulwich, on Tuesday, at the age of 75. The late Dr. Clowes was appointed in 1881 Professor of Chemistry at University College, Nottingham, and held the chair till 1897, being also the first Principal of the College. From 1897 to 1913 he was Chemical Adviser to the London County Council and Director of the Council's staff and laboratories, and had since been expert adviser in gas supply to the Corporation of London. He was a past president of the Society of Chemical Industry, twice a vice-president of the Institute of Chemistry, twice vice-president of the Chemical Section of the British Association. Professor Clowes was the author of various contributions to analytical chemistry, including text-books which have gone through many editions and have become standard works.

The German Chemical Industry.—According to a report received by the Department of Overseas Trade from Mr. J. W. F. Thelwall, Commercial Secretary at Berlin, the general economic situation necessitated further restrictions of work during November in the chemical industry in Occupied Territory. In the chemical preparations industry the demand for laboratory chemicals was very small, and that for glass chemicals diminished in the degree in which the glassworks were compelled to restrict work or close down. The demand from abroad also fell off as sale prices approached the world's market level. It is felt to be a particular burden that just at the present time the refunding of the British Reparation Levy should have been discontinued and thus all possibility of selling German products to England removed. It is all the more to be regretted as French competition is greatly felt in England, and will now secure the whole trade without effort

Indian Tariff on Sulphur.—The Indian Tariff Board, which began an inquiry in Bombay on November 18, examined the representatives of the Dharamsi Morarji Chemical Company and the Eastern Chemical Company. The representative of the former company said that sulphur cost in India from Rs.115 to Rs.125 per ton. The import duty amounted to about 18 to 20 per cent. of the invoiced value of imported sulphur, besides Rs.5 per ton for landing and other charges. He suggested that sulphur should be imported duty free. The State's revenue from that source was less than Rs.2 lacs. The representative of the Eastern Chemical Company pointed out that sulphur, which had to be imported, formed the basis of at least three industries of vital importance to India—viz., steel, fertilisers, and chemicals. Regarding fertilisers especially, the witness considered the development of the use of fertilisers a matter of the first national importance.

BRITISH OVERSEAS CHEMICAL TRADE.

NOVEMBER IMPORTS AND EXPORTS.

TRADE in chemical products during November decreased, the value of exports dropping from £2,572,881. in October to £2,014,741. Imports were lower, though not to such a great extent as in exports, the November figure of £1,138,282. comparing with £1,245,916. in October. Compared with last year, however, the November figures are higher in the case of both imports and exports. The quantity figures of selected products are given in the comparative table below :—

IMPORTS—Increases on October Quantities.

		1923. November.	October.
Acetic acid (including acetic anhydride)	tons	630	537
Barytes, ground	cwts.	51,560	49,135
Borax	,,	9,320	2,555
Boron minerals	tons	1,938	1,757
Calcium carbide	cwts.	100,544	87,509
Cream of tartar	,,	3,059	2,871
Gums and resins (except rosin)	,,	17,123	16,868
Indigo, natural	,,	56	Nil
Paraffin wax	,,	79,895	64,578
Phosphate of lime	tons	36,696	21,181
Potassium nitrate	cwts.	14,459	12,352
Rosin	,,	134,570	131,226
Sodium nitrate	,,	110,629	109,142
Tanning extracts	,,	112,075	70,933
Tartaric acid (including tartrates not elsewhere specified)	,,	999	60
White lead	,,	11,942	10,561
Zinc oxide	tons	628	451

Decreases on October Quantities.

Bleaching materials	cwts.	1,445	2,285
Dyeing extracts	,,	7,558	9,457
Glycerine, crude and distilled	,,	1,472	3,524
Manganese ore	tons	31,199	76,336
Mercury	lb.	131,298	179,776
Nickel oxide	cwts.	1,873	6,656
Petroleum, crude mineral	galls.	21,375,599	31,907,825
Pyrites	tons	15,510	28,273
Sodium c'p'ds (except nitrate)	cwts.	22,008	24,462
Sulphur, crude	tons	2,181	7,982
Turpentine	cwts.	39,097	100,686

EXPORTS—Increases on October Quantities.

Ammonium chloride	tons	479	266
Caustic soda	cwts.	149,972	145,967
Copper sulphate	tons	585	340
Glycerine, distilled	cwts.	12,045	9,653
Naphtha, coal-tar	galls.	103,791	29,456
Paraffin wax	cwts.	18,832	17,448
Potassium chromate and bichromate	cwts.	4,200	3,815
Salt (other than table)	tons	34,404	34,050
Sodium carbonate	cwts.	486,743	375,804
Tartaric acid (including tartrates not elsewhere specified)	,,	2,901	2,422
Zinc oxide	tons	273	240

Decreases on October Quantities.

Ammonium sulphate	tons	19,005	26,587
Barytes, ground	cwts.	280	8,148
Benzol and toluol	galls.	214,830	424,599
Bleaching powder	cwts.	16,482	31,918
Carbolic acid	cwts.	10,848	15,694
Cement	tons	52,934	77,938
Disinfectants, insecticides, etc.	cwts.	38,472	48,279
Dyestuffs, coal-tar	,,	12,915	16,224
Glue and size	,,	15,875	16,128
Naphthalene	,,	18,281	21,314
Pitch, coal-tar	tons	36,005	36,208
Potassium compounds (except chromate and bichromate)	cwts.	3,230	5,545
Soaps (total)	,,	108,825	117,974
Sodium sulphate	,,	97,944	187,031
Sulphuric acid	,,	1,515	2,707
Tar, coal	tons	242	770
Tar oil, creosote, etc.	galls.	1,561,826	7,250,372
White lead	cwts.	14,604	15,988

MIDLAND CHEMISTS' DINNER.

CONJOINT FUNCTION AT BIRMINGHAM.

THE joint annual dinner of the Birmingham and Midland Section of the Society of Chemical Industry, and the Institute of Chemistry took place on Saturday, December 15, at the Queen's Hotel, Birmingham. Professor G. T. Morgan, head of the Chemistry Department of the University of Birmingham (and chairman of the Birmingham and Midland Section of the Institute), presided over a representative attendance which included: Professor Wynne (President of the Chemical Society); Dr. H. Levinstein (President of the British Association of Chemists); Mr. H. B. Jacks (President of the Birmingham Metallurgical Society); Professor Smith (Physics Department of the Birmingham University); Dr. Douglas Stanley (President of the Midland Medical Association), with Dr. A. P. Thomson, secretary of that Association; Dr. H. W. Brownsdon (Institute of Metals); Mr. F. R. O'Shaughnessy; Mr. Geo. King; Dr. W. Wardlaw, Mr. S. R. Carter; Mr. E. J. Hunt and Mr. W. A. S. Calder (Chance and Hunt, Ltd.); Mr. J. Wilson (Albright and Wilson, Ltd.); Mr. A. W. Knapp (Cadbury Bros.); Mr. E. W. Mann; Dr. R. S. Morrel (Mander Bros., Wolverhampton); Mr. T. F. E. Rhead (Birmingham Gas Department Laboratories); Dr. A. Parker (Research Department, Gas Industry); and Mr. E. C. Rossiter (British Cyanides). Professor F. W. Burstall, Dr. E. B. Maxted, and Professor Ling, were absent through indisposition. Dr. E. F. Armstrong and Mr. Woolcock also wrote apologising for absence.

The toast "The Society of Chemical Industry," was proposed by Mr. H. B. Jacks (Metallurgical Society). Mr. O'Shaughnessy, in responding, said: "It has been stated that every industry nowadays is practically a chemical industry. It is certainly no exaggeration to say—and those who are engaged on the chemical side in industrial operation, and able to appreciate the drift and extent of comparatively recent progress, will, I think, agree—that the modern industrial tendency is wholly in that direction. Even in the metallurgical industries in this country chemistry has something to say with regard to their welfare."

The Institute of Chemistry and the B.A.C.

Dr. H. Levinstein, in proposing the toast "The Institute of Chemistry," said he thought the British Association of Chemists had rendered admirable service in that it had aroused the Institute from a prolonged slumber to visible signs of activity in unexpected directions. As a result the Institute was stronger, more prosperous and more representative of chemists than ever before, and certainly it spoke with greater authority. He attributed this progress largely to the stimulus which had been given by other bodies, and particularly by the B.A.C. Birmingham, continued Dr. Levinstein, was to-day one of the greatest centres of chemistry, and one of the great centres of the Institute, and he felt that the progress it had made was due very largely to the distinguished Professor of Chemistry at the Birmingham University, Dr. Morgan. One of the things he always thought of with regret, particularly when one was talking closely about the Institute of Chemistry, was that there was not quite as much correlation between the work of that great Institute and with, for instance, the British Association of Chemists. He would welcome a much closer connection, from the administrative point of view, between the British Association and the Institute; and he thought it would be a very desirable thing if the affairs of those two societies, which affected chemists so much, were administered from one office. He would like to see some unity among the great chemical societies by which there would be set up one uniform entrance fee that would enable a man of suitable qualifications to become an associate of the Institute in the first case, and associated with the other bodies, and, by payment of a combined subscription, to have advantage of combined facilities.

Professor Morgan on the Need for Co-ordination.

Professor Morgan, in a facetious reply, observed that the various Associations, to which chemists belonged for scientific and professional reasons, illustrated all the types of government by which mankind was afflicted. The Chemical Society, the senior body, was as a Republic of the classical type—a centralised Bureaucracy. The Society of Chemical Industry was a Confederation of States—many of which had decided ideas about State rights,—and they had a Council that sometimes appeared to be as much related to it as was the American Senate to the affairs of Europe. (Laughter.) The Institute of Chemistry was a little more difficult to place in the scheme of Government, but it seemed to him that the Institute was not unlike a feudal monarch that existed in Japan until the year 1868. (Laughter.) The Institute was presided over by the President who was paraded once or twice a year before the eyes of the multitude, though the real power of the Institute lay in the hands of the Mayor of the Palace. (Renewed laughter.) He desired there to testify to the enthusiasm and energy of Mr. Pilcher. The British Association of Chemists, another and very active professional organisation, perhaps might be referred to as the Soviet Republic. (Laughter.) Dr. Levinstein had spoken of the lack of co-ordination, but he would point out that there was a composition fee of £3. for those who subscribed to the publications of the two principal Societies.

A NEGLECTED POINT IN MODERN PATENT PRACTICE.

VALUE OF "LICENCES OF RIGHT" REGULATION.

A JOINT meeting of the Leeds Area Section of the Institute of Chemistry and the Yorkshire Section of the Society of Chemical Industry was held at the Queen's Hotel, Leeds, on December 13. Mr. Griffith Brewer read a paper entitled "Practice Under the Modern Patent Law," in which he described how patentees were needlessly paying £140,000. every year in full-scale Government taxes, when they could with additional advantages save 50 per cent. on their payments.

A Fifty-per-cent. Saving in Fees.

Under a Regulation introduced in the Patents Act of 1919, a patentee may have his patent indorsed "Licences of Right." This indorsement has the effect of empowering the Comptroller of the Patent Office to intervene in the event of a patentee refusing to grant a licence on reasonable terms. The object is the ensuring of the invention being used to the greatest extent and so of the patentee being rewarded adequately for his invention. Although this provision has been in force for nearly four years, and although over 2,000 patents have been brought within the Section, no compulsory Licence of Right has yet been granted against the will of the inventor. As an inducement for the patentee to be reasonable and have his patent indorsed in this way, the taxes payable on the patent are reduced to a half scale. Thus, instead of a patentee paying the full £126. in renewal fees to the end of the term, he pays only £63. if the patent has been indorsed. This, Mr. Griffith Brewer contends, must be welcome news to many patentees who may not have realised the possibility of saving £63., in addition to the additional advantage that in many cases offers to work the invention may be received merely because of the declaration of the patentee that he will not be unreasonable.

The lecturer drew attention to the fact that every patent had indorsed upon its face the full scale of fees, and a statement saying that the continuance of the patent is conditional on the payment of those full scale fees. He suggested that this indorsement is misleading and should be corrected to conform to the new provisions of the Act, by adding a second column to the table showing the half-scale fees payable in respect of patents indorsed "Licences of Right." He believes that if, instead of merely publishing this information in the Act and in the *Official Journal of Patents* (which not one patentee in a hundred ever sees), the information were given on the face of every patent, instead of two per cent. of patents granted being indorsed "Licences of Right," eighty per cent. at least would be thus indorsed.

Negotiating power of the Patentee Strengthened.

It frequently happened, in his experience, the lecturer stated, that a patentee of an improvement desired to obtain a licence in respect to a patent of earlier date, but was afraid to approach the earlier patentee for fear of being refused a licence, and by the mere fact of having approached the earlier patentee, to have his notice drawn to the wish of the patentee of the improvement desiring to manufacture. In cases where the patent has not been indorsed "Licences of Right," the utmost caution has to be exercised in approaching the patentee, whereas if the patent has been indorsed then the patentee of the improvement can approach the earlier patentee with greater confidence.

LEGAL INTELLIGENCE.

ROAD TRANSPORT OF CARBON BISULPHIDE.

T. Paulding, Ltd., *v.* The Talbot Clearing House.

At Manchester, on Monday, December 17, before Mr. Commissioner Radcliffe, K.C., an action was brought by T. Paulding, Ltd., against The Talbot Clearing House. The plaintiffs, who are chemical merchants, sought to recover £260. damages from the defendants, who are haulage contractors, for breach of contract and negligence. The defendants made a counter-claim for £33.

It appeared that in November of last year the plaintiffs employed the defendants to convey from a London wharf to Manchester 35 drums of carbon bisulphide. They, in turn, employed sub-contractors. The plaintiffs, in communications to the defendants, stated that the goods to be conveyed, while of a dangerous nature, were quite safe if carefully handled; it was important that the drums should be securely fastened, and no drums shou'd be accepted which showed any signs of leakage. It was shown that when the goods were loaded up on January 2 there were, in fact, two drums which were leaking. On the next day the motor-wagon, petrol-driven, had reached Cannock, and while it was standing the whole wagon, with its load, was destroyed by fire owing to the leakage from the two drums. The plaintiffs accordingly claimed for the loss, alleging that the defendants had failed to carry out their instructions.

On the part of the defendants it was urged that they were not liable, as the goods were sent at the risk of the plaintiffs, that the arrangement with the plaintiffs (which they denied) was that they should insure against loss by fire, and that the drums in which the carbon bisulphide was carried were not suitable for the purpose. It was brought out in evidence that the defendants had given to the sub-contractors the same warning that had been given to them as to the need for securely fastening the drums, and as to not accepting leaking drums.

Judgment was given for the plaintiffs for £227., or less the counter-claim, with costs, and the costs of the counter-claim to a given date.

RE-PULPING OF SALVAGED PAPER.

Burlington Industrial Laboratories, Ltd.

A meeting of the creditors of the Burlington Industrial Laboratories, Ltd., Charing Cross Chambers, Duke Street, Adelphi, W.C. 2, late of Onslow Mills, Yewsley, Middlesex, consulting manufacturing chemists and dealers in chemicals and drugs, etc., was held on December 17 at the offices of Mr. C. H. Whatley, Duke Street, Adelphi, the liquidator of the company. The statement of affairs showed liabilities £1,780., all due to unsecured creditors. There was a debenture holder for £848. Mr. Whatley stated that the only tangible asset of the company was an amount of £582. owing from Protecine, Ltd. (in liquidation), which might in time realise 2s. in the £. The company was incorporated on August 24, 1921. The share capital was £1,000., in one thousand shares of £1. each, all issued. The registered office at that time was at Onslow Mills, Yewsley, Middlesex. In September, 1921, Dr. A. L. Burlin was appointed managing director of the company at a salary of £500. per annum. In November, 1923, Dr. Burlin ceased to be a director, and Mrs. Burlin was appointed in his place.

The liquidator also referred to a secret process by which Dr. Burlin was able to convert old "news" paper into pulp of a texture and quality which permitted it to be again utilised for the manufacture of "news" print, and he stated that this process was calculated to revolutionise the existing practice of repulping and milling salvaged paper. Mr. Whatley added that if this process were commercially exploited it might, of course, have a very marked result so far as the payment of creditors of the present company was concerned.

After some discussion, it was decided to confirm the appointment of Mr. Whatley as liquidator.

CASEIN COMPANY IN LIQUIDATION.

British Casein Company (1911), Ltd.

The Official Receiver has now issued his report in the liquidation of the above company of 24, Gt. Dover Street, S.E.

The statement of affairs showed as regards creditors liabilities expected to rank £1,689., and net assets £817. As regards contributories, the paid-up capital was £2,002., and the total deficiency amounted to £2,873. The report states that the company was a reconstruction of the British Casein Company, Ltd., which had been registered in 1907, and had an issued capital of £2,000., in £1. shares. By an agreement dated March 11, 1911, the company purchased the assets of the old company for £2,000., the voluntary liquidator retaining sufficient cash out of the assets to settle outstanding liabilities. The company was principally engaged as merchants in placing casein and milk products on the market. The business at first proved profitable, and until the year 1917 dividends were declared and paid. On December 10, 1918, Mr. N. A. C. Ouwehand was the sole director, and it was resolved that he should be responsible for the conduct of the business and for the due payment by the company of any debts contracted. The accounts for the year ended 1919 showed a net profit of £719, whilst the total remuneration and expenses of managing director amounted to £1,365. For the year 1920 the net profit was £482., and the total remuneration and expenses of managing director £1,584. Ouwehand states that he was unsuccessful in his efforts to obtain the assistance of another director, and that the business gradually decreased owing to lack of working capital.

The failure and insolvency of the company was attributable to lack of working capital, which restricted the company's operations in buying and selling casein, and to the comparatively heavy amounts drawn by Ouwehand for remuneration and expenses.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[Specially Contributed.]

The information given in these notes a few weeks ago concerning the developments in the coking and by-product industries prepared readers for the announcement that there is in course of arrangement a debenture issue by the United Coke and Chemicals Company, Ltd., formed by the United Steel Company, Workington, which is absorbing the whole of the capital. It is stated that the issue will consist of half a million first debenture stock unconditionally guaranteed by the present company. The intention, as was stated here, is to acquire the control of the supplies of coke from at least three of the collieries for the company's furnaces in West Cumberland. That control will come under the clauses of the agreement to be entered into between the company and the collieries which will send their tar to the new distillation plant to be erected at the United Steel Company's by-product plant at Lowca. At the present time the tar of some of the collieries is going to Messrs. Brotherton and Co., who since they are dismantling their distillation plant at the Lonsdale Dock at Workington are forwarding it to Sunderland. It is very important, it goes without saying, that the United Steel Company should make sure of obtaining the supplies of local coke they require. They have at present seven furnaces in blast in the district, and the number will be greater, it is believed, in the early months of next year. Even now practically all the coke is going to the Workington furnaces. The proportion being sent south from the whole of the Cumberland cokeries to other furnaces in the county and in the Furness district is not large. It has to be remembered that if the new washery plant does what it is declared it will do—namely, eliminate the phosphorus from the coke, then the Cumberland and North Lancashire smelters' needs of coke will be considerably increased. It is known that the smelters of low-phosphorus iron, bad as trade is, consume not less than 10,000 tons of East Coast coke every week. If the aim to make a coke as hard and as low in phosphorus as East Coast coke is achieved then the production of both the collieries and cokeries will have to be substantially increased.

British Coal Output.—The coal output at the mines of Great Britain for the week ended December 8 was 5,728,800 tons, as against 5,719,200 tons for the preceding week, and 5,592,000 tons for the corresponding week last year.

REPORTS OF COMPANIES.

Chemical and Metallurgical Corporation, Ltd.

The ordinary annual meeting was held in London on Monday, Mr. H. Guedalla (chairman of the company) presiding. The Chairman, in moving the adoption of the report and accounts, said: Since the last meeting, works at Stratford have been erected for the demonstration of the process on a commercial scale. These works are now nearing completion, and will come into operation early in the New Year.

As is so often the case in the heavy metallurgical and chemical industries, it is found that in the course of operations directed with one end in view many by-products are produced, and the credit against the cost of the process by this reason is such as to reduce very much, if not to entirely offset, the cost of the main process. Such will undoubtedly be the case in the treatment of lead-zinc sulphide ores by the company's process. The work during the past year has shown that numerous by-products can be produced, and the result is that the value of these by-products, quite unobtainable by existing metallurgical processes, will probably result in our being able to separate lead and zinc from their complex ores at an extremely low figure. It is possible by the company's processes to extract directly from a complex ore in substantially one operation the whole of the lead, leaving the bulk of the zinc constituents of the ore free from lead. At the same time, in the course of these operations we prepare valuable compounds of zinc. The operations are all conducted without the use of any materials other than those which occur at every mine.

The works at Stratford are intended chiefly to demonstrate the application of the process to ores of different characteristics, and naturally the cost on the scale of operations there will be higher than on the scale which would be adopted at a mine or a smelter. These works will, however, serve as a model from which others of larger capacity in suitable localities can be erected.

The resolution was unanimously adopted.

Anglo-Persian Oil Company, Ltd.

The annual general meeting was held in London on Monday. Sir Charles Greenway, in moving the adoption of the report and accounts, said: The development of production is best shown by continuing the table of figures which I gave you last year—viz.: 1918-19, 1,106,415 tons; 1919-20, 1,385,301 tons; 1920-21, 1,743,557 tons; 1921-22, 2,327,221 tons; 1922-23, 2,959,028 tons as compared with my estimate last year of 2,900,000 tons. For the current financial year it will probably amount to 3,775,000 tons, and for the following year it should amount to well over 4,500,000 tons.

With regard to the operations of Scottish Oils, Ltd., I regret to say that the heavy fall which has taken place in the prices of products has seriously affected the position of the shale industry, which at the moment is being conducted at a heavy loss. This loss is offset to some extent by the profit which is being made on the refining of Persian crude oil, but this aid is adventitious, and does not suffice to cover the loss on shale operations. The directors are very loth to close down the shale mines, in view of the far-reaching effect this would have, and particularly because of the serious unemployment which would inevitably result. They have decided, therefore, to carry on for the time being, but unless conditions improve or assistance in some form or other is provided for the industry, a very serious situation will arise within the next few months. Meantime the directors have been compelled to pass the interim dividend on the participating preference shares, which in the ordinary course would be paid next month. As I have already mentioned, the new refinery at Grangemouth is nearing completion, and when in operation will benefit Scottish Oils. It would be manifestly unsound, however, to permanently utilise the profits of one distinct industry—that is, the refining of imported crude oil—in order to keep alive another industry—the extraction of crude oil from shale—which can only be worked at a loss.

The resolution was adopted unanimously.

Peachey Process Company, Ltd.

The annual general meeting was held on Friday last in London. Sir Robert W. Gillan, the chairman, in moving the adoption of the report and accounts, said that in the commercial exploitation of the process the most important event had been the launching of Peachey Leather Products, Ltd. Another important line was floor coverings, for which an option had been given. A third application of the process was to the proofing of goods, where there was no doubt that the Peachey process had many advantages over the old method. The vulcanisation of raw rubber articles had been carried out by Plantation Rubber Manufacturing Company, and "Cold Process Rubberware, Ltd.," had been formed for the manufacture of moulded goods. Turning to the foreign rights, a cable had been received from the U.S.A. to say that the final appeal against the issue of a patent there had been dismissed. In other foreign countries their experience was that a successful conclusion to negotiations was not to be looked for until the process was operating in Great Britain. In Belgium, however, their licensee had already begun, and had produced excellent results.

After some considerable discussion the report and accounts were formally adopted.

Cassel Cyanide Company, Ltd.

Sir George Beilby, F.R.S. (chairman), presided over the annual meeting at Glasgow last week. The Chairman, in moving the adoption of the report, stated that the volume of trade for the year showed a gratifying increase compared with previous year. The quantity of ore treated on the Rand during 1923 should reach 26½ million tons. This was in excess of any year since 1917, and reflected the improvement in working conditions on this important goldfield. In Canada precious metal mining continued to develop, and all indications pointed to Northern Ontario becoming a great gold producer. In other fields, Australia excepted, a better tone prevailed, and operations were being carried on with greater confidence. While the turnover for the year was good, and while the outlook was satisfactory so far as the demand was concerned, the market price of cyanide continued to fall. The company saw no prospect in the near future of any improvement in the competitive conditions which prevailed in the cyanide trade. The position could only be met by a lowering of production costs. Substantial progress had been made during the year in this direction, and also with the important developments which they had on hand for improving the processes of manufacture.

The report was approved.

British Cyanides Company, Ltd.

The following statement has been issued: At the annual general meeting in July last the chairman stated that an interim dividend on the ordinary shares would be considered before the end of the year, subject to the proviso that the conditions of trade did not depart from the normal to any great extent. Unfortunately, conditions have been by no means normal since then, and the directors therefore do not feel justified in declaring a dividend. The plant for the manufacture of permanganate of potash was started up last August, and is earning revenue. The first unit plant for the fixation of atmospheric nitrogen, mentioned at the annual meeting, has been installed, and was started up in November. The process is producing and promises well, and further units are being installed.

DIVIDENDS.

United Indigo and Chemical Company, Ltd. — Interim dividend at 5 per cent. per annum for the six months ending December 31 on the ordinary shares, subject to tax, payable on December 29. This is the same as a year ago.

Reckitt and Sons, Ltd.—Interim dividend of 8d. per share on the ordinary shares.

Explosives and Chemical Products Company, Ltd.—Dividend of 2s. 6d. per share, free of tax, being at rate of 6d. per share for each of five years to June 30, 1923, payable December 27.

Ebbw Vale Steel, Iron and Coal Company, Ltd. — The directors have decided not to pay an interim dviidend on the 7 per cent. preference shares in respect of the year ending March 31 next. This leaves the dividend eighteen months in arrear

Tarslag (1923), Ltd.—Dividend at the rate of 8 per cent. per annum on the preference shares for the period ending December 31, payable on January 1.

Asbestos Corporation of Canada.—Dividend on the preferred stock of 1½ per cent. for the quarter ending December 31, payable January 15. The second quarterly dividend on common is passed.

FERTILISER NEWS.

Nitrate of Soda.—There has been a very decided recovery in nitrate sales during the first half of this month, and the market is rather firmer. The Producers' Association have disposed of some 85,000 tons, which brings the total for the current year up to about 1,525,000 tons. Of the former quantity, 50,000 tons was on American account, and it appears that the cotton planters, encouraged by the increased revenue from their cotton sales, are inquiring for nitrate in greater quantities. Such is the confidence in a complete revival in demand in the United States, that several cargoes which were originally destined for Europe have been diverted to that country. Shipments are on a much higher level for the fortnight, and total some 168,000 tons, against 120,000 tons last year and 146,000 tons in 1913. Of this amount, 105,000 tons were for Europe and Egypt, 60,000 tons for United States, and 3,000 tons for Japan and other countries. These large figures are hardly to be taken as indicative that the trade is, however, altogether re-established, but as due to the erratic movements of vessels consequent on the loading and labour conditions at the nitrate ports. Production during November is now reported to have reached 188,000 tons, leaving stocks on the West Coast at the end of the month about 990,000 tons, against 1,325,000 a year ago, and 636,000 in 1913. Producers are evidently making every effort to increase production, in spite of the shortage of labour. The increasing efficiency in working is undoubtedly having its effect, and the improved types of plant installed at many of the oficinas have raised the production capacity to a much higher point than was attained before the war. Amongst the developments which have been taking place recently, it is interesting to note that the Alianza Company is reported to have purchased the nitrate properties at Buenaventura, in connection with which negotiations have been proceeding for some months. It will be remembered that the control of this company was transferred from London to Chile in 1918, so that the present deal is an index of the trend of a certain body of opinion in Chile, which feels that the development of Chilean resources is too much dependent upon foreign capital.

Sulphate of Ammonia.—The Board of Trade figures for the month of November show that the exports of sulphate during that month amounted to 19,005 tons—a serious decline when compared with the figure for the previous month of 26,587 tons. Compared with the average monthly exportation for 1923, which totals nearly 21,000 tons, the November exports are low, but the present year has revealed a greatly increased overseas demand for the British product in comparison with the past three or four years. The pre-war figure of about 325,000 tons is hardly likely to be reached until world conditions become more settled, if, indeed, it will be reached at all. Foremost in the list of customers taking sulphate from this country is the Dutch East Indies. During November, 6,200 tons were despatched, against 4,300 tons in October, making the total for 1923 some 30,140 tons, about 50 per cent. higher than for the corresponding eleven months of last year. Japan, whose continued dependence upon this country for sulphate is clearly demonstrated in the November figures, took over 4,000 tons, compared with 3,650 tons in October. In the corresponding month of 1922, no material at all was shipped from British ports. For the eleven months, however, this year's exports are more than two hundred times greater than for last year, the actual figures being 53,340 tons against 255 tons. Inquiries and shipments are still strong, as the stocks destroyed in the earthquake have yet to be replaced. Spain and the Canaries record a decrease in November shipments, but this can only be of a temporary nature. The trade there has been carefully built up, and the year's figures show that exports in 1922 were approximately doubled this year, the tonnage for the latter period amounting to 62,170. With regard to France, exports dropped from 3,360 tons in October to 1,850 tons last month, compared with 202 tons for November, 1922. The depression in the French sulphate market earlier in the year, consequent on the seizure by the French at Oppau of large quantities of this fertiliser, is responsible for the 30 per cent. decline on the previous year's total trade. The British West Indies and Italy took less than in October; countries not separately specified also registered a considerable decrease, though in all these cases the year's total exports were on a much higher scale than in 1922. The total for the eleven months ending November 30 amounted to 230,598 tons, as compared with 127,338 tons in the corresponding period of last year.

SOUTH WALES NOTES.

(Specially Contributed.)

During the last few weeks the improvement in the tinplate trade has been so marked that the majority of factories will only be on stop for two days during the holiday season. Export orders are now plentiful, and in many instances customers are strongly pressing for immediate delivery. There is still some hesitancy by large consumers to enter into any contracts just at present, while manufacturers are not offering with freedom on long commitments owing to the threatened trouble in the coalfields. Galvanised sheets are not so much in demand, and with the slight reduction both in spelter and raw steel, makers are offering corrugated galvanised sheets at about 5s. less per ton. The patent-fuel trade is much brighter and the outlook for next year seems rather hopeful; pitch has again been reduced in price, and small coal is rather more plentiful. Export trade is keeping good, and it seems likely that more briquette works will be re-opened at the commencement of the year. At the factory of the Crown Preserved Coal Co., Ltd., at Port Talbot, which has been idle for several months, steps are being taken to make a restart in two or three weeks' time. The copper smelters are fairly well employed, but the trade is very indifferent. Spelter furnaces are working well, and there will not be much relaxation during the holidays, the trade being fairly good. Several more batteries of coke-ovens are to be started at the beginning of January, and several colliery owners have announced their intention to build new ovens and extend their by-product plants.

The imports for the week included 297cwt. barytes from Hamburg, 43cwt. zinc oxide from Rotterdam to Cardiff; 15 tons felspar from Antwerp to Newport; 2,200 tons iron pyrites from Seville, 31cwt. cobalt oxide, and 9 tons zinc ashes from Montreal, 103 tons precipitate of copper from Antwerp, 53 tons nitrate of soda from Hamburg, 50 tons nitrate of soda from Porsgrund, 22 tons copper ore from Christiania, 20cwt. refined saltpetre from Rotterdam to Swansea.

NEW COMPANIES.

United Coke and Chemicals Company, Ltd.—Capital £150,000. To adopt an agreement with the United Steel Company, Ltd., and manufacture chemicals and allied products, etc. Office: Moss Bay, Workington, Cumberland.

Coty (England), Ltd.—Private company. Capital £25,000. Perfume manufacturers, etc. Office: 3, Grays Inn Place, W.C.

Ellis Jones and Co. (Stockport), Ltd.—Private company. Capital £30,000. Colour and chemical manufacturers, etc. Office: Tiviot Colour Works, Manchester Road, Stockport.

"Flare" Firelighters, Ltd.—Private company. Capital £100. Manufacturers of firelighters, etc. Office: 21A, Berrylands Road, Surbiton.

Hydro Carbon Distillation Syndicate, Ltd.—Private company. Capital £5., in 1s. shares. To acquire and turn to account certain patent rights, etc. Office: 277, Finsbury Pavement House, E.C.

Lee and Pollard, Ltd.—Private company. Capital £3,000. Dyers and finishers. Office: Priestree Road, Sutton-in-Ashfield, Notts.

New Brights, Ltd. — Private company. Capital £30,000. Manufacturers, refiners, preparers of and dealers in blue, blacklead, starch, ultramarine, plumbago, emery, emery cloth, knife, plate, and other powders, etc. Office: Ings Lane Brough, East Yorks.

Standfast Dyers and Printers, Ltd.—Private company. Capital £60,000. Office: Caton Road Works, Lancaster.

Stream-Line Filter Company, Ltd.—Private company. Capital £72,000., in £1. shares (20,000 7½ per cent. cumulative preference). Office: 64, Victoria Street, Westminster, S.W.

Stovoids, Ltd.—Private company. Capital £1,000. Manufacturers of and dealers in briquettes and patent fuels, etc. Office: Clare House, 57, Kingsway, W.C.

Voldek Soap Company, Ltd.—Private company. Capital £2,500. Soap manufacturers, etc. Office: 15, Henthorn Street, Oldham.

World List of Scientific Periodicals. — Limited by guarantee. Council of management: Sir Arthur Schuster, Dr. P. C. Mitchell, and R. L. Mond, 10, Cavendish Square, W.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN NOVEMBER.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of November, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the returns.

(To be concluded.)

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN NOVEMBER.

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during the month of November, 1923, compared with 1921 and 1922. As from April 1, 1923, the export trade of the Irish Free State is excluded from the returns.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

Barnsley Chemical Company, Ltd.—Registered November 26, £15,000. debs.

British Burmah Petroleum Company, Ltd., London, E.C. —Registered December 1, mort. created out of the United Kingdom (supplemental to Trust Deed dated January 16, 1922, securing £600,000. 2nd deb. stock and premium of 5 per cent.).

Clement and Johnson, Ltd., London, W.C., chemists.—Registered December 3, £38,600. debs., part of £60,000.

Cyprus Sulphur and Copper Company, Ltd. (late New Lymni, Ltd.), London, E.C.—Registered November 30, £1,300. 1st. debs., part of £20,000.

Somerset Oxide and Ochre Company, Ltd., Bristol.—Registered November 26, £6,000. deb., to Branch Nominees, Ltd., 15, Bishopsgate, E.C.

Walker (J. B.) and Co., Ltd., Hull, oil refiners.—Registered November 27, mort. (collateral to £8,000. debs.), to London Joint City and Midland Bank, Ltd., securing all moneys due or to become due to the bank.

West Hensbarrow China Clay Company, Ltd.—Registered November 29, £500. debs., part of £10,000.

SATISFACTIONS.

Standardised China Clay Company, Ltd., London, E.C.—Satisfaction registered December 3, £9,223., registered November 27, 1914, to February 15, 1921.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Burlington Industrial Laboratories, Ltd. — Resolved November 30: That the company be voluntarily wound up. C. H. Whatley, 6/7, Charing Cross Chambers, Duke Street, Adelphi, W.C., liquidator.

Surrey Chemical Company, Ltd., London, S.E. — W. R. Theobald, 143, Bow Road, E., appointed receiver. November 27.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Scholes (John R.) and Co., Ltd., 14-15, Argyle Chambers, 67, Hanging Ditch, Manchester; chemical merchants; £15. 5s. 7d. October 29.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Canada.

A well-known Montreal firm are desirous of receiving quotations from British firms for 75 to 100 containers for liquid chlorine in accordance with specification. (Ref. D.O.T. 12,639/E.D./E.C./2.)

Egypt.

Tenders are invited for the supply of various stores required during 1924-25 by the Port and Lighthouses Administration, Alexandria, comprising considerable quantities of paints (mixed and in powder), varnishes, various oils (boiled and raw linseed, bicycle, clock, colza, etc.), shellac, coal and Stockholm tar, tallow, soap, etc. Tenders will be received by the Director-General, Ports and Lighthouses Administration, Alexandria, up to noon on January 7, 1924. (Ref. D.O.T. 11,944/F.E./C.C.)

Netherlands.

A firm of wholesale dealers in Almelo are desirous of obtaining the sole agency of British chemical works for the sale in Holland of heavy chemicals, including caustic soda, sodium sulphide, bichromates, bleaching powder, sulphate of alumina, potash alum, etc. (Ref. No. 640.)

Hardening the Products of Condensation from Phenols and Aldehydes. Deutsch, L.; Thorn, I.; and "Amalith" Chemische Industrie Ges. 25,274. **207,790, 207,791,** and **207,792**
Diaphragm for Electrolytic Pressure. Reinhardt et Cie, P (firm of). 28,853. **207,801**
Hydrogen Cyanide. Deutsche Gold- und Silber-Scheideanstalt vorm. Roessler. 30,414. **207,830**

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Amino-Anthraquinone Derivatives. A. G. Bloxam, London. (Soc. of Chemical Industry in Basle, Basle, Switzerland.) British Patent **205,525,** of 1922.

Aminoanthraquinone derivatives are prepared by the condensation of an amino compound of the anthraquinone series, the amino group of which may be monosubstituted, with a 1 : 3 : 5-triazine derivative halogenated in the nucleus—for example, cyanuric chloride or bromide; when the triazine derivative contains more than one atom of chlorine, part of the halogen only may react, and remaining reactive halogen atoms may then be saponified or caused to react with substances such as ammonia or primary or secondary amines, or with aliphatic or aromatic compounds containing one or more -OH or -SH groups. For the condensation diluents, such as nitrobenzene, chlorbenzene, naphthalene, toluene, or glacial acetic acid, may be employed, or condensing agents such as

cuprous chloride or agents binding halogen acid. Some of the products are useful as dyes, dyeing cotton and wool in red to yellow shades from the vat, and others as starting materials for the manufacture of dyestuffs. Several examples are given.

Benzanthrone Dyestuffs. Farbwerke vorm. Meister, Lucius, and Brüning, Hoechst-on-Main, Germany. Convention date, October 12, 1922. British Patent **295,502.**

Vat-dyestuffs are obtained by condensing benzanthrone, or a substitution product thereof having a free 1'-position, with an aromatic acid chloride in presence of a catalytic or condensing agent. The products dye cotton in yellow to deep orange shades from red to bluish red hydrosulphite vats; that obtained by condensing benzanthrone with benzoyl chloride in presence of aluminium chloride, with or without some zinc chloride, is probably 3 : 4 : 8 : 9-dibenzopyrene-5 : 10-quinone.

Monazo Dyestuffs. Farbwerke vorm. Meister, Lucius, and Brüning, Hoechst-on-Main, Germany. Convention date, October 12, 1922. British Patent **205,503.**

Monoazo dyes are prepared by coupling diazotised *m*-aminobenzaldehyde, or a substitution product thereof, with a pyrazolone; in place of a *m*-aminobenzaldehyde, a substance yielding one may be used such as an oxime, hydrazone, or aldazine. The products dye wool from an acid bath in even greenish-yellow shades fast to light, alkalies, and washing.

Welding or Cutting Metals. J. R. Rose, Pennsylvania; and J. Harris, Lakewood, Ohio, U.S.A. British Patent **205,543,** of 1922.

A gaseous fuel for the cutting or welding of metals with oxygen comprises a mixture of hydrogen with from 1 to 50 per cent. by volume of a hydrocarbon or hydrocarbon derivative with entire absence of oxides of carbon. Examples of hydrocarbons are butane, propane, methane, natural gas, gasoline alcohol, hydrocarbons from distillation of vegetable and animal oils and fats, acetylene, or hydrocarbons of the benzene series. With liquid hydrocarbons the mixture is made by saturating the hydrogen with their vapours, employing a saturator or carburettor. A mixture of 1 to 5 per cent. of hydrocarbons is used for cutting light metals and for narrow clean cuts, 5 to 15 per cent. for medium and heavy masses, and 15 to 50 per cent. for the heaviest masses of metal, including cast iron.

Aryl-oxy-naphthyl-ketones. O. Y. Imray, London. (Soc. of Chemical Industry in Basle, Basle, Switzerland.) British Patent **203,824,** of 1922.

Aryl-oxy-naphthyl-ketones are prepared by interaction of an arylchloroform such as a phenylchloroform or 1-chlor-2-naphthylchloroform and β-naphthol, or an α-or β-naphthol containing negative substituents, in absence of a substance for neutralising acid; by heating in presence of a suitable liquid the carboxylic or sulphonic group of those ketones derived from naphthol carboxylic or sulphonic acids is eliminated, giving the simple ketones.

Cellulose Ester-containing Paints. Titanine, Ltd., T. W. H. Ward, and J. Fletcher, London. British Patent **203,847,** of 1922.

Varnishes or paints comprising solutions of cellulose esters, particularly nitrocellulose, are rendered less inflammable by adding a finely divided substance which is insoluble in the solvents used and which decomposes with heat absorption at moderate high temperatures, such as above 350° C. Suitable substances are bicarbonates, double borates, and phosphates, containing ammonium borate or phosphate as a constituent; and particularly magnesium ammonium phosphate, which may be added in small proportions, such as 5 per cent. The prior use of ammonium phosphate is referred to.

Aluminium Chloride and Alumina. A. L. Mond, London. (Chemische Fabrik Griesheim-Elektron, Frankfurt-on-Main, Germany.) British Patent **205,563,** of 1922.

An aluminium-chloride solution which may be obtained by treating calcined clay with hydrochloric acid (or with aluminium-chloride solution enriched with hydrochloric acid) is evaporated to produce a crystal sludge from which the mother liquor is separated. The crystals are washed with hydrochloric acid or first with some of the original solution and then with pure hydrochloric acid (for instance of 20 per cent. strength), the mother liquor and washings being used to absorb hydrochloric acid arising from the calcination of the crystals to obtain alumina (when such calcination is effected) or from other sources and used according to their content of iron either for washing the crystals or for treating more clay. When the solutions accumulate too much iron they are evaporated and calcined to produce hydrochloric acid.

Synthetic Drugs. O. Y. Imray, London. (Soc. of Chemical Industry in Basle, Basle, Switzerland.) British Patent **203,608,** of 1922.

N-Mono- or di-carboxylic acid esters of asymmetrically substituted alkylene diamines are produced by the interaction of one molecular proportion of an asymmetrically substituted alkylene diamine with one or two molecular proportions respectively of a halogeno-formic acid ester, followed by the addition of alkali. According to an example, diethylamino-ethyl carbamic acid benzyl ester is obtained from *as*-diethyl-ethylene diamine and chloroformic acid benzyl ester.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Germicides and Fungicides. Koholyt Akt.-Ges., Berlin. British Patent **205,827.** Convention date, October 21, 1922.

Products having germicidal and fungicidal properties are obtained by treating plant extracts, such as sulphite lye or tanning extracts, with a halogen or a substance giving rise thereto. Sulphite lye is treated with chlorine, for example, preferably until the reddish-yellow precipitate obtained has a chlorine content of at least 10 per cent. The product may be subsequently treated with an oxidising agent, such as chloric acid. The products may be mixed with ointments and soaps, and, for making compresses or antiseptic powders, with substances such as clay; they may be applied to materials for dressing wounds. In solution they may be used for steeping seeds and for preserving wood, hair, feathers, and other animal or vegetable fibres. Their action is more powerful in acid than in alkaline solution, and is assisted by the presence of neutral salts.

Production of Alcohol and Yeast. E. Klein, Vöslau, near Vienna. British Patent **205,813.** Convention date, August 29, 1922.

In preparing alcohol by fermentation and utilising the residual liquor after separation of the alcohol for the formation of yeast by the aeration process, phosphorus compounds such as phosphates are added to the materials used in forming the mash prior to or during the sugar-conversion period. Nitrogen-containing materials and other yeast-nourishing substances may be added after the first fermentation. A mash prepared with a mixture of rye, malt, and superphosphate is acidified. Fermentation is effected in a concentrated liquor to diminish yeast formation. Alcohol is separated by distillation. The residual liquor is clarified and fermented with yeast while being vigorously aerated. In using mash prepared from rice or other materials poor in nitrogen, the fermentation to produce alcohol is stopped before completion, and nitrogenous substances such as uric acid, calcium cyanamide, extracts of acrospires, or cotton-seed cake are added prior to the fermentation to produce yeast. In using worts from molasses or crude sugar, additions of phosphates are made and the alcoholic fermentation is not carried to completion. The wash, after distillation to separate alcohol, is treated to yield the maximum quantity of yeast, additions of wort from molasses, superphosphate, and ammonium sulphate being made periodically. The yeast is afterwards improved by growth in a mash prepared from grain and superphosphate.

Chlorine Dioxide in Glue Manufacture. Köln-Rottweil Akt.-Ges., Berlin. British Patent, **203,276.** Convention date, January 31.

The raw material, such as sinews, bones, or split leather scrap, is treated with an aqueous solution of chlorine dioxide, washed with cold water, and finally treated with warm water for the extraction of gelatin or glue.

Vulcanising Fats. J. H. van der Meulen, Arnhem, Holland. British Patent, **201,531**. Convention date, July 31, 1922.

Fats, etc., are vulcanised by exposure to sulphur chloride vapour, preferably in an exhausted chamber and at atmospheric temperature The process is especially adapted for varnishing or lacquering leather, artificial leather, and rubber goods, by coating the article with fatty oil and then submitting it to the action of the chloride. The untreated layer of oil may be covered with one of rubber, so that the oil and rubber are vulcanised simultaneously.

Decomposition of Titanium-nitrogen Compounds. Titan Co. Aktieselskabet, Fredriksstad, Norway. British Patent. **199,713**. Convention date, June 24, 1922.

Titanium-nitrogen compounds are treated with sulphuric acid (which may be somewhat diluted) at a pressure greater than atmospheric and at a suitable temperature, the products being titanium sulphate or oxide and ammonium sulphate. If the temperature pressure and dilution of the acid are suitably chosen, the titanium may be obtained as oxide, a small quantity of acid beyond that necessary to produce ammonium sulphate being then sufficient. In an example 50 per cent. sulphuric acid is employed at a heat necessary to produce a pressure of 25 atmospheres. The titanium oxide obtained contains a small quantity of nitrogen and may be treated again with sulphuric acid under pressure to remove the nitrogen, the acid liquor obtained being used for treating fresh nitride. Specification 115,020 is referred to.

Desk Calendar, 1924.—Messrs. Brotherton and Co., Ltd., Leeds. A very attractive day-to-day calendar, mounted on a substantial metal base carrying a vertical support for the current date. Suitable, very striking quotations have been compiled by Mrs. Charles Ratcliffe, a lady of considerable literary reputation and accomplishment.

Chemical Society Library.—The library of the Chemical Society will be closed for the Christmas holidays from Monday, December 24, to Thursday, December 27, inclusive.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Wednesday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—There is little change to report on the past week. Business has been rather quieter, but the general tone of the market remains quite steady. The Continental position is still very strong. The complete stoppage of business with Germany continues. **Acetic Acid,** 80% technical, £47. 10s.; 80% pure, £50. to £51.; 98% glacial, £60. in casks, and about £73. per ton in glass demijohns, ex wharf London; spot supplies are running short, and prices are dearer, with the market firm; still higher prices are expected for the 80% pure grade. **Acetone,** British Government specification, about £124. per ton, in drums; the spot position holds very steady, and some fair business has been done. **Alum,** lump, in casks, £10. to £10. 10s. per ton, dealers continue to quote at these figures, with the market quiet. **Arsenic,** Cornish white powdered, £68. per ton, ex wharf; at the figure quoted the market is firm; business, however, has again been poor; the price stated appears to be too high for buyers, but there is little evidence of any easier conditions. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; this item has been again quiet, and dealers' prices are unchanged. **Bleaching Powder,** 35—37%, £10. to £10. 10s. per ton; very little interest is shown in dealers' offers of Continental material at these rates. **Barium Chloride,** 98—100%, £14. 10s. to £15. per ton; some limited business has been done close up to these quoted rates. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27.; B.P., crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commercial, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71. per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P. crystals, about 1s. 4½d. per lb., less 5%; spot supplies are offered at about this figure, with little or no demand. **Cream of Tartar,** B.P., 99—100%, 86s. to 87s. 6d. per cwt., less 2½%; dealers continue to quote close up to these rates, and some fair business has been booked; the market is steady. **Epsom Salts,** commercial quality, about £4. 15s. per ton, in bags; there is little interest shown in this item, and dealers' prices for Continental material are unchanged. **Formaldehyde,** 40% volume, £64. to £65. per ton; quotations on spot for this article are rather irregular, and it may be possible to place orders at lower figures. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers' prices are round about these rates, with business dull. **Lead Acetate,** brown, about £43.; white, £44. per ton; material in limited quantities is available on spot; the market is fully maintained. **Litharge,** imported, about £37. 10s. per ton, on spot; slightly cheaper to arrive; dealers are quoting at these prices, with occasional business being done. **Lithopone,** 30% Continental red seal, £23. to £24. per ton; a very satisfactory inquiry continues on spot for this article, and dealers' prices as quoted are supported by Continental offers. **Ammonium Chloride,** grey galvanising, £31. to £31. 10s. per ton; spot supplies are available at the prices mentioned; the market is very steady, with a rising tendency. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these unchanged rates. **Oxalic Acid,** about 5¾d. per lb.; there is still but poor business for this article; prices are about the same, with market unsteady. **Carbonate of Potash,** 90—92%, about £25. 10s. to £26.; 96—98%, £28. to £28. 10s. per ton; this item is quite firm on spot, with dealers holding spot supplies doing a fair business. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; business, so far as merchants are concerned, remains dull; quoted values unchanged. **Caustic Potash,** 88—92% solid, fully £33. per ton; during the past week there has been only a small call for this article, but owing to the much firmer conditions on the Continent spot values are fully maintained, and may advance. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers report a week of slow and small business; prices well maintained. **Prussiate of Potash,** yellow, about 10¼d. per lb.; only small business is reported, with dealers offering British material quoting at about this figure. **Sulphate of Potash,** 90%, £11. per ton; this market shows no change on the week. **Mercury,** about £9. 17s. 6d. per bottle of 75—76lb.; the spot market has been rather quiet again, but so far prices are being maintained. **Red Lead,** imported, about £37s. 10d. per ton on

spot; slightly cheaper to arrive; dealers continue to quote at about these rates. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; dealers holding spot supplies are firm at about these figures; supplies are now limited, and the market has a rising tendency. **Saltcake,** ground and unground, about £4. 10s. per ton, delivered; supplies available are fully taken up to the end of the year. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; merchants are offering at about these prices, with still but small inquiry. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; this figure is quoted by British makers for home trade only, packages free, carriage paid. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers continue to quote at this figure for home trade only; dealers are offering at cheaper prices to arrive. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers continue to quote at these rates, and slightly more for home trade. **Soda Ash,** 58% light alkali. £7. 10s. per ton, in bags; British makers' price, for home trade only, is unchanged, packages free, carriage paid to any station in Great Britain. **Hyposulphite of Soda,** pea crystals, about £15. 10s. per ton, in 1cwt. kegs; commercial quality, about £10. to £10. 10s. per ton, in casks; spot prices show a further slight hardening, and the market stands quite firm; Continental prices are dear. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b.; prices quoted here are very steady. **Nitrite of Soda,** 100%, £28. 10s. per ton; no further change in quotations is recorded, with market steady. **Prussiate of Soda,** about 5½d. per lb.; only small business is being done; dealers continue to offer British material at about this figure. **Sodium Sulphide,** 60—62%, about £14. 10s.; ditto, broken, £15. 10s. per ton, in drums; dealers are finding but small business; their prices, however, are fully maintained. **Tin Crystals,** 1s. 3½d. per lb.; this market shows no change on the week. **Tartaric Acid,** B.P. crystals, about 1s. 1½d. per lb., less 5%; although business is just as poor, the market seems a little steadier; spot supplies are freely offered. **White Lead,** imported, about £41. to £42. per ton, on spot; dealers are quoting at these prices, and slightly less to arrive; business is quiet. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' prices remain at these levels.

Pharmaceutical Chemicals.—The tone of this market continues firm throughout, with very few exceptions. One or two further advances in spot values are recorded. A good volume of business is again reported. The position of the Continent, especially in Germany, indicates nothing in the way of easier conditions in the near future. **Acetanilid,** crystals and powder, up to 4s. per lb.; spot offers are now made up to the higher figure quoted, and supplies are very short. The Board of Trade persist in their attitude of refusing to grant import licences for adequate quantities, thus forcing up the spot price to consumers. **Acetyl-Salicylic Acid,** B.P., 3s. 9d. to 4s. per lb.; holders of spot supplies of good material are quoting at about these rates, according to quantity. **Benzoic Acid,** B.P., 4s. to 4s. 3d. per lb., nominal; it is doubtful if there are any supplies available; licences to import in sufficient quantity are still being refused by the Board of Trade. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. 9d. to 19s. per lb.; although there is little call for this article, the spot price is well maintained. **Salicylic Acid,** B.P., 2s. 6d. per lb.; at this unchanged rate the spot position is very steady. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; spot values are steady as quoted, with some demand on the market. **Amidopyrin,** about 15s. per lb.; this article is seldom asked for on spot; market steady. **Ammonium Bromide,** B.P., 9d. per lb.; at this figure the spot position is now very steady, and any movement will probably be to higher rates. **Benzonaphthol,** 5s. per lb., nominal; there is little or no demand on spot; dealers' prices are unchanged. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; the market remains dull, and quoted prices by dealers are unchanged. **Benzaldehyde 03,** 3s. 5d. to 3s. 6d. per lb.; a sharp advance in spot values is recorded, with the market quite firm. **Calcium Lactate,** about 2s. 6d. per lb.; spot values are fully maintained, with a fair volume of business being done. **Chloral Hydrate,** duty paid, 4s. 3d. per lb.; this is a very steady market, with business fairly good. **Creosote,** B.P., about 2s. 6d. per lb.; the market has been rather quieter, but prices are steady. **Creosote Carbonate,** about 6s. 6d. per lb., nominal; there is practically no interest shown in this product. **Guaiacol Carbonate,** about 14s. per lb.; the position here holds very firm at the rate quoted, with supplies on the short side, and Continental offerings small and dear. **Hexamine,** fully 4s. 6d. per lb.; the spot price as quoted is fully maintained, with a fair volume of business being done. **Hydroquinone,** 4s. to 4s. 3d. per lb.; not much actual business has been on the market, but prices from dealers are steady at about these rates. **Methyl Salicylate,** 3s. to 3s. 3d. per lb.; there is little offering on spot below these figures, and business has again been good. **Methyl Sulphonal,** about 25s. per lb.; dealers are quoting up to this figure, but any business would generally be at lower rates. **Paraformaldehyde,** about 3s. 9d. per lb.; it should not be difficult to book orders for early delivery at slightly less than this figure. **Paraldehyde,** about 1s. 7d. per lb.; supplies are being taken up quite well, and are now on the short side; prices are firmer. **Phenacetin,** up to 8s. per lb.; there has been good business for this article, and dealers' stocks are now restricted. **Phenazone,** fully 8s. 9d. per lb.; there is very little offered on spot at below this figure, the tendency is towards higher prices. **Phenolphthalein,** 8s. 6d. per lb.; any supplies about should be worth close up to this quoted figure; the market is firm. **Potassium Bromide,** B.P., crystals and granular, about 8d. per lb.; the spot position is fully maintained at this figure; business continues satisfactory, and Continental offerings are dearer. **Potassium Permanganate,** B.P., about 9½d. per lb.; dealers seem unable to offer below this figure, and any fresh imports will have to be well up to this figure. **Potassium Sulphoguaiacolate,** about 7s. per lb.; this market has been idle during the past week. **Resorcin,** about 6s. 6d. per lb.; dealers are asking up to this figure, with the market moderately active during the past week. **Sodium Benzoate,** 3s. 3d. to 3s. 6d. per lb., nominal; supplies are kept very short here, with the result that prices have been forced up. **Sodium Bromide,** B.P., crystals and granular, fully 9d. per lb.; dealers offering spot material at this price are firm; business has again been good. **Sodium Diethylbarbiturate,** about 20s. per lb.; the spot market is well maintained at last week's higher price as quoted by dealers. **Sodium Salicylate,** B.P., crystals, about 3s. powder, about 3s. 2d. per lb.; this article has been in active demand during the past week, and higher prices are now being quoted, with the position generally very firm. **Sulphonal,** about 20s. per lb.; this market has shown but little life during the week; quoted values are easy. **Terpin Hydrate,** about 1s. 9d. per lb.; a steady but not very active market. **Thymol,** about 14s. to 14s. 6d. per lb.; the market is steady, but the demand has been rather quiet.

Coal-tar Products, Etc.—Pitch, solvent naphthas, and one or two other products are again easier. The general tone of this market is rather unsteady, and any movements are likely to be towards slightly cheaper prices. **Aniline Oil,** 9d. to 9½d. per lb., naked, ex works; this item shows no change on the week, with business dull. **Aniline Salt,** 9½d. to 10d. per lb., naked, ex works; the market is steady, with business slow. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; as quoted the market is rather easy, with little doing. **Benzol,** crude 65's, 8d. to 10d.; standard motor, 1s. 1d. to 1s. 4d.; pure, 1s. 6½d. to 1s. 8d. per gallon, ex works, in tank wagons; British makers report no change in their prices. **Carbolic Acid,** crystals, 11½d. to 1s. per lb.; at the lower prices quoted last week this market remains dull and still unsteady. **Cresylic Acid,** 97—99%, 2s. to 2s. 1d. per gallon; this market is slightly firmer, and the demand has improved. **Toluol,** 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; 90%, 1s. 3d. per gallon; prices are about the same, with business quiet. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per gallon; this market remains dull, with no change in quoted values. **Creosote Oil,** about 9¼d. per gallon, f.o.b.; a fair volume of business is reported, with the market well maintained. **Naphtha,** crude, 8½d. to 8¾d. per gallon; matters have not improved here; market dull. **Solvent Naphtha,** 90/160, 1s. 1d. to 1s. 2d. per gallon; a further reduction in price is recorded, with the market still neglected and far from steady. **Heavy Solvent Naphtha,** 90/190, 1s. 1d. to 1s. 2d. per gallon; this item is again cheaper, but the market seems fairly steady, with but very little business being done. **Naphthalene,** about £19. per ton; this market is slightly easier, and matters have been quiet all round. **Pyridine,** 22s. to 23s. per gallon; spot supplies remain very small, and

prices are fully maintained. **Hexamethylene,** 3s. 9d. to 4s. per gallon; this item keeps very steady, with some little business passing. **Pure Methyl Alcohol,** £90. per ton, in drums, ex wharf London; dealers' prices are well maintained at this level. **Pitch,** about 105s. per ton, f.o.b. East Coast; a further decline in quoted rates is recorded, and the market is still neglected; it is not thought that values will go much lower, and with a revival in demand a sharp recovery may take place.

LONDON METAL MARKET. Wednesday.

Copper: Standard brands, £62. to £62. 2s. 6d., cash; £62. 17s. 6d. to £63., three months; electrolytic, £67. 15s. to £68. 5s. **Tin**: Standard, £232. 15s. to £233., cash; £234. 12s. 6d. to £234. 15s., three months; Straits, £234. 15s.; English, £233. 10s. **Lead,** soft foreign, £30. 15s., prompt; English, £32. 5s.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter,** prompt £32. 17s. 6d.; hard, £27. **Antimony,** English regulus, 99%, £38.; special brands, £44. to £45. **Aluminium,** 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel,** £130., delivered; £125. to £130. for export, f.o.b. **Mercury,** £9. 12s. 6d. to £9. 15s. **Bismuth,** 10s. **Platinum,** £29. per oz.; scrap, £27. **Wolfram,** spot, 11s. 9d. per unit, c.i.f. U.K. or Continent. **Zinc Dust** has shown much increased activity; Beaver brand, 90—92%, £48.; American, 92—94%, £48.; Continental, 83—88%, £42. to £46. per ton, delivered.

MANCHESTER CHEMICAL MARKET. Wednesday.

The demand for heavy chemicals remains on the slow side both for home and export account, with values generally in buyers' favour. Alkali products are unchanged, and makers are fairly well engaged with orders. **Bleaching Powder,** softwoods, is now offering at £10., delivered, for 1924 contracts, 4-ton lots, with extra carriage for smaller quantities. **Chlorates** are firmly maintained at 3d. per lb., ex store. **Bichromates** unaltered. **Roasted Saltcake,** quiet at £4. 10s. in bulk, carriage paid. **Glauber's Salt** only in small request, and price easy at 70s. per ton, carriage paid. Imported American **Sulphur,** firm at £5. 5s. on rails. Demand for **Copper Sulphate** is quiet, and price weak at £25., f.o.b. **Phosphate of Soda,** lower at £14., c.i.f. Commercial **Hyposulphite of Soda,** £9. 10s., bags, f.o.r. **Nitrite,** firm at £28. 10s., ex store. Concentrated **Sodium Sulphide** £14. 10s. per ton. White powdered Cornish **Arsenic** is a shade easier at £68., delivered Manchester, but supplies are short. **Yellow Prussiates** weaker; **Potash** at 9½d., and **Soda** 5½d., per lb. Grey and brown **Acetate of Lime** are scarce, and the recent advanced prices are well maintained. **Acetic Acid** and **Acetate of Soda** are without change. Miscible wood **Naphtha,** 5s. 6d. per gallon. **Acetone,** £124. per ton. **Lead Salts** are firm, and supplies short: White **Acetate** £46., brown £45.; **Nitrate,** £43., delivered. **Barium Chloride,** steady at £11 10s., ex store. **Ammonia Salts** are moving off fairly well, and prices have a firmer tendency. **Green Copperas** is in active demand, and stocks are low. **Oxalic Acid** dull at 5¾d., delivered.

SWANSEA MARKET REPORT. Wednesday.

Tinplate prices have a slight upward tendency, and premiums were again offered on the fixed basis of £1. 3s. 6d. per standard box, f.o.b., as the minimum. **Galvanised Sheets** firm at £19. 2s. 6d. per ton. **Copper** steady at £62. 7s. 6d. per ton cash and £63. 7s. 6d. three months. **Tin** prices irregular round £232. 7s. 6d. cash and £234. 12s. 6d. three months; English ingots, £234. 7s. 6d. **Lead** firm, with fair demand; foreign, £31. 10s. 6d. per ton prompt, and £30. 17s. 6d. forward; English, £32. 12s. 6d. **Spelter** easier, with prompt at £32 7s. 6d. per ton, and forward £32. 12s. 6d. **Zinc Sheets** £39. 7s. 6d. per ton, on rails at makers' works. **Pitch** prices fell back to £5. 7s. 6d. per ton, delivered docks. **Creosote** active, and in much call at 8½d. to 9½d. per gallon. **Benzol** in less demand at 1s. 1d. to 1s. 4½d. per gallon. **Tar** in better request at 9d. to 10d. per gallon, and refined £1. 13s. 6d. per barrel of 40 gallons; crude, £4. 12s. 6d. per ton at ovens. **Sulphate of Ammonia** in better inquiry, with fair export business; home trade prices £14. 16s. **Sulphate of Copper** dull at £25. 7s. 6d. per ton, less 5%, in casks, f.o.b. **Nitrate of Soda** rather slow at £13. 7s. 6d. per ton. **Bone Meal** dull at £9. 1s. 6d. per ton for prompt Indian. **Seed Oils** firmly held, with raw **Linseed** at £2. 5s. 8d. and boiled £2. 7s. 6d. per gallon. **Cottonseed Oil** firmly held, with common edible at £2. 6s. 3d., and deodorised £2. 8s. 3d., per cwt., net, in barrels. **Rape Oil** firm; refined, prompt, £2. 7s. 3d. per cwt., net, in barrels. **Cod Oil** steady; Newfoundland, prompt, £2. 5s. 3d.; English, £1. 13s. 9d., per cwt. **Coconut Oil** rather quiet at £2. 7s. 3d. per cwt. for prompt Ceylon. **Castor Oil** firmly held, with bests at £3. 6s. 3d., seconds £3. 1s. 3d., and ordinary £3 0s. 3d., all per cwt., net; quotations for delivery over January slightly higher. **Olive Oil** scarce and nominal. Palm Oil quietly steady; Lagos, £38. 2s. 6d.; softs, £37. 7s. 6d. prompt and £37. 10s. forward; mediums, £37. 12s. 6d.; and hards, £37. 17s. 6d., all per ton, ex ship. **Sulphuric Acid** in good call at unchanged prices. **Oxalic Acid** moves slowly at 6¼d. per lb., f.o.r. **Arsenic** in rather better demand, with white powdered at £66. 17s. 6d. per ton. **Copperas** remains dull at £2. 2s. 6d. per ton, delivered London or equal in 4-ton lots. **Turpentine** quiet, with American, prompt, at £3. 13s. 6d. per cwt. **Coal**: Best Admiralty smokeless £1. 9s. 6d., seconds £1. 8s. 6d.; ordinaries, £1. 7s.; Monmouthshire black vein, £1. 8s. 6d., all per ton, f.o.b. **Anthracite** in fair demand: Best large £2., seconds £1. 15s.; Paris and French nuts, £2. 12s. 6d. per ton, all f.o.b. **Cokes** very strong; export, £2. 10s. per ton, f.o.b.; foundry, £2.; and furnace, £1. 10s. per ton at ovens. **Patent Fuel,** very steady from £1. 10s. to £1. 12s. 6d. per ton, f.o.b.

LIVERPOOL CHEMICAL MARKET. Wednesday.

Inquiries for chemicals of the heavier kind, for delivery to home-trade users in the early part of 1924, have been made to an extent that has shown an anticipation of a very fair consumption of chemicals within the first three months of the New Year. In the export branch of the trade shipments have been fairly active, especially those of some soda products. **Bleaching Powder** has been in steady and fair demand, and the price for 1924 has been reduced by 5s. per ton; for spot and for export it is £11. per ton; for contracts special prices are quoted, according to requirements. **Chloride of Calcium** has been in moderate demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has been rather more in request for use in the U.K., and has had a fairly large shipment to overseas ports; it is £19. 7s. 6d. per ton, carriage paid to home-trade buyers; special prices being quoted in contracts, according to requirements. **Bicarbonate of Soda** has again been in good request for use by the home trade, and has been shipped largely for export; it is £10. 10s. per ton, in bags, for use in the U.K. **Soda Crystals** have sold with some freedom for home-trade use, and have had a moderate shipment on export account; they are £5. 5s. per ton, carriage paid, for use by the home trade. **Nitrate of Soda** has had a quietly steady sale, and is £13. 5s. to £13. 10s. per ton. **Borax** has been more in request; commercial crystals are £25. per ton, and powdered is £26.; higher grades are—crystals £29. per ton, powdered £30., and superfine £31. per ton, in 2cwt. bags, carriage paid, to home-trade users. **Saltcake** has been in very fair demand; the price is £4. 10s. to £5. per ton for use in Great Britain, and is £5. to £6. per ton for export. **Bichromate of Soda** has been quieter, and is 4½d. to 4¾d. per lb. **Ammonia Alkali** has been in rather good request for use by the home trade, and has had a heavy shipment; the price has been reduced for the New Year, and is £6. 15s. per ton, f.o.r., special prices being quoted for export, according to destination and for home-trade contracts, according to requirements. **Hyposulphite of Soda** has been in fair request, and is £10. per ton, in 2cwt. bags, for commercial, and £15. per ton for photographic. **Sulphide of Soda** has had a moderate inquiry, and is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has been but little called for, and is 3d. per lb. **Phosphate of Soda** has been rather more inquired for, and is £14. 10s. to £15. per ton. **Prussiate of Soda** has been very quiet, and is 6d. per lb. **Yellow Prussiate of Potash** has been in quietly steady demand, and the price has eased; it may be given as 10d. to 10½d. per lb. **Red Prussiate** has been quiet, and is 2s. 8d. per lb. **Carbonate of Potash** has been in fair demand, and is £25. 10s. to £28. per ton, according to test. **Nitrate of Potash** has been more in request, and is £29. to £32. per ton. **Chlorate of Potash** has been but little called for, and is 3½d. to 4d. per lb. **Caustic Potash**

has again been in rather good demand, and is £32. to £35. per ton. **Permanganate of Potash** has been more in request, and is 9d. to 9¼d. per lb. **Bichromate of Potash** has had a moderate sale, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has sold more freely; first quality is £56. per ton, and second quality £53. per ton. **Sulphate of Ammonia** continues to meet with a moderate inquiry for use in the United Kingdom, but has again had a large shipment on export account; it is £14. 16s. per ton, neutral, of 25¾%, and £13. 13s. per ton for ordinary of 25¼%; for January neutral is £15. 2s. per ton, for February £15. 3s., and for March to May £15. 5s. per ton, for use in the United Kingdom, the price of ordinary being also increased. **Carbonate of Ammonia** has sold with some freedom, and is 4d. per lb. **Muriate of Ammonia** has been quiet; grey is £32. per ton. **Magnesia** has been in very fair demand; **Carbonate** is £2. per cwt., and **Sulphate** £4. to £6. per ton. **Alum** has been quieter; it is £11. per ton for use by the home trade, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has had a steady inquiry, and is £8. to £11. per ton, according to quality. **Sulphur** has been in good request; flowers are £9. 10s. per ton, roll is £8. 10s., rock is £8. per ton, and American £5. 10s. per ton. **Tartaric Acid** has been rather more in request, and is 1s. 0¼d. to 1s. 1d. per lb. **Cream of Tartar** has again sold somewhat freely, and is £4. 6s. to £4. 8s. per cwt. **Boric Acid** has had a steady inquiry; commercial is £48. per ton, and powdered £51.; B.P. grades were £54. to £60. per ton, carriage paid to home-trade users. **Citric Acid** has been but little called for, and is 1s. 5d. per lb. **Oxalic Acid** has been very quiet, and is 6d. per lb. **White Acetate of Lead** has been rather more in demand, and is £44. 10s. to £45. per ton. **Sulphate of Copper** has moved but slowly for home-trade use, but has been shipped more freely for export; it is £25. to £25. 10s. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been in very fair demand; white powdered is £68. to £69. per ton.

WEST OF SCOTLAND CHEMICALS.

Tuesday.

A fair amount of business has been transacted on home account after the quietening-down during the election. Export demand, however, continues to be limited, and will doubtless remain dull until the advent of the New Year. Prices generally are steady, with a firmer tendency in lead acetate. **Alum**, lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic**, white powdered, scarce at £70. 10s. per ton on spot; some resale material is obtainable at this price. **Barium Chloride**, £15. per ton; at this price the market remains steady; foreign imported material offered round £14. to £14. 5s. **Bleaching Powder**, quiet at £11. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid**, crystals, £48. per ton, carriage paid in the U.K., makers' prices. **Borax**, crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities lower. **Calcium Chloride**, 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid**, 1s. 5d. per lb., less 5%; business a little firmer at this figure, with some local inquiry. **Copper Sulphate**, £25. 15s. per ton, less 5%. **Cream of Tartar**, £4. 1s. per cwt. for 99% at Glasgow; quotation steady, and inquiry small. **Lead Acetate**, white, dearer at £44. per ton on spot; brown, good inquiry at £45. per ton; Continental material offering at slightly cheaper rates. **Magnesium Chloride**, £3. 5s. per ton, ex store; foreign material quoted at much under this figure. **Oxalic Acid**, quiet at 5¾d. per lb.; inquiry in this direction is moderate. **Paraffin Bichromate**, 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate**, crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate**, crystals, 1s. per lb.; at this price there is only a medium inquiry. **Salammoniac**, first and second lump, £55. and £52. 10s. per ton respectively; crystals, £48. 10s. per ton; at these reduced quotations the market is rather inactive. **Saltpetre**, £1. 12s. per cwt., net; a better market, with price unaltered; fresh arrivals are cheaper. **Sodium Bichromate**, 4½d. per lb.; unchanged. **Sodium Chlorate**, 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate**, 7d. per lb., ex store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate**, £9. 15s. per ton, in 2cwt. bags; £12. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic**, 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid**, 1s. 1d. per lb.; less 5%, at Glasgow; the market is much firmer, with price slightly higher.

IMPORTS OF CHEMICAL PRODUCTS

Auckland, 1 t., £85. ; Fremantle, 2 t., £176. ; Melbourne, 2 t., £174. ; Sydney, 3 t., £261. ; Townsville, 2 t., £174.

DISINFECTANTS (*otherwise undes.*)
Algoa Bay, 1 t. 1 c., £29. ; Buenos Ayres, 10 c., £88. ; Cape Town, 5 c., £23. ; Canton, 4 pkgs., £17. ; East London, 2 t. 3 c., £62. ; Famagusta, 8 c., £16. ; Hong Kong, 1 t. 18 c., £26. ; Havre, 18 c., £101. ; New Plymouth, 3 c. 2 qrs., £12. ; Nelson, 2 c. 1 qr. £19. , Timaru, 2 c. 3 qrs., £31. ; Wellington, N.Z., 2 t., £53.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Madras, 15 t. 17 c., £1,775.
Indigo
Shanghai, 53 t. 15 c., £7,506.
Unspecified
Brisbane, 1 t., £240. ; Lyttleton, 4 c., £25. ; Melbourne, 3 t. 2 c., £166. ; Montreal, 3 t. 4 c., £614. ; Napier, 3 c., £37. ; Oporto, 10 c., £170. ; Singapore, 3 qrs., £15. ; Sydney, 1 t. 9 c., £575. ; Shanghai, 3 t. 15 c., £880. ; Wellington, N.Z., 1 c., £12.

DYESTUFFS (NATURAL)—
Fustic
Hamburg, 16 c., £147.
Logwood
Hamburg, 2 t. 9 c., £116. ; New York, 1 t., £93. ; Santos, 1 t., £91.
Unspecified
Sav-la-Mar, 2 t. 6 c., £16.

ESSENTIAL OILS (SYNTHETIC)—
Iddo, 8 c., £70.

FERTILISER (NITROGENOUS)—
Charleston, 99 t. 5 c., £495.
Wilmington, 75 t.,

FERTILISERS (*otherwise undes.*)—
Kobe, 99 t. 5 c., £1,700.
Las Palmas, 5 t., £76.

GLYCERINE—
Antofagasta, 31 t. 15 c., £2,729. ; Antwerp, 2 t. 3 c., £143. ; Amsterdam, 3 t. 18 c., £266. ; Bourgas, 1 t. 19 c., £164. ; Cape Town, 2 t. 19 c., £210. ; Christiania, 25 t., £1,900. ; Carupano, 2 c. 2 qrs., £10. ; Copenhagen, 1 t., £67. ; Gothenburg, 19 c., £75. ; Kobe, 123 t. 5 c., £9,196. ; Pt. Said, 3 t. 18 c., £325. ; Sydney, 6 t. 17 c., £525. ; Shanghai, 5 t. 1 c., £430. ; Varna, 2 t., £162. ; Yokohama, 19 t. 7 c., £1,410.

HYDROFLUORIC ACID—
Bahia, 3 c., £18.

IRON CHROMATE—
Valencia, 1 t. 1 c., £26.

LACTIC ACID—
Fremantle, 1 t. 4 c., £56. ; Melbourne, 2 t. 8 c., £112. ; Sydney, 1 t. 3 c., £54.

MAGNESIA—
Havana, 17 c., £64.

MAGNESIA (CALCINED)—
Kobe, 2 t. 10 c., £244.
New York, 5 t., £480.

MAGNESIUM CARBONATE—
Havana, 1 t., £65. ; Melbourne, 5 c., £16. ; New York, 5 t., £145.

MAGNESIUM SULPHATE—
Calabar, 2 c., £3. ; Duala, 2 c. 2 qrs., £3. ; Falklands, 1 c., £1. ; Fernando, Po , 2 c., £3. ; Grand Bassam, 6 c., £8. ; Lyttleton, 14 c., £32. ; Rangoon, 2 t. 11 c., £18.

NICKEL OXIDE—
Santos, 5 c., £37.

PHOSPHORUS (AMORPHOUS)—
Kobe, 6 t. 14 c., £1,242.
Rio de Janeiro, 1 t. 19 c., £470.

PHOSPHORUS SESQUISULPHIDE
Auckland, 1 t. 9 c., £325.

PITCH (*otherwise undescribed*)—
Calcutta, 11 t. 10 c., £277. ; Havre, 7 c., £19. ; Rio, 9 c., £21.

POTASSIUM BICARBONATE—
Constanza, 1 t. 1 c., £51.
Melbourne, 10 c., £28.

POTASSIUM BICHROMATE—
Alexandria, 3 t. 14 c., £176. ; Lisbon, 2 t., £106. ; Malmo, 7 c., £16. ; Marseilles, 10 t. 1 c., £399. ; Piraeus, 19 c., £47. ; Valencia, 1 t. 19 c., £86.

POTASSIUM BISULPHITE—
Adelaide, 7 c., £29.

POTASSIUM CHLORATE—
Wellington, N.Z., 5 t., £198.

POTASSIUM CITRATE—
Bombay, 2 c., £26.

POTASSIUM CYANIDE—
Montreal, 3 c., £55.

POTASSIUM IODIDE—
Accra, 37 lb., £39. ; Calabar, 150 lb., £138. ; Madras, 2 qrs., £48. ; Pt. Harcourt, 150 lb., £146.

POTASSIUM IODIDE AND IODOFORM—
Warri, 74½ lb., £76.

POTASSIUM NITRATE—
Lagos, 6 c., £11.
Melbourne, 10 c., £19.

POTASSIUM PRUSSIATE—
Bordeaux, 1 t. 19 c., £176. ; Bilbao, 7 c., £44. ; Kobe, 24 t. 2 c., £1,920. ; New York, 1 t. 2 c., £219.

SALAMMONIAC—
Madras, 2 t. 2 c., £104.
Marseilles, 15 c., £37.

SALICYLIC ACID—
Singapore, 1 c., £13.

SHEEP DIP—
Algoa Bay, 25 t. 2 c., £1,627. ; Buenos Ayres, 3 t., £155. ; Calcutta, 1 t. 1 c., £39. ; Comodoro Rivadavia, 24 t. 18 c., £962. ; Durban, 2 t. 13 c., £204. ; East London, 13 t. 10 c., £1,005. ; Gisborne, 10 t. 13 c., £793. ; Napier, 17 t. 17 c., £1,316. ; Pto. Deseado, 49 t. 3 c., £4,675. ; Rio Coyle, 3 t. 10 c., £131. ; Rio Gallegos, 4 t. 14 c., £175. ; San Julian, 9 t., £350. ; Timaru, 4 t. 10 c., £331. ; Wellington, N.Z., 27 t. 5 c., £1,947.

SULPHUR—
Christiania, 1 t., £12.

SULPHURIC ACID—
Adelaide, 29 t. 19 c., £282.

SUPERPHOSPHATE—
Demerara, 1 t. 16 c., £42.
Las Palmas, 3 t., £19.

TANNING MATERIALS—
Unspecified
Alexandria, 1 t. 1 c., £24.
Christiania, 5 t. 8 c., £70.

TANNING MATERIALS—
Unspecified
Dunkirk, 7 t. 12 c., £202.
Pt. Elizabeth, 11 c., £22.

TARTARIC ACID—
Adelaide, 2 t., £252. ; Brisbane, 10 c., £61. ; Perth, 1 t. 10 c., £189. ; Sydney, 3 t. 10 c., £428.

TIN OXIDE—
Santos, 11 c., £133.

VANILLIN—
Montreal, 5 c., £532.

WOOD PRESERVATIVE—
Singapore, 2 t. 5 c., £65.

ZINC CHLORIDE—
Calcutta, 1 t. 15 c., £45. ; Rotterdam, 5 t. c., £119. ; Rangoon, 1 t. 14 c., £44. ; Sydney, 1 t., £33.

Week ending December 14.

BASIC SLAG—
Fremantle, 100 t.

CALCIUM CHLORATE—
Barcelona, 30 pkgs.
Wellington, 40 pkgs.

CASEIN—
Hamburg, 5 t.

CAUSTIC SODA—
Acapulco, 52 pkgs. ; Adelaide, 50 drms ; Alexandretta, 169 drms ; Algoa Bay, 116 drms. ; Bangkok, 100 cs. ; Bari, 17 drms. ; Bourgas, 250 drms. ; Bombay, 110 drms. ; Brisbane, 32 drms. ; Buenos Ayres, 983 drms. ; Calabar, 10 drms. ; Cartagena, 30 drms. ; Cabedello, 159 drms. ; Calcutta, 108 drms. ; Christiania, 40 drms. ; Cape Town, 77 pkgs. ; Constantinople, 683 drms., 35 pkgs. ; Corinto, 10 drms. ; Corfu, 10 pkgs. ; Danzig, 50 drms. ; Dunedin, 55 drms. ; Durban, 17 drms. ; Fremantle, 37 pkgs. ; Genoa, 176 drms. ; Gothenburg, 23 pkgs. ; Hamburg, 817 drms. ; Karachi, 200 drms. ; Luderitz Bay, 10 cs. ; Melbourne, 587 pkgs. SODIUM BISULPHITE—
Corral, 20 drms.

SODIUM HYDROSULPHITE—
Genoa, 10 pkgs.
Rio de Janeiro, 5 kgs.

SODIUM PEROXIDE—
Antofagasta, 6 cs.

SODIUM SILICATE—
Adelaide, 115 pkgs.; Barranquilla 20 cks.; Cartagena, 30 pkgs.; Dunedin, 32 pkgs.; Durban, 106 pkgs.; Lisbon, 265 pkgs.; Melbourne, 241 pkgs.; Messina, 33 cks.; Newcastle, 5 drms.; Para, 10 pkgs.; Sydney, 29 bgs., 14 drms.; Teneriffe, 3 drms.; Vancouver, 10 cs.

SODIUM SULPHIDE—
Cape Town, 8 pkgs.; Dunedin, 34 pkgs.; St. John, N.B., 32 drms.; Lisbon, 14 pkgs.; Lyttleton, 15 pkgs.; Pernambuco, 36 pkgs.; Santos, 62 drms.

STEARINE—
Cuidad Bolivar, 27 bgs.; La Guaira, 27 pkgs.; Shanghai, 93 dble. bgs.

TALLOW—
Alexandria, 6 brls.; Antwerp, 70 pkgs.; Dunkirk, 158 pkgs.; Shanghai, 16 pkgs.

WAX (*otherwise undescribed*)—
Christiania, 20 pkgs.

LONDON.

OFFICIAL AMENDMENT.

From return for week ending September 5, 1923, deduct—

CREAM OF TARTAR—
Auckland, 1 t., £98.

Week ending December 12.

ACETIC ACID—
Auckland, 1 crby., £6.; Cape Town, 4 cs., £13.; Channel Islands, 2 cks., £5.; East London, 2 cs., £7.; Lyttleton, 20 cs., £63.; Timaru, 6 cs., £18.

ACETONE—
Antwerp, 31 drms., £1,085.; Antwerp (F.), 34 drms., £1,320.; Delagoa Bay (F.), 15 drms., £71.

ACETYL SALICYLIC ACID—
Irish Free State, 3 cs. (pt.), £34.; Karachi, 1 cs. (pt.), £9.; Montreal, 5 cs. (pt.), £50.; Shanghai, 2 cs. (pt.), £8.

ALKALINE TARTRATES—
Santander, 14 cs., £125.

ALUMINIUM SULPHATE—
Pt. Sudan, 5 cs., £29.

AMMONIA—
Alexandria, 27 pkgs., £56.; Barcelona, 14 drms., £140.; Buenos Ayres, 4 cs. (pt.), £9; Cape Town, 24 cs., £44.; Delagoa Bay, 9 drms., £40.; Durban, 9 cs., £16.; Irish Free State, 26 cs., £47.; Pt. Elizabeth, 15 cs., £43.; Pt. Sudan, 3 cs., £5.; Rangoon, 10 cs., £18.; Valparaiso, 20 cs., £60.

AMMONIA (ANHYDROUS)—
Penang, 10 cylds., £121.; Pt. Said, 5 cylds., £68.; Punta Arenas, 22 cylds., £186.; Singapore, 20 cylds., £151.

AMMONIUM CARBONATE—
Bari, 1 t., £27.; Beyrouth, 2 c., £6.; Calcutta, 14 c., £60.; Durban, 5 c., £11.; Hamburg, 1 t., £28.; Helsingfors, 1 t. 10 c., £38.; Hong Kong, 2 t., £112.; Jaffa, 6 c., £18.; Kobe, 7 t. 10 c., £250.; Penang, 1 t. 3 c., £55.; Seremban, 2 c., £6.; Trinidad, 2 c., £5.

AMMONIUM CHLORIDE—
Sydney, 1 brl., £12.

AMMONIUM NITRATE—
Harlingen, 50 t. 19 c., £1,130.

AMMONIUM SULPHATE—
Bombay, 200 t., £2,595.; Calicut, 15 t., £198.; Dunkirk, 45 t., £585.; Hong Kong, 100 t., £1,540. Jamaica, 40 t., £550.; Keelung, 560 t., £8,316.; Kobe, 200 t., £2,786.; Teneriffe, 25 t., £340.; Yokohama, 1,350 t., £18,225.

ANTIMONY SULPHIDE—
New York, 8 cks., £151.; Ostend, 3 cks., £56.; Rotterdam, 5 bgs., £19.; Rouen, 2 cks., £17.

ARSENIC—
East London, 1 cs., £6.

BARIUM NITRATE—
Santos, 10 cks., £19.

BENZINE—
Durban, 30 brls., £205.

BENZOIC ACID—
Wellington, 1 cs., £8.

BISMUTH CARBONATE—
Alexandria, 1 cs. (pt.), £6.; Calcutta, 7 cs. (pt.), £113.; Melbourne, 1 cs., £73.; Pt. Elizabeth, 1 cs. (pt.), £7.

BISMUTH SALICYLATE—
Durban, 1 cs. (pt.), £7.

BISMUTH SALTS (*otherwise undes.*)
Amoy, 1 cs. (pt.), £32.; Calcutta, 3 cs., £124.; Montreal, 1 cs., £53.; Toronto, 1 cs. (pt.), £12.

BISULPHITE OF LIME—
Irish Free State, 50 brls., £37.
Toronto, 4 kgs., £28.

BITUMEN—
Auckland, 3 brls., £8.
Melbourne, 18 brls., £60.

BORAX—
Antwerp, 40 t. (F.), £980.
Bremen, 5 t., (F.), £130.

BORAX GLASS—
Benkoelen, 2 t. 5 c., £176.

BORIC ACID—
Calcutta, 13 c., £39.
Madras, 1 c., £5.

CALCIUM CARBIDE—
Channel Islands (F.), 2 t. 7 c., £42.; Sierra Leone, 10 c., £8.

CALCIUM CARBONATE—
Toronto, 1 ck., £7.

CALCIUM CHLORIDE—
Adelaide, 8 pkgs., £7.
Singapore, 3 cs., £9.

CALCIUM HYPOPHOSPHITE—
Bombay, 2 cs. (pt.), £30.

CALCIUM LACTATE—
Melbourne, 2 cs., £15.

CARBON BISULPHIDE—
Cape Town, 4 cs., £11.
Pt. Elizabeth, 3 cs., £8.

CARBON TETRACHLORIDE—
Belawan, 2 cs., £11.; Lyttleton, 2 cs., £6.; Madras, 14 cs., £43.

CARBONATE OF LIME—
Channel Islands, 965 bgs., £150.

CAUSTIC POTASH—
Sydney (F.), 1 cs., £6.

CAUSTIC SODA—
Cairns, 1 t., £52.
Jamaica, 4 c., £7.

CHEMICALS (*otherwise undescribed*)
Alexandria, 7 pkgs. (pt.), £22.; Amsterdam, 1 t., £100.; Basra, 1 cs., (pt.), £18.; Beyrouth, 2 cs. (pt.), £6.; Bombay, 7 cs. (pt.), £34.; Brisbane, 10 pkgs., £15.; Buenos Ayres, 13 pkgs., £34.; Calcutta, 20 pkgs. (pt.), £79.; Cape Town, 3 pkgs. (F.), £8.; Cape Town, 4 pkgs., £12.; Christchurch, 8 cs., £73.; Colombia, 4 cs. (pt.), £15.; Demerara, 3 pkgs. (F.), £8.; Durban, 3 pkgs. (pt.), £15.; Hamburg, 10 pkgs. (F.), £51.; Hankow, 2 cs., £5.; Hong Kong, 24 cs. (pt.), £88.; Irish Free State, 3 cs. (pt.), £8.; Madras, 50 pkgs., £63.; Mauritius, 1 cs. (pt.), £10.; Melbourne, 32 pkgs. (pt.), £114.; Milan, 1 cs. (pt.) £15.; Mombasa, 2 pkgs., £19.; Montreal, 10 pkgs. (pt.), £84.; New York, 2 cs. COAL TAR PRODUCTS—
Carbolic Acid
Bombay, 6 cs., £34.; Rio de Janeiro, 1 ck., £12.; Sydney, 3 cks., £18.
Mirbane Oil
Penang, 2 cs., £8.
Naphthalene
Rangoon, 10 cs., £12.
Pitch
Alexandria, 50 brls., £60; Antwerp (bulk), 485 t., 47 pkgs., £2,784.; Asuncion, 50 kgs., £11.; Cette, 850 t., £6,375.; Dunkirk, 1,060 t., £6,800.; Havre, 18 cks., £90.
Tar
East London, 180 drms., £24.; New York, 1 cs. (pt.), £8.; Penang, 10 brls., £25.; Pt. Elizabeth, 200 drms., £16.

COBALT OXIDE—
Amsterdam (F.), 1 ck., £203.; Copenhagen (F.), 2 pkgs., £97.; Paris, 8 cs., £563.

COLOURS (*otherwise undescribed*)—
Colombo, 1 cs. (pt.), £5.
Singapore, 1 cs., £8.

COPPER OXIDE—
Buenos Ayres, 8 drms., £111.

COPPER SALT (*otherwise undes.*)—
Santos, 1 cs. (pt.), £6.

COPPER SULPHATE—
Pt. Elizabeth, 11 c., £19.

CREAM OF TARTAR—
Beyrouth, 2 c., £9.; Brisbane, 6 t., £502.; Cairns, 1 t., £84.; Calcutta 1 c., £5.; Durban, 10 c., £50.; Fremantle, 2 t. 1 c., £173.; Mackay, 19 c., £42.; Malta, 2 c., £9.; Maryborough, 10 c., £42.; Melbourne, 20 t., £1,672; Nassau, 1 c. DISINFECTANTS (*otherwise undes.*)
Belawan, 2 t. 5 c., £67.; Buenos Ayres, 6 c., £10.; Cape Town, 3 t. 9 c., £80.; Channel Islands, 3 c., £10.; Durban, 4 t. 3 c., £120.; East London, 1 t., £30.; Hong Kong, 7 c., £13.; Irish Free State, 5 c., £13.; Malacca, 5 c., £6.; Penang, 13 c., £25.; Pt. Elizabeth, 2 t. 14 c., £97.; Pt. Swettenham, 3 t. 4 c., £89.; Shanghai, 17 c., £46.; Singapore, 11 c., £39.

DYESTUFFS (ARTIFICIAL)—
Alizarine
New York, 1 kg., £5.
Nigrosine
Sydney, 4 drms., £50.
Unspecified
Adelaide, 1 kg., £10.; Boulogne, 8 kgs., £40.; Dunedin, 1 cs., £21.; Hobart, 1 cs., £13.; Melbourne, 12 pkgs., £189.; Pt. Elizabeth, 4 kgs., £32.

ETHER—
Bombay, 3 cs., £24.

ETHYL ACETATE—
Demerara, 1 cs., £6.

ETHYL CHLORIDE—
Pt. Elizabeth, 2 cs. (pt.), £24.

FERTILISERS (*otherwise undes.*)—
Channel Islands, 108 t., £905.
Irish Free State, 3 c., £15.

FORMALDEHYDE—
Paris, 25 cks., £298.

GLYCERINE—
Bilbao, 1 c., £5.; Buenos Ayres, 4 c., £32.; Colombo, 2 c., £6.; Durban, 1 c., £5.; Madras, 1 c., £5.; Rio de Janeiro, 1 c., £5.; Wellington, 2 cs., £5.

GUANO—
Barbados, 60 t., £716.
Melbourne, 25 t., £286.

HYDROCHLORIC ACID—
Benkoelen, 1 t. 16 c., £81.; Hong Kong, 4 c., £11.; Pt. Elizabeth, 8 c., £25.; Trinidad, 2 c., £6.

HYDROFLUORIC ACID—
Pt. Elizabeth, 2 cs., £34.

HYDROGEN PEROXIDE—
Alexandria, 3 cs. (pt.), £9.; Basrah, 2 cs., £23.; Post Said, 1 cs., £9.

HYPOPHOSPHITE OF LIME—
Sydney, 3 c., £64.

IODIDES (*otherwise undescribed*)—
Athens, 1 cs. (pt.), £28.
Melbourne, 1 cs. (pt.), £40.

IODINE—
Calcutta, 1 cs. (pt.), £53.
Rockhampton, 1 cs. (pt.), £14

IODINE (RESUBLIMED)—
Alexandria, 1 cs. (pt.), £7.; Dunedin, 1 cs., £20.; Petrograd, 20 cs., £198.

IRON AMMONIUM CITRATE—
Bombay, 3 cs., £26.

IRON IODIDE—
Lyttleton, 1 cs., £8.

LEAD ARSENATE—
Pt. Elizabeth, 2 cs., £14.

LEAD OXIDE—
Vancouver, 4 cks., £38.

LITHIUM BENZOATE—
Buenos Ayres, 1 cs. (pt.), £6.

MAGNESIA—
Calcutta, 2cs. (pt.) £8.; Sydney, 60 cs., £1,285.; Wanganui, 5 cs., £12.

MAGNESIA (CALCINED)—
Alexandria, 1 cs., £15.
Rio de Janero, 1 cs., £6.

MAGNESIUM CARBONATE—
Bombay, 2 cs., £11.
Valparaiso, 4 cs., £14.

MAGNESIUM CITRATE
Havre, 13 cs., £214.

MAGNESIUM SULPHATE—
Brisbane, 4 t. 8 c., £98. ; Calcutta, 5 c., £15. ; Fremantle, 2 t. 14 c., £59. ; Jaffa, 10 c., £13. ; Lyttleton, 1 t. 15 c., £51. ; Malacca, 6 c., £5. ; Melbourne, 3 t. 19 c., £94. ; Penang, 10 c., £9. ; Perth, 1 t. 5 c., £28. ; Rockhampton, 2 t. 8 c., £54. ; Sydney, 1 t. 5 c., £27. ; Townsville, 2 t. 7 c., £53. ; Wanganui, 1 t. 2 c., £26. ; Wellington, 2 t. 2 c., £50.

MANGANESE BORATE—
Petrograd, 3 t. 6 c., £210.

MANGANESE HYDROXIDE—
Petrograd, 15 cks., £146.

MERCURIALS (*otherwise undes.*)—
Calcutta, 2 cs. (pt.), £24.

MERCURY OXIDE—
Bombay, 2 cs., £69.

NICKEL SALTS (*otherwise undes.*)—
Lyttleton, 3 cs. (pt.), £5.

NICKEL SULPHATE—
Kobe, 3 cks., £27.

NITRIC ACID—
Christchurch, 3 c., £5. ; Madras, 2 c., £17. ; Pt. Sudan, 3 cs., £6.

PHOSPHATE (*otherwise undescribed*)
Hamburg, 1 t. 18 c., £20.

PHOSPHORIC ACID—
East London, 2 cs., £6. ; Hong Kong, 6 cs., £13. ; Pt. Elizabeth, 1 cs., £7.

PHOSPHORUS—
Melbourne, 1 cs., £9.

POTASSIUM CITRATE—
Bombay, 6 cs. (pt.), £63. ; Melbourne, 1 cs., £10. ; Montreal, 2 cks., £19. ; Sydney, 2 cs., £25. ; Toronto, 2 cks., £19.

POTASSIUM CYANIDE—
Malacca, 1 cs., £10.

POTASSIUM IODIDE—
Alexandria, 1 cs. (pt.), £10. ; Bangkok, 2 cs., £185. ; Bombay, 2 cs., £175. ; Calcutta, 2 cs., £176. ; Durban, 1 cs. (pt.), £6. ; Lyttleton, 1 cs., £88. ; Madras, 1 cs., £88. ; Melbourne, 1 cs., £98. ; Pt. Elizabeth, 1 cs., £40. ; Rockhampton, 1 cs. (pt.), £26. ; Singapore, 1 bx., £17.

POTASSIUM METABISULPHITE
Brisbane, 5 pkgs., £20.

POTASSIUM NITRATE—
Colombo, 1 ck., £6.

POTASSIUM PERMANGANATE
Paris, 30 kgs., £130.

POTASSIUM PRUSSIATE—
Antwerp, 5 cks., £89. ; Bangkok, 1 cs., £6. ; Kobe, 150 kgs., £650. ; Tarragona, 1 ck., £25.

POTASSIUM SALTS (*otherwise undescribed*)—
Cape Town (F.), 1 ck., £16.
Malta, 1 kg., £6.

POTASSIUM SODIUM NITRATE—
San Jose (Guatemala), 1 t., £20.

PRUSSIAN BLUE—
Paris, 4 cks., £78.

SALAMMONIAC—
Cape Town, 6 pkgs. (pt.), £8. ; Ceara, 1 ck., £32. ; Madras, 1 ck., £12. ; Rockhampton, 7 cs., £29.

SALICYLATES (*otherwise undes.*)—
Montreal, 3 cs. (pt.), £35.
New York, 1 cs., £10.

SALICYLIC ACID—
Toronto, 2 cs., £12.

SALTPETRE—
Cape Town, 5 c., £10. ; Copenhagen, 3 c., £12. ; Irish Free State, 10 c., £20. ; Rio de Janeiro, 2 t. 9 c., £101.

SHEEP DIP—
Colombo, 3 t. 19 c., £170. ; Puerto Deseado, 3 t. 19 c., £170. ; San Julian, 3 t. 19 c., £170.

SODA ASH—
Townsville, 2 t., £18.

SODA CRYSTALS—
Bermuda, 1 t., £6.

SODIUM ACETATE—
Melbourne (F.), 1 cs. (pt.), £8.
Sydney, 4 t. 18 c., £113.

SODIUM ANTIMONY TARTRATE
Calcutta, 1 cs. (pt.), £8.

SODIUM ARSENITE—
Durban, 4 t. 9 c., £308.
Pt. Elizabeth, 9 c., £36.

SODIUM BENZOATE—
Cape Town, 3 c., £35. ; Jaffa, 1 c., £9. ; Paris, 1 t. 10 c., £390.

SODIUM BICARBONATE—
Alexandria, 6 c., £12. ; Cairns, 1 t., £15. ; Calcutta, 1 t. 3 c., £71. ; Constantinople, 3 c., £26. ; Durban, 10 c., £84. ; Jamaica, 1 c., £6. ; Montreal, 10 c., £24. ; Penang, 6 c., £7. ; Pt. Sudan, 2 c., £5. ; Townsville, 9 t., £98.

SODIUM BISULPHATE—
Buenos Ayres (F.), 1 c., £9.

SODIUM BISULPHITE—
Toronto, 4 c., £30.

SODIUM CARBONATE—
Benkoelen, 6 c., £8.
Santos, 4 cks., £21.

SODIUM CITRATE—
Bombay, 1 cs. (pt.), £6.

SODIUM HYPOPHOSPHITE—
Bombay, 1 c., £27.
Sydney, 3 c., £64.

SODIUM HYPOSULPHITE—
Pt. Elizabeth, 5 c., £5.

SILVER NITRATE—
Auckland, 1 cs. (pt.), £5.

SODIUM PERBORATE—
Irish Free State (F.), 1 c., £23.

SODIUM SALICYLATE—
Bombay, 1 c., £16.
Colombo, 1 t. 8 c., £148.

SODIUM SULPHIDE—
Calcutta, 10 c., £8.
Wellington, 24 t. 8 c., £317.

SODIUM SULPHITE—
Lyttleton, 1 t., £26. ; Melbourne, 1 t., £26. ; Sydney, 1 t., £26. ; Wellington, 3 c., £12.

SULPHUR—
Durban (F.), 2 c., £5.

SULPHURIC ACID—
Benkoelen, 20 t., £315. ; Buenos Ayres, 2 t. 19 c., £104. ; Christchurch, 4 c., £7. ; Jaffa, 6 c., £30. Penang, 1 c., £11. ; Pt. Sudan, 1 t., £27 ; Pt. Swettenham, 1 c., £5.

TARTARIC ACID—
Bombay, 1 c., £9. ; Bucare 6 c., £59. ; Cairns, 7 c., £42. ; Calcutta, 2 c., £19. ; Dunedin, 1 t., £120. ; Durban, 2 c., £14 ; Irish Free State, 3 pkgs. (pt.), £7. ; Limassol, 3 c. (F.), £17. ; Lyttleton, 15 c., £89. ; Mackay, 6 c., £36. ; Melbourne, 8 t., £960. ; Montreal, 2 t. 2 c., £300. ; Pt. Elizabeth, 2 c., £12. ; Riga, 10 c., £55. ; Sydney, 2 t. 10 c., £300. ; Townsville, 5 c., £30 ; Wellington 1 c., £9.

ZINC OXIDE—
Copenhagen, 195 cks., £711. ; Sydney, 20 cks., £88. ; Toronto, 350 cks., £1,347. ; Wellington, 9 bgs., £26.

Week ending December 15.

ANTIMONY REGULUS—
Melbourne, 2 t.

BEESWAX—
Brisbane, 1 t.
Melbourne, 1 t.

CARNAUBA WAX—
Irish Free State, 10 c.

CASEIN—
Rotterdam, 1 t.

FULLER'S EARTH—
Christiania, 30 t. ; New York, 140 t. ; Philadelphia, 25 t. ; Santos, 10 t.

GLUE AND GELATINE
Amsterdam, 1 t. 6 c. ; Auckland, 1 t. 11 c. ; Boulogne, 2 c. ; Calcutta, 4 t. ; Cape Town, 4 c. ; Delagoa Bay, 2 c. ; Durban, 10 c. ; Kobe, 24 t. 17 c. ; Los Angeles, 7 t. 1 c. ; Melbourne, 3 t. 19 c. ; Montreal, 6 t. ; New York, 2 t. 10 c. ; Perth, 1 c. ; Paris, 35 t. 1 c. ; Pt. Elizabeth, 1 t. ; Rotterdam, 1 c. ; Shanghai, 4 c. ; Sydney, 1 t. 16 c. ; Trinidad, 4 c. ; Wellington, 1 c.

MINERAL WAX—
Piraeus, 10 c. ; Sydney, 1 t. ; Trieste, 1 t. 5 c.

PARAFFIN WAX—
Montreal, 1 t.
Rangoon, 5 c.

PITCH (STOCKHOLM)—
Rangoon, 1 t.

PLUMBAGO—
Hamburg, 4 c. ; St. John, N.B., 18 c. ; Sydney, 1 t. 13 c. ; Valparaiso, 4 c.

QUININE—
Bombay, 4,729 oz. ; Calcutta, 23,236 oz. ; Constantinople, 1,024 oz. ; Melbourne, 1,000 oz. ; Piraeus, 1,057 oz. ; Smyrna, 37 oz. ; Sydney, 242 oz.

ROSIN—
Gothenburg, 6 t. 19 c.

SALT—
Basrah, 10 c. ; Cape Town, 14 c. ; Penang, 5 c. ; Pt. Elizabeth, 1 t. 5 c. ; Singapore, 2 c.

SOAP—
Alexandria, 4 c. ; Amsterdam, 3 t. 13 c. ; Antwerp, 11 c. ; Auckland, 10 c. ; Basrah, 4 c. ; Bilbao, 10 c. ; Bombay, 8 t. 9 c. ; Bonny, 1 t. 1 c. ; Buenos Ayres, 5 c. ; Calabar, 5 t. 2 c. ; Calcutta, 3 t. 7 c. ; Canary Islands, 2 t. 10 c. ; Cadiz, 8 c. ; Cape Town, 1 c. ; Christiania, 1 c. ; Christchurch, 1 t. 5 c. ; Cologne, 6 t. 17 c. ; Colombo, 1 t. 2 c. ; Demerara, 1 c. ; Delagoa Bay, 1 c. ; Grenada, 2 t. 4 c. ; Hong Kong, 14 c. ; Irish Free State, 3 t. 5 c. ; Kobe, 6 c. ; Lagos, 2 t. ; La Libertad, 2 c. ; Larache, 5 t. ; Lisbon, 3 c. ; Malta, 1 c. ; Madras, 17 c. ; Malacca, 1 c. ; Monte Video, 7 c. ; Melbourne, 5 c. ; Mormugao, 2 c. ; Montreal, 9 c. ; Opobo, 17 t. 18 c. ; Paris, 1 t. ; Penang, 16 c. ; Perth, 2 c. ; Portland (Maine), 4 t. 2 c. ; Pt. Said, 13 c. ; Pt. Elizabeth, 12 c. ; Pt. Swettenham, 6 c. ; Pt. STEARINE—
Rotterdam, 55 t. 3 c.
Shanghai, 1 t. 11 c.

TALLOW—
Hamburg, 5 t. ; Harlingen, 1 t. 11 c. ; Rotterdam, 14 t. 9 c.

WHITE LEAD—
Adelaide, £106. ; Auckland, £445. ; Barbados, £38. ; Brussels, £41. ; Hobart, £133. ; Irish Free State, £113. ; Jamaica, £42. ; Madras, £12. ; Melbourne, £120. ; New York, £13. ; Paris, £112. ; Penang £13. ; Pt. Elizabeth, £143. ; Rangoon, £288. ; Shanghai, £188. ; Timaru, £180. ; Wellington, £217.

ZINC ASH—
Matadi, 7 t.

MANCHESTER.

Week ending December 12.

ALBUMEN—
Antwerp, 7 cks.

AMMONIUM SALTS (*otherwise undescribed*)—
Paris, 10 cks.

ANTHRAQUINONE—
Basle, 12 cks.

BLEACHING POWDER—
Basrah, 40 drms.

CAUSTIC SODA—
Hamburg, 340 drms.

CHEMICALS (*otherwise undescribed*)
Bombay, 14 drms. ; France, 1 brl., 2 crts. ; Gothenburg, 55 drms., 28 brls., 10 kgs.

COAL TAR PRODUCTS
Creosote
U.S.A., 35 drms.
Pitch
Dunkirk, 795 t.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 193 cks.

NITROBENZOL—
Basle, 20 drms.
Unspecified
Alexandria, 2 cs. ; Australia, 2 drms., 2 kgs. ; Basle, 33 pkgs., 15 cks. ; Belgium, 1 kg. ; Bombay, 15 pkgs. ; Gothenburg, 6 cks. ; Malta, 1 cs. ; Melbourne, 11 drms. Rouen, 3 cs., 2 kgs., 2 cks. ; Sydney, 8 drms.

GLUE—
Bagdad, 10 bgs. ; Bombay, 50 bgs.

MINERAL WHITE—
India, 60 bgs.

POTASSIUM BICHROMATE—
France, 7 cks.

SALT—
Ghent, 3,000 sks.

SALTCAKE—
Gothenburg, 404 t. 16 c.

SIZE—
France, 39 brls. ; Holland, 22 cks.

SOAP—
Bombay, 87 cs., 1 cs. (pt.) ; Holland, 25 cs. ; India, 18 brls. ; Sydney, 1 cs. ; Tuticorin, 125 cs.

SODIUM BICHROMATE—
France, 26 cks.

SULPHURIC ACID—
France, 14 drms.

TALLOW—
Bombay, 47 brls.

ZINC CHLORIDE—
Bombay, 3 cs.

NEWCASTLE-ON-TYNE

Week ending December 15.

AMMONIA—
Bergen, 10 kgs.
Copenhagen, 10 cks.

ANTIMONY—
Copenhagen, 9 cks.
Gothenburg, 31 cks.

BLEACHING POWDER—
Gothenburg, 123 cks.

CARBON DIOXIDE—
Bergen, 9 cylds.

CAUSTIC SODA—
Bergen, 2 cks. ; Christiania, 62 drms. ; Copenhagen, 131 drms. ; Gothenburg, 145 drms.

COAL TAR PRODUCTS—
Benzol
Rouen, 109 drms.
Pitch
Christiania, 1 pcl.

GLUE (MARINE)—
Bergen, 57 cs., 10 tins.

LITHARGE—
Christiania, 6 cks.
Copenhagen, 2 cks.

RED LEAD—
Christiania, 16 cks. ; Copenhagen 22 cks. ; Gothenburg, 31 cks.

SODIUM SULPHATE—
Skoghall, 357 t.

WHITE LEAD—
Copenhagen, 10 cks.

N. & S. SHIELDS.

Week ending December 15.

NIL.

PRICES CURRENT.

WEDNESDAY, DEC. 19. 1923.

Prepared by Messrs. Higginbottom & Co., 21, Spring Gardens, Manchester.

The values stated are f.o.r. at makers' works, but it must be understood that the prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, STRAND, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage—are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	**19s. 6d.**	**24s.**
Half-yearly (26 numbers)	**10s. 6d.**	**13s.**
Quarterly (13 numbers)	**5s. 6d.**	**7s.**

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

Our Registered Telegraphic Addresses are:—
"Trepex, Estrand, London." "Expert, Manchester."

Our Telephone Numbers are—
London: 13692, Central. Manchester: 3060, Central.
Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

DISPLAYED.

Rates upon application. Series may be booked for weekly, fortnightly, or monthly insertions. Contracts arranged either for fixed or varied space. Settlement quarterly. Copy may be altered or changed as frequently as desired.

CURRENT TOPICS.

THE FERTILISER SITUATION.

DEVELOPMENTS in the fertiliser industry during the year which is now rapidly drawing to a close have been most interesting. The position of the nitrogenous fertilisers has strengthened considerably, while, on the other hand, the superphosphate industry is in worse straits than ever before. All hopes of immediate protection for the latter having vanished, the outlook for the British manufacturers of this material is very black. In this country, despite the critical state of agriculture generally, consumption of artificial nitrogenous fertilisers has increased, and this increase has taken place in face of a reduction in the area of arable land and a continued drop in the prices of produce and livestock. Imports of nitrate of soda have steadily risen, and although comparison with pre-war years shows that the total imports are smaller since the war, yet the proportion of the importation used solely for agricultural purposes has risen from about 65 per cent. to approximately 85 per cent. British trade in this particular fertiliser, of course, is very small when viewed in the light of the world consumption of the product, but the general trend of the market is unmistakable. Turning to sulphate of ammonia, the home trade, which absorbed during the year about 40 per cent. of the total output in this country, increased its takings by three or four per cent. on the previous year. This favourable result is due, in a large measure, to the active propaganda work carried out by the Federation of British sulphate makers. Trial plots instituted by the Federation have interested and impressed farmers to an extent much greater than is revealed in the published figures; for there is little reason to doubt that, were it not for the considerable difficulties now being experienced by the agricultural class, the use of fertilisers would be much larger than it is at the present time. But it is in the larger markets of the world that the success of the British sulphate makers is most pronounced. Exports have almost doubled in the past twelve months, the largest individual increase being in the case of Japan, a country which has purchased very large quantities during 1923. It is doubtful whether we shall maintain our supremacy in the Far East, however, when American production is resumed at full capacity, with resulting lower prices. The question of price is the main factor influencing the world's markets at this time, and the high rates quoted in the United States have

resulted in fair quantities being imported from Canada at prices competing with the American product, even after allowing for the tariff. When lower prices prevail, therefore, we may expect to encounter serious competition from the other side of the Atlantic. Nevertheless, it is an encouraging fact that the use of fertilisers is expanding in all parts of the world, and an outlet is assured for all material which can be put on to the market at a reasonable and competitive price.

POWDERED FUEL IN CHEMICAL WORKS.

Powdered fuel and its utilisation, particularly for steam-raising purposes in power plants, is at present attracting a considerable amount of attention in this country. Mr. David Brownlie, in his comprehensive paper read before several sections of the Institution of Electrical Engineers, has summarised admirably the progress made both here and in the United States, and has presented a closely reasoned argument why, in his opinion, the use of coal in the pulverised form is a development in fuel technology destined to make still greater strides in the future than it has done in the past. We understand that the detailed information given by Mr. Brownlie on the use of powdered coal in power-stations is to be supplemented during the spring or early summer by a similar detailed account of the performance of the pulverised fuel installation at the Hammersmith Electricity Works, where, as is now generally known, the central system of coal pulverisation and distribution has been very successfully adopted. The use of powdered fuel firing is not, however, confined to power-generating stations, but considerable progress has also been made towards the modification of the system to meet the needs of ordinary industrial establishments. Some account of this progress is given in the article by Mr. H. W. Hollands and Mr. C. Elliott, which we publish on another page. Particulars are given of the use of powdered coal in Lancashire boiler-firing, and also of the proposal under consideration by one of the largest chemical works in the country to convert their boiler installations to the new system. During the next few weeks we shall publish a further detailed article dealing exclusively with the value of powdered fuel in an average chemical works for purposes other than power generation.

LOW TEMPERATURE CARBONISATION.

The report and accounts just published by the directors of Low Temperature Carbonisation, Ltd., leave little room for doubt that both the commercial and technical success of the undertaking have been realised. During the first seven months of this year there has been a profit of £101,700., and if a similar rate of progress has been maintained during the past five months, the debit balance of £187,700. remaining at the end of last year should now be more than cancelled. For over two years the company has been producing the high-grade smokeless fuel, "Coalite," and it appears that the entire output has been sold at prices equal to that of the best domestic coal. The most illuminating portion of the report is the statement that the company has contracts for forward delivery of 250,000 tons of "Coalite" per annum for four years, and that the purchasers are prepared to increase their contracts to a million tons per annum as soon as that amount can be produced. The marketing of the residual solid fuel at a remunerative price is the most serious problem confronting all low-temperature carbonisation undertakings, and the successful solution of this problem by the Barnsley establishment has been a natural result of the long series of technical improvements that has marked the development of the company. It has been known for some time that the Barnsley plant is being extended so as to be capable of carbonising 500 tons of coal per 24 hours, and that it is also the directors' intention to erect similar 500-ton plants in different industrial centres, so as to supply the local demand for smokeless fuel, motor spirit, liquid fuel, and ammonium sulphate. The information contained in the present report makes it evident that justification exists for these large schemes of development.

THE CUBAN ALCOHOL INDUSTRY

Some interesting figures on the Cuban alcohol industry are contained in a report just issued by the Department of Overseas Trade. The production of alcohol from molasses, both as the pure product and as a fuel for internal-combustion engines, is rapidly becoming a very important item of Cuban industry. This is evidenced by the facts that Cuba contains 37 distilleries, with a capital of over 25 million dollars, and that the industry employs nearly 3,000 men. Most of the industrial undertakings of Cuba are controlled by American or British capital, but it appears that the capital of the alcohol industry is entirely Cuban. In the year 1919 the output of alcohol was in the neighbourhood of 23 million litres, but so rapidly has the industry expanded that in 1922 the total output of alcohol was almost 50,000,000 litres, of which some 18,000,000 litres were converted into motor spirit. At the present moment, however, the industry is passing through a period of depression, owing to the difficulty encountered in obtaining supplies of the raw material—molasses. The gradual rise in the price of sugar, which has been a pronounced feature of the present year, has naturally influenced also the price of molasses, and producers are able to obtain better prices for the sugar residues from overseas customers than from the alcohol distillers. The present supplies of molasses are all in the hands of exporters, and the distillers have been forced to ask for Government support, in the form of partial prohibition of export of molasses.

DYESTUFFS CORPORATION RECONSTRUCTION.

Another step in the reorganisation of the British Dyestuffs Corporation was taken on Thursday, when meetings were held in Manchester of creditors of the Huddersfield and Blackley companies, which are in voluntary liquidation. These meetings were purely formal, and only called for the purpose of complying with statutory provisions.

FUEL ECONOMY IN CHEMICAL WORKS.

WHERE POWDERED FUEL HAS PROVED ITS VALUE.

By H. W Hollands, B.Sc., and C. Elliott, B.Sc.

In a recent article (*Chemical Trade Journal and Chemical Engineer*, November 23, page 605) attention was drawn to the great neglect with which the boilers and steam mains in the average works are treated, but only general remarks were made concerning the heavy item of expenditure, coal, and the equally important matter, the efficient combustion of the coal. In the following article these very vital points are dealt with in somewhat greater detail, and the possibilities of employing powdered fuel firing are examined in the light of the experience that is now available.

Both with hand firing and mechanical stoking several factors affect the efficiency of combustion. The first is the amount of ash, which not only tends to prevent the combustion of the combustible part of the coal, but also renders the combustion incomplete. As a result very large amounts of unburnt carbon are left in the ashes and clinker, and it is by no means uncommon to find very considerable losses in this way, even up to as much as 7 per cent. of the coal bill. W. S. Patterson (*J.S.C.I.*, 1923, 42, 904) gave the results of his examination of the ash from fifteen different mechanical stoker installations. He found that the amount of carbon in the ash varied from 5 to 40 per cent. or from ¾ to over 19 per cent. of the original carbon in the coal.

Another factor affecting efficient combustion is the amount of excess air required over that theoretically necessary. With hand firing and mechanical stoking, the amounts of excess air employed average about 100 per cent. and 40 to 50 per cent. respectively, but considerably higher figures are reached with careless working. The effect of this excess air is to dilute and cool down the furnace gases.

In the opinion and experience of the writers powdered fuel firing offers many advantages in these respects, and will certainly be adopted when its uses are more appreciated and understood. Although powdered coal was first used commercially about thirty years ago in connection with the manufacture of Portland cement and is now almost exclusively used in that industry, it is only within comparatively recent years that the possibilities of applying the system to steam generation and other purposes have been considered. In general there are two systems in use:—(1) The central system, much favoured in America; (2) the unit system which has been developed in England and in France.

The Central System and its Disadvantages.

In the central system the coal is pulverised at a centre and transported as a powder to any number of furnaces that may be included in the installation, the detailed series of operations being as follows: The coal is first crushed roughly, and then passed over a magnetic separator where the whole of the tramp iron is removed. The next operation is that

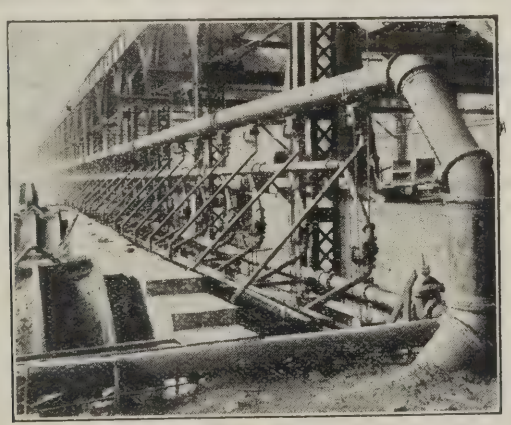

Fig. 1.

of drying the coal, which is effected in various ways. After drying, the coal is passed by means of suitable automatic conveyors to the mills, where it is reduced to the requisite degree of fineness. The actual degree of pulverisation is a debatable point and will be dealt with later, but in general the amount is about 90 per cent. through 100 mesh and 80 per cent. through 200 mesh. After the air has been separated from the coal in suitable separators, the fuel is stored and has to be distributed either by low-pressure air, as illustrated in Fig. 1 (Holbeck System), by screw conveyors, or by high-pressure air. Fig. 2 shows a type of ball mill which is used for grinding the coal, and is included by permission of Messrs. Edgar Allen and Co., Ltd., Sheffield. There are, of course, many types of mill suitable for this purpose. In

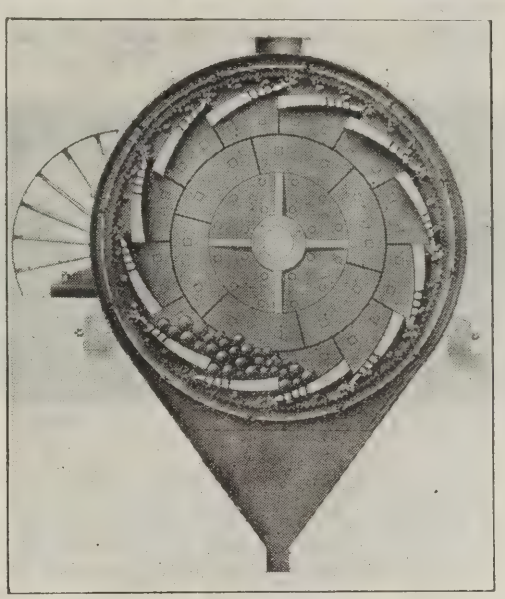

Fig. 2.

the case of the two latter methods it is necessary to have some form of powdered fuel storage at the units being fired, and Fig. 3 shows a typical arrangement. The central system

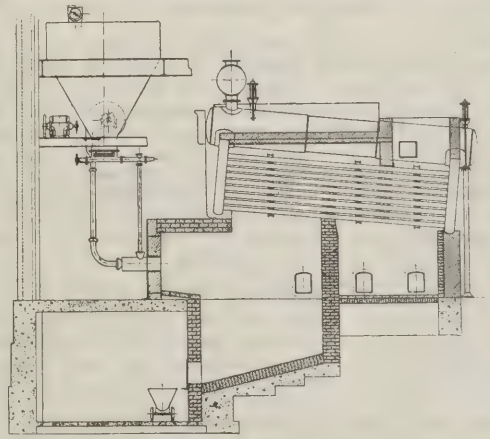

Fig. 3.

from many points of view gives entire satisfaction, and we believe that the plant on the Holbeck System at the Hammersmith Corporation Electricity Works, where three boilers are evaporating 130,000lb. of water per hour, is running with a constant efficiency of about 84 per cent. We would add that this plant is the only one on the central system at present running in England.

The central system of powdered coal firing is, however, open to some disadvantages,* the chief of which are as follows:—(1) Dry powdered coal when stored is liable to spontaneous combustion, and many disastrous explosions have already taken place in America. By taking great precautions, this danger has been lessened, but will probably never be eliminated entirely. (2) In the event of failure of any part of the plant, the entire boiler-house is usually shut

* We note that Mr. G. G. Bell, engineer manager to the Hammersmith Electricity Works, in a letter to *Engineering* of October 21, states: "I am convinced that powdered fuel has a great future. There is a place for each system, but for large-scale operations, such as power stations, the central pulverising house, run as a separate factory for the preparation of the fuel, will prove to be the correct solution."—Ed., *C.T.J. and C.E.*

down since it is not advisable to store more than 15 hours supply on account of the danger mentioned in (1). (3) The plant is very costly and, inasmuch as it is necessary to have dryers, mills, cyclone fans, balloon collectors, etc., it occupies a large area of ground—much more than is usually available in this country, and certainly more than is found in the average chemical works.

The Unit System and the Moisture-Content of the Coal.

The unit system, as its name implies, means one pulveriser per boiler or furnace, and a battery of this type of pulveriser

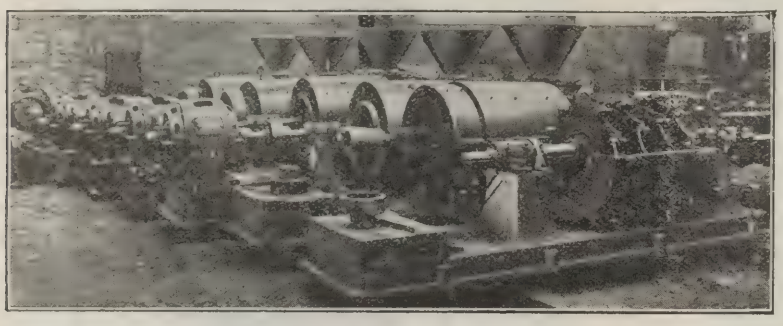

Fig. 4.

is shown in Fig. 4. The pulveriser itself consists of a rotor, a casing with three or more compartments, and a fan. The coal is fed continuously and automatically into one end of the machine, and is rapidly crushed by the revolving blades of the rotor. The fan which is carried on the same shaft as the rotor is at the other end of the machine in a separate compartment. It creates a draught which moves the particles of coal from one compartment to the other, the heavier particles of course moving more slowly than the finer, so that they are completely pulverised. The fan finally mixes the dust with air and sends it to the burner. Air is admitted at the feed end, and another inlet is provided near the fan.

One of the most striking differences between the unit and the central system is the amount of moisture allowable in the coal. In the central system, it is necessary to dry the coal down to about 1 per cent. to prevent choking of the grinding mills. The writers have heard of one Bonnet mill taking coal with 3 per cent. of moisture, but this is an exceptional figure and would certainly represent the largest possible moisture content. On the other hand, the unit type pulveriser can deal with coal containing about 8 per cent. of moisture while, by introducing preheated air from the combustion chamber into the machine along with the coal, coals with moisture contents of 12 to 15 per cent. have been dealt with successfully. Obviously this is a most important advantage as it does away with the necessity for dryers, which are costly and unpleasant machines to work near.

With regard to power consumption the unit pulveriser compares very favourably with the mills when it is remembered that the machine supplies its own air for combustion. There is no doubt that in theory the finer the coal can be pulverised, the more efficiently it will burn, but it is found that, actually, there is a point beyond which any advantage due to increase fineness is more than outweighed by the greatly increased horse-power required. This is shown in the following table:

Output of Coal per hour. lbs.	Horse power.	Fineness. Through 100 Mesh Sieve. Per cent.	Through 200 Mesh Sieve. Per cent.
1,000	21.46	96	82
1,000	13.70	94	75

If the coal will ignite quickly, burning with the minimum of excess air—say 15 per cent.—and leave no trace of CO in the flue gases and no trace of unburnt carbon in the ashes, then the coal is sufficiently fine. As regards the average power for a Turbo pulveriser expressed as a percentage of the power developed by an efficient boiler plant 2 per cent. is a fair figure to take.

Working of the Turbo Pulverisers.

The working of the unit pulverisers presents no difficulties, and they do not call for elaborate precautions to ensure that maximum efficiency is being attained. The coal feed is automatic and can be adjusted easily and rapidly from the machine's smallest output to a heavy overload. On the unit plant a magnetic separator is not required, as a relief pocket is provided in the machine itself into which tramp iron drops by gravity. Fig. 5 shows the tramp iron collected from this pocket after 70 tons of Midland coal had been passed through the pulveriser. The first cost of these units

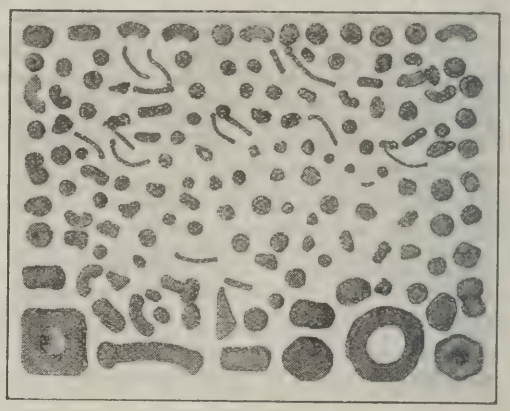

Fig. 5.

is low, the space occupied is small, there is no risk of explosions since the powdered coal is used as it is made; and lastly, if the machine or motor breaks down, only one small unit is shut down instead of, as in the case of the central system, the whole plant.

The application of powdered fuel is probably the most difficult of all its branches. It is not enough, having made a machine which will give the required degree of fineness, to blow the coal *via* a burner into a firebrick chamber. The shape and volume of the combustion chamber, the direction and length of the flame, the position of the ash and slag doors have all to be considered. A large combustion chamber is always required, but in order not to lose much by radiation, due regard must be paid to its arrangement.

As already stated, the unconsumed carbon in the ash taken from a stoker or a hand-fired furnace is usually high and averages 12 to 15 per cent., and cases have been known where this figure has been as high as 40 per cent. In a powdered coal-fired furnace the carbon content of the ash should never exceed 2 per cent., and should usually be under 1 per cent.

No Trouble from Damaged Brickwork and Ash Slag.

A number of objections have been raised to powdered coal firing, on the ground that it causes serious damage to the brickwork. In early days this was possibly a fact, due entirely to the too high velocity of the coal entering the combustion chamber. Experience has shown, however, that not only are these high velocities unnecessary, but that they are certainly detrimental to the efficient working of the boiler and to the life of the refractories, since apart from all other reasons, they cause impinging on, and thus serious scouring of, the furnace walls. The velocity should be such that it is just high enough to prevent deposition of the heavier particles of coal in a main, and further it should allow the flame more or less to meander into the combustion chamber and through the tubes.

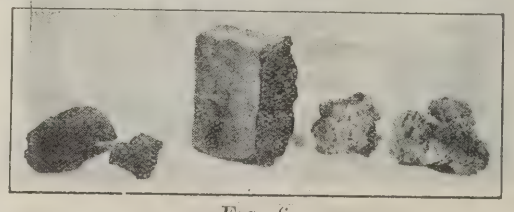

Fig. 6.

In a properly-designed combustion chamber, the dust or incombustible ash will be deposited either completely dry or slightly nodulised, and can be raked out at any convenient time without stoppage of plant. Fig. 6 shows some samples of nodulised ash, together with a brick taken from the arch of a powdered coal-fired furnace, and it will be noticed that

the brick has taken on its surface a natural coating of slagged ash which forms a very good protection. To illustrate how completely immune are modern plants from damaged brickwork and slag ash troubles, the writers recently inspected in London a B. and W. boiler which has been fired with a turbo pulveriser for two and a half years. No money had been spent on this combustion chamber for the last 22 months, and yet this was still in most excellent condition. The life of the tubes in a water tube boiler fired with powdered coal is certainly as long as in a boiler fired by any other means. "Bird nesting" or the deposition of a sticky mass of unconsumed carbon on the water tubes should never take place, and although there is usually a small deposit of very fine dry dust on the first row of tubes, this can easily be removed by means of a steam blower.

Tests at Large British Chemical Works.

Probably the biggest saving in the use of powdered coal is the ability to burn, efficiently, a very cheap form of fuel—that is, one usually too small to use on a mechanical stoker or hand-fired grate. Tests have been made on a coal containing 43.7 per cent. ash and costing 2s. at the pit and a temperature of over 1,400° C. was obtained, using this coal in a welding furnace. In this connection it is interesting to examine the proposal which is at present being considered by a large chemical works in this country. Their existing plant consists of 6 B. and W. boilers, five of which are running at an average efficiency of 75 per cent. Each boiler burns 100 tons of coal per week, the total weekly coal bill being in the neighbourhood of £600. The proposal is to equip these boilers with turbo pulverisers with a guaranteed efficiency of 82 per cent. Coal is available at 10s. a ton, and the total cost of the coal into the boiler comes to 12s. per ton, including grinding, maintenance, etc. The total overall cost of the plant including dismantling and equipping with combustion chambers, pulverisers, motors, etc., comes to £8,500. The gross saving amounts to no less than £224. per week or £11,650. per annum. Thus allowing 10 per cent. interest and depreciation, the net saving would be £10,800. per annum or in other words the expenditure would be recovered in 10 months.

Powdered Fuel in Lancashire Boiler Firing.

So far the remarks on the application of powdered fuel have been confined to water tube boilers, since any difficulties in this connection have been overcome. The firing of Lancashire boilers has presented considerably more trouble, and it is only with recent months that a successful application has been achieved. In the following table the efficiencies obtained with two water tube boilers and two Lancashire boilers are given, and these are typical of unit pulveriser installations. Attention should be paid particularly to the Lancashire boiler efficiencies, as a great many chemical works—probably the majority—use this type. An efficiency of 68.1 per cent. with 9,050B.Th.U. refuse-tip coal and 71.4 per cent. with dried washery slurry of 9,720B.Th.U. is well worth consideration, especially as neither economisers nor superheaters were used.

Type boiler	B. & W.	B. & W.	Lancashire	Lancashire
Type pulveriser	Turbo C.R. 2	Turbo C.R. 4	Turbo C.R. 2	Turbo C.R. 2
Heating surface of boiler	2,690 sq. ft.	5,764 sq. ft.	28 × 7	30 × 8

Efficiency, boiler, superheater, and economiser	86 per cent.	83 per cent.	—	—

* This efficiency includes the water-cooled neck. It should be explained that the external combustion chamber is connected to the flues of a Lancashire boiler by means of a neck. This neck is water-cooled, the water passing into the feed pump.

In a further article the writers will deal with the application of powdered fuel-firing to processes in chemical works and other kindred industries. The writers are indebted to J. S. Atkinson, The Powdered Fuel Plant Co., Ltd., London, for some of the information in the present article.

THE ROSIN INDUSTRY AND TRADE.*

A SURVEY OF THE WORLD'S RESOURCES AND POSSIBILITIES.

THE chief districts of the United States, where the rosin industry is carried on, are located in the South-East corner, including: North Carolina, South Carolina, Georgia, Florida, and Alabama. The industry may be said to have started in 1584, when Philip Amadas and Arthur Barton landed on the shores of North Carolina, and in their report to Sir Walter Raleigh they emphasised the importance of the pine forests of species unknown to Europe, which they found in the immediate vicinity of their landing. It was twenty-two years after Raleigh's first expedition came to the islands off the coast of Carolina, that the French, in an amateurish, and certainly a small way, began what was probably the first Naval Stores operations in America.

Early Days of the American Industry.

In 1664, to encourage the production of tar, and pitch, in both Virginia and Maryland, these commodities were ordered to be admitted into England for five years without being subjected to any duties—England at that time importing tar and pitch, together with other tree products, from Denmark, Norway, Sweden, and Russia. In 1753 the exports from North Carolina plantations had risen to approximately 10,500 barrels of gum, or, as it was termed at that time, turpentine. Prior to 1764 inspection laws had not been formulated. A law of this date conveys an adequate idea of the endeavours to ensure proper packages and maintain the quality of their contents. This act to "prevent the exportation of unmerchantable commodities," provided that no tar, pitch, or turpentine should be exposed for sale for exportation until duly inspected under the regulations. Various Justices of the Inferior Court were directed to appoint inspectors throughout each producing district. Barrels were made standard, and the contents in each case were to be weighed in the inspector's presence, and every 322lb. weight, including the cask, and so in proportion, should be accounted a lawful barrel. Also every barrel found cleaned, well filled and truly made merchantable, and passed by the inspector, should be by him branded. Many attempts were made to avoid inspection, and consequently much inferior rosin and gum was exported.

In 1778 the newly formed American Commonwealth charged a fee of 2d. per barrel for inspection of pitch and turpentine. From this point the industry developed with remarkable speed, so that by 1840 the production of crude turpentine and rosins for the State of North Carolina was given as 593,451 barrels. In 1840, there were 1,526 turpentine stills in the State. In 1890, the number had dropped to 174 plants, and in 1905 only 87 plants, with an output of 65,000 barrels of rosin per year, were in existence. The industry in North Carolina is almost now non-existent.

Extraction of the Gum from the Tree.

The chief trees from which rosin is obtained are: Douglas Fir, Maritime Pine, Cuban Pine, Slash Pine, Loblolly Pine, Longleaf Pine, Shortleaf Pine, Pitch Pine, and the Western Yellow Pine, also the Scotch or Wild Fir. The Shortleaf and Loblolly Pine are sometimes referred to as North Carolina Pines, and the Longleaf, Shortleaf and Cuban Pines as Southern Yellow Pines.

The general method of extraction in use is to open a face on the tree at the base, and fix a metallic apron, which would divert the exuding gum into a small cup placed below it. The cupping is done in the winter months, between November and March, when the sap is dormant. Sometimes a box system is used, which means cutting into the stump at the base of the tree, to collect the gum from the prepared face immediately above. The cup method, although more expensive than the old box method, is preferable both to the turpentine operator and the lumberman, for the reason that the incision required for the cup is only a slight one, and by no means damages the tree in the slightest degree, where it is properly and judiciously operated. It also produces a better yield, in quantity, and higher grades of rosin.

The gum is removed from the cup or box by means of a "dip iron," which is somewhat similar to a large tablespoon,

* Abstract of paper read by Mr. B. L. Morgan to the Manchester Division of the Paper Makers' Association of Great Britain and Ireland on March 9, 1923. From the *Proceedings* of the Technical Section of the Association (Sept., 1923, Vol. IV., Part I.).

and transferred into a bucket or similar container, from which it is emptied into barrels, and taken to the distillery.

American Rosin Distillery Practice.

The copper kettle and worm, and general arrangement of the average distillery, have been substantially the same for the past seventy-five years. The still itself ranges in capacity from 400/1,000 gallons—the average size being seven feet at its greatest diameter, and about five feet high, with a concave bottom and semi-spherical top connected to the worm. The diameter of the worm is 6/8in., tapering to 3in. at the outlet. The total length is approximately 140ft., comprised of seven turns, and is about 6ft. in diameter and 7ft. high. The kettle is set in a circular brick furnace, fitted with proper flues, and is generally fired direct with wood. In the base of the still is an opening of about 8in. wide, to which is attached the tail pipe or outlet for the residue or rosin, extending through the furnace wall, and is fitted on to the outside end with a quick-opening slide valve, where connection is made by a trough to a succession of wire cloth filters placed over the rosin reception vat.

Except at the most advanced plants, the basic features of the distillation are the same everywhere. The kettle being filled with crude rosin or gum to about 75 per cent. of its capacity, the furnace is fired up, and the distillation started as soon as the temperature of the mass reaches the boiling point of water. A small continuous stream of water is introduced in the still after about one-third of the distillate has come over. A good fire is kept under the kettle until the percentage of turpentine coming over with the water, or low wine, as it is then called, is too small to justify further firing. The water is now cut off, the fire withdrawn, the still uncapped, and the charge run out into the strainers through the filters to the rosin vat.

Much depends on the ability and knowledge of the man in charge of the still as to what grade of rosin is produced. The pine rosin, as it comes to the still, contains more or less water, depending upon the amount of exposure the gum has had and the rain that has taken place prior to the dipping. The man in charge of the still, by constant practice, is able to tell the height of the mass in the still by what is termed "sounding," and he endeavours by adjusting the water supply, or the heat supply, to keep the mass regular. At the same time, if he does not keep enough fire the cooling mass becomes more viscous, thus imprisoning more vapour, and increasing the volume, and finally causing the still to boil over, with loss of rosin, and a danger by fire.

Factors Influencing Quality of the Rosin.

Many influences have to be counteracted in the production of rosin, and amongst them are the following:—1. The exposure of the gum to atmospheric conditions. 2. The amount of dirt, wood particles, and other foreign matter in the gum, mixing low-grade with high-grade gum. 3. The colouring matter that is introduced from metal aprons and cups and the chemical action which takes place between the gum and these receptacles. 4. Distillation: (*a*) By heating too fast at the time of firing up; (*b*) delaying too long in the introduction of water; (*c*) by a constant fluctuation of the temperature and corresponding rise and fall in the mass in the kettle; (*d*) by prolonged heating; (*e*) overheating or carbonising; (*f*) by "holding" the charge at too high a temperature. 5. In handling by bad straining through faulty, dirty, or torn batting: (*a*) By turning into the rosin vat, that has recently held a charge of lower-grade product; (*b*) delaying dipping rosin or dipping at too low a temperature.

The French Rosin Industry.

The main difference between the tapping methods in France and America is that the width of the face and the annual rate of increase in height and the number of faces per tree are increased by the French method. There are three methods of distillation in France. Crude distillation, which consists of heating by an open fire of the receptacle into which the gum has been poured, just as it arrives from the forest. The result is the best as regards quantity, but the quality is not so good. The turpentine is satisfactory, but the better pale rosins cannot be obtained by this process. Steam distillation differs from the process above, inasmuch as the necessary temperature is obtained either by hot water under pressure, or by a steam under high pressure, or by super-heated steam. The boiler also serves for reheating and filtering the gum, and tends to improve the colour of the rosin. Distillation by vacuum is an improvement on the preceding process. Its principal advantage is a great economy in fuel and labour, and further it gives better pale rosins. The rosin is run into barrels which are made at the works, and contain about 40 gallons—or the liquor, still hot, is poured into large shallow trays and exposed to the sun, with the object of bleaching it. This, however, is done with rosin that is already pale, and not with anything inferior to "N" and "W.G.," except in very rare instances when the difference in price makes it worth while.

The Mining of Old Rosin Dumps.

Turning again to the American supplies, from the day the distillation of turpentine from the crude gum began, until as late as 1892, the molten rosin from the still, instead of being run into barrels, was frequently turned into a channel that led it into a convenient pool, or river, or to a hollow in the land. It is one of the romances of the rosin industry that the inception of rosin mining came from a Federal soldier of Sherman's army, when on a march to North Carolina he learned of a large bed of rosin near Angier, and returning some time after the cessation of hostilities, bought the right to work this rosin, and had the distinction, as far as is known, of being the first man to become a rosin miner. Prices at this time had risen high enough to make the venture profitable. How many thousands of barrels of rosin were mined, nobody can guess, but a rough estimate would show well over 100,000 barrels. Mining is still carried out, and within a few miles of Jacksonville, N.C., along the curve of a lake near by, the Federal Forces, during the Civil War, found thousands of barrels of rosin had accumulated, and one day an order came from the Confederate Commander of the district that all turpentine and rosin not removed within ten days to a place of safety would be destroyed. As it was impossible to convey the rosin across miles of country, the amount was set fire to, and the heat caused the rosin to melt and find its way into the lake, and soon a perfect river was pouring into the water and becoming a solid mass. To-day it awaits the construction of a dam, and the pumping of the water that conceals it, and it will soon be available for straining and placing on the market. One thousand five hundred barrels of rosin have already been taken from this one particular bed, but the main source is believed not yet to have been touched.

Commercial Customs in the Rosin Trade.

Prior to the recent war the world's consumption of rosin was approximately 2¾ million barrels of 500lb. each. Of these the United States had approximately supplied 2,150,000, with France next on the list, followed up by Spain and Portugal, Greece and India. The rosin trade may be considered a most interesting one, although not as "spectacular" as that of its sister product "turpentine," but considerably larger in its volume of actual consumption. As is well known, rosin is imported into this country by numerous firms, and sold either ex ship on c.i.f. terms or ex wharf. Until the Government control, which became necessary during the war, the article was subject to 2½ per cent. discount on ex wharf terms, but since that time, I believe, all prices have become strictly net.

The grades most sought after are grades "B" and "C," known as "common strained," "F" and "G" known as "medium," "N," "W.G.," and "W.W.," known as "three tops." Competition is keen between America and France, also Spain, for the better or paler qualities, although during recent times France has become a powerful rival in "F" and "G" grades, both for home consumption and export. The general terms on which these rosins are sold differ in one or two respects only from the American method—the allowance for tare being only 7 per cent. in casks, as against 20 per cent. by the American, in barrels six to the ton net.

Relevant Statistics.

A glance over a period of twenty-five to thirty years will show the wonderful advance which has taken place in the production and consumption of rosin. Round about 1895 it was quite an easy matter to buy rosin at £3. to £5. per ton, according to quality, but since that time, owing, of course, to exceptional circumstances, the price rose to £70. to £75. per ton.

Relative imports of rosin from a few countries in 1920 show as under:—

	Tons.
United States	31,250
France	22,500
Spain and Portugal	4,800
Other sources	1,800

These are approximate figures. In 1913 the imports were:—

	Tons.
United States	66,700
France	9,700
Spain and Portugal	8,400
Other sources	3,300

It will be noticed that the American rosin has decreased by 50 per cent. The French imports have increased over 100 per cent. Of course, besides the competition between America and France, trade conditions have played a very important part, and the consumption of rosin generally has been lower since the war than immediately prior to it.

In 1900 we imported over			90,000	tons.
,, 1905	,,	,,	80,000	,,
,, 1910	,,	,,	75,000	,,
,, 1915	,,	,,	102,000	,,

which marks the high level of rosin imports, whilst in 1920 the imports were round about 60,000 tons.

Germany's War-time Efforts.

At the outbreak of war it appeared that the supply of rosin, in Germany, was comparatively small, and that the production of that country, from the pine tree, was insufficient to cover the requirements of their industries. Attempts were therefore made to produce rosin from the fir tree, and as the American method could not be considered under the prevailing conditions, a method which is used in Austria was adopted. Although the result at the beginning was not a bad one, methods were attempted to increase the production by means of a brush-hook. This is an instrument which scratches the face of the tree in a so-called "Fish-Bone" manner. Heavy cuts in the tree are thereby avoided, and cups are used to catch the gum at the base. In some instances more rosin was produced in various areas than had previously been done, but nevertheless the supply was less than the demand. Numerous substitute rosins were manufactured, and tree roots and light wood, or stumps, in the occupied territories, were taken for the manufacture of rosin from various pine oil extracts. During the war special distillation plants were sent to the forests of Poland, Austria, and Russia.

The Future of Russia as a Rosin Producer.

It is evident that when the paper and allied trades do pick up, and resume their former prosperity, that new areas for the production of rosin will be looked for, and not only will new sections be developed in America, but also, I think, it is quite possible that Russia will, in the near future, become one of the first sources of rosin.

It has been said in some quarters that the supplies from the United States are decreasing rapidly, but I might say that although the supplies of timber available are certainly decreasing slightly, strong efforts are being made by the various Forestry Commissions to resuscitate the timber wealth of America by planting new areas, and so prolonging the life of America as a rosin producing country, than would be the case if re-afforestation did not take place. The idea of a rapid decrease in the supply of rosin from America twenty years hence must, therefore, be taken as erroneous. In Russia labour will doubtless be fairly cheap in the coming years, and there lies before the prospector huge territories of rosin-bearing trees. With a stable Government re-established, and outside capital absorbed and protected, as it must be some day, and modern scientific methods brought in, Russia will surely hold her own as a producer of rosin. In the Archangel district of Russia, prior to 1914, approximately 80,000 barrels of heavy pitch and tar were exported. The method of manufacture was almost entirely in the hands of the peasants, and the method of extraction was very different to that in use in America. It is interesting to know that the tapping of the common pine began in Russia in 1780, on the initiative of an Englishman, and developed at first in the Vel district of the Vologod Government, and then in the Shenkur district of the Archangel Government, which is now called the "Vazh" area. Now a large quantity of American rosin and turpentine is imported into Russia, notwithstanding the high duties on the product of tapping. The Russian methods generally were very crude, and attempts were made to improve the methods, and to a certain extent tapping is being resorted to. The rosin thus produced is said to be as good as French or American rosin. In view of the enormous area of the pine forests in Russia, it is a deplorable fact that modern methods have not been brought into play in that direction. One great difficulty met with in Russia is that the final product varies much in quality.*

Discussion.

The Chairman, Mr. T. N. Nuttall, in opening the discussion, said: The author rather indicated that there was some kind of control adopted in tapping in the United States, but he did not make that point quite clear. The paper might have been a little clearer as to how we get the various grades of resin. From the small samples shown it was evident there was a very wide range of grade and quality, and it would be very interesting to know how that grading is carried out and what really causes the difference, and how the difference in the colouring of the resin comes about. I find in 1915 that we imported 102,000 tons of resin; that in 1920 we only imported 60,000 tons.

Mr. R. H. Parker said he had always understood that the colour of resin depended on the period when the trees are tapped, the early tappings giving the pale resins, and the late tappings yielding the darker grades.

Mr. Morgan, replying, said the tapping control was worked chiefly under the United States Department of Agriculture and the Forest Service, along with the Bureau of Chemistry. Inspectors were also present at Savannah, the chief point of export, and they worked under State Regulations. Inspectors were also present at Jacksonville and Brunswick and New Orleans. Sales were chiefly controlled by the Savannah Board of Trade. Inspectors worked under licence. Grading is carried out under the supervision of State officials, and the colour, which is the chief factor, is determined by means of a Lovibond Tintometer. Over-boiling causes partial carbonisation, and so deepens the colour of the resin produced. He recently visited a paper mill where trouble was being experienced owing to the machine wire being clogged with a dark organic substance which was found to be pitch, due to over-boiling of the resin in the still. He agreed with Mr. Parker's remarks that the early tappings give the pale resins, and the later ones the darker grades, which is due to the more viscous gum from the heartwood coming forward.

THE USES OF KIESELGUHR.

Diatomaceous earth, when properly prepared, finds a use in a number of industries. Its value depends on its silica content and the shape of the individual skeletons. Its three largest uses are probably (1) as an abrasive material; (2) as a heat insulator; and (3) for filtration.

As an abrasive material it has found considerable favour on account of the extreme hardness and minuteness of the grains, as well as their sharp cutting power. In this connection it is used extensively in metal polishing, and in soaps for scouring.

The great porosity of diatomaceous earth makes it a non-conductor of heat, and this property, together with its extreme lightness, has caused it to be employed extensively as an insulating material, for covering high pressure steam pipes, for linings of furnaces, and in many places where a high grade fire-resisting insulating material is required. As a filtrant it may be used directly as the filter body or added to the filtering medium to keep it porous. It has also been found to have considerable decolourising power, and has been employed to a small extent like fuller's earth, in the filtering and decolourising of vegetable or mineral oils.

Owing probably to the fact that a considerable portion of the silica present in diatomaceous earth is present in a form soluble in alkali, the purer varieties are used in the manufacture of silicate of soda (water glass) in preference to the less easily soluble powdered quartz. For this purpose however, only the purest grades, free from iron, are suitable. To a small extent, it is employed in the manufacture of dynamite as an absorbent of nitroglycerine. It enters as a methods, and to a certain extent tanning is being resorted be some day and modern scientific methods brought filler into the composition of rubber, sealing wax, phonograph records, fertilisers, and wherever a light and inert filling agent is required.

* In this connection see also the series of articles entitled "Russian Turpentines," by B. A. Smirnoff, in the *Chemical Trade Journal and Chemical Engineer*, April, 1923.—Ed., *C.T.J. and C.E.*

ACID TRANSPORT IN CARBOYS AND DRUMS.*

SAFETY METHODS IN AMERICAN PRACTICE.

TO one of many years' experience in the handling and use of sulphuric acid in various industries, the crudity of the methods sometimes used is indeed surprising. I am impressed as a safety and operating man with the fact that a great deal in the way of education should be done by the chemical companies in promoting the best possible methods of handling sulphuric acid not only in the producing but also in the consuming plants. Apparatus used by many consumers of acid, not only sulphuric but other acids as well, is very crude and constitutes in many cases a direct risk to human life.

A great bulk of the hydrochloric acid handled in the United States is by means of the carboy, despite the use of transportation tanks by some of the large users. A great deal of the sulphuric acid goes out from the producers in carboys. It is, therefore, important to the acid industry that the handling of carboys and the perfection of the carboy package should receive due consideration. During the past year one of our large railway systems has endeavoured to cut down the 12½-gal. carboy to a 5-gal. package, with intent to reduce the risk of handling.

The chemical industry cannot effect improvement in the package methods or handling methods without the aid of those who use as well as of those who produce the acid. Safety in the chemical industry is not only safety in the chemical plant itself. Consumers are urged, especially small users, that, prior to the return of empty carboys, they be washed out with water.

Containers used for the transportation of acids must combine in themselves the necessary strength to endure reasonable transportation strains and ability to withstand the action of the product. Glass bottles come within the latter range and the jacketed carboy is generally used because it meets the two requirements mentioned. The carboy cannot be considered a fragile container, but there are definite limits to its shock-resisting strength. A broken carboy *en route* means possible damage to merchandise as well as danger to workmen who may not be informed as to the proper method of dealing with such leakage.

Machine to Determine Carboy Strength.

The insistence, therefore, has been for a stronger, bettered-conditioned carboy and the adoption of regulations which would automatically eliminate the unfit. The Manufacturing Chemists' Association of the United States, upon invitation by the Bureau of Explosives, undertook a study of the problem. Up to this time the Bureau required semi-annual dropping and swinging strain tests, but these were shown to be ineffective because, with the old type swing apparatus, the tests were susceptible of such manipulation as to make them unreliable. As a result some carboys were in use which could not be considered other than below standard. The Investigating Committee devoted much time, pains and money in determining: (1) a machine that would give an approximately perfect swing strain test; (2) in making experiments to determine a reasonable strain test requirement; and (3) in the study of the conditioning of carboys, perfecting of seals, etc.

After exhaustive tests a swing test machine was developed that is practically fool-proof in operating, giving an accurate gauge of the shock-resisting strength of the package. This machine became officially operative on January 1 of this year. With a standardised testing machine so developed, it became necessary to determine the shock to which carboys should be subjected as a minimum requirement. This was a difficult matter, for it was necessary to consider: (1) the elimination of a large number of carboys in circulation, which were not equal in strength to other or better-conditioned types; and (2) the reasonable average strain to which these better-conditioned types should be subjected.

In approaching this problem the committee synchronised, by means of service tests, reasonable shocks sustained by railroad cars with shocks sustained on the swing testing machine. This information was obtained by loading a car of carboys (carboys filled with water) braced according to the best practice and bumping it at varying speeds against a substantial semi-rigid obstacle consisting of a string of cars with brakes tightly set. The test car was provided with a sensitive shock-recording machine. The speed of the test car was accurately determined for each shock test, so that the records were obtained at speeds ranging from five to nearly ten miles per hour. The results of these tests, when applied to the carboy swing testing machines, was the determining of a swing test component of 55 inches—equivalent to a railroad speed or collision shock of nearly eight miles per hour.

The Sealing of Carboys.

It had been definitely determined through study of actual practice over an extended period, that much of the material damage, as well as most of the burns sustained by workmen, were caused by defective or inadequate seals. The old method of placing a vitrified stopper on the lip of a carboy bottle, covering it over with a cast made of plastic clay or calcined plaster, and then covering it over with burlap secured with twine, no longer sufficed. This seal had the appearance of solidity, but not the necessary strength; it also was convenient as a hand rest for moving the carboy, and so added to its risk.

After careful and exhaustive tests a new type of seal was developed which has been made standard. This may be described briefly as follows: A compressible gasket of acid-resistant material; a porous earthenware stopper, which is acid-leakage proof, but permits of no pressure being built up in the carboy; and a metal mechanical seal, which effectively secures the stopper in place. This gives a seal which is strong, safe and reasonably free from damage, at a nominal cost.

A further source of danger to both workmen and merchandise is in the use of carboys with chipped lips, as such a carboy cannot be sealed with entire safety. A machine has been developed which will surface away the depression in the lips,† thus leaving a perfect surface on which to seat the stopper gasket. The time is very close at hand when damaged lip carboys will be barred for transportation service. Conformity to Interstate Commerce Commission regulations governing the conditioning and sealing of carboys is now assured by the revised regulations, which became operative on January 1, 1923, which provide that one of the semi-annual service tests required shall be made in the presence of a Bureau of Explosives inspector. These tests are mandatory at all plants or stations where carboys are repaired and filled.

Safety Precautions for Transport in Drums.

It might be supposed that a steel container would represent the maximum of strength and efficiency in the course of transportation. There are, however, many variables, which must be taken into consideration:—(1) The drum must be made of metal of sufficient thickness to withstand severe strains and the deterioration incident to its service; (2) it must be free from carbonised or oxidised spots in the welded seams; and (3) the inspection and testing service before filling should be efficient and carefully supervised.

Occurrences are exceptional where a drum sheet or head gives way in the metal. The 12-gauge requirement for 110 gallon and 14-gauge for 55-gallon 5-A drums are deemed ample protection. Careful operators, however, provide for natural wear and tear by placing a minimum weight at which drums are automatically withdrawn from acid service. This should be common practice. It has been found that drums constructed of dissimilar metals are subject to electrolytic action, which greatly accelerates deterioration of the metal. It is, therefore, important that the drum sheet, welding metal, collars and plugs be of similar metal. A smooth inside surface, free from corrugations for rolling hoops, is desirable as these depressions tend to hold drippage from emptied drums and thus to localise deterioration. Coarse threads should be cut for plugs and drum collars as a better resistant against acid action and providing a stronger seal. Gaskets made of acid resistant material, such as asbestos, should invariably be used under the plugs.

All users of acid in drums should observe scrupulously the rule of storing filled drums in a cool place and never expose to the direct rays of the sun. Full drums when stored for any length of time should be stored with plugs on top and loosened frequently to release any pressure which may have accumulated. Many explosions have resulted through neglect of these simple rules.

* An address by Maurice F. Grass (of the Grasselli Chemical Co.) before the Chemical Section of the National Safety Congress, Buffalo, N.Y., Oct. 3, 1923. Abstracted from the *Chemical Age* (New York), Nov., 1923.

† See also the *Chemical Trade Journal and Chemical Engineer*, January 12, 1923, p. 44, and April 6, 1923, p. 419.

Many concerns who store drums, wash them out in slack periods. As regards those used for the shipment of sulphuric acid, washing, often imperfect, serves to dilute the acid, whereby the metal is attacked. Investigation of accidents arising from drum explosions often reveals that the drums were beneath standard. An ordinary drum will weigh about 21lb. When that drum deteriorates to around 19lb., danger is imminent. Repaired drums should be subjected to a hydrostatic pressure of 15lb., which will compensate for any ordinary expansion of acid due to change of temperature.

THE NICKEL INDUSTRY.*

PRODUCTION, METALLURGY AND USES.

THE nickel industry is of comparatively recent date. Although alloys of nickel have been found as Bactrian coins of the year 235 B.C. and ancient Chinese alloys of unknown age containing nickel and copper exist, the metal itself has only been produced on any considerable scale since the early part of the nineteenth century. Indeed, until after the discovery of the New Caledonian nickel deposits (about 1890) nickel was regarded as a somewhat rare metal, and its high cost prohibited its use except for a few special purposes.

The progress of the industry in later years is indicated by the fact that whereas the world's total production of metallic nickel for the year 1900 was given as 7,526 metric tons, the production of Canada alone, estimated at 80 to 85 per cent. of the world's output, for 1918 amounted to 48,886 short tons. As to the many uses for nickel, it is stated that upwards of 75 per cent. of the total output is employed in the production of the various kinds of nickel-steel alloys known under the general term of "nickel steel." The value of nickel steels in industrial engineering is rapidly becoming more appreciated, and it is safe to anticipate a progressive increase in their employment, as their cost of production is cheapened.

The cost of metallic nickel is high, owing to the comparative scarcity of nickel ores, their low nickel content, and the somewhat costly metallurgy of the extraction of the nickel from them. On the other hand, certain nickeliferous iron ores contain nickel in sufficient quantities to yield ultimately a low nickel steel of good quality, the value of which is enhanced by the presence of chromium, which almost invariably accompanies the nickel. Such ores exist in enormous deposits in various parts of the world, the most notable being in Cuba, Greece, Borneo and Celebes.

The Most Important Nickel Ore Deposits.

Another possible source of low nickel steel, which has not yet been exploited, is in the blast furnace slags resulting from the smelting in Ontario of the Sudbury nickel ores. Of all known deposits of nickel ore these Sudbury deposits are by far the most important. At the end of 1916 it was stated that the ore which might ultimately be obtained from them would probably exceed 150 million tons, which would be sufficient to maintain the normal annual output for a century.

Other known deposits of nickel ore within the Empire are in Tasmania, South Africa, India and Egypt. So far as they have been explored, they appear to be comparatively small, and as sources of supply of nickel ore are not likely to be seriously exploited so long as the large Sudbury deposits are available. Nevertheless, they constitute a useful mineral asset. Of nickel deposits in foreign countries those of New Caledonia are second in importance in the world to those of Sudbury. For some years past Norway has produced appreciable quantities of nickel from native ores, but so far as is known the ore reserves are not large. A considerable tonnage of low-grade ore is mined in Germany, and it is reported that in Austria during the war old mines were reopened, and, although the ore available was also low-grade, a large quantity was mined.

The Metallurgy of Nickel.

The ores of nickel, whatever their type, do not readily lend themselves to ordinary methods of concentration. The usual metallurgical practice is first to smelt partially roasted ore directly in blast furnaces to obtain a matte of iron, copper and nickel, which practice, while costly, has the advantage of a high recovery of the nickel content, and also of collecting the greater portion of any precious metals the ore may contain. The second stage consists of smelting the partially roasted material with due proportions of coke and flux in a blast furnace. The pyrrhotite in these ores is almost entirely converted to silicate of iron in the blast furnace. The matte now consists of a mixture of practically iron-free copper and nickel sulphides.

The treatment of enriched matte to produce refined nickel has hitherto been carried out by three principal methods known respectively as the Orford, the Mond and the Hybinette methods. Only the outlines of each process are given here.

Orford Process.—The matte is fused with a given quantity of sodium sulphide, the result of which is that the upper and more fusible layer will contain most of the copper and the iron, if any, and the bottom layer, nickel sulphide chiefly. The separation can be made practically complete by one or two repetitions of the fusion. The two products are tapped separately from the melting furnace. The nickel sulphide is washed, dried and roasted with salt. By this treatment it is converted into insoluble oxide, while the copper is converted into a soluble chloride and can be dissolved out. The nickel oxide is reduced to a form of nickel suitable for marketing. The process is said to yield nickel 99 per cent. pure, but is believed to result in the sacrifice of a large proportion of the precious metals. It is by a modification of this process that the valuable alloy of nickel and copper known as monel metal is produced.

Mond Process.—The Mond process is one of great ingenuity, and depends upon a series of remarkable chemical reactions. The bessemmerised or converter matte is roasted down to about 2 per cent. sulphur. This treatment is followed by a leach with a 10 per cent. solution of sulphuric acid, by which about 70 per cent. of the copper content is dissolved out, but very little of the nickel. The solid residue, washed free of acid, is transferred to the top of a "reduction" tower, in which it slowly descends, meeting in its passage an upward stream of water gas. This gas reacts on the nickel oxide at a temperature of about 350° C., and reduces it to metallic nickel. The reduced material is then passed to another tower known as the "volatiliser," in which a temperature of 50° to 80° C. is maintained, and it is here brought in contact with producer gas rich in carbon monoxide. The carbon monoxide reacts with the finely-divided metallic nickel to form the volatile nickel carbonyl, $Ni(CO)_4$, which passes out of the tower mixed with the producer gas. This mixture is led through "decomposing" towers, heated internally to 200° C. At this temperature the nickel carbonyl dissociates into nickel and carbon monoxide. The nickel is collected by passing the heated gas, containing nickel particles in suspension, through a mass of nickel granules, on which the nickel deposits in concentric layers. The granules, which have reached a given size, are removed by screening and are marketed as such. The process yields a very pure nickel; the whole of the precious metals in the matte is recovered and the copper finds a market as copper sulphate.

Hybinette Process.—The Hybinette or electrolytic nickel-refining process originated in Norway, and by this method the concentrated matte is roasted and extracted with acid as in the Mond process. The solid residue contains about 65 per cent. nickel, 3 to 8 per cent. copper and traces of iron, and is melted down and case into anodes. Cathodes consisting of iron plates coated thinly with graphite are used, and an electrolyte, which is a solution of 45 grammes of nickel sulphate per litre, practically free of copper.

The current employed is a direct one, and the voltage is 160 to 170. As electrolysis proceeds the electrolyte becomes enriched in copper and requires treatment for its removal. This consists of transferring the solution into other vats in which are placed broken pieces and the short ends of anodes, the nickel in which has a similar action in precipitating copper as metallic iron. At the same time the solution takes up nickel and is thus restored to its original nickel strength. The nickel deposits on both sides of the cathode, and when it has reached a thickness of ⅛in. it is stripped off in sheets which weigh about 20 to 30lb. each. The nickel is about 99 per cent. pure, but a higher degree of purity can be reached if desired. The precious metals pass into the anode slimes, and are recovered. The copper is recovered partly as cement copper as mentioned above, and partly as electrolytic copper. The process has been adopted by the British American Nickel Corporation.

* From introductory chapter to Monograph on Nickel Ores by W. G. Rumbold, published by the Imperial Institute (London, John Murray, 5s. net). The chapter contains an excellent account of the nickel steel alloys.

The Uses of Nickel.

One of the most largely used of the less common non-ferrous metals, nickel is employed mainly in the form of alloys with other metals, but also, to a much lesser extent, in the form of metal. Owing to its non-corrosive properties nickel is used for cooking utensils, and for evaporating basins, crucibles and other small articles used in chemical laboratories and works. Larger pieces of apparatus are sometimes made of iron with a nickel lining, while a further quantity of metal is employed for electroplating articles of iron, steel, zinc, brass and many other alloys. Latterly it has been found possible to electroplate aluminium with nickel, which formerly could not be done. A large number of small articles of general utility are made of nickel, and several European and other countries employ unalloyed nickel for coinage.

Nickel is also used as an anode in storage batteries of the Edison type; in the production of malleable steel tubes; as wire and sheet for the construction of the electrodes in certain wireless valves; as a wire for making the points of sparking plugs; as a gauze in the construction of atmospheric burners of the Mecker type and for furnaces; and as one of the elements of thermo-electric pyrometers used for rough industrial purposes.

Nickel is also employed as a catalyst in hydrogenation operations, and in the enrichment of water-gas; in the presence of nickel, and at 250° C., the carbon monoxide and hydrogen constituents interact to form methane and water, thus producing a gas of smaller volume, but with a much higher calorific value.

The chemical compounds of nickel of industrial importance are not numerous. The oxide is used in the manufacture of glass, in the ceramic industry and for a few minor purposes; the oxide and some other compounds are sometimes used as catalysers; nickel sulphate and the double sulphate of nickel and ammonium are largely used in nickel electroplating.

Composition of Commercial Nickel.

Commercial nickel is marketed in several forms: (*a*) As grains, cubes, rondelles or powder reduced from nickel oxide below the fusing-point of nickel; (*b*) as concentric layers deposited, round a nucleus, from nickel carbonyl; (*c*) as cathode sheets resulting from electrolytic deposition; (*d*) in the form of blocks made by reducing nickel oxide above the melting-point of nickel; (*e*) as malleable nickel, obtained as in (*d*) but with magnesium or some other deoxidiser added to it before being poured into ingots. The metal is prepared in the forms of rods, sheets, wire, etc. Most of the nickel produced falls under class (*d*). The International Nickel Co. of Canada supply the following grades of nickel:

Description.	Nickel. Per Cent.	Iron. Per Cent.	Sulphur. Per Cent.	Silicon Per Cent.	Carbon. Per Cent.	Manganese Per Cent.	Copper, Arsenic, etc., Per Cent.
1. Malleable Nickel Rods "A"	99·00	0·55	0·025	0·10	0·15	0·15	—
2. Ditto "B"	98·75	0·50	0·025	0·20	0·15	1·75	—
3. Ditto "C"	96·75	0·75	0·030	0·20	0·15	1·75	—
4. Nickel Castings	98·95	0·50	0·035	—	0·16	—	—
5. Orford Electrolytic Nickel	99·84	—	0·005	—	0·025	—	0·03
6. Nickel Shot "A"	98·65	0·50	0·060	0·15	0·45	—	1·25
7. ,, "X"	99·05	0·47	0·040	0·10	0·18	—	1·25

Generally, shot metal is the form in which nickel is used in the nickel steel industry, and electrolytic nickel is the material used for producing high-grade "nickel silver" and for cupro-nickel alloys. Anodes for nickel electroplating may contain 88 per cent. and upwards of nickel. Impurities in the anodes facilitate the dissolution of the metal and the maintenance of the correct nickel concentration in the plating bath.

World's Production of Nickel.

No reliable statistics of the total world production of nickel metal can be obtained, as only in the case of Canada are official returns published of the amount of nickel in the ores mined and treated. But inasmuch as the Canadian production of nickel is considered to be 80 to 85 per cent. of this total, a close approximation to the correct amount may be estimated. The only large producer of nickel other than Canada is New Caledonia. During the war years transport difficulties and other circumstances connected with the war seriously reduced the New Caledonian output, but for the four years ending in 1914 an average annual output of 7,000 to 8,000 tons of nickel was obtained from about 100,000 tons of ore containing 5 to 6 per cent. nickel and about 5,000 tons of matte containing approximately 45 per cent. nickel.

World's Production of Nickel (Metal).

(Metric tons.)

Country of Refining.	1913.	1914.	1915.	1916.	1917.	1918.	1919.	1920.
England	5,000	5,000	5,600	4,500	5,000	5,000	2,200	3,200
Germany	5,200	4,200	900	400	1,300	1,000	1,000	1,000
France	1,500	3,400	2,200	2,400	1 900	700	500	600
Norway	700	800	900	800	400	100	—	100
Europe	12,400	13,400	9,600	8,100	8,600	6,800	3,700	4,900
U. S. A. and Canada	18,200	16,700	25,000	30,400	30,800	33,700	13,800	19,200
World Production	30,600	30,100	34,600	38,500	39,400	40,500	17,500	24,100

In the table given above, taken from *Metallgesellschaft*, 1922, the world's production of nickel is arranged according to countries in which the metal is actually refined. *Metallgesellschaft* estimates that the world's production of nickel in 1921 did not exceed 5,000 metric tons.

SIZING MATERIALS FOR COTTON TEXTILES.*

A REVIEW OF MODERN PRACTICE.

PRIMARILY intended to facilitate weaving, sizing took on another character about the middle of the 19th century, and now includes among its aims the addition of cheap weighting materials to the cloth. This change may be said to coincide with the granting of a patent in 1854 for the use of magnesium chloride in size, and with the award in 1858 of a patent for the inclusion of china clay. According to the amount of size which it is desired to leave on the yarn, the process may be divided into the ill-defined classes of heavy (80 to 100 per cent.), medium, and light (up to 20 per cent.) sizing. Pure sizing is a term employed when the only object is to protect the yarn against the disintegrating action of the loom. All writers are agreed that size should be as adhesive as possible, a property which would aid equally well the functions of laying loose hairs, strengthening the yarn or holding weighting materials. In order to be successful, a size must adequately assist weaving and hold weight, and at the same time must allow the finished cloth to have the requisite "feel," "fulness," and colour. If the woven cloth is to be bleached or dyed, the size must not introduce any material to the prejudice of these operations.

Starch Adhesives.

The materials used in sizing are conventionally considered under the headings of adhesives, lubricants and softening substances, weighting materials, deliquescents, and antiseptics. The order of merit assigned by Moore to common adhesives is glue, dextrin, starch. The first two are too brittle when dry, and on account of its superior flexibility, some form of starch is in universal use for cotton warp sizing. Most generally employed in Great Britain is wheat flour, which is said to give a mellow feel to the cloth, and to be capable of adding as much as 40 per cent. to the weight of the yarn without the use of mineral matter or the loss of weaving qualities. These desirable properties are only to be obtained, however, if the flour has been fermented or steeped with antiseptics for several weeks.

Potato starch (farina) is recommended for all weights of size. It is considered to impart smoothness and pliability to fabrics of light reed and pick; to add greater weight than any other starch; to be whiter and much stronger, and capable of holding more china clay per pound than wheat flour; and to be of good sizing quality even when made from frosted or decayed potatoes. Sizes made from different samples vary in viscosity, low viscosity being attributed to immaturity of the tubers, or to bleaching or overheating in the manufacturing processes.

* From a review of the literature relating to the sizing of cotton by F. D. Farrow, B.Sc., of the British Cotton Industry Research Association. The complete annotated paper is published in the *Journal of the Textile Society*, August, 1923.

Maize starch (corn starch) is widely used in America for the light and medium sizing practised there. Thorough cooking is required in order to prevent the size being rubbed off in the loom, but if well prepared it gives a firm feel to the cloth. It is said to be more uniform and of higher sizing value than other starches. Though too harsh for heavy sizing, it is valuable for this purpose when mixed with wheat flour. Its liability to mildew can be decreased by long boiling. Sago is another starch which requires to be well boiled. It has great strengthening power, and is generally employed for heavily-picked goods of fine count. Rice starch, tapioca, and wheat starch are used for special work. "Soluble starch" possesses the advantage of dissolving readily in warm water, giving a clear solution of low viscosity, and is useful in reducing the consumption of soap and fat.

Other Adhesives.

Dextrin is considered to be a better adhesive than starch, and though too stiff, or too sticky when used alone, is useful in small quantities for correcting the loss of adhesiveness which starch suffers in the presence of fat, or for laying surface hairs. Many other adhesives have been patented for sizing purposes. Of some importance is gum tragasol, a carbohydrate derived from the cotyledons of the carob bean. It is a powerful adhesive, resistant to mildew, and is frequently used for special work.

Softeners and Lubricants.

There is no certainty as to the mode of action of the fats and waxes in common use. Successful sizing has been done without the use of any fat, but the amount encountered in goods for bleaching has been known to be as much as 36 per cent. of the weight of starch. Fat is said to lubricate the healds and reeds, or to increase the flexibility of the starch film. It is generally agreed that any saponifiable fat may be used with safety, but warning is given against the presence of excessive acidity in tallow (5 per cent. or more of free fatty acid), or of adulteration with unsaponifiable material, such as paraffin wax. With regard to the latter substance, there is almost complete unanimity that it is unnecessary, and should be rigidly excluded from any goods which are to be bleached or dyed. Soap is frequently included as a softener for size mixtures. Glycerine is a softener which meets with approval on account of its ready solubility in water, its hygroscopic properties and the absence of any power to cause tendering. If used in excess, the goods become sticky. A suggestion has been made that polyglycerols would be of service, while the use of glycol has been patented for sizing dyed yarn. Castor oil is largely used in India and to some extent in this country, but it must be used with caution, or the size will be sticky. Turkey red oil is considered useful and gives great pliability to the yarn.

Deliquescents.

Deliquescents are hygroscopic substances which are used on account of their power of remaining in solution in equilibrium with air of ordinary humidity. The presence of such solutions in the starch films confers flexibility on the latter, which is particularly useful in heavy sizing where large quantities of starch and clay are put on the yarn. Magnesium chloride is most commonly used, but calcium chloride is also occasionally employed When either of these substances is present, the moist starch film unfortunately becomes a favourable medium for the vigorous growth of moulds, which may be checked, however, by including zinc chloride in the size as an antiseptic. Sizing compounds of unrevealed compositions are often found to contain chlorides. In addition to its use as a softening agent, glycerol is frequently considered as a deliquescent.

Weighting Substances.

China clay is of value in size solely because of its weight, aand has therefore no importance in pure sizing. Magnesium sulphate is occasionally used in heavily-sized goods for producing a special feel, but it is said to crystallise in the yarn. Heavy sizing is sometimes applied to goods which are to be bleached and finished, with the object of ensuring that when the goods are finished at "loom weight" there shall be some starch present to replace the size which has been removed. The heavier the sizing the more is the finishing material required, and, since the starch takes the finish, improved appearance results. Powdered clay and French chalk are sometimes added to size in order to facilitate separation of the ends.

Antiseptics.

As already mentioned, zinc chloride is commonly employed, in spite of its relative inefficiency compared with other substances now available. The following table shows the weight of antiseptic per hundred of wheat flour which is considered to be sufficient in order to ensure safety. (Smith, *Text. Manufacturer*, 1920, 46, 278):—

Zinc chloride	8—10
Sodium silicofluoride	3
Boric acid	3
Copper sulphate	0.5
Salicylic acid	0.5
Phenol	0.5

Pickard has noted that copper sulphate is extensively employed in Germany but very little in England, but he thinks it may be objectionable in bleaching cloths. Stocks and White quote some Alsatian mixtures in which 1.5 per cent. of copper sulphate on the dry starch is used. In spite of its volatility in steam, boric acid is capable of replacing zinc chloride, and even salicylic acid is stated not to be lost in appreciable quantities during the boiling of the size, although there is no information as to its evaporation during drying. In America, turpentine, in amount about 1.5 per cent. of the weight of starch, is included in size mixtures as an antispetic, and has the additional advantage of preventing frothing.

THE OIL SITUATION IN CANADA.

RECENT DEVELOPMENTAL WORK.

THE High Commissioner for Canada has received from the Dominion Department of Mines at Ottawa the following report, prepared by Mr. G. S. Hume, of the Canadian Geological Survey, in regard to the oil situation in Canada, based on information collected by him during the recent summer's work:—

During recent years active drilling operations for oil have been carried on in many parts of Canada, both in well-established oil territory and in new prospective fields. Among these may be mentioned the producing fields of New Brunswick, the south-western peninsula of Ontario, and the Sheep Creek field of Alberta, as well as exploration in the Prairie Provinces, British Columbia, and in the *Mackenzie River* District, North-West Territory. Recent developments concern particularly Ontario, Alberta, and the Mackenzie District.

New Wells in Ontario and Alberta.

The oil fields of the south-western peninsula of Ontario date back to the early days of the oil industry in America. Of late years the production has, as a whole, shown a gradual decline, with sporadic increases as new fields opened up. Late in the summer of 1923 a new oil well was "brought in" in Romney Township, Kent County, the well being 3,560ft. deep, and having an estimated initial producing capacity of two hundred barrels per day.

Active drilling operations were carried on during 1923 near the International Boundary in Alberta, just north of the producing Kevin-Sunburst field of Montana. Two wells found showings of oil, and active drilling is proceeding. No commercial wells have yet been reported. Further north in Alberta, British Petroleums, Ltd., in November "brought in" a well near Wainwright, 120 miles east of the city of Edmonton. The depth of this well is 2,036ft., the oil being of a heavy quality. The well probably has an initial capacity of 60 to 100 barrels per day, but has not yet been thoroughly tested. Several gas-producing areas are located in this part of Alberta, and the results from past drilling are encouraging for further exploration.

Prospects in the Mackenzie River District.

In the Fort Norman area the Discovery well of the Imperial Oil Company, Ltd., "brought in" in 1920, was slightly deepened in 1923, an increase in flow now estimated at 100 barrels per day being secured. Two other wells were drilled in 1923, one of which had a small showing of oil of no commercial value. The Mackenzie River District is far removed from railroad facilities, although three transportation companies operate steamers for three months during the summer on the Mackenzie as far north as the delta of the river at the Arctic Ocean. The possible oil fields in this area may, therefore, be considered of future rather than of immediate commercial importance.

ITEMS OF INTEREST.

British Coal Output.—The coal output for the week ended December 15 was 5,947,900 tons, compared with 5,728,800 tons for the previous week, and 5,741,600 tons a year ago.

Tariff Revisions in 1923.—The *Board of Trade Journal* for December 27 contains a general review of recent tariff announcements abroad, with particular reference to those made during the present year.

Decrease in Unemployment.—The number of persons recorded on the live registers of the Employment Exchanges in Great Britain on December 17 was 1,137,100. This was 43,195 less than in the preceding week, and 348,778 less than the figure recorded on January 1 last.

Reduced Insulin Prices.—In addition to the two firms mentioned in last week's issue of this *Journal*, Burroughs Wellcome and Co. announce that they are making a further reduction in the price of insulin from 1s. 9d. to 1s. 3d. per dose, and the reduced price will come into effect on January 1, 1924.

Home-Grown Sugar.—It is understood that, owing to the situation brought about by the result of the General Election and the uncertainty existing as to the future Government's attitude towards the home-grown beet sugar industry, it has been found impossible to carry out the plans to establish a beet sugar factory in Kidderminster for the 1924 season.

Committee on Food Preservatives.—The Departmental Committee on the use of preservatives and colouring matters in foods which has been sitting at frequent intervals during the past two months and has taken a considerable amount of evidence from manufacturing, commercial, and scientific sources will resume its sittings at the beginning of the New Year.

Dyestuffs Corporation Reconstruction.—An announcement is made by the British Dyestuffs Corporation that the creditors of the Huddersfield and Blackley companies are required, in connection with the voluntary liquidation of these companies, to send all particulars to the liquidator, Mr. D. R. Mackay, 70, Spring Gardens, Manchester, on or before January 14, 1924.

Camphor Refining in Hong Kong.—It is reported that the camphor refinery belonging to A. S. Watson and Co. in Hong Kong, which was wrecked by a heavy typhoon last August, will be replaced by a much larger plant. The new plant will have a capacity of approximately 10 tons of high-grade refined camphor per month. New machinery has been added to the plant to facilitate the manufacture of the tablets and to simplify the refining process, and it is hoped that this new factory will be in full operation by next January.

Exports of Copra and Coconut Oil from Malaya.—The gross exports of copra from British Malaya during the September quarter amounted to 35,960 tons, valued at £756,476.; imports amounted to 15,804 tons, valued at £296,434. Of the gross exports, 9,780 tons, valued at £204,476., were taken by the United Kingdom, and the entire balance of 26,180 tons, valued at £552,000., by European Continental countries. Over the same quarterly period exports of coconut oil amounted to 1,562 tons, valued at £60,776., of which the United Kingdom and other parts of the Empire took only 65 tons, valued at £2,552.

A New Disinfectant. — The Graesser-Monsanto Chemical Works, Ltd., Ruabon, N. Wales, are producing an excellent saponified antiseptic disinfectant and deodorant under the registered trade mark name of "Acrosyl." It is a cresol preparation containing 50 per cent. of tar acids, these acids containing 55 to 60 per cent. of meta-cresol, which is known to be a more powerful antiseptic than phenol or the other cresols. Irritant impurities have been removed from the tar acids in the process of manufacture, and the caustic action of the cresols is reduced by the fatty acids present in Acrosyl. The carbolic acid co-efficient by the Rideal-Walker test is 3. The odour is particularly pleasant for a preparation of this nature. It is made of a uniform quality, has no corrosive effect on instruments, and does not blunt knives. The price is low—namely, 3s. 7d. per gallon in 1 to 50-gallon lots; or 3s. 5d. in 40-200 gallon lots. It is also obtainable in ¼lb., ½lb., 1lb., and 5lb. bottles at a price which is considerably less than the foreign-made preparations.—*Pharmaceutical Journal.*

Obituary.—We regret to announce the death of Mr. C. F. Gerhardt, chairman of C. F. Gerhardt, Ltd., chemical merchants, of 5, Fenchurch Street, E.C., at the age of 84, which occurred on December 19 at Henley.

Tariff Notes.—The tax on sugar imported into or produced in Germany has been increased as from December 13.—Certain modifications in the consumption duties levied in Brazil on certain inks and varnishes have been made.

Institute of Patentees.—The first meeting of the Scottish members of the Institute of Patentees was held on Wednesday (December 19) in the Grand Hotel, Glasgow. Mr. R. O. M'Gowan presided, and resolutions formally approving of the Scottish Branch were passed.

Chemical Worker's Death.—William Stamford (44), chemical labourer, of Ledsham Place, Gordon Road, Leeds, was admitted to the Leeds Infirmary on Friday of last week suffering from severe burns on the legs and arms, caused by falling into a vat of sulphuric acid whilst working at the chemical works of John Nicholson and Sons, Ltd., of Hunslet.

Pig-iron Production in Great Britain.—The production of pig-iron in November amounted to 597,600 tons, compared with 595,700 tons in October, and 493,900 tons in November, 1922. The furnaces in blast at the end of the month numbered 199, an increase of ten during the month. The average monthly production of pig-iron in 1922 was 408,500 tons.

Cement Manufacture in India.—In 1919 an inquiry was set on foot in the United Provinces, under Government auspices, into the possibilities of manufacturing Portland cement in India. The results of this inquiry, now published in a Bulletin of the Government of India Industries Department, go to establish the possibilities of cement manufacture so far as the United Provinces are concerned.

American Chemical Warfare Service.—A grant of 720,760 dollars for the work of the Chemical Warfare Service during the next fiscal year is recommended by the President and the Director of the Budget, in the report submitted to the new Congress. The amount actually granted for the Chemical Warfare Service for use during the current fiscal year was 717,240 dollars.

Lead Poisoning Fatality.—An inquest was held at Kingston, Surrey, on Friday last, on Walter Edward Martin, a house painter, aged 47, of 104, Fulwell Road, Teddington. Dr. Davies, medical superintendent at the Kingston and District Hospital, where Martin died, said death was due to chronic lead poisoning, from which Martin must have been suffering for about a year. It was stated that Martin had been employed during the last two months on external painting.

Coalfields in the North of Ireland.—In a paper read before the Manchester Literary and Philosophical Society on December 4, Mr. W. B. Wright gave an account of the observations which led him in 1917 to the conclusion that valuable areas of unworked coal existed in the counties of Antrim and Tyrone. The margin of one of the coalfields indicated is visible at Coalisland, Co. Tyrone, where the newer rocks have been removed by denudation, and is now being worked by Sir Samuel Kelly some little distance in from the outcrop. An exceptionally rich series of coals have been penetrated and a large output is confidently predicted. An account was also given of the bore put down by the Ministry of Munitions in 1918 by the side of Lough Neagh, and subsequently stopped at a depth of about 2,000 feet.

Personal.—It is reported that Professor A. J. Turner, M.A., Professor of Textile Technology in the University of Manchester, has been appointed Director of the Indian Central Cotton Committee's Technological Research Laboratory now being established in Bombay.—Dr. G. D. Liveing, of Cambridge, who celebrated his 96th birthday on Friday, December 21, may fairly be regarded as the father of chemical studies in the University. Soon after he had obtained the first place in the first-class list of the Natural Sciences Tripos, which was instituted in 1851, he was elected to a Fellowship at St. John's, and in the laboratory which his college established he was the first in Cambridge to teach science experimentally. For 47 years he was Professor of Chemistry, only resigning the chair in 1908, when he was 81 years of age.—Dr. J. A. Hanley has been appointed as Agricultural Information Officer at Bristol University. Dr. Hanley is at present lecturer in Agricultural Chemistry and Advisory Chemist at Leeds University.

Rockefeller Foundation and Toronto University.—The Rockefeller Foundation has granted the University of Toronto a million-dollar Endowment Fund for the maintenance of the Medical Faculty of the University. The Foundation has been giving annually for three years the interest on the million dollars, but has now announced that the principal will be turned over in recognition of the research work of the Faculty, which culminated in the discovery of insulin by Dr. Banting.

Red Stains on Brass.—Mr. E. A. Bolton, of the Metallurgical Department of Birmingham University, reported in a paper before the Birmingham Metallurgical Society on December 14, that he was fully persuaded that the most important cause of staining lay in the use of old-fashioned furnaces in which the flames had direct access to the metal. Red staining was seldom present before the pickling operation; it was formed as the result of reactions between the copper oxides in the scale and the pickling acid. Cupric oxide was as harmful as cuprous oxide.

German Dyestuffs Production.—The total production of eleven German dye plants during October, 1923, was 12,404,112lb., including: Alizarin red, 863,968lb.; indigo paste, 2,539,008lb.; vat colours, except indanthrene blue GCD, 238,032lb.; indanthrene blue GCD, 17,632lb.; alizarin colours other than red, 149,872lb.; direct colours for cotton, 2,680,064lb.; direct colours for diazotisation, 211,584lb.; acid colours for wool, 1,251,872lb.; chrome colours for wool, 670,016lb.; basic colours, 705,280lb.; sulphur colours, 2,777,040lb.; and lake colours, 299,744lb.

Calico Printing Industry in Czecho Slovakia.—Czecho-Slovakia, which contains the greater number of the calico printing establishments of pre-war Austria, is now one of the leading Continental countries in this work. There are about 150 printing machines in the country, states the *Manchester Guardian*, which is more than there are in post-war Germany, whose calico printing industry was reduced by one-half owing to the loss of Alsace. Czecho-Slovakia is dependent chiefly on the export trade, the chief markets being the Near East, Poland, and Austria. The industry was not well employed at the beginning of this year, but for some months all the establishments have been running full time with all their machines, and are said to be well booked up.

Royal Institution Lectures.—An interesting and varied programme of Friday evening discourses and afternoon lectures has been arranged by the Royal Institution for the coming session. The weekly lectures on Tuesdays and Thursdays are to be held at 5.15 p.m., and on Saturdays at 3 p.m. Professor Henry E. Armstrong will open the Friday discourses on January 18 with an account of the scientific work of Sir James Dewar. Sir William Bragg on February 1 will describe details of the work now being carried on in the Davy-Faraday laboratories. Physics will also be represented in the programme by Sir Ernest Rutherford's discourse on April 4 on "The nucleus of the atom." Dr. Jocelyn Thorpe on April 11 will deal with "Colours, Stains, and Dyes," and Dr. Hugh Maclean, Professor of Medicine in the University of London, is to give an address on March 28 on "Insulin."

Food Preservatives and Sterilisation Methods.—The members of the Newcastle Section of the Society of Chemical Industry paid a visit on December 13 to Angus Watson and Co.'s city preserving works; and in the evening Miss C. M. Dugdale, of their laboratory, delivered a lecture on "The Sterilisation of Preserved Foods" in the chemical lecture theatre of Armstrong College. In the course of her remarks, the lecturer explained various processes of sterilisation by heat penetration, and said that a process could be found for preserving every type of food. The Chairman, Mr. A. Trobridge, expressed the thanks of the Section to Miss Dugdale, who, he said, was the first lady member to read a paper before them. Dr. Harold Kerr, Medical Officer of Health for Newcastle, expressed disapproval of the use of chemicals as food preservatives. Borax and boric preparations might be harmless in themselves, but the accumulated doses absorbed from preserved foods in the course of a day could not be other than harmful, particularly to invalids and children; while the use of copper sulphate for colouring peas was absolutely reprehensible. Brawn and corned meat could be counted as among dangerous preserved foods, especially after exposure to air for some days. Dr. Kerr concluded by conveying his assurance that the conditions under which preserved foods were made in Newcastle were much better than in the majority of other places in the country.

Barytes Deposits in Corea.—The discovery of a valuable deposit of barytes at a spot about 25 miles from the town of Kinka, Kogen Province, Corea, has recently been reported in the local Press, says the Acting British Consul-General at Seoul. At present the deposit is being worked from the surface only, the output per month being about 2,000 or 3,000 tons; about 900,000 tons can, it is estimated, be obtained in this way, and further large quantities are said to be available. The quality is said to be good, the average grade of the ore being approximately 91 per cent.

Australian Motor Spirit.—In connection with the manufacture of benzol by the Broken Hill Proprietary Company at its Newcastle steelworks, the initial installation at Newcastle is capable of an output of 1,500,000 gallons of benzol a year. The plant is designed to produce commercially pure benzol, toluol, and xylol, if required; but there being little or no demand for these products at the present stage of development of Australia's chemical industry, the benzol and toluol are being marketed together as motor spirit.

British Empire Exhibition.—In connection with the British Empire Exhibition, the Imperial Mineral Resources Bureau, 2, Queen Anne's Gate Buildings, Dartmouth Street, London, S.W. 1, has in preparation a descriptive handbook and guide in which reference will be made to mineral and metallurgical exhibits. The Bureau cannot accept any responsibility for any omissions from the handbook, but will endeavour to include references to all firms exhibiting crude mineral and semi-manufactured products, if information as to the exhibits is received at the Bureau not later than March 1, 1924.

Electrical Engineering at Wembley.—The Electrical and Allied Engineering Section of the British Empire Exhibition, which occupies a floor space of about 3½ acres in the Palace of Engineering, has been organised by the British Electrical and Allied Manufacturers Association and will possess a completely equipped boiler house, power station of 6,000H.P. together with a sub-station. In the boiler house every appliance available for saving labour will be shown. In the power station are installed three steam turbines with direct coupled generators. Arrangements have been made by which the public will be able to see all the essential details of the plant.

COMING EVENTS.

Society of Chemical Industry (Bristol Section).—Meeting, **Thursday, January 3, 1924,** at **7.30 p.m.,** at the University, Woodland Road. Paper: "The Chemical Technology of Canned Foods," by O. Jones.—**(London Section):** Meeting, **Monday, January 7,** at **8 p.m.,** at the Chemical Society, Burlington House, Piccadilly, W.

Institution of the Rubber Industry (London Section).—Meeting, **Monday, January 7,** at **8 p.m.,** at the Engineers' Club, Coventry Street, W. Paper: "Consistency of Rubber and Rubber Compounds," by Dr. S. S. Pickles.

Hull Chemical and Engineering Society.—Meeting, **Tuesday, January 8,** at **7.45 p.m.,** at Grey Street, Hull. Paper: "X-rays and Their Application," by J. Pryce Jones.

Institute of Metals (Birmingham Section).—Meeting, **Tuesday, January 8,** at **7 p.m.,** at the Chamber of Commerce, New Street. Paper: "Nickel Brasses," by O. Smalley.—**(N.-E. Coast Section):** Meeting, **Tuesday, January 8,** at **7.30 p.m.,** at Armstrong College, Newcastle-on-Tyne. Paper: "The Action of Molten Brass on Nickel-steel," by H. N. Duncan.—**(London Section):** Meeting, **Thursday, January 10,** at **8 p.m.,** at 85-88, The Minories, Tower Hill, E. 1. Paper: "X-rays and Metallurgy," by W. T. Griffiths.—**(Sheffield Section):** Meeting, **Friday, January 11,** at **7.45 p.m.,** at the Albany Hotel, Fargate. Paper: "Influence of Casting Temperature on the Physical Properties of Metals," by F. H. Hurren.

Society of Chemical Industry (Manchester Section).—Meeting, **Friday, January 11,** at **7 p.m.,** at the Textile Institute, St. Mary's Parsonage. Paper: "Fractional Distillation," by C. Elliot.—**(South Wales Section):** Meeting, **Friday, January 11,** at **7.30 p.m.,** at the Technical College, Cathay's Park, Cardiff. Paper and cinematograph exhibition on "Cocoa," by Dr H. W. Bywaters.

Society of Dyers and Colourists (Scottish Section).—Meeting, **Friday, January 11.** Paper: "Dyeing of Artificial Silk," by W. E. Sanderson.

RAMSAY CHEMICAL DINNER.

INTERESTING FUNCTION AT GLASGOW.

UNDER the joint auspices of the local sections of the Society of Chemical Industry, the Institute of Chemistry, the Society of Dyers and Colourists, and also of the Glasgow University Alchemists' Club, the Andersonian Chemical Society, and the Ardeer Chemical Club, the Ramsay Chemical Dinner was held in Glasgow on December 20. Principal Irvine, of St. Andrew's University, presided over a large gathering, and among those present were Professor G. G. Henderson, Mr. David Perry, Councillor Barrie, Councillor Kennedy, Mr. R. B. Pilcher, Professor Thom Gray, Mr. G. A. Mitchell, and Professor T. S. Patterson.

Councillor Kennedy, in proposing the toast of the "Institute of Chemistry," referred to the great progress made in the science of chemistry during the lifetime of the present generation.

Principal Irvine's Tribute.

The Chairman, in responding, said it was well, in their own interest as much as in the interest of the nation, that they should gather together from time to time in a spirit of fellowship, and realise that they were brothers with common aims, common ideals, and a common goal in front of them. That was what a gathering such as was being held that evening effected. He was delighted to think that they had taken the name of a great chemist, a great Scot, and a great Glaswegian, that of William Ramsay, in whose memory they were assembled together. It was impossible to put into words exactly the effect that a tradition such as that must create.

It had occurred to him to inquire why they had not chosen some other notable chemist. Why did they not take Thomas Graham, another chemist who lived and worked in Glasgow. They had preferred Ramsay to Graham, and he thought they were wise, because they had picked a man whose time was not so far away from their own, and they were able to picture the real man and to draw some inspiration from his life and character. What was it in Ramsay that had made his name so well known? It was his versatility. It was also in part his brilliancy. But that did not account altogether for his influence among his fellow-men; nor was it his genius, which was undoubted. Above all, it was his humanity. A magnificent worker, he was an example to all by his industry. One of the keys to Ramsay's success in life was his control and influence over young men and the zeal with which he inspired them. Referring to the future of chemical science, the Chairman said he had great faith in Scotland, and he had little fear for chemistry, but, he asked, were we quite secure in our position regarding physics? He was greatly impressed by what he had seen of the equipment of laboratories in the United States for physical research. In this country, on the other hand, the returns showed that the number of students in physics was much smaller than the numbers going in for chemistry. He thought that such a state of affairs was not to the best interests of the country.

Glasgow and the Institute.

Mr. R. B. Pilcher, who submitted "The City of Glasgow," said he had been asked by the president of the Institute to convey his best wishes to the local section, together with an expression of his high appreciation of the good work which the section had been doing. Referring to the association of Glasgow with the chemical industry, Mr. Pilcher said he was not a stranger to the city, and as registrar of the Institute he could say that that body was grateful to Glasgow for its contribution to the history of chemistry. Glasgow had provided a host of chemists of high competence and not a few of eminence, among whom were William Cullen, Joseph Black, Andrew Ure, Thomas Thomson, Thomas Graham, Thomas Anderson, and William Ramsay, while there were also others who happily were with us. The Institute was, moreover, grateful to Glasgow for three distinguished past-presidents whose services would never be forgotten. He referred to Professor J. Millar Thomson, Sir George Beilby, and Sir James Dobbie. He thought it was a remarkable fact that more candidates had presented themselves for the examination for the associateship of the Institute from the Royal Technical College of Glasgow than from any other college in the kingdom.

CORRESPONDENCE.

**** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

THE CORROSION OF IRON AND STEEL.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—I have read with interest the statement made by Dr. J. Newton Friend, to the effect that "chromates will inhibit corrosion" (*vide C.T.J. and C.E.*, page 734). It is now quite a long time ago that I commenced the series of experiments which culminated in my British Patent No. 188,778, of 1921, and the successful use of "Calmate" Boiler Fluid by various railway companies, chemical manufacturers, cloth mills, etc., is well confirmed by the testimonials and reports I have received.

The treatment of boiler-feed liquor with softening and anti-corrosive salts and fluids containing chromates is fully protected under the Letters Patent referred to above, and I am grateful to Dr. Friend for the publicity he has given to this highly successful method of treatment.—Yours, etc.,

London, S.W. 1. W. Stanley Smith, Lt.-Col.

December 21, 1923.

LEGAL INTELLIGENCE.

BANKRUPTCY OF CHEMICAL MANUFACTURER.

Edmund Herbert Wrigglesworth.

The public examination of E. H. Wrigglesworth, 369, Spring Bank West, late St. Andrew's Works, Mason Street, Kingston-on-Hull, was held on December 17 at the Guildhall, Alfred Gelder Street, Hull. Debtor stated that in 1914 he became a chemical merchant, and in 1918 he commenced to manufacture his own chemicals and was successful. Subsequently the business was converted into a limited company with a subscribed capital of £20,000. and debentures of £5,000. Debtor received 5,000 shares for his interest. In December, 1920, the company went into liquidation and nothing had been paid to the creditors or contributories. He attributed his failure to the loss of £5,000. in the liquidation of the company and to making himself liable for £4,400. in respect of guarantees given to the bank, also for machinery, and to the railway company. The examination was closed.

SOUTH WALES NOTES.

(Specially Contributed.)

In the tinplate trade there is a confident feeling that business, which has been steadily expanding during the last three months, will still further progress early in the new year. The November exports were comparatively high, 27,225 tons more than the corresponding month of 1922. Tin has an easier tendency, and it is fully expected that there will be concessions in steel bars. Outputs are on the increase, and more mills will be started if sufficient skilled labour is available. The galvanised sheet trade has not been so active, and there has been a considerable falling off during the week, but it is anticipated that there will be a change shortly. Exports for November were over 50 per cent. above a year ago. The patent-fuel business continues to improve, a noteworthy feature being the fall in pitch values. For the last four or six weeks prices have experienced a steady reduction, and some transactions have taken place at under £5. per ton. Small coals are plentiful, and the outlook for briquette makers is promising for next year.

The imports for the week were 190 tons phosphate of lime from Antwerp, 10 tons ferro silicon from Fredrikstad, 79 tons calcium carbide from Gothenburg to Swansea; 30½cwt. wood tar from Gothenburg, 20cwt. chemical sheet lead from Antwerp, 297cwt. soap powder from Montreal, 14cwt. olive oil from Genoa, 2cwt. soap from Dublin to Cardiff; 21 tons ferro silicon from Antwerp, 2,940 tons iron ore from Bilbao to Newport. Among the exports were 1,050 tons copper sulphate to Cette from Swansea; 5 tons zinc chloride to Antwerp from Newport; 72 tons copperas to St. John (N.B.), and 114 tons basic slag to Fremington from Port Talbot.

RESINS FROM EASTERN ASIA.

DIRECTIONS OF THE EXPORT TRADE.

THE principal resins produced in Eastern Asia are copal, dragon's blood, gamboge, gurjun-balsam, elemi, and rosin. Copal is collected in the Philippine Islands to a considerable extent, and statistics published in *Finance and Commerce* (Shanghai) show that in 1920 no less a quantity than 1,019,834 kilos. was exported, while in 1921 the total shipments were 542,700 kilos. India, Great Britain, the United States, Belgium, France, Spain, Japan, China, and Australia are the purchasers. Dragon's blood is obtained from the *Calamus draco* which grows in the Dutch East Indies, the Straits Settlements, and the Federated Malay States, Singapore and Batavia being the chief export centres, shipping large quantities to India, China, and Europe. Gamboge is a product of several trees, of which the chief variety is *Garcinia morella*, growing in Siam, the islands on the east coast of the Gulf of Siam, and the southern parts of Cochin China. It is also found in various parts of India. Bangkok, Saigon, and Singapore are the chief export centres. Gurjun-balsam is an oleo-resin obtained from several species of *Dipterocarpus*, of which *D. turbinatus* is found in the Straits Settlements and French Indo-China, and *D. trinervis* in Java and the Philippines. It is exported chiefly from Singapore, although there is a small trade from Siam, the Malay States, and the Philippines.

Rosin Exports from China.

China is the only producer of rosin in Eastern Asia to any important extent. Kwangtung and Kwangsi provinces are the chief sources of supply, and export shipments are made from Kowloon, Canton, Swatow, and Wuchow. Hupeh and Kiangsi provinces also produce rosin and export it through the ports of Hankow and Kiukiang, while Fukien and Chekiang provinces make small shipments through the ports of Foochow and Wenchow. Practically all the rosin exported from China goes to Hongkong. Japan is the next largest buyer, and small quantities are shipped to Macao, French Indo-China, Siam, and the Straits Settlements. The only country in Far Eastern Asia producing elemi is the Philippines, which exports considerable quantities to the United States and Great Britain.—*Chamber of Commerce Journal.*

SULPHUR IN ORGANIC AND INORGANIC COMPOUNDS.

NEW GENERAL METHOD OF ESTIMATION.

A METHOD described by F. Feigl and R. Schorr (*Zeit anal. Chem.*, 1923, 63, 10) is termed "oxidising sintering." According to an abstract in *The Analyst*, the very finely powdered substance is intimately mixed in an iron crucible with 2 grammes of potassium permanganate and 2 grammes of sodium carbonate (both finely powdered and quite dry), and the mixture is covered with 3 grammes of equal parts of the two salts. The covered crucible is heated 20 to 30 minutes over a small flame, then to 30 to 40 minutes at a stronger heat until the bottom of the crucible is red hot. The cold mass is transferred to a beaker, and the crucible cleaned with hot water. Any permanganate (manganate) is destroyed by addition of alcohol. After digestion on a water-bath the liquid is filtered, and the residue well washed with hot water containing a little sodium hydroxide. The sulphate in the acidified filtrate is precipitated as usual with barium-chloride solution. The method gave very good results when applied to various sulphide ores, phenylthiourea, sulphanilic acid, and sulphonal. In the estimation of sulphur in organic substances, the raising of the temperature must take place very gradually, and the oxidising mixture must be very thoroughly dehydrated.

Applicable Also for Arsenic and Antimony.

The above method is applicable to the estimation of arsenic in ores and organic substances (*e.g.*, atoxyl, various substituted phenylarsinic acids, and neosalvarsan); the filtrate containing arsenate is precipitated as usual with magnesia mixture. The precipitate may be ignited and weighed, or dissolved on the filter in 25 per cent. hydrochloric acid, and the solution is treated with 2 to 3 grammes of potassium iodide, and titrated, after 15 minutes' standing, with thiosulphate. For the estimation of arsenic, sulphur, and antimony in ores, the sintered mass is leached with 30 per cent. alcohol, the extract filtered after 24 hours, and the residue washed with alcohol of the same strength. The filtrate is made up to 500 c.c., and the arsenic and sulphur estimated in aliquot portions. The residue is dissolved in dilute hydrochloric acid, and a little oxalic acid; this solution contains the whole of the antimony. The method is being extended to the estimation of chlorine in organic substances.

PATENT RIGHTS IN JAPAN.

EARTHQUAKE EMERGENCY REGULATIONS.

THE following communication has been received from the Japanese Government by the Patent Office through the Japanese Consul-General in London relative to the preservation of industrial property rights in Japan which might be affected by the recent earthquake:—

Owing to the recent earthquake and the fire which followed in Tokyo, the whole of the Registers and almost the whole of the documents in the Patent Office were destroyed. The following is an extract from the laws and regulations promulgated with a view to avoiding any possible detriment or inconvenience to any party whom it may concern:—

Any right or interest, which arose from the decision of any administrative office within the area of the earthquake (such decision having been given prior to September 1, 1923), and which was to expire between September 1, 1923, and March 31, 1924, shall be deemed to expire on March 31, 1924, with the exception of such rights and interests as were granted with a special order as to the period of their duration.

Any person who, prior to September 1, 1923, applied for the prolongation of a patent right and has not yet been granted any decision, shall present to the Patent Office not later than December 31, 1923, the copies of the application and other documents related thereto, together with a written statement declaring the date of the original application.

Attention is drawn at this opportunity to the fact that according to a provision in the Patent Law a person who is not resident within the Empire of Japan cannot make an application to or take any other steps at the Patent Office except through a representative who is resident in the Empire.

THE TREATMENT OF SPENT OXIDE.—According to *Das Gas- und Wasserfach*, the Rhenania Company, of Mannheim, have patented a new process for recovering from spent oxide cyanogen compounds and high-percentage sulphur, leaving the oxide fit for further use. It consists in treating the spent oxide with a hot solution of sulphides or polysulphides of alkaline earths, and subsequently decomposing with sulphurous acid the polysulphide liquor formed. The result is a mixture of sulphur and sulphites of alkaline earths, while the cyanogen compounds remain in solution in the form of their earth-alkali salts, and can be worked-up by known methods. The separation of the sulphur from the sulphite follows by treatment with acid, and thus sulphurous acid is formed, which is used again in the process. The lixiviated oxide is regenerated as usual, and is then available for further purification work. The following example is given to illustrate the working of the new process: 2,000 kilos. (about 2 tons) of spent oxide with about 50 per cent. of sulphur content are mixed into 6,000 litres of barium-sulphide solution, which should contain more than 300 grammes BaS to the litre, and treated with heat. The lixiviated oxide is then separated by filtration from the barium polysulphide liquor which has formed, and the latter is treated with strong sulphurous acid. During this process, besides the sulphur extracted from the oxide, a considerable quantity results from the action of the sulphurous acid on the barium sulphide. Also the total barium separates out in the form of barium sulphite, while the cyanogen compounds remain in solution, and can be filtered off. The mixture of sulphur and barium sulphite is now stirred with hydrochloric acid. In this way sulphurous acid and barium chloride are formed, while the sulphur remains undissolved, and by filtration and washing can be prepared for whatever purpose required. The barium chloride is worked-up to a solid salt, and the ferrocyanide salts are taken out of the solution in the usual way, and worked-up to potassium ferrocyanide. The sulphurous acid is used again in the process.—*Gas Journal.*

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS IN NOVEMBER

(Concluded from page 744.)

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month of November, 1923, compared with 1921 and 1922. As from April 1, 1923, the import trade of the Irish Free State is excluded from the Returns.

THERMAL PROPERTIES OF ETHYL CHLORIDE.—The Department of Scientific and Industrial Research have issued a special report by the Engineering Committee of the Food Investigation Board on "The Thermal Properties of Ethyl Chloride." The report is priced at 1s. 6d. net, and may be purchased through a bookseller or from H.M. Stationery Office, 120, George Street, Edinburgh.

REPORTS OF COMPANIES.

Sulphide Corporation, Ltd.

The annual meeting was held in London on Thursday, December 20, Lord Kintore (chairman) presiding. The Chairman, in moving the adoption of the report and accounts, said that at their Cockle Creek establishment, owing to the suspension of smelting, productive work had been confined to the manufacture of superphosphates and sulphuric acid, both of which were produced last year on a considerably smaller scale than in the previous year. They started the past year with a considerable stock of superphosphate on hand, and owing to a severe drought which affected the agricultural districts of New South Wales the demand was on a much reduced scale. The plant was, therefore, closed down for a portion of the second half-year, with the result that on June 30 last the stock was considerably reduced, the sales during the year having amounted to 20,984 tons. The plant was now capable of producing about 40,000 tons a year. As to sulphuric acid, there had also been special reasons during the past year for an exceptionally low production. Sulphuric acid was an essential ingredient in the manufacture of superphosphates, and owing to the smaller tonnage of superphosphates they used last year only 8,415 tons of acid for this purpose, as against 15,187 tons in the previous year. A third section of acid plant was completed during the year, and they were now capable of producing about 35,000 tons of chamber acid a year, while a contract plant for producing concentrated acid was also nearing completion.

The English works of the Corporation at Seaton Carew had had quite a satisfactory year. Construction work had been on a considerable scale. Last year they produced 3,791 tons of zinc, as against 967 tons in the previous year, 2,365 tons of silver lead residue concentrates, against 528 tons, and 11,462 tons of sulphuric acid, against 3,139 tons. In the current year they expected to see the production of zinc and residue concentrates again largely increased, while, as soon as the new sulphuric acid unit was available, their sulphuric acid production would be doubled, and their hydrochloric and salt-cake plant would at once be put into operation.

After dealing with the accounts the Chairman said that unfortunately the present conditions were very far from normal, and until the fire at the Central Mine was extinguished it was impossible to give an even approximately correct forecast of what the current year's results were likely to be.

Low-Temperature Carbonisation, Ltd.

The report for the period ended July 31, 1923, states that sales contracts for the forward delivery of 250,000 tons of "Coalite" per annum over the next four years have been made with one of the leading firms of coal distributors in the United Kingdom, who are prepared to increase their contracts to 1,000,000 tons a year as soon as plants have been erected to fulfil this demand. To cope with these sales contracts, the works at Barnsley are being enlarged to produce 150,000 tons of "Coalite" per annum, and the directors state that they have been able to complete the necessary financial arrangements on satisfactory terms for this further extension, and also for the erection of similar plants in Staffordshire and other coal-producing counties. Not only has the production of domestic smokeless fuel been commercially proved, but the company is also actively engaged in producing smokeless fuel in industrial form for burning under boilers, or in pulverised or powdered "Coalite" condition. The directors have now succeeded in firmly establishing the business on sound commercial lines, and the company has now entered the profit-earning stage. The accounts show a debit balance as at December 31, 1922, of £187,718.; less credit balance for seven months to July 31, 1923, £101,106.; debit carried forward, £86,612.

Kaye's Rubber Latex Process, Ltd.

Presiding at the first annual meeting on Thursday (December 20), Mr. D. F. L. Zorn said that they had used up the cash in hand, and it would be necessary to call up the remaining 5s. per share upon the ordinary capital. Considering the difficulty of establishing a new process the progress made was satisfactory. Licences covering 21 mills had already been granted, and he thought they might say that the making of latex paper had passed beyond the stage of merely supplying a demand created among rubber shareholders. Nothing had yet been accomplished as to the sale of foreign patents, but the conditions prevailing in Europe did not make for enterprise, and people on the Continent were very shy of putting up money for new departures. They had now obtained patents in 28 separate countries as compared with eight countries at the date of incorporation.

Corocoro United Copper Mines, Ltd.

Profit on trading for year to June 30 last, £43,852., plus for bearer warrants and transfer fees, £105., and sundry interest, etc., £812.; total, £44,769. After deducting all charges and expenses, £7,804.; royalties and taxes, £5,861.; interests and discounts, £15,989., etc., together, £30,204., balance, £14,565.; applied as follows: Writing off one-third expenses on issue of preference shares, £5,636.; provision for reserve for doubtful debts, £5,000.; additional depreciation written off, £3,929.; equal total £14,565. Accounts will henceforward be closed on December 31 each year, as from December 31, 1923, and next account will, therefore, be presented for only six months, from June 30 to December 31, 1923.

DIVIDENDS.

BRITISH CYANIDES COMPANY, LTD.—No interim dividend will be paid on the ordinary shares.

BROUGHTON COPPER COMPANY, LTD.—Interim dividend of 2½ per cent. (actual) on the ordinary shares.

JOSEPH NATHAN AND COMPANY, LTD.—Half-year's dividend on the 7 per cent. "A" preference shares.

LEEDS FIRECLAY COMPANY, LTD.—Dividend of 6 per cent. on preference and 4 per cent. on ordinary. For past year profits were £38,197. Debenture interest took £11,319., and after providing for dividends there is £4,877. to be carried forward.

BRITISH PLATINUM AND GOLD CORPORATION, LTD.—After allowing for depreciation, the accounts for the year to July 31 show a net profit of £33,385. (against £1,064. for the preceding year). With £18,198. brought forward, the profit and loss shows a total credit of £51,583. It is not proposed to make a distribution of profits at the present time.

KILLIFRETH MINE, LTD.—Report for period to June 30 last states that accounts show a debit balance of about £34,505., but it may be considered desirable later to submit some suitable scheme for reduction of capital whereby this loss may be disposed of. Present rate of arsenic production is between 40 and 50 tons per month. All the marketable arsenic produced and being prepared has been sold.

VAR OIL AND COAL COMPANY, LTD.—The accounts for the year show a debit balance of £1,681. The advances to the French company during the year amounted to £30,456., making a total of £146,608.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

[SPECIALLY CONTRIBUTED.]

There has been such keen pressure upon the coal trade during the past fortnight that it has been difficult to give the coke ovens all the supplies they need to maintain the supply of coke wanted by the smelters of ordinary iron. What would have been the position had there been more furnaces blowing and had the coking plants been working at their full capacity it is difficult to say. Such a situation, however, may arise sometime in January or February, for when the steel rail mills at Workington begin rolling three weeks in four it is certain that additional furnaces will be blown in and that a bigger output of coke will be necessary. No doubt East Coast coke could be got in greater quantity the weekly supplies are now over 10,000 tons,—but the whole aim of the ironmasters is to reduce costs, and of course that cannot be achieved if East Coast coke at 43s. per ton delivered is to take the place of local coke at 25s. to 27s. per ton, according to carbon content. More than ever the importance of the developments that are taking place to obtain a larger production of coal in Cumberland is realised. The Irish market has hitherto been the mainstay of the Cumberland coal trade, and owners would be reluctant to abandon it to any competitors. But if it is to be retained in periods when the iron and steel industries are busy, it can only be retained by having at command an output considerably in excess of that at present being won. There is very little change to record this week. The Continental demand for coke at 35s. per ton is small, and the whole of the make is passing to the local furnaces. Residuals are a fair market. A good deal of the tar is going to Sunderland. Sulphate of ammonia is being stocked.

WELDED STEEL BARRELS DRUMS AND KEGS.

SOFNOL SUPER-LIME SPECIALITIES

About real lime

COMPARE Sofnol Calcium hydrate with ordinary lime. It is a fine dry powder, stable, of known composition and ready to use. Crude lime involves heavy labour charges for slaking and handling, is in every sense of the word "messy," extremely unstable in the atmosphere; of doubtful composition when raw, it is still less definite when slaked—and the cost of slaking is not light.

When you use crude lime you work in the dark. When you use Sofnol Calcium hydrate you know just what you are using. It is an alkali of definite strength, strictly reproducible—in every way dependable.

For water softening, the preparation of Calcium salts, hydrolysis, sugar refining, rubber manufacture, and a hundred other chemical applications, its properties are ideal—Have you tried it yet?

CALCIUM HYDRATE.
LIME-SODA MIXTURES
for Water Softening.
SODA LIME.
Everything for Water Testing.

EXPORTS OF CHEMICALS AND ALLIED PRODUCTS IN NOVEMBER.

(Concluded from page 745.)

THE following returns, which are taken from the export statistics of the United Kingdom, give the amount and value of chemicals and allied products exported during November, 1923, compared with 1921 and 1922. As from April 1, 1923, the export trade of the Irish Free State is excluded from the Returns.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

British India.

The Director-General, Indian Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E. 1, invites tenders before January 8, 1924, for the supply of 6 tons of potassium permanganate, required by March 1, 1924. Further information to be obtained direct from the Director-General.

South Africa.

The Municipal Council of Johannesburg is calling for tenders, to be presented by January 29, for the supply and delivery at Vredeorp store of 135 tons (each 2,000lb.) of creosote in steel drums. (Ref., D.O.T. 12794/E.D./C.C./2.)

Austria.

An agent in Vienna with good knowledge of the local market desires to secure the representation on a commission basis of British manufacturers and exporters of chemicals. (Ref. No. 671.)

Spain.

A commission agent of Barcelona is desirous of obtaining the representation of British manufacturers of sodium sulphide, chloride of barium, oxalic acid, lead acetate, and sodium bicarbonate. (Ref. No. 676.)

A commission agent of Bilbao is desirous of securing the representation of a British firm with head office in the United Kingdom exporting copra direct from the Federated Malay States. Copra from other sources is not desired. (Ref. No. 678.)

Central America.

A British commission agent, experienced in the Latin-America market, proposes to leave at the end of January for a business trip to Mexico and Central America. In addition to the lines which he already handles he desires to secure agencies for paint, proprietary medicines, etc. (Ref. No. 687.)

Turkey.

A merchant firm, of Turkish nationality established in Constantinople, is desirous of getting into touch with British pharmaceutical chemical manufacturers. (Ref. No. 680.)

THIRTY-FIVE YEARS AGO.

(From the "Chemical Trade Journal," December 29, 1888.)

A New Field for Chemists.—It should be the practice for any student intending to enter upon a certain craft or profession to understand clearly what his prospects for the future are likely to be; and if everyone studying chemistry at the present time in the laboratories of the United Kingdom were to ask himself that question, we are afraid the answer would not be very encouraging. For some years past we have been producing chemists at a remarkably rapid rate, and the cry is now a serious one that many who have been thus educated cannot find any work to do. If everyone now studying in British laboratories intends to enter manufacturing establishments as chemists earning fair salaries, we feel sure the majority will be grievously disappointed. There is an outlet for talent in the direction of well-informed superintendents, and it is in that direction that we urge the attention of the rising generation of chemists. Education is a good thing in its way, but it will neither clothe the back nor minister to the pangs of hunger. Excessive education is apt to engender false pride, and to make the brain-worker look down upon the toiler with his hands, and that bad example, which has been set in many of our schools and colleges, has tended in no small degree to check that flow of scientific talent into channels which under ordinary circumstances the natural course of trade would have led it. Some chemists may, perhaps, think it a mean thing to be called a foreman; let masters then consult their pride by coining a special designation to suit their idiosyncrasies. From a monetary point of view the chemist would be the gainer; pride without a salary is a very hollow show, and while some chemists are now to our own knowledge existing on £60 per annum, the foreman is flourishing on £3 per week, and even much more.

GAZETTE NEWS.

MORTGAGES AND CHARGES.

African Manganese Company, Ltd., London, E.C.—Registered December 5, £16,000. debenture stock, part of £600,000.

Harding Chemical Company, Ltd., Manchester.—Registered December 6, £2,000. debentures (filed under sec. 93 (3) of the Companies (Consolidation) Act, 1908), present issue £1,300.

Organam, Ltd. (late Elstree Chemical Works (1922), Ltd.).—Registered December 3, £2,000. debenture, to Branch Nominees, Ltd., 15, Bishopsgate, London, E.C.

Pottsghyll Barytes Mining Company, Ltd., London, E.C.—Registered November 30, £4,760 19s. 6d. 1st debenture, to C. H. Pryor, 222, Strand, London, W.C.

Spooner and Bailey, Ltd., Eling, Southampton, chemical manufacturers.—Registered December 5, £500. (not ex.), £12,000. (not ex.), and £100. (not ex.) morts., to Lloyds Bank, Ltd.

Sydbie, Ltd., London, E.C., glass manufacturers.—Registered December 7, £2,300. debenture, to Baron Somers, Eastern Castle, Ledbury.

United Chemical Corporation, Ltd., London, S.W.—Registered December 5, £2,000. debenture, to A. Moray, 44, Fitz George Avenue, Kensington.

SATISFACTIONS.

Organam, Ltd. (late Elstree Chemical Works (1922), Ltd.).—Satisfactions registered December 3, £550.; registered November 3 and November 8, 1923.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions; Orders; and Official and Other Notices.

Hightensite, Ltd., London, E.C., rubber manufacturers.—C. Comms ceased to act as receiver. November 28.

COUNTY COURTS' JUDGMENTS.

(The following returns are taken from the Registry of County Courts' Judgments. Publication does not imply inability to pay. Many Judgments may have been settled between the parties, or paid. Judgments settled otherwise than through the Court may appear unless "Satisfaction" is entered up within twenty-one days from Judgment. Registered Judgments are not necessarily for debts. They may be for damages or otherwise, or they may be against defendants liable in a representative capacity, and not personally. Judgments are not returned to Registry if satisfied in Court Books within twenty-one days.)

Florey, Hartley, 32, Great Tower Street, London, E.C.; chemical merchant; £29. 13s. 6d. October 11.

Lambert (Samuel) and Co., Ltd. (registered office, 10, Great St. Helens, London, E.C.), druggists and chemical merchants; £13. 6s. 11d., November 2.

NEW COMPANIES.

Kynaston, Ltd.—Capital £50,000., in 45,000 £1. 8 per cent. cumulative participating preference and 100,000 1s. ordinary. Manufacturers of chemicals, drugs, etc., manufacturers of and dealers in mineral waters, etc. Office: Connaught Mansions, 34, Victoria Street, Westminster.

Ciela Photographic Supplies, Ltd.—Private company. Capital £2,000., in 1,995 £1. 10 per cent. cumulative preference and 100 1s. ordinary. Manufacturers of and dealers in chemicals and allied products, etc. Office: P. and O. House, Cockspur Street, S.W.

Enzymetan, Ltd.—Private company. Capital £10,000., in 5s. shares. To acquire rights in a scientific process in connection with the preparation of hides for tanning into leather, etc. Office: 365, Bank Chambers, 329, High Holborn, W.C.

Lanes Lead Patents, Ltd.—Private company. Capital £500., in 1s. shares. Solicitors: Claremont, Haynes and Co., Vernon House, Sicilian Avenue, W.C.

M.F.W. Syndicate, Ltd. — Private company. Capital £100. 2s. in 1s. shares. To acquire a secret preparation for the cleaning of buildings, etc. Solicitor: J. Lee Smith, 119, Moorgate, E.C.

Metal Treatment Company, Ltd. — Private company. Capital £2,000. Electro chemists and metallurgists, etc. Office: Fitzalan House, Arundel Street, Strand, W.C.

Tarrant and Co., Ltd. — Private company. Capital £10,000. Manufacturers of boot, furniture, and metal polishes, etc. Office: 14, Rafter Street, Enniscorthy, Ireland.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

December 10 to 15 (inclusive).

Catalysts for Synthesis of Ammonia. Ammonia Casale Soc. Anon. 31,168.
Hardening Colloids. Bloxam, A. G. (*Akt.-Ges. für Anilin-Fabrikation*). 31,033.
Azo-dyestuffs. Bloxam, A. G. (*Chemische Fabrik Griesheim-Elektron*). 31,359.
Barium Cyanide. Deguide, C. 30,988.
Mixing and Stirring Apparatus. Easterbrook, F. A. 31,102.
Effecting Intimate Contact between Liquids and Gases. Hersey, S.; and Kirkham, Hulett and Chandler, Ltd. 31,256.
Sulphuric Acid. Jackson, W. J. Mellersh- (*Hurt Engineering Corporation*). 31,118.
Pneumatic Manipulation of Liquids. Mauclère, P. A. P. V. 31,250.
Dyestuffs. Morton Sundour Fabrics, Ltd.; Thomas, J.; and Wylam, B. 31,264.
Decolourising Carbon. Naamlooze Vennootschap Algemeene Norit Maatschappij. 31,451.
Centrifugal Separators. Plauson's (Parent Co.), Ltd. 31,355.
Electrolytic Apparatus. Scott, J. P. 31,015.
Grinding-mills. Sedberry, J. B. 31,013.
Continuous Rectification of Hydrocarbons. Soc. des Etablissements Barbet. 31,145.
Conservation of the Pellicles of Hydrate or of Hydrated Ethers of Cellulose. Soc. Française des Crins Artificiels. 31,444.
Decolourising Petroleum Distillates. Union Oil Company of California. 31,017.
Chlorination of Raw Cellulose. Vains, A. R. de. 31,362.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 1s. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1922.

Leaching of Caliche and Recovery of Nitrate Therefrom. Guggenheim Brothers. 18,460. **188,634**
Dyestuff Intermediates. Thomas, J.; and Scottish Dyes, Limited. 18,804. **207,840**
Methane. Farbwerke vorm. Meister, Lucius, and Brüning. 23,674. **186,900**
Combustible Gases. Broadhead, C. F.; Barker, F. G.; and Hunt, P. C. H. 23,761. **207,851**
Cellulose Esters. Soc. de Stearinerie et Savonnerie de Lyon. 24,153. **201,510**
Pipes for Use when Immersed in Chemical Liquids. Judson, F. (legal representative of *Judson G. R.*, deceased); Gibson, J. M.; and Galloway, H. 24,974. **207,902**
Paints. Plauson's (Parent Co.), Limited (*Plauson, Dr. H.*). 25,813. **207,919**
Ozone-generators. Hartman, H. B. 28,032. **207,946**
Treatment of Asbestos. Hydroloid, Ltd. (*Exportingenieure für Papier und Zellstofftechnik Ges.*). 29,059. **207,958**
Gas Purification. Davidson, W. B. 32,317. **207,995**

1923.

Vulcanisation of Rubber. Naugatuck Chemical Co. 2,778. **200,788**
Glycerine and Alkali Soaps. Schmidt, L. 4,129. **196,579**
Sluphate of Chromium. Nydegger Dr. O 4,509. **198,645**
Colloidal Solutions of Ferric Oxide. Aktieselskabet Hydropeat. 7,747. **195,089**

COMPLETE SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

1923.

Nitrate of Potassium. Michael and Co., J. 19,229. **208,114**
Evaporating-apparatus. Metallbank-und Metallurgische Ges. Akt.-Ges.; and Gensecke, W. 29,481. **208,130**
Albumen Compounds Containing Arsenic. Haco Ges. Akt.-Ges. Bern. 30,193. **208,143**
Organic Mercury Compounds. Albert, Dr. A. 30,611. **208,151**
Chlorinating Benzene. Farbwerke vorm. Meister, Lucius, and Brüning. 30,645. **208,155**
Disazo Dyestuffs. Durand and Huguenin Akt.-Ges. 30,838. **208,162**
Continuous Rectification of Liquids Containing Constituents of High Boiling-point. Soc. des Etablissements Barbet. 31,145. **208,175**

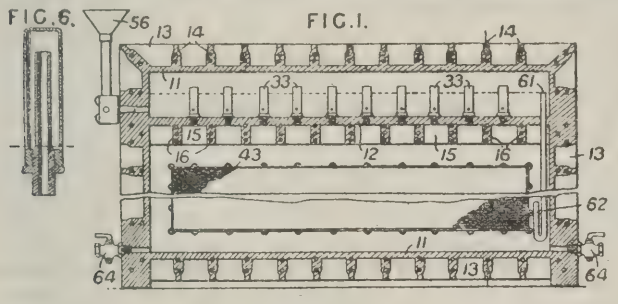
ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

p-Phenetol-carbamide. A. Sonn, Königsberg, Prussia, Germany. British Patents **206,083,** of 1923.

p-Phenetol-carbamide is produced by adding a concentrated aqueous solution of potassium cyanate to a solution of *p*-phenetidine in an excess of diluted acetic acid. The reaction may be combined with the production of phenacetin, in which dilute acetic acid forms a by-product.

Electrolytic Oxygen and Hydrogen. J. P. Scott, Toronto, Ontario, Canada. British Patent **205,884**, of 1922.

A cell comprises a pair of rectangular cast iron or steel frames, such as 11, Fig. 1, each divided into two parts by a bridge-piece 12, the two frames being insulated from one another and separated in the upper part by an impermeable partition and in the lower part by a diaphragm, and enclosed by side plates, the lower of which support wire-gauze electrodes 43, spaced from the plates so as to be substantially in contact with the diaphragm. The bridge-pieces 12 are provided with a number of devices 33, shown in detail in Fig. 6, which allow the evolved gases to bubble up through water in the upper chambers for the purpose of washing, but prevent return flow of gas or electrolyte. Water is supplied to the upper chambers by a funnel 56, and is maintained at



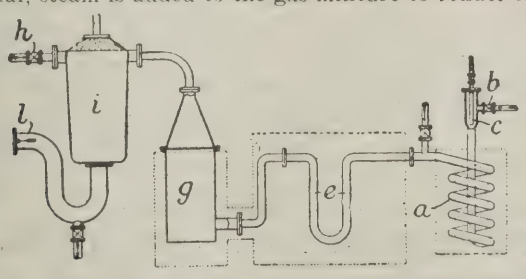
a predetermined level by overflow pipes 61 provided with bent ends 62 within the electrode chambers to prevent escape of gas. The bridge-pieces 12, being of heat-conducting material, allow pre-heating of the water in the upper chambers. The frames 11 and the bridge-pieces 12 are provided with pairs of flanges 13, 15 connected by webs 14, 16 which receive screws securing the side-plates, and insulated screws joining the frames. Taps 64 are provided at the bottom for removing sludge. Any number of cells may be connected in series or parallel by conductive strips or by contact of their side-plates.

Electrolytic Production of Carbonates and Sulphites. Plauson's (Parent Co.). Ltd., London. (H. Plauson, Hamburg, Germany.) British Patent **205,955**, of 1922.

Alkali carbonates, sulphites, and the like, are obtained by electrolysing a solution of an alkali sulphate, and allowing the acid produced to react with an insoluble carbonate, sulphite, etc., for instance, of calcium, barium, or lead, situated below the cathode, so that the carbonic acid, etc., produced combines with the alkali generated by the electrolysis. In one method the anode of carbon, coke, graphite, etc., is placed at the bottom of the cell and covered with lumps of the insoluble carbonate. Above the cathode is a porous iron or other cathode through which the alkali carbonate solution is withdrawn; it usually contains some caustic alkali. Fresh sulphate solution is introduced below or through the anode. Barium carbonate may alternatively be supplied in the form of a suspension in the entering liquid. Calcium sulphate may be dried and burnt

Ammonia Oxidation. J. R. Partington, London. British Patent **205,856**, of 1918.

In the oxidation of ammonia by passing it in admixture with oxygen or air enriched with oxygen over a catalytic material, steam is added to the gas mixture to render it non-



explosive. Ammonia solution is sprayed through a nozzle *c* in the presence of oxygen or a gas rich in oxygen admitted by a pipe *b* and becomes evaporated in a heated spiral *a*, preferably of aluminium and packed with aluminium turnings; the resulting gas mixture passes to a preheater *e*, consisting of a number of aluminium pipes heated by hot gases; the gas mixture then proceeds to the converter *g* containing the catalyst, such as heated platinum gauzes; the products are cooled and absorbed in a vessel *i*, any remaining nitrogen oxides passing by the outlet *l* to an absorption tower. The original gas mixture may be enriched with either oxygen or ammonia by admitting a supply through an inlet pipe between the evaporator and the preheater; alternatively, water may be sprayed or steam admitted into the evaporator and ammonia gas then introduced by the intermediate inlet pipe. Also, a further supply of oxygen may be admitted by the pipe *h* into the cooler *i*, if the higher oxides of nitrogen are to be produced.

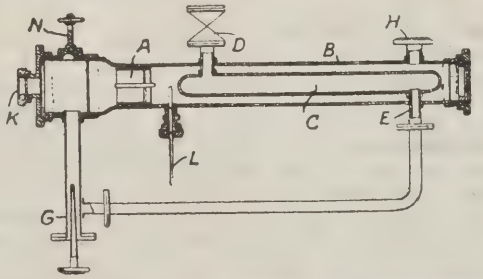
ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Bacteria for Indigo Dyeing. Farbwerke vorm. Meister, Lucius, and Brüning, Hoechst-on-Main. Germany. British Patent **205,834.** Convention date, October 23, 1922.

Cultures of bacteria, suitable for use in the reduction of the indigo vat, are obtained by selecting aerobic or anaerobic bacteria contained in substances in which reducing processes caused by bacteria are occurring or have occurred, for example, the contents of the intestines, natural rotting substances such as manure, garden soil, or humus, mud from brackish water, hay, or even natural indigo, and continuing to cultivate those which have a particularly great reducing power. It is advantageous to carry on the cultivation in the presence of indigo, and also to select those species which are resistant towards heat and drying.

Formaldehyde. Soc. des Etablissements Barbet, Paris. British Patent **206,158.** Convention date, October 30, 1922.

An apparatus for the manufacture of formaldehyde by the catalytic oxidation of methyl alcohol vapour comprises a tube B having inlet and outlet passages G, H, and an internal concentric tube C with inlet and outlet passages D, E. Air is admitted to the tube C, and becoming heated by the flow of the hot exit gases around the tube, passes through



a branch pipe to the inlet G for the methyl alcohol vapour; the resulting hot mixture of methyl alcohol vapour and air then flows through the copper catalyst A and the hot reaction products pass around the tube C to washing and condensing apparatus. K is a peephole for viewing the catalyst and L is a pyrometer. The reaction is started by withdrawing the plug N and heating the catalyst. A number of the elements described may be combined into a battery.

Naphthoquinone Derivatives. Soc. Anon des Matières Colorantes et Produits Chimiques de St. Denis, Paris; A. Wahl, Enghien, Seine-et-Oise, France; and R. Lantz, Paris. British Patent **206,142.** Convention date, October 30, 1922.

4-Arylamino-1-arylimino-2-naphthoquinones (1, 4, diarylimino-2-naphthols) are produced by reacting upon 1-arylimino-2-naphthoquinones with a primary aromatic amine. According as the latter is in excess or not, the products contain two aryl radicles which are the same or different. In the former case the initial product reacts with a further molecule of the primary amine. The oxyarylnaphthylamine, which occurs as a by-product, may be treated, either with an oxidising agent or in contact with air and a catalyst, in presence of a primary amine to produce a further quantity of 4-arylamino-1-arylimino-2-naphthoquinone. Alternatively the original reaction may be carried out in presence of oxidising agents. When metallic oxides, such as lime, baryta or copper oxide, are employed as catalysts, the naphthoquinone derivatives generally forms a compound therewith,

Deodorising Fumes. M. Donkervoort, J. L. van der Voorden, and A. Donkervoort, Rotterdam. British Patent, 206,118. Convention date, October 27, 1922.

Fumes from the treatment of animal products such as bones are deodourised by passage through a chimney or other conduit containing wires heated to incandescence by electricity or by gas flames. In a form shown a ventilating chimney, through which the fumes are forced by an electric fan, is fitted with two horizontal wire nets attached to the walls of the chimney by insulators and heated by the passage of an electric current.

Granulating Slag. Soc. Anon. des Chaux et Ciments de Lafarge et du Teil, Le Viviers, Ardèche, France (assignees of M. Maguet). British Patent 206,132. Convention date, October 26, 1922.

Molten slag is granulated by the action of a gaseous or liquid fluid under pressure playing uniformly on the jet of molten slag, in the direction of flow of the latter, from the periphery to the centre of the slag jet and at a determined point in the course of this jet, the axis of flow of the slag coinciding with the axis of the cones of convergence and dispersion of the projected fluid.

Chlorine-containing Perylene Vat Dyes. H. Pereira, Vienna. British Patent 206,133. Convention date, October 28, 1922.

Perylene vat dyes are produced by treating perylene quinone with chlorine. A chlorine addition product is first formed which, on treatment with agents fixing hydrochloric acid, is transformed into a chloroperylene quinone. According to the examples (1) a suspension of perylene quinone in nitrobenzene is heated with chlorine in the presence of a trace of iodine; the chlorine addition product formed is precipitated by the addition of light petroleum and is recrystallised from nitrobenzene; (2) the chlorine addition product of the preceding example, dissolved if desired in nitrobenzene, is boiled with aniline; on cooling chloroperylene quinone separates out; it dyes cotton greenish yellow from a cherry red vat. The colours obtained by the use of the chlorine addition product are not so fast towards chemical reagents as those of the chloroperylene quinone.

Preserving Latex. N. S. Bostock, Aiken, Spence and Co., Colombo, Ceylon. British Patents 206,163, 206,164, and 206,165. Convention dates, October 30, 1922.

Caustic soda, quicklime or slaked lime, or sodium carbonate, with or without known preservatives, such as phenol, formaldehyde, or ammonia, are added to latex to prevent coagulation.

PUBLICATIONS RECEIVED.

Arsenic, Calcium Arsenate, and the Boll Weevil.—Articles and addresses by Howard W. Ambruster. Barr-Erhardt Press Inc., 205, West 19th Street, New York, U.S.A. 1923. Pp. 42. Price 50 cents.

Mechanisch - und Physikalisch - technische Textiluntersuchungen.—By Dr. Paul Heermann. Second Edition. Julius Springer, Linkstr. 23-24, Berlin, W. 9. Price (bound) three dollars.

Legation, Havana; price 1s. net.—**Peru** (to August, 1923), by Mr. A. J. Hill, British Vice-Consul, Callao; price 1s. net.

MARKET REPORTS.

LONDON "OPEN MARKET" REPORT. Monday.

It is recognised that in many cases the prices quoted show little relation to makers' prices to domestic consumers on contract. They will, however, serve as a useful indication of current values on the open market for spot supplies. Attention is drawn to the fact that the British Chemical and Dyestuffs Traders' Association, whose Secretary compiles this report, is prohibited from trading or profit-making in any form; consequently, the market information given may be taken as impartial and unbiassed. Prices quoted ex wharf, except where otherwise stated.

Industrial Chemicals.—There is little change to report on the past week. Business has been quiet on account of the seasonal dullness due to stocktaking and holidays. The Continental position is still very strong. The complete stoppage of business with Germany continues. **Acetic Acid,** 80% technical, £47. 10s.; 80% pure, £50. to £51.; 98% glacial, £60. in casks, and about £73. per ton in glass demijohns, ex wharf London; spot supplies are running short, the prices are dearer, with the market firm; still higher prices are expected for the 80% pure grade. **Acetone** British Government specifications, about £124. per ton, in drums; the spot position holds very steady. **Alum,** lump, in casks, £10. to £10 10s. per ton; dealers continue to quote at these figures, with the market quiet. **Arsenic,** Cornish white powdered, £68. per ton, ex wharf; at the figure quoted the market is firm; business, however, has again been poor; the price stated appears to be too high for buyers, but there is little evidence of any easier conditions. **Anhydrous Ammonia,** 99.95%, about 1s. 5d. per lb.; this item has been again quiet, and dealers' prices are unchanged. **Bleaching Powder,** 35—37%, £10. to £10. 10s. per ton; very little interest is shown in dealers' offers of Continental material at these rates. **Barium Chloride,** 98—100%, £14. 10s. to £15. per ton. **Borax,** commercial, granulated £24. 10s., crystals £25., powder £26., extra fine £27. B.P. crystals £29., powdered £30., extra fine £31. per ton, in free 2cwt. bags, carriage paid to any station in Great Britain. British makers' prices, for home trade only, are kept at these levels; their prices for export vary as to destination; dealers are quoting under similar conditions for home trade at: Commerical, granulated £23. 10s., and powdered £25. per ton. **Borax Glass,** lump, £70.; powdered, £71 per ton, in tin-lined cases; British makers quote at these prices, for home trade only, packages free, carriage paid in Great Britain. **Boric Acid,** commercial, granulated £48., powdered £50., extra fine £52.; B.P., crystals £54., powdered £58., extra fine £60. per ton, in free bags, carriage paid to any station in Great Britain; British makers' prices are unchanged as quoted for home trade; their prices for export vary according to destination; dealers are offering some grades at competitive prices. **Citric Acid,** B.P. crystals, about 1s. 4½d. per lb., less 5%; spot supplies are offered at about this figure, with little or no demand. **Cream of Tartar,** B.P., 99—100%, 86s. to 87s. 6d. per cwt., less 2½%; dealers continue to quote close up to these rates; the market is steady. **Epsom Salts,** commercial quality, about £4. 15s. per ton, in bags; there is little interest shown in this item, and dealers' prices for Continental material are unchanged. **Formaldehyde,** 40% volume, £64. to £65. per ton; quotations on spot for this article are rather irregular, and it may be possible to place orders at lower figures. **Glauber's Salt,** commercial quality, £3. 10s. to £3. 15s. per ton, in bags; dealers' prices are round about these rates, with business dull. **Lead Acetate,** brown, about £43.; white, £44. per ton; material in limited quantities is available on spot; the market is fully maintained. **Litharge,** imported, about £37. 10s. per ton, on spot; slightly cheaper to arrive; dealers are quoting at these prices, with occasional business being done. **Lithopone,** 30% Continental red seal, £23. to £24. per ton; dealers' prices as quoted are supported by Continental offers. **Ammonium Chloride,** grey galvanising, £31. to £31. 10s. per ton; spot supplies are available at the prices mentioned; the market is very steady, with a rising tendency. **Nickel Sulphate,** home trade, single and double salts, £38. per ton, delivered; export, single and double salts, £38. per ton, f.o.b.; British makers continue to quote at these unchanged rates. **Oxalic Acid,** about 5¾d. per lb.; there is still but poor business for this article; prices are about the same,

with market unsteady. **Carbonate of Potash,** 90—92%, about £25. 10s. to £26.; 96—98%, £28. to £28. 10s. per ton: this item is quite firm on spot, with dealers holding spot supplies doing a fair business. **Chlorate of Potash,** crystals and granular, about 3d. per lb.; business, so far as merchants are concerned, remains dull; quoted values unchanged. **Caustic Potash,** 88—92% solid, fully £33. per ton; during the past week there has been only a small call for this article, but, owing to the much firmer conditions on the Continent, spot values are fully maintained, and may advance. **Permanganate of Potash,** commercial quality, about 9d. per lb.; dealers report a week of slow and small business; prices well maintained. **Prussiate of Potash,** yellow, about 10½d. per lb.; only small business is reported, with dealers offering British material quoting at about this figure. **Sulphate of Potash,** 90%, £11. per ton; this market shows no change on the week. **Mercury,** about £9. 17s. 6d. per bottle of 75—76lb.; the spot market has been rather quiet again, but so far prices are being maintained. **Red Lead,** imported, about £37. 10s. per ton on spot; slightly cheaper to arrive; dealers continue to quote at about these rates. **Salammoniac,** dog-tooth crystals, fully £50.; medium, £44. to £45.; fine white crystals, £28. to £29. per ton; dealers holding spot supplies are firm at about these figures; supplies are now limited, and the market has a rising tendency. **Saltcake,** ground and unground, about £4. 10s. per ton, delivered; supplies available are fully taken up to the end of the year. **Caustic Soda,** 70—72%, £17. 10s.; 76—77%, £19. 10s. per ton, in drums, ex wharf shipping port; merchants are offering at about these prices, with still but small inquiry. British makers' prices for domestic consumers on contract are unchanged at: 70—72%, £17. 17s. 6d.; 76—77%, £19. 7s. 6d. per ton, in drums, carriage paid to any station in Great Britain; their prices for export vary as to destination. **Bicarbonate of Soda,** £10. 10s. per ton, in bags; this figure is quoted by British makers for home trade only, packages free, carriage paid. **Bichromate of Soda,** home trade, about 4½d. per lb.; British makers continue to quote at this figure for home trade only; dealers are offering at cheaper prices to arrive. **Cyanide of Soda,** export, 8d. to 8½d. per lb.; British makers continue to quote at these rates, and slightly more for home trade. **Soda Ash,** 58% light alkali, £7. 10s. per ton, in bags; British makers' price, for home trade only, is unchanged, packages free, carriage paid to any station in Great Britain. **Hyposulphite of Soda,** pea crystals, about £15. 10s. per ton, in 1cwt. kegs; commercial quality, about £10. to £10. 10s. per ton, in casks; spot prices show a further slight hardening, and the market stands quite firm; Continental prices are dear. **Nitrate of Soda,** 96%, £13. 5s. per ton, f.o.r. or f.o.b.; prices quoted here are very steady. **Nitrite of Soda,** 100%, £28. 10s. per ton; no further change in quotations is recorded, with market steady. **Prussiate of Soda,** about 5½d. per lb.; only small business is being done; dealers continue to offer British material at about this figure. **Sodium Sulphide,** 60—62%, about £14. 10s.; ditto, broken, £15. 10s. per ton, in drums; dealers are finding but small business; their prices, however, are fully maintained. **Tin Crystals,** 1s. 3½d. per lb.; this market shows no change on the week. **Tartaric Acid,** B.P., crystals, about 1s. 1½d. per lb., less 5%; although business is just as poor, the market seems a little steadier; spot supplies are freely offered. **White Lead,** imported, about £41. to £42. per ton, on spot; dealers are quoting at these prices, and slightly less to arrive; business is quiet. **Zinc Oxide,** B.P., £52.; white seal, £44. 10s.; green seal, £37. 10s.; red seal, about £36. per ton, f.o.r. makers' works; British makers' prices remain at these levels.

Pharmaceutical Chemicals.—The tone of this market continues firm. The position on the Continent, especially in Germany, indicates nothing in the way of easier conditions in the near future. **Acetanilid,** crystals and powder, up to 4s. per lb.; spot offers are now made up to the higher figure quoted, and supplies are very short. **Acetyl-Salicylic Acid,** B.P., 3s. 9d. to 4s. per lb.; holders of spot supplies of good material are quoting at about these rates, according to quantity. **Benzoic Acid,** B.P., 4s. to 4s. 3d. per lb.; nominal; it is doubtful if there are any supplies available; licences to import in sufficient quantity are still being refused by the Board of Trade. **Diethylbarbituric Acid,** B.P. (barbitone), about 18s. 9d. to 19s. per lb.; although there is little call for this article, the spot price is well maintained. **Salicylic Acid,** B.P., 2s. 6d. per lb.; at this unchanged rate the spot position is very steady. **Tannic Acid,** leviss, 3s. 3d. to 3s. 6d. per lb.; spot values are steady as quoted, with some demand on the market. **Amidopyrin,** about 15s. per lb.; this article is seldom asked for on spot; market steady. **Ammonium Bromide,** B.P., 9d. per lb.; at this figure the spot position is now very steady, and any movement will probably be to higher rates. **Benzonaphthol,** 5s. per lb., nominal; there is little or no demand on spot; dealers' prices are unchanged. **Betanaphthol,** resublimed, about 2s. 6d. per lb.; the market remains dull, and quoted prices by dealers are unchanged. **Benzaldehyde 03,** 3s. 5d. to 3s. 6d. per lb.; a sharp advance in spot values is recorded, with the market quite firm. **Calcium Lactate,** about 2s. 6d. per lb.; spot values are fully maintained, with a fair volume of business being done. **Chloral Hydrate,** duty paid, 4s. 3d. per lb.; this is a very steady market, with business fairly good. **Creosote, B.P.,** about 2s. 6d. per lb.; the market has been rather quieter, but prices are steady. **Creosote Carbonate,** about 6s. 6d. per lb., nominal, there is practically no interest shown in this product. **Guaiacol Carbonate,** about 14s. per lb.; the position here holds very firm at the rate quoted, with supplies on the short side, and Continental offerings small and dear. **Hexamine,** fully 4s. 6d. per lb.; the spot price as quoted is fully maintained, with a fair volume of business being done. **Hydroquinone,** 4s. to 4s. 3d. per lb.; not much actual business has been on the market, but prices from dealers are steady at about these rates. **Methyl Salicylate,** 3s. to 3s. 3d. per lb.; there is little offering on spot below these figures, and business has again been good. **Methyl Sulphonal,** about 25s. per lb.; dealers are quoting up to this figure, but any business would generally be at lower rates. **Paraformaldehyde,** about 3s. 9d. per lb.; it should not be difficult to book orders for early delivery at slightly less than this figure. **Paraldehyde,** about 1s. 7d. per lb.; supplies are being taken up quite well, and are now on the short side; prices are firmer. **Phenacetin,** up to 8s. per lb.; there has been good business for this article, and dealers' stocks are now restricted. **Phenazone,** fully 8s. 9d. per lb.; there is very little offered on spot at below this figure; the tendency is towards higher prices. **Phenolphthalein,** 8s. 6d. per lb.; any supplies about should be worth close up to this quoted figure; the market is firm. **Potassium Bromide,** B.P., crystals and granular, about 8d. per lb.; the spot position is fully maintained at this figure; business continues satisfactory, and Continental offerings are dearer. **Potassium Permanganate,** B.P., about 9½d. per lb.; dealers seem unable to offer below this price, and any fresh imports will have to be well up to this figure. **Potassium Sulphoguaiacolate,** about 7s. per lb.; this market has been idle during the past week. **Resorcin,** about 6s. 6d. per lb.; dealers are asking up to this figure, with the market moderately active during the past week. **Sodium Benzoate,** 3s. 3d. to 3s. 6d. per lb., nominal; supplies are kept very short here, with the result that prices have been forced up. **Sodium Bromide,** B.P., crystals and granular, fully 9d. per lb.; dealers offering spot material at this price are firm; business has again been good. **Sodium Diethylbarbiturate,** about 20s. per lb.; the spot market is well maintained at last week's higher price as quoted by dealers. **Sodium Salicylate,** B.P., crystals, about 3s. powder, about 3s. 2d. per lb.; this article has been in active demand during the past week, and higher prices are now being quoted, with the position generally very firm. **Sulphonal,** about 20s. per lb.; this market has shown but little life during the week; quoted values are easy. **Terpin Hydrate,** about 1s. 9d. per lb.; a steady but not very active market. **Thymol,** about 14s. to 14s. 6d. per lb.; the market is steady, but the demand has been rather quiet.

Coal-tar Products, Etc.—The general tone of this market is rather unsteady, and any movements are likely to be towards slightly cheaper prices. **Aniline Oil,** 9d. to 9½d. per lb., naked, ex works; this item shows no change on the week, with business dull. **Aniline Salt,** 9½d. to 10d. per lb., naked, ex works; the market is steady, with business slow. **Betanaphthol,** 1s. 1d. to 1s. 2d. per lb.; as quoted the market is rather easy, with little doing. **Benzol,** crude 65's, 8d. to 10d.; standard motor, 1s. 1d. to 1s. 4d.; pure, 1s. 6½d. to 1s. 8d. per gallon, ex works, in tank wagons; British makers report no change in their prices. **Carbolic Acid,** crystals, 11½d. to 1s. per lb.; at the lower prices quoted last week this market remains dull and still unsteady. **Cresylic Acid,** 97—99%, 2s. to 2s. 1d. per gallon; this market is slightly firmer, and the demand has improved. **Toluol,** 1s. 9d. per gallon, f.o.r. makers' works, in buyers' packages; 90%, 1s. 3d. per gallon; prices are about the same, with business quiet. **Xylol,** pure, 2s. 3d.; commercial, 1s. 6d. per

gallon; this market remains dull, with no change in quoted values. **Creosote Oil,** about 9¼d. per gallon, f.o.b.; a fair volume of business is reported, with the market well maintained. **Naphtha,** crude, 8¼d. to 8¾d. per gallon; matters have not improved here; market dull. **Solvent Naphtha,** 90/160, 1s. 1d. to 1s. 2d. per gallon; a further reduction in price is recorded, with the market still neglected and far from steady. **Heavy Solvent Naphtha,** 90/190, 1s. 1d. to 1s. 2d. per gallon; this item is again cheaper, but the market seems fairly steady, with but very little business being done. **Naphthalene,** about £19. per ton; this market is slightly easier, and matters have been quiet all round. **Pyridine,** 22s. to 23s. per gallon; spot supplies remain very small, and prices are fully maintained. **Hexamethylene,** 3s. 9d. to 4s. per gallon; this item keeps very steady, with some little business passing. **Pure Methyl Alcohol,** £90. per ton, in drums, ex wharf London; dealers' prices are well maintained at this level. **Pitch,** about 105s. per ton, f.o.b. East Coast; it is not thought that values will go much lower, and with a revival in demand a sharp recovery may take place.

LONDON METAL MARKET. MONDAY.

Copper: Standard brands, £61. 10s. to £61. 12s. 6d., cash; £62. 5s. to £62. 7s. 6d., three months; electrolytic, £67. 15s. to £68. 5s. **Tin**: Standard, £235. to £235. 5s., cash; £236. 10s. to £236. 15s., three months; Straits, £237.; English, £236. **Lead**, soft foreign, £30. 12s. 6d., prompt; English, £32. 5s.; chemical sheet, 37s. 6d. per cwt. for 2-ton lots, delivered. **Spelter**, prompt £32. 12s. 6d.; hard, £27. **Antimony**, English regulus, 99%, £38.; special brands, £44. to £45. **Aluminium**, 98—99%, £115. to £120.; foreign, £110., c.i.f. **Nickel**, £130., delivered; £125. to £130. for export, f.o.b. **Mercury**, £9. 12s. 6d. to £9. 15s. **Bismuth**, 10s. **Platinum**, £29. per oz.; scrap, £27. **Wolfram**, spot, 11s. 9d. per unit, c.i.f. U.K. or Continent. **Zinc Dust**, Beaver brand, 90—92%, £48.; American, 92—94%, £48.; Continental, 83—88% £42. to £46. per ton, delivered.

MANCHESTER CHEMICAL MARKET. MONDAY.

Owing to the Christmas holidays and approaching stock-taking, the demand for heavy chemicals is only small, and business generally is very quiet, with few alterations to record. The current quotations for alkali products are unchanged, and the greater portion of the forward business has now been settled. **Bleaching Powder,** softwood casks, steady at £10. per ton, on rails works. **Chlorates** are quiet at 3d. per lb. for **Potash** and **Soda,** ex store. **Bichromates** unchanged. **Glauber's Salt** easy at 70s. per ton, carriage paid. Roasted **Saltcake** is only in small request, but price firm at £4. 10s., net, carriage paid, in bulk. American rock **Sulphur** £5. 5s., ex store. The demand for **Copper Sulphate** is slow, and price remains nominal at £25., f.o.b. Liverpool. **Phosphate of Soda** easier at £14. per ton. Commercial **Hyposulphite of Soda** £9. 10s., on rails, in bags. **Nitrite of Soda** firmly held at £28. 10s. per ton, ex store, basis 100%. White powdered Cornish **Arsenic** steady at £68. per ton delivered, but there is not much inquiry. Yellow **Prussiate of Potash** weaker at 9½d. per lb.; **Soda** 5d. to 5¼d., and sales are small. **Barium Chloride** firm at £14. 10s., ex store. **Caustic** and **Carbonate of Potash** continue in good request, and prices have an upward tendency. Grey and brown **Acetate of Lime** are unaltered in position or value. **Acetic Acid** and **Acetate of Soda** are moving off better at recent rates. **Miscible Wood Naphtha** dull at 5s. 6d. per gallon. **Acetone** unchanged at £124. per ton. **Lead Salts** continue in short supply, and quotations are firm; white **Acetate** £46., brown £45.; **Nitrate** £43. per ton, all carriage paid. Green **Copperas** meets with steady inquiry, and values are improving. **Oxalic Acid** easy at 5¾d., carriage paid. **Permanganate of Potash,** B.P. quality, 9½d., carriage paid.

SWANSEA MARKET REPORT. MONDAY.

The business done in **Tinplates** was very good considering the season, and buyers continued to offer premiums on the fixed basis price of £1. 3s. 6d. per standard box, f.o.b. **Galvanised Sheets** very quiet at £18. 17s. 6d. per ton. **Copper** easier at £61. 7s. 6d. per ton prompt, and £62. 2s. 6d. three months. **Tin** met with little interest, and quotations irregular at £234. 17s. 6d. prompt, and £235. 7s. 6d. three months. **Lead** much easier, with prompt at £30. 7s. 6d. per ton, and three months £29. 17s. 6d. for soft; English, £32. 2s. 6d. **Spelter** very firm, and good demand at £32. 12s. 6d. per ton prompt, and £32. 17s. 6d. forward. **Zinc Sheets** steady, with English at £39. 2s. 6d. per ton, on rail at makers' works. **Seed Oils** firmly held, and little business transacted: Raw **Linseed** £2. 5s 9d., boiled £2. 7s. 9d. per cwt.; **Cottonseed Oil,** common edible £2. 6s. 1½d., and deodorised £2. 8s. 3d. per cwt. **Rape Oil** firm; refined, prompt, £2. 7s. 3d. per cwt., net, in barrels. **Cod Oil** steady, with Newfoundland at £2. 5s. 3d., and English £1. 13s. 9d. per cwt. **Coconut Oil** quiet, with Ceylon at £2. 7s. 3d. per cwt. **Castor Oil** quiet and steady, with best at £3. 6s. 3d.; seconds, £3. 0s. 3d. per cwt., net, in barrels. **Olive Oil** scarce at £66. 7s. 6d. per ton, ex ship. **Palm Oil** firmer; Lagos, £38. 2s. 6d. prompt, £38. 5s. forward; softs, £37. 12s. 6d. prompt, £37. 10s. forward; mediums, £37. 12s. 6d.; and hards, £37. 12s. 6d., all per ton, at docks. **Turpentine,** £3. 12s. 9d. per cwt. for American refined. **Pitch** prices have again receded, and some transactions have taken place under £5. per ton; spot quotations are about £5. 3s. 6d. **Creosote** not so active at 8¾d. per gallon. **Benzol** in slightly better demand at 1s. 1d. per gallon up to 1s. 4d. **Tar** in fair request at £1. 13s. 4½d. per 40 gallon cask for refined, and about £4. 12s. 3d. per ton for crude, f.o.r. at ovens. **Nitrate of Soda** slow at £13. 7s. 6d. per ton, in cwt. bags. **Sulphate of Ammonia** quiet. **Sulphate of Copper** remains dull at £25. 7s. 6d. per ton, less 5%, in casks, f.o.b. **Bone Meal** dull, with Indian prompt at £9. 2s. 6d. per ton. **Arsenic** in better demand, with white powdered at £68. 12s. 6d. per ton. **Oxalic Acid** very quiet at 6¼d. per lb., f.o.r. **Sulphuric Acid** in good demand, and price unchanged. **Copperas** dull at £2. 2s. 6d. per ton, with free delivery to London or equal. **Coal** market showed very little business: Best Admiralty smokeless £1. 9s., seconds £1. 8s. 6d.; ordinaries, £1. 7s.; Monmouthshire black vein, £1. 8s. 6d., all per ton, f.o.b. **Anthracite** qualities, large £2., seconds £1. 15s., Paris and French Nuts £2. 12s. 6d., all per ton, f.o.b. There was an active call for **Cokes** at former rates. **Patent Fuel** firm from £1. 9s. to £1. 12s. 6d. per ton, f.o.b.

LIVERPOOL CHEMICAL MARKET. MONDAY.

With respect to buying and selling of the heavier chemicals, the New Year may be said to have begun. The business done has been on 1924 account, and, in volume, has been quite as large as could have been expected, with exports steady. The British home trade continues in a very fair condition. **Bleaching Powder** has been quieter; the price of spot and for export is £11. per ton, special prices being quoted for contracts, according to requirements. **Chloride of Calcium** has again been in moderate demand, and is £5. 12s. 6d. per ton. **Caustic Soda** has sold rather freely for use in the U.K., and has had a fairly active shipment; it is £19. 7s. 6d. per ton for 76%, carriage paid, to home-trade buyers; special prices, according to requirements, being quoted for contracts. **Bicarbonate of Soda** has met with a steady and good inquiry for use in the United Kingdom, and has had a very fair shipment to overseas ports; it is £10. 10s. per ton, in bags, carriage paid, for use by the home trade. **Soda Crystals** have again sold rather freely for use in the U.K.; they are £5. 5s. per ton, carriage paid, to home-trade users. **Nitrate of Soda** has had a steady but moderate inquiry, and is £13. 5s. to £13. 10s. per ton. **Borax** has been in very fair demand; commercial crystals are £25. per ton, and powdered is £26.; higher grades are—crystals £29. per ton, powdered £30., and superfine £31. per ton, in 2cwt. bags, carriage paid to the home trade. **Saltcake** has been more in demand; it is £4. 10s. to £5. per ton for use in Great Britain, and £5. to £6. per ton for export. **Bichromate of Soda** has been in fair request, and is 4½d. to 4¾d. per lb. **Ammonia Alkali** has sold with some freedom for use in the U.K., and has had an active shipment on export account; it is £6. 15s. per ton, f.o.r., for the home trade; special prices are quoted for contracts and for export, according to destination. **Hyposulphite of Soda** has been steadily called for; it is £10. per ton, in 2cwt. bags, for commercial, and £15. per ton for photographic. **Sulphide of Soda** has been quieter; it is £14. 15s. to £15. 15s. per ton for solid, and £9. 2s. 6d. to £9. 17s. 6d. per ton for crystals. **Chlorate of Soda** has been very quiet, and is 3d. per lb. **Phosphate of Soda** has had a moderate inquiry, and is £14. 10s. to £15. per ton. **Prussiate of Soda**

has been but little called for, and is 6d. per lb. **Yellow Prussiate of Potash** has been in somewhat freer request, and is 10d. to 10½d. per lb. **Red Prussiate** has been rather more in demand, and is 2s. 8d. per lb. **Carbonate of Potash** has been in good request; it is £25. 10s. to £28. per ton, according to test. **Nitrate of Potash** has had a steady inquiry, and is £29. to £32. per ton. **Chlorate of Potash** has had a very limited inquiry, and is 3d. per lb. **Caustic Potash** has been quieter, and is £32. to £33. per ton. **Permanganate of Potash** has been in fair request, and is 9d. to 9½d. per lb. **Bichromate of Potash** has been in quietly steady demand, and is 5¾d. per lb., c.i.f. to usual ports. **Salammoniac** has been in very fair demand; first quality is £55. per ton, and second quality £52. per ton. **Sulphate of Ammonia** has been quiet on British home-trade account, but has had an active shipment to foreign ports; neutral of 25¾% is £14. 16s. per ton, and ordinary of 25¼% £13. 13s. per ton; for January neutral is £15. 2s. per ton; for February, £15. 3s.; and for March to May, £15. 5s. per ton, for use in the U.K.; the price of ordinary also being slightly increased. **Carbonate of Ammonia** has been in good request, and is 4d. per lb. **Muriate of Ammonia** has been rather more in demand; grey is £32. per ton. **Magnesia** has been in good request; **Carbonate** is £1. 17s. 6d. per cwt., and **Sulphate** from £4. 15s. to £6. 15s. per ton. **Alum** has sold more readily; it is £11. per ton for use by the home trade, and £11. to £11. 10s. per ton for export. **Sulphate of Alumina** has been rather more in demand, and is £8 to £11. per ton, according to quality. **Sulphur** has had a steady and very fair inquiry; flowers are £9. 10s. per ton; roll is £8. 10s.; rock, £8.; and American, £5. 10s. per ton. **Tartaric Acid** has been in fair demand, and is 1s. 1d. to 1s. 1½d. per lb. **Cream of Tartar** has been in good request, and is £4. 6s. to £4. 8s. per cwt. **Boric Acid** has been quieter: commercial is £48. per ton, and powdered £51.; B.P. grades are £54. to £60. per ton, carriage paid, for the home trade. **Citric Acid** continues quiet, and the price has tended to ease; it may be given as 1s. 5d. per lb. **Oxalic Acid** has been but little called for, and is 6d. per lb. **White Acetate of Lead** has had a fair inquiry, and is £44. 10s. to £45. per ton. **Sulphate of Copper** has been but little in demand for use in the U.K., and has been quieter in the export branch; it is £25. per ton, less 5%, in casks, f.o.b. at Liverpool. **Arsenic** has been neglected, the increased price having apparently checked the demand; the high price is still maintained, white powdered being £68. to £69. per ton.

WEST OF SCOTLAND CHEMICALS. Monday.

Business is at a low ebb at the moment of writing, and will continue to be so over the next few days. Dealers are looking forward to the New Year, the better conditions of employment giving rise to hopeful anticipations. Prices generally are steady as follows: **Alum**, lump, £12. 5s. per ton; ground, £12. per ton; these prices are for spot lots, and quotations for new business might be lower. **Arsenic**, white powdered, scarce at £70. 10s. per ton on spot; some resale material is obtainable at this price. **Barium Chloride**, £15. per ton; at this price the market remains steady; foreign imported material offered round £14. to £14. 5s. **Bleaching Powder**, quiet at £11. per ton for spot parcels; there is little doing, and contract business would probably be taken at under this figure. **Boric Acid**, crystals, £48. per ton, carriage paid in the U.K., makers' prices. **Borax**, crystals, fairly steady at £25. per ton, delivered; granulated, £24. 10s. per ton; imported qualities lower. **Calcium Chloride**, 70—75%, solid, £5. 10s. per ton on spot; Continental material quoted below this figure. **Citric Acid**, 1s. 5d per lb., less 5%; business a little firmer at this figure, with some local inquiry. **Copper Sulphate**, £25. 15s. per ton, less 5%. **Cream of Tartar**, £4. 1s. per cwt. for 99% at Glasgow; quotation steady, and inquiry small. **Lead Acetate**, white, £44. per ton on spot; brown, good inquiry at £45. per ton; Continental material offering at slightly cheaper rates. **Magnesium Chloride**, £3. 5s. per ton, ex store; foreign material quoted at much under this figure. **Oxalic Acid**, quiet at 5¾d. per lb.; inquiry in this direction is moderate. **Paraffin Wax**, 2¾d. per lb.; a fair export trade. **Potassium Bichromate**, 5¾d. per lb., delivered; this figure has held steady for some little time now. **Potassium Chlorate**, crystals and powder, 3¾d. per lb.; quietly steady inquiry. **Potassium Prussiate**, crystals, 1s. per lb.; at this price there is only a medium inquiry. **Salammoniac**, first and second lump, £55. and £52 10s. per ton respectively; crystals, £48. 10s. per ton; at these reduced quotations the market is rather inactive. **Saltpetre**, £1. 12s. per cwt., net; a better market, with price unaltered; fresh arrivals are cheaper. **Sodium Bichromate**, 4½d. per lb.; unchanged. **Sodium Chlorate**, 3½d. per lb.; a quiet market, with price unaltered. **Sodium Prussiate**, 7d. per lb., ex store; the spot market remains fairly steady, with but little demand. **Sodium Bicarbonate**, £9. 15s. per ton, in 2cwt. bags; £12. in 1cwt. kegs; in good supply, with steady inquiry. **Tartar Emetic**, 43—44%, 1s. 1d. per lb.; inclined to be dull. **Tartaric Acid**, 1s. 1d. per lb., less 5%, at Glasgow.

Jersey, 1 c., £19.

AMMONIUM CARBONATE—
Antwerp, 10 c., £13.; Aarhus, 2 t. 10 c., £65.; Antonina, 1 t. 19 c., £85.; Bombay, 2 t. 10 c., £89.; Bahia, 1 t. 14 c., £73.; Bilbao, 10 c., £13.; Barcelona, 1 t., £28.; Constanza, 2 t., £52.; Calcutta, 2 t., £67.; Copenhagen, 3 t. 1 c., £80.; Gothenburg, 1 t., £25.; Galatz, 2 t. 10 c., £70.; Genoa, 4 t. 8 c., £113.; Kobe, 20 t., £480.; Karachi, 2 t., £75.; Moji, 5 t., £133.; Marseilles, 1 t. 14 c., £[illegible]; Madras, 15 c., £28.; New York, 5 t. 7 c., £241.; Osaka, 7 t. 10 c., £196.; Piraeus, 10 c., £16.; Rotterdam, 1 t. 19 c., £50.; Rio de Janeiro, 4 t. 18 c., £210.; Santander, 10 c., £16.; Singapore, 1 t. 10 c., £46.; Yokohama, 30 t. 3 c., £777.

AMMONIUM SULPHATE—
Cheribon, 150 t. 1 c., £2,300.; Hong Kong, 121 t. 1 c., £1,677.; Kobe, 200 t., £2,701.; Samarang, 1,370 t. 14 c., £21,666.; Sourabaya, 465 t. 2 c., £7,124.; Tarragona, 149 t., £1,900.

AMMONIUM CHLORIDE—
Alexandria, 3 t., £131.; Bombay, 1 t., £41.; Bourgas, 10 c., £20.; Bilbao, 5 t. 2 c., £170.; Barcelona, 10 t. 4 c., £316.; Calcutta, 7 t., £284.; Constantinople, 1 t., £41.; Gothenburg, 1 t. 1 c., £37.; Kobe, 139 t. 12 c., £4,105.; Karachi, 10 t., £406.; Lyttleton, 19 c., £37.; Patras, 1 t., £32.; Rouen, 10 t. 4 c., £309.; Sydney, 1 t. 2 c., £34.; Shanghai, 10 t., £406.; Varna, 10 c., £20.; Yokkaichi, 10 t., £298.

ANTIFOULING COMPOSITION—
Bilbao, 2 c., £11.
Havana, 1 t., £125.

ARSENIC—
Valencia, 1 t., £125.

ARSENIOUS ACID—
Melbourne, 2 t., £165.

BLEACHING POWDER—
Alexandria, 9 t. 18 c., £99.; Bombay, 25 t., £300.; Calcutta, 69 t. 2 c., £733.; Copenhagen, 2 t. 4 c., £22.; Hankow, 5 t., £60.; Shanghai, 5 t., £60.; Vancouver, 2 t. 4 c., £27.

BOILER COMPOSITION—
Amsterdam, 11 c., £30.
Christiania, 12 c., £20.

BORAX—
Alexandria, 2 c., £3.; Caibarien, 5 c., £6.; Genoa, 19 t. 14 c., £500.; Havana, 8 c., £10.; Madras, 7 t. 10 c., £199.; Naples, 19 c., £25.; Patras, 1 t., £26.; Sydney, 5 t. 12 c., £140.; St. John's (N.F.), 3 qr., £1. 5s.; Talcahuano, 18 c., £24.

BORIC ACID—
Bombay, 1 c., £4.; Duala, 1 c., £4.; Gothenburg, 1 t., £48.; Lisbon, 10 c., £24.; Pt. Stanley, 1 c. 1 qr., £2. 15s.

CALCIUM CHLORIDE—
Alexandria, 5 t. 2 c., £29.; Buenos Ayres, 30 t. 3 c., £120.; Melbourne, 5 t. 2 c., £29.; Sydney, 9 t. 19 c., £57.; Singapore, 15 t., £86.; Vancouver, 25 t. 4 c., £150.

CHEMICALS (*otherwise undescribed*)
Amsterdam, 4 t. 10 c., £675.; Adelaide, 4 t. 1 c., £100.; Auckland, 1 t., £28.; Brisbane, 2 t. 10 c., £80.; Buenos Ayres, 10 t., £103.; Calcutta, 5 t., £34.; Danzig, 16 t. 1 c., £1,846.; Dunedin, 1 t. 13 c., £46.; Fremantle, 1 t. 5 c., £32.; Gothenburg, 2 t. 10 c., £99.; Geelong, 2 t., £52.; Leghorn, 25 t., £625.; Melbourne, 5 t. 19 c., £527.; Perth, 1 t. 2 c., £31.; Penang, 5 t., £125.; Ronneby, 20 t., £510.; Sydney, 4 t. 5 c., £110.; Sourabaya, 32 t. 10 c., £81.; Wellington, 10 c., £14.

COAL TAR PRODUCTS—
Carbolic Acid
Auckland, 9 c., £21.; Cape Town, 8 c., £10.; Danzig, 5 t. 1 c., £544.; Genoa, 5 t. 2 c., £571.; Kobe, 17 t. 2 c., £2,015.; Perth, 11 c., £32.; Russia, 10 t. 1 c., £1,123.; Sydney, 2 t. 1 c., £88.
Creosote
Antwerp, 1 t. 18 c., £55.; Perth, 2 t. 10 c., £69.; Sydney, 1 t. 3 c., £49.; St. John (N.B.), 9 t. 15 c.; £261.; Wellington, 4 t. 16 c., £111.
Naphthalene
Dunedin, 3 t. 9 c., £66.; Lagos, 8 c., £29.; Pt. Sudan, 6 t., £78.
Orthocreosotinic Acid
Bordeaux, 1 t., £158.
Pitch
Demerara, 1 t. 14 c., £15.
Pyridine
Wellington, 2 c. 2 qr., £40.
Tar
Lagos, 2 t. 7 c., £25.
Tar Oil
Calcutta, 10 t., £287.
Unspecified
Bolivia, 7 c., £29.
Maracaibo, 1 t. 2 c., £104.

COBALT LINOLEATE—
Genoa, 9 c. 2 qr., £94.

COBALT OXIDE—
Hankow, 9 c., £462.

COPPER CARBONATE—
Fremantle, 3 t., £62.

COPPER SULPHATE—
Las Palmas, 10 c., £12.; Madras, 1 t., £26.; Monte Video, 4 t. 18 c., £124.; Singapore, 2 t. 10 c., £70.

CREAM OF TARTAR—
Auckland, 1 t., £88.
Melbourne, 3 t., £261.

DISINFECTANTS (*otherwise undes.*)
Amsterdam, 9 c., £212. Antwerp, 1 t. 18 c., £444.; Adelaide, 10 c., £78.; Alexandria, 1 t. 3 c., £104.; Bombay, 9 c., £15.

DISINFECTANTS (*otherwise undes.*)
Buenos Ayres, 2 c., £37. ; Cape Town, 17 c., £25. ; Corunna, 1 c. 1 qr., £15. ; Demerara, 1 t., £17. ; Dunedin, 7 c., £14. ; East London, 2 t., £24. ; Lyttleton, 4 t., £160. ; New York, 54 t. 15 c., £2,090. ; Puerto Cortes, 10 c., £30. ; Para, 8 c., £26. ; Philadelphia, 8 t. 1 c., £177. ; Pt. Said, 2 t. 10 c., £70. ; Rangoon, 3 t. 4 c., £150. ; Sourabaya, 2 t. 6 c., £106. ; Sarawak, 9 c., £16. ; Singapore, 3 t. 18 c., £96. ; Wellington, 7 c., £405.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Bombay, 31 t. 15 c., £3,143.
Indigo
Malta, 3 c. 2 qr., £28.
Shanghai, 25 t., £3,486.
Unspecified
Barcelona, 1 c. 2 qr., £37. ; Boston, 3 t. 12 c., £1,117. ; Calcutta, 2 qr., £13. ; Dunedin, 2 c., £132. ; Genoa, 13 c., £330. ; Hong Kong, 4 c. 2 qr., £169. ; Lyttleton, 1 c., £42. ; Melbourne, 1 t. 2 c., £451. ; Madeira, 2 c. 1 qr., £17. ; New York, 3 c. 2 qr., £120. ; Sydney, 1 t. 2 c., £618. ; Shanghai, 1 t. 8 c., £557. ; St. John (N.B.), 1 t. 2 c., £582.

ESSENTIAL OILS (SYNTHETIC)—
Rotterdam, 3 t. 17 c., £1,279. ; St. John (N.B.), 2 c., £169. ; Switzerland, 12 c., £207. ; Wellington, 1 t. 5 c., £409.

FERTILISER (*otherwise undes.*)—
Burutu, 4 t. 19 c., £74.

GLYCERINE—
Antwerp, 1 t. 14 c., £142. ; Braila, 1 t., £85. ; Christiania, 19 c., £73. ; Hong Kong, 5 t. 5 c., £428. ; Kobe, 59 t. 18 c., £4,322. ; Karachi, 1 t., £90. ; Shanghai, 13 t. 18 c., £1,163. ; St. John (N.B.), 10 c., £35. ; Yokohama, 4 t. 16 c., £351.

HYDROFLUORIC ACID—
Melbourne, 2 c., £27.

IODOFORM—
Burutu, 10 lb., £17. ; Calabar, 47 lb., £59. ; Sapele, 11 lb., £14. ; Pt. Harcourt, 56 lb., £71. ; Warri, 15 lb., £19.

LACTIC ACID—
Algoa Bay, 2 t. 2 c., £87.

LEAD ACETATE—
Melbourne, 2 t. 1 c., £100.

MAGNESIA—
Santos, 8 c., £54.

MAGNESIA (CALCINED)—
Valparaiso, 3 c., £37.

MAGNESIUM CARBONATE—
Vera Cruz, 1 t. 3 c., £83.

MAGNESIUM SULPHATE—
Abidjan, 1 c. 2 qr., £2. ; Abonema, 1 c., £2. ; Bathurst, 1 c., £3. ; Burutu, 2 qr., £2. ; Cape Coast, 2 c., £2. 10s. ; Demerara, 1 t., £7. ; Duala, 1 c., £1. ; Gibraltar, 1 c., £3. ; Kingston, 1 t. 15 c., £19. ; Lome, 1 c., £3. ; Lagos, 2 c., £2. 10s. ; Montreal, 2 t. 13 c., £22. ; Pt. Harcourt, 4 c., £5. ; Pt. Stanley, 1 c., £4. 10s.

MANGANESE OXIDE—
Sydney, 5 c. 2 qr., £10.

NICKEL SULPHATE—
Shanghai, 19 c., £40.

OXYGEN—
Belgian Congo, £14.

PHOSPHORUS—
Riga, 10 c., £110.

PHOSPHORUS (AMORPHOUS)—
Demerara, 2 c., £23.
La Guaira, 8 c., £94.

PITCH (*otherwise undescribed*)—
Genoa, 51 t. 14 c., £1,060.

POTASSIUM BICHROMATE—
Riga, 3 t. 2 c., £144.

POTASSIUM IODIDE—
Abonema, 2 qr., £60. ; Calabar, 38 lb., £40. ; Degama, 2 qr., £60. ; Opobo, 150 lb., £158. ; Pt. Harcourt, 201 lb., £241. ; Sierra Leone, 19 lb., £21. ; Sapele, 22 lb., £22. ; Warri, 30 lb., £30.

POTASSIUM PRUSSIATE—
Kobe, 5 t., £444.

POTASSIUM SILICATE—
Amsterdam, 15 c., £13.

SALTCAKE—
Buenos Ayres, 5 t. 1 c., £34.

SALTPETRE—
Sierra Leone, 5 c., £10.

SHEEP DIP—
Algoa Bay, 16 t. 5 c., £965. ; Buenos Ayres, 41 t. 3 c., £1,455. ; Barranquilla, 18 c., £71. ; Constanza, 1 t. 8 c., £116. ; Cape Town, 3 t. 8 c., £75. ; Copenhagen, 4 c. 2 qr., £19. ; Dunedin, 5 t. 19 c., £414. ; Monte Video, 4 t. 6 c., £170. ; Oamaru, 2 t. 17 c., £214. ; Puerto Barrios, 1 t. 1 c., £74. ; Puerto Descado, 47 t. 7 c., £3,825. ; Rio Gallegos, 1 t. 7 c., £225. ; San Julian, 2 t. 14 c., £450. ; Santa Cruz, 1 t. 7 c., £225. ; Timaru, 6 t. 7 c., £560. ; Wellington, 9 t. 16 c., £723.

SULPHURIC ACID—
Accra, 12 c., £34.
Lagos, 5 c., £17.

SUPERPHOSPHATE—
Teneriffe, 100 t., £355.

TANNING MATERIALS—
Unspecified
Alexandria, 2 t. 13 c., £42. ; Algoa Bay, 1 t. 3 c., £20. ; Christiania, 11 t. 3 c., £150. ; Cape Town, 13 t. 11 c., £247. ; Gothenburg, 1 t. 14 c., £32. ; Melbourne, 5 t. 16 c., £185. ; Sydney, 3 t. 12 c., £97. ; Stavanger, 1 t. 5 c., £21. ; Syra, 7 t. 10 c., £95.

TAR (VEGETABLE)—
Hong Kong, 1 t., £19.

TAR (*otherwise undescribed*)—
Apapa, 4 t. 5 c., £44.
Bilbao, 14 c., £41.

TARTARIC ACID—
Sydney, 3 t., £364.

TIN CRYSTALS—
Antwerp, 4 c., £30.

TIN OXIDE—
Santander, 2 c., £25.

TITANIUM POTASSIUM OXALATE
Melbourne, 10 c., £84.

VANILLIN—
Amsterdam, 2 c., £230.

WOOD PRESERVATIVE—
Barranquilla, 9 c., £30. ; Barbados, 1 t., £21. ; Kobe, 1 t. 2 c., £60. ; Pt. Swettenham, 1 t. 12 c., £45. ; Puerto Colombia, 9 c., £13.

ZINC CHLORIDE—
Bombay, 7 t. 14 c., £194.
Calcutta, 4 t. 15 c., £108.
Shanghai, 3 t. 2 c., £82.

Week ending December 21.

ALBUMEN—
New York, 6 t.

CAUSTIC SODA—
Adelaide, 18 drms. ; Alexandretta, 132 drms. ; Auckland, 23 drms. ; Bergen, 20 drms. ; Belize, 10 drms. ; Bombay, 25 drms. ; Bourgas, 200 drms. ; Bremen, 71 drms. ; Brisbane, 48 pkgs. ; Buenos Ayres, 684 drms. ; Calabar, 4 drms. ; Cheribon, 8 pkgs. ; Christiania, 235 pkgs. ; Dunedin, 70 drms. ; East London, 9 drms. ; Gothenburg, 20 pkgs., 20 drms. ; Hankow, 150 pkgs. ; Hamburg, 571 drms. ; Jaffa, 52 drms. ; Lisbon, 45 drms. Callao, 20 drms.
Riga, 40 drms.

SODIUM HYDROSULPHITE—
Adelaide, 20 kgs. ; Rouen, 42 kgs. ; Shanghai, 10 cs. ; St. John (N.B.), 20 kgs. ; Sydney, 20 kgs.

SODIUM NITRATE—
Sydney, 4 cks.

SODIUM SILICATE—
Abo, 30 drms. ; Buenos Ayres, 149 pkgs. ; Calcutta, 191 drms. ; Christiania, 53 cks. ; Fremantle, 23 pkgs. ; Hankow, 78 pkgs. ; Kobe, 79 pkgs. ; Lyttleton, 10 pkgs. ; Melbourne, 89 drms. ; Messina, 17 cks. ; Newcastle, 6 cks. ; Oporto, 6 cks. ; Rangoon, 19 pkgs. ; Sydney, 30 cks. ; Tampico, 200 bgs.

SODIUM SULPHIDE—
Alexandria, 4 pkgs.
Algoa Bay, 5 drms.
Auckland, 21 drms.
Coronel, 32 pkgs.
Gothenburg, 57 pkgs.
Pt. Elizabeth, 5 drms.

STEARINE—
Rotterdam, 280 brls.

SUPERPHOSPHATE—
Demerara, 2 t.

TALLOW—
Alexandria, 6 bls.: Calcutta, 22 cks.: Danzig, 66 cks.

LONDON.

OFFICIAL AMENDMENTS.

From return for week ending Sept 12, *Deduct*—

CREAM OF TARTAR—
Port Elizabeth, 1 c., £7.

From return for week ending Sept 26, *Deduct*—

SALTPETRE—
Cape Town, 10 c., £21.

Week ending December 19.

ACETIC ACID—
Barbados, 1 cs., £10.; Cuidad Bolivar, 6 cts., £18.; Irish Free State, 1 ck., £7.; Sapele, 1 cs., £6.; Trinidad, 6 cts., £20.

ACETONE—
Auckland, 6 drms., £65.
Antwerp, 3 drms., £120.
Durban (F.), 2 cs., £9.

ACETYL SALICYLIC ACID—
Bombay, 2 cs. (pt.), £7.; Calcutta, 1 cs. (pt.), £5.; Irish Free State, 1 cs. (pt.), £11.; Lagos (F.), 2 cs., £10.; Montreal, 5 cs. (pt.), £50.

ALUM—
Cuidad Bolivar, 2 brls., £11.
Palma, 3 cks., £9.
Singapore, 8 kgs., £8.

AMMONIA—
Accra, 8 cs., £61.; Bombay, 9 cs., £16.; Canton, 4 cs., £16.; Cape Town, 22 cs., £41.; Channel Islands, 4 cs. (pt.), £10.; Durban, 5 cs., £9.; East London, 4 cs., £7.; Irish Free State, 48 cs., £87.; Lagos, 10 cs., £18.; Kobe, 12 cs., £22.; Shanghai, 5 drms., £14.; Singapore, 5 cs., £16.

AMMONIA (ANHYDROUS)—
Delagoa Bay, 2 cs., £9.; Irish Free State, 2 cylds., £9.; Rangoon, 13 cylds., £108.; Rotterdam, 40 cylds., £529.

AMMONIUM ACETATE—
Calcutta, 1 cs., £8.

AMMONIUM CARBONATE—
Alexandretta, 10 c., £14.; Antwerp, 1 t. 19 c., £49.; Bahia, 1 t. 19 c., £90.; Bolivar, 4 c., £11.; Bombay, 2 c., £9.; Calcutta, 19 c., £75.; Cape Town, 2 c., £5.; Colombo, 8 c., £36.; Dunkirk, 1 t. 19 c., £61.; Durban, 6 c., £13.; Hamburg, 4 t. 18 c., £128.; Hong Kong, 1 t. 3 c., £64.; Mormugao, 5 c., £12.; Palermo, 2 t. 9 c., £64.; Paris, 4 t. 19 c., £150.; Pt. Elizabeth, 8 c., £16.; Singapore, 10 c., £28.; Trieste, 3 t., £71.

AMMONIUM CITRATE—
Calcutta, 1 cs., £11.

AMMONIUM NITRATE—
Harlingen, 50 t. 12 c., £1,130.

AMMONIUM SULPHATE—
Demerara, 30 t., £425.
Kobe, 1,010 t., £13,545.

ANTIMONY OXIDE—
Rio de Janeiro, 4 cks., £30.

ANTIMONY SULPHIDE—
Antwerp, 2 cks., £26.; Charleroi, 2 cks., £44.; Ostend, 3 cks., £56.; Paris, 4 cks., £48.; Santos (F.), 40 kgs., £57.

ARSENIC—
East London, 10 cs., £35.

ARSENIC CHLORIDE—
Calcutta, 1 cs., £6.

ARSENIC SULPHIDE—
New York, 10 kgs., £56.

BARIUM PEROXIDE—
Rotterdam, 33 drms., £435.

BARIUM SULPHATE—
Buenos Ayres, 1 cs., £33.

BARIUM SULPHATE (BLANC FIXE)—
Sydney, 35 bgs., £50.

BISMUTH CARBONATE—
Auckland, 1 cs. (pt.), £9.; Beira, 1 cs., £18.; Christchurch, 1 cs. (pt.), £18.; Lagos, 1 cs., £10.; Melbourne, 1 cs., £72.; Otago, 3 cs., £167.; Wellington, 1 cs. (pt.), £18.

BISMUTH CITRATE—
Auckland, 1 cs., £17.
Melbourne, 1 cs. (pt.), £64.

BISMUTH SALICYLATE—
Lagos, 1 cs., £19.
Melbourne, 1 cs. (pt.), £7.

BISMUTH SALTS (*otherwise undes.*)
Bombay, 2 cs. (pt.), £114.
Calcutta, 3 cs., £126.

BISMUTH SUBNITRATE—
Auckland, 1 cs. (pt.), £11.
Melbourne, 1 cs. (pt.), £15.
Sydney, 1 cs., £30.

BITUMEN—
Calcutta, 170 pkgs. (pt.), £55.
Dunedin, 2 brls., £7.
Madras, 12 pkgs. (pt.), £11.

BONE MEAL—
Channel Islands, 20 t., £160.

BORAX—
Auckland, 5 c., £7.; Cape Town, 3 c., £8.; Delagoa Bay, 2 c., £5.; Durban, 3 c., £6.; Pt. Elizabeth, 2 c., £5.; Pt. Elizabeth (F.), 2 t., £19.; Rotterdam (F.), 1 t. 10 c., £39.; Rotterdam, 3 t., £142.; Shanghai, 5 c., £8.

BORIC ACID—
Bombay, 1 t., £58.; Calcutta, 4 c., £19.; Cape Town, 4 c., £12.; Cape Town (F.), 3 c., £8.; Lagos, 2 c., £14.; Madras, 2 c., £9.

BROMINE—
Penang, 1 cs., £7.

CALCIUM CARBIDE—
Burutu, 5 c., £5.
Sekondi, 6 c., £6.

CALCIUM CHLORIDE—
Sydney, 10 drms., £16.

CARBON TETRACHLORIDE—
Melbourne, 8 cs., £34.

CAUSTIC POTASH—
Danzig, 1 cs., £100.
Dunkirk, 8 drms., £65.

CAUSTIC SODA—
Hong Kong, 2 c., £8.
Shanghai, 15 c., £56.

CHEMICALS (*otherwise undescribed*)
Amsterdam, 100 pkgs., £245.; Auckland (F.), 4 cs. (pt.), £5.; Auckland, 18 pkgs. (pt.), £140.; Beira (F.), 2 pkgs., £8.; Beira, 26 pkgs., £145.; Bombay (F.), 7 cs., £26.; Bombay, 29 pkgs. (pt.), £145.; Brisbane, 22 cs., £101.; Buenos Ayres, 64 cs. (pt.), £549.; Calcutta, 25 pkgs. (pt.), £152.; Cape Town (F.), 1 cs., £8.; Cape Town, 13 pkgs. (pt.), £30.; Christchurch, 2 cs., £10.; Christiania, 5 pkgs. (F.), £27.; Colombo, 7 cs., £31.; Delagoa Bay, 2 cs., £6.; Demerara, 5 pkgs. (pt.), £18.; East London, 5 cs., £8.; Egersund, 30 pkgs., £75.; Fremantle, 40 pkgs., £142.; Gibraltar, 2 cs., £6.; Gothenburg, 3 cs., £130.; Hamburg, 150 pkgs., £375.; Havana, 60 pkgs., £50.; Helsingfors, 25 pkgs., £62.; Hong Kong, 3 cs., £88.; Irish Free State, 10 pkgs. (pt.), £17.; Jesselton, 1 cs., £9.; Jinja, 2 cks., £7.; Libau, 1 cs., £13.; Lyttleton, 20 pkgs., £26.; Madras, 7 cs., £12.; Malta, 2 pkgs., £27.; Marseilles, 4 cs., £52.; Matanzas, 10 pkgs., £25.; Melbourne, 13 pkgs. (pt.), £205.; Montreal, 6 cs., £71.; Mormugao, 3 cs., £5.; Newcastle, 1 cs. £19.

CHEMICALS (*otherwise undescribed*)
Piraeus, 10 pkgs., £25.; Pt. Elizabeth, 24 pkgs., £98.; Reval, 3 cs., £14.; Ronneby, 100 pkgs., £250.; Rotterdam (F.), 10 pkgs., £50.; Rotterdam, 115 pkgs., £284.; Sekondi, 2 pkgs., £7.; Singapore, 7 pkgs., £48.; Stockholm, 6 cs., £150.; Sydney, 148 pkgs. (pt.), £2,567.; Trinidad, 4 pkgs. (pt.), £7.; Wellington, 15 pkgs. (pt.), £87.; Winnebah, 4 pkgs. (pt.), £6.

CITRIC ACID—
Auckland, 3 c., £21.; Cape Town, 2 c., £15.; Constanza (F.), 2 c., £16.; Dunedin, 2 c., £22.; Mormugao, 1 c., £8.; Napier, 1 cs. (pt.), £5.; Rangoon, 1 c., £9.; Stockholm (F.), 2 t., £285.

COAL TAR PRODUCTS—
Anthracene Oil
Rotterdam, 50 drms., £110.
Benzol
Durban, 100 drms., £50.; 30 pkgs., £205.
Carbolic Acid
Bombay, 1 kg., £220.; Calcutta, 11 cs., £54.; Channel Is., 2 cks., £14.; Colombo, 17 cs., £139.
Creosote
Auckland, 1 cs., £7.
Auckland (F.), 1 cs., £8.
Naphthalene
Panama, 9 cs., £18.
Pitch
Alexandria, 210 brls., £263.; Antwerp, 50 brls., £275.; Antwerp (bulk), 320 t., £1,967.; Dunedin, 5 pkgs., £9.; Dunedin (bulk), 1,132 t., £7,325.; France (bulk), 463 t., £2,435.; Genoa, 9 drms., £32.; Pt. Said, 210 pkgs., £239.
Tar
Durban, 705 drms., £100.; East London, 250 drms., £20.; Elizabethville, 100 drms., £23.; Iddo, 100 drms., £79.; Isipingo, 9 drms. £5.; La Libertad, 2 brls., £6.; Nairobi, 80 drms., £19.; Pt. Elizabeth, 95 drms., £21.; Wellington, 1 cs., £8.

COBALT ACETATE—
Brussels, 1 cs., £13.

COBALT OXIDE—
Brussels, 8 cs., £380.
Genoa (F.), 2 pkgs., £396.

COBALT SULPHATE—
Sydney, 5 kgs., £89.

COLOURS (*otherwise undescribed*)—
Bangkok, 3 cs. (pt.), £15.; Calcutta, 2 cs. (pt.), £13.; Kobe, 1 cs., £38.; Madras, 1 cs. (pt.), £10.; Montreal, 1 cs. (pt.), £12.; Rangoon, 1 cs., £20.

COPPER SALTS (*otherwise undes.*)
Melbourne, 2 cs., £43.

CREAM OF TARTAR—
Bolivar (F.), 1 c., £5.; Calcutta, 1 c., £6.; Cape Town (F.), 2 c., £12.; Cologne, 5 c., £22.; Colombo, 2 c., £10.; Delagoa Bay (F.), 1 c., £6.; Delagoa Bay, 4 c., £17.; Durban, 5 c., £21.; Durban (F.), 4 c., £25.; East London (F.), 1 c., £6.; Hong Kong (F.), 1 c., £6.; Pt. Elizabeth (F.), 1 c., £6.

DISINFECTANTS (*otherwise undes.*)
Alexandria, 2 c., £7.; Bangkok, 4 t. 14 c., £154.; Barbados, 9 c., £11.; Bathurst, 1 c., £9.; Beira, 3 c., £8.; Bombay, 2 c., £18.; Burutu, 3 c., £20.; Calcutta, 4 t. 10 c., £162.; Canton, 1 t., £94.; Cape Town, 7 c., £19.; Christchurch, 6 t. 2 c., £1,004.; Colombo, 12 t. 6 c., £773.; Delagoa Bay, 1 t. 5 c., £60.; Demerara, 5 t. 17 c., £168.; Durban, 1 t. 10 c., £90.; Irish Free State, 6 c., £21.; Kilindini, 5 t. 16 c., £340.; Malta, 1 c., £5.; Medan, 3 t. 11 c., £137.; Mollendo, 11 c., £17.; Paris, 4 t. 12 c., £75.; Penang, 15 c., £14.; Pt. Sudan, 2 t. 6 c., £113.; Rangoon, 1 t., £11.; St. Lucia, 8 c., £11.; Trinidad, 1 t. 10 c., £47.; Wellington, 4 c., £88.

DYESTUFFS (ARTIFICIAL)—
Alizarine
Madras, 20 kgs., £172.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Auckland, 1 cs., £19.; Bombay, 1 kg., £220.; Boulogne, 14 kgs., £440.; Cape Town, 1 cs., £13.; Channel Islands (F.), 1 bx., £5.; Madras, 1 cs. pt.), £71.; Melbourne, 1 ck., 3 cs., £148.; Sydney, 1 cs., £48.; Wellington, 1 pkg., £21.

ETHER—
Bombay, 2 cs. (pt.), £12.
Lagos, 4 cs., £18.
Wellington, 4 cs., £16.

ETHER (METHYLATED)—
Calcutta, 7 cs., £36.

FERTILISERS (*otherwise undes.*)—
Amsterdam F.), 3 c., £14.
Channel Islands, 154 t. 8 c., £1,301.

FORMALDEHYDE—
Colombo (F.), 4 cs. (pt.), £10.; Demerara (F.), 3 brls., £38.; Rouen (F.), 28 cks., £320.; Shanghai, 2 drms., £12.

GLYCERINE—
Barbados, 5 c., £21.; Bolivar, 1 c., £6.; Calcutta, 1 cs., £8.; Cuidad Bolivar, 1 c., £6.; Danzig, 1 t., £70.; Ghent (F.) (crude), 1 t., £76.; Irish Free State, 1 cs., £10.; Karachi, 3 cs., £8.; Yokohama, 4 t. 17 c., £368.

GLYCEROPHOSPHATES (*otherwise undescribed*)—
Karachi, 2 cs. (pt.), £13.

HYDROBROMIC ACID—
Calcutta, 1 cs., £6.
Wellington, 1 cs., £6.

HYDROCHLORIC ACID—
Durban, 4 c., £14.
Wellington, 7 c., £12.

HYDROFLUORIC ACID—
Brisbane, 1 cs., £7.
Pt. Elizabeth, 5 cs., £56.
Wellington, 1 cs., £7.

HYDROGEN PEROXIDE—
Lagos, 2 cs., £15.

IODIDES (*otherwise undescribed*)
Bombay, 1 cs., £56.
Calcutta, 1 cs., £114.

IODINE—
Buenos Ayres, 2 cs., £212.
Calcutta, 1 cs., £54.
Paris (F.), 40 kgs., £3,970.

IODINE (RESUBLIMED)—
Bilbao, 5 cs., £531.; Brussels, 3 cs. (pt.), £112.; Durban, 1 cs., £27.; Melbourne, 1 cs. (pt.), £87.; Otago, 1 cs., £54.; Turin, 1 cs., £112.

IRON AMMONIUM CITRATE—
Bombay, 2 cs., £11.
Calcutta, 2 cs. (pt.), £21.

KIESELGUHR—
Rio de Janeiro (F.), 8 c., £7.

LEAD ARSENATE—
Jinja, 2 drms., £11.
Melbourne, 24 drms., £51.

LEAD OXIDE—
Brisbane, 3 kgs., £9.

MAGNESIA—
Auckland, 9 cs., £29.; Bangkok, 3 cs., £8.; Barbados, 3 cs., £97.; Christchurch, 20 cs., £48.; Demerara, 3 cs., £97.; Hong Kong, 2 cs., £5.; Wellington, 21 cs., £53.

MAGNESIA (CALCINED)—
Bolivar, 2 cs., £9.
Cuidad Bolivar, 2 cs., £9.
Cartagena, 1 cs., £10.

MAGNESIUM CARBONATE—
Bombay, 10 cs., £17.
Mormugao, 5 cs., £14.

MAGNESIUM CITRATE—
Calcutta, 2 cs., £17.

MAGNESIUM SULPHATE—
Auckland, 4 t. 14 c., £123.; Barbados, 4 c., £8.; Beira, 4 c., £5.; Bombay, 16 c., £24.; Colombo, 1 t. 1 c., £16.; Delagoa Bay, 6 c., £8.; Dunedin, 1 t. 10 c., £35.; Durban, 4 c., £5.; Mombasa, 10 c., £13.; Mormugao, 11 c., £14.; Pt. Elizabeth, 10 c., £13.; Sierra Leone, 4 c., £5.; Wellington, 5 c., £9.

MERCURIALS (*otherwise undes.*)—
Amsterdam, 4 cs., £208.
Bombay, 1 cs. (pt.), £19.
Calcutta, 3 cs., £48.

MERCURY BICHLORIDE
Bahia, 1 cs. (pt.), £13.

MERCURY CHLORIDE—
Sydney, 1 cs. (pt.), £6.

MERCURY OXIDE—
Karachi, 1 cs., £20.

MERCURY SUBCHLORIDE—
Cocanada, 1 cs., £38.
Madras, 2 cs., £66.

NICKEL OXIDE—
Brussels, 1 cs., £6.

NICKEL SALTS (*otherwise undes.*)—
Melbourne, 12 cs., £36.

NICKEL SULPHATE—
Hamburg, 8 brls., £47.
Shanghai, 2 kgs., £10.

NITRIC ACID—
Benkoellen, 1 cs., £8.; Durban, 5 cs., £22.; Penang, 6 cs., £29.; Wellington, 2 cs., £5.

PHOSPHORIC ACID—
Auckland, 6 cs., £16.
Cape Town, 1 cs., £6.
Otago, 5 cs., £13.

POTASH (*otherwise undescribed*)—
Brisbane, 1 ck., £5.

POTASSIUM BICARBONATE—
Auckland, 2 cs., £6.

POTASSIUM CARBONATE—
Antwerp, 3 cs., £8.
Stockholm, 6 kgs., £12.

POTASSIUM CHLORIDE—
Irish Free State, 6 drms., £23.

POTASSIUM CITRATE—
Bangkok, 4 cs., £26.; Bombay, 5 cs., 1 cs. (pt.), £47.; Calcutta, 3 cs., 2 cks., £56.; Sydney, 2 cks., £20.

POTASSIUM CYANIDE—
Shanghai, 1 cs., £11.

POTASSIUM FERROCYANIDE—
Pt. Sudan, 1 kg., £7.

POTASSIUM IODIDE—
Bangkok, 2 cs., £185.; Bombay, 1 cs., £88.; Calcutta, 1 cs., £88.; Brussels, 3 cs. (pt.), £49.; Jamaica, 1 cs. (pt.), £5.; Melbourne, 6 cs., £553.; Milan, 2 cs., £173.; Penang, 1 cs., £20.; Wellington, 1 cs., 1 cs. (pt.), £111.

POTASSIUM NITRATE—
Dunedin, 2 cs., £8.

POTASSIUM PERMANGANATE—
Auckland (F.), 4 cs., £18.
Buenos Ayres, 2 cs. (pt.), £22.
Melbourne (F.), 5 drms., £20.

POTASSIUM PRUSSIATE—
Rosario, 3 drms., £17.

POTASSIUM SALTS (*otherwise undescribed*)—
Calcutta, 1 cs., £5.
Oporto, 1 cs., £10.

SALAMMONIAC—
Bangkok, 5 pkgs. (pt.), £10.; Buenos Ayres (F.), 1 ck., £8.; Paris, 8 cks., £69.; Shanghai, 6 cks., £14.

SALICYLATES (*otherwise undes.*)—
Montreal, 3 cs. (pt.), £20.
Sydney, 6 cs., £119.

SALICYLIC ACID—
Cuidad Bolivar, 1 kg., £8.
Durban, 1 cs., £5.
Melbourne, 6 cs., £81.

SALTPETRE—
Adelaide, 1 t., £41.; Cape Town, 5 c., £11.; Dunedin, 3 t., £124.; Durban, 9 c., £21.; East London, 5 c., £9.; Irish Free State, 3 t. 3 c., £126.; Pt. Elizabeth, 11 c., £23.; Wellington, 2 t. 10 c., £103.

SHEEP DIP—
Buenos Ayres, 11 t. 5 c., £300.; Delagoa Bay, 4 t. 3 c., £255.; Durban, 6 t. 12 c., £315.; Timaru, 9 t. 13 c., £427.

SILVER NITRATE—
Lyttleton, 1 cs. (pt.), £10.

SODA CRYSTALS—
Perth, 5 c., £19.

SODIUM ACETATE
Auckland, 3 t. 6 c., £74.

SODIUM ARSENITE
Durban, 4 t. 9 c., £308.

SODIUM BICARBONATE
Alexandria, 1 c., £8.; Calcutta, 16 c., £48.; Cape Town, 5 c., £8.; Delagoa Bay, 6 c., £9.; Durban, 10 c., £13.; East London, 14 c., £19.; Montreal, 9 c., £25.; Pt. Elizabeth, 12 c., £19.; St. Helena, 5 c., £6.; Sydney, 11 c., £32.

SODIUM BISULPHITE—
Belawan, 2 t. 9 c., £45.
Buenos Ayres, 5 t., £90.
Rotterdam, 10 t., £185.

SODIUM CARBONATE—
Benkoelen, 8 c., £11.
Hong Kong, 5 c., £16.

SODIUM CITRATE—
Calcutta, 2 c., £16.

SODIUM HYPOSULPHITE—
Colombo, 10 c., £9.
Hong Kong, 1 t., £20.
Wellington, 1 cs., £11.

SODIUM IODIDE—
Brussels, 3 cs. (pt.), £52.; Calcutta, 1 cs. (pt.), £37.; Melbourne, 1 cs. (pt.), £13.; Naples, 1 cs., £125.

SODIUM OXALATE—
Karachi, 3 c., £20.

SODIUM SALICYLATE—
Auckland, 1 c., £8.
Calcutta, 1 c., £14.

SODIUM SALTS (*otherwise undes.*)
Perth, 1 t., £23.

SODIUM SILICATE—
Townsville, 9 c., £17.

SODIUM SULPHATE—
Accra, 10 cs., £12.; Cartagena, 10 c., £6.; East London, 20 kgs., £7.; Jamaica, 20 cks., £8.; Sydney, 17 kgs., £50.

SODIUM SULPHIDE—
Dunedin, 5 t., £63.
Lyttleton, 34 t. 13 c., £440.

SODIUM SULPHITE—
Hong Kong, 4 c., £15.
Stockholm, 1 t. 10 c., £30.

SODIUM TARTRATE—
Canton, 2 pkgs., £14.

SPENT OXIDE—
Rotterdam, 371 t. 19 c., £1,075.

SULPHUR—
Beira (F.), 10 c., £7.
Sydney, 9 c., £33.
Trinidad (F.), 5 brls., £8.

SULPHUR (FLOWERS)—
Pt. Sudan (F.), 11 c., £8.

SULPHURIC ACID—
Accra, 11 c., £17.
Penang, 6 c., £25.
Sekondi, 1 t. 18 c., £38.
Wellington, 8 c., £15.

SUPERPHOSPHATE—
Channel Islands, 10 t., £28.

TARTARIC ACID—
Callao, 1 c., £9.; Cape Town, 1 c., £8.; Cape Town (F.), 1 c., £7.; Constanza (F.), 1 c., £6.; Delagoa Bay (F.), 2 c., £14.; Durban, 1 c., £7.; Durban (F.), 7 c., £59.; Irish Free State, 2 c., £12.; Mormugao, 1 c., £6.

TIN OXIDE—
Sydney, 4 cks., £113.

TITANIUM, POTASSIUM OXALATE—
Sydney (F.), 14 kgs., £120.

TURPENTINE—
Cape Town, 2 cs., £7.

URANIUM NITRATE—
Stockholm, 1 cs., £12.

ZINC AND AMMONIUM COMPOUNDS (*otherwise undes.*)—
Antwerp (F.), 15 pkgs., £75.

ZINC OXIDE—
Alexandria, 10 cks., £59.; Bombay, 1 cs., £9.; Calcutta, 1 cs., £8.; Copenhagen, 30 cks., £95.; Leghorn, 10 cks., £14.; Wellington, 2 cs., £8.

ZINC SULPHATE—
Antwerp, 1 drms., £11.

Week ending December 19.

ANTIMONY REGULUS
Lyttleton, 2 t.

CERESINE WAX
Salonica, 5 t.

FULLER'S EARTH
St. John (N.B.), 50 t.

GLUE AND GELATINE—
Delagoa Bay, 1 t.; Durban, 1 t. 10 c.; Kobe, 7 t.; Madras, 3 c.; Montreal, 2 t.; Newcastle, 2 t.; Perth, 10 c.; Piraeus, 5 c.; Rangoon, 1 c.; Salaverry, 1 t.; Sourabaya, 12 c.; Townsville, 2 c.; Tunis, 1 t.

MINERAL WAX—
Yokohama, 5 t.

PARAFFIN WAX—
Antwerp, 2 t. 15 c.

PLUMBAGO—
Bilbao, 3 t. 19 c.
Cape Town, 1 t.
Copenhagen, 4 c.
Hong Kong, 1 t. 15 c.

QUININE—
Calcutta, 6,050 oz.; Melbourne, 200 oz.; Montreal, 1,500 oz.; Sydney, 2,224 oz.

SALT—
Cape Town, 1 t. 1 c.; Calcutta, 4 c.; East London, 1 t. 5 c.; Hong Kong, 10 c.; Madras, 3 c.; Mombasa, 1 c.; Paramaribo, 13 c.; Pt. Sudan, 19 c.; Punta Arenas, 6 c.; Rangoon, 1 c.; Rockhampton, 16 c.; San Francisco, 1 c.; Townsville, 1 t. 7 c.; Valparaiso, 1 c.

SOAP—
Abonema, 1 t. 2 c.; Ascension, 1 c.; Auckland, 1 t. 8 c.; Bombay, 4 c.; Calabar, 1 t. 10 c.; Channel Islands, 4 c.; Christchurch, 1 c.; Dunedin, 11 c.; Durban, 1 c.; Forcados, 10 c.; Gibraltar, 1 c.; Gothenburg, 1 c.; Irish Free State, 3 t. 5 c.; Italy, 9 c.; Kilindini, 2 t. 7 c.; Lagos, 2 t. 5 c.; Loango, 5 c.; Malta, 2 c.; Melbourne, 1 c.; Mombasa, 8 c.; Pt. Harcourt, 5 t. 14 c.; Punta Arenas, 1 c.; Rangoon, 1 c.; Sapele, 1 t. 3 c.; Sekondi, 22 t.; Seville, 3 c.; Shanghai, 7 c.; Stockholm, 2 c.; Tanga, 2 c.; Toronto, 2 c.; Trinidad, 4 c.; Victoria (B.C.), 3 c.; Warri, 9 t. 12 c.; Wellington, 1 t. 18 c.; Winnebah, 1 t. 5 c.

TALLOW—
Harlingen, 4 t. 8 c.; Nantes, 6 t. 3 c.; Paris, 10 t. 1 c.

WHITE LEAD—
Buenos Ayres, £1,185.; Cape Town, £41.; Dunedin, £119.; East London, £60.; Fremantle, £238.; Irish Free State, £31.; Lyttleton, £213.; Oamaru, £44.; Sydney, £342.

MANCHESTER.

Week ending December 20.

ALBUMEN—
Providence (R.I.), 6 cks.

AMMONIUM CARBONATE—
Denmark, 20 cks.
Egypt, 5 cks.

AMMONIUM SALTS (*otherwise undescribed*)—
Italy, 1 cs.

AMMONIUM SULPHATE—
France, 2,176 bgs.

CARBON BLACK—
Bombay, 80 cks.

CHEMICALS (*otherwise undescribed*)
Bombay, 12 drms., 4 cs.
Boston, 15 cks.
France, 2 cks.

CHROME ALUM—
Belgium, 20 kgs.
France, 10 cks.

COAL TAR PRODUCTS—
Pitch
Dunkirk, 952 t.
Unspecified
Austria, 2 cks.
Belgium, 98 drms.

DYESTUFFS (ARTIFICIAL)—
Unspecified
Basle, 10 cks., 13 drms.; Bombay, 104 cks., 16 pkgs., 1,100 kgs.; Gothenburg, 20 pkgs.; India, 1 kg., 1 bx.; Malta, 1 cs.; Rouen, 2 cs., 25 cks., 3 pkgs., 1 kg.; Switzerland, 5 cks.

FERRO MANGANESE—
Philadelphia, 50 t.

GELATINE—
Belgium, 17 bgs.

GLUE—
Belgium, 1 ck.; Canada, 20 bgs.

IRON OXIDE—
Philadelphia, 10 cks.

KIESELGUHR—
Odense, 2 bgs.

PITCH (*otherwise undescribed*)—
New York, 610 brls.

SALT—
Ghent, 3,000 sks.; Gothenburg, 2,545 bgs., 35 brls.; St. John (N.B.), 1,436 sks., 115 brls.

SALTCAKE—
Gothenburg, 1,085 t. 18 c.

SIZE—
Belgium, 1 ck.

SOAP—
Belgium, 10 cs.; Bombay, 22 cs.; Cairo, 44 cs.; Holland, 85 cs.; The Hague, 17 cs.

SODA ASH—
Bombay, 25 bgs.

SODIUM SALTS (*otherwise undes.*)
Austria, 1 ck.

TALLOW—
Bombay, 42 brls.

NEWCASTLE-ON-TYNE

Week ending December 21.

ANTIMONY—
Antwerp, 2 cks.
Portland (Me.), 48
Rotterdam, 3

BARYTES—
Antwerp, 250 bgs.

BLEACHING POWDER—
Rotterdam, 204 cks.

CAUSTIC SODA—
Antwerp, 104 drms.; Bergen, 86 drms.; Christiania, 40 drms.; Copenhagen, 82 drms.

COAL TAR PRODUCTS—
Pitch
Rotterdam, 1 cs.

GLUE (MARINE)—
Antwerp, 67 pkgs.

LITHARGE—
Hamburg, 39 cks.
Rotterdam, 7 cs.

MAGNESIA—
Antwerp, 100 bgs.
Copenhagen, 42 cs.
Portland (Me.), 20 cks.

RED LEAD—
Bergen, 4 cks.; Christiania, 4 cks.; Copenhagen, 17 cks.; Hamburg, 75 cks.; Rotterdam, 2 cks.

SODIUM SULPHITE—
Copenhagen, 16 kgs.
Rotterdam, 69 cks.

WHITE LEAD—
Antwerp, 300 kgs., 100 ktls., 9 cks.; Hamburg, 18 cks.; Rotterdam, 250 cks.

ZINC ASHES—
Antwerp, 271 bgs.

ZINC OXIDE—
Antwerp, 12 cks.

N. & S. SHIELDS.

Week ending December 21.

CALCIUM CARBIDE—
Valparaiso, 1 t. 16 c.

LITHARGE—
Callao, 3 c. 2 qrs.

SODIUM HYPOSULPHITE—
Antofagasta, 1 t. 2 qrs.
Iquique, 48 t. 15 c.

PRICES CURRENT.

WEDNESDAY, DEC. 26, 1923.

PREPARED BY MESSRS. HIGGINBOTTOM & Co., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, but it must be understood that the prices in different localities may vary

		£	s.	d.
ACIDS.				
Acetic, 40% and 80%	*cwt.	23- / & 46/-		
Acetic, (Glacial, B.P.) in carboys	*ton	70	0	0
Arsenic, S.G. 2.000	ton	80	0	0
Boric (crystals)	†ton	48	0	0
Citric	lb.	0	1	4½
Formic, 80/85%	*ton	49	0	0
Hydrofluoric, 59/60%	*lb.	0	0	7½
Lactic, 50%	ton	43	0	0
Muriatic (Tower Salts), 28° Tw.	*carboy	0	3	6
Nitric, 80° Tw.	*ton	21	10	0
Oxalic	lb.	0	0	5¾
Phosphoric, 1,500° tech.	*ton	33	0	0
Sulphuric (168°)	*ton	7	10	0
Sulphuric (140°)	*ton	3	15	0
Sulphuric (free from Arsenic, 144°)	*ton	4	10	0
Tannic (commercial)	lb.	0	1	6
Tarteric (crystals)	lb.	0	1	1
COAL TAR PRODUCTS.				
Aniline Oil	*lb.	0	0	8½
Aniline Salt	*lb.	0	0	8½
Anthracene, 40/45% "A"	unit	0	0	4
Benzol, 90%	*gallon	0	1	3
Carbolic Acid (crude 60%)	gallon	0	3	4
Carbolic Acid (crystals 40°)	lb.	0	1	0
Creosote	*gallon	0	0	9¼
Cresylic Acid, 97/99%	*gallon	0	2	0
Naphtha, crude, 30%	*gallon	0	0	8½
Naphtha, solvent (90/160)	*gallon	0	1	3
Naphthalene, refined	ton	17	10	0
Pitch (f.a.s. Liverpool)	ton	5	7	6
Pyridin	gallon	1	2	6
Tar, crude	ton	4	10	0
Tar, refined	barrel	1	17	6
Toluol	*gallon	0	1	9
Xylol, (pure)	*gallon	0	2	3
GENERAL CHEMICALS.				
Acetone	*ton	124	0	0
Alum, loose lump (delivered)	*ton	10	10	0
Aluminium Sulphate, 17/18%	ton	10	10	0
Aluminium Sulphocyanide	lb.	0	0	7
Aluminoferric (in slabs) 20° Tw.	ton	7	0	0
Ammonia, anhydrous	*lb.	0	1	4
Ammonia, .880	*ton	22	10	0
Ammonia, .920	*ton	14	10	0
Ammonium Carbonate (lump)	lb.	0	0	4
Ammonium Muriate (grey)	†ton	30	0	0
Ammonium Nitrate	ton	35	0	0
Ammonium Phosphate	ton	60	0	0
Ammonium Sulphate, 25¾% delivered	†ton	14	16	0
Ammonium Sulphocyanide, 95%	lb.	0	1	3
Antimony (Golden Sulphide)	lb.	0	0	9
Arsenic (Cornish White)	ton	68	0	0
Barium Carbonate (native), 92/94%	ton	5	15	0
Barium Chlorate	lb.	0	0	7
Barium Chloride (in casks)	ton	14	10	0
Barium Sulphate	ton	£5	to	£7
Barium Sulphocyanide, 95%	lb.	0	0	9½
Bleaching Powder, 35%	*†ton	10	0	0
Bleaching Liquor, 7%	*ton	4	10	0
Calcium Chloride	†ton	5	10	0
Carbon Bisulphide	*ton	26	0	0
Casein (commercial)	ton	81	0	0
China Clay (at Runcorn), in bulk	ton	50/-	to	90/-
Chromium Acetate (crystals)	lb.	0	0	8
Copper Sulphate	ton	25	0	0
Formaldehyde, 40%	ton	63	0	0
Glycerine (chemically pure, S.G. 1,260)	*ton	85	0	0
Glycerine (crude), 80%	*ton	60	0	0
Iodine	*oz.	0	1	0
Iron Nitrate, 80° Tw.	*ton	6	5	0
Iron Sulphate (copperas), delivered in bulk	*ton	2	2	6
Iron Sulphide (lumps)	ton	6	0	0
Lead Acetate (white)	ton	46	0	0
Lead Acetate (brown)	ton	45	0	0
Lead Carbonate (White Lead)	ton	47	0	0
Lead Nitrate	ton	43	0	0
Lime Acetate (brown)	*ton	14	10	0
Lime Acetate (grey), 80%	*ton	22	0	0
Lime Bisulphite (S.G. 1,070)	*ton	8	0	0
Lime Superphosphate, 30%	ton	3	5	0
Litharge (British)	ton	43	0	0
Magnesite, Calcined (delivered)	ton	11	0	0
Magnesite, Raw	ton	3	0	0
Magnesium Carbonate (light)	cwt.	1	16	0
Magnesium Chloride (solid)	ton	3	0	0
Magnesium Sulphate (Epsom Salts, coml.)	ton	4	10	0
Magnesium Sulphate, B.P.	ton	6	10	0
Manganese Borate, 85%	ton	105	0	0
Manganese Sulphate, 90%	ton	45	0	0
Methylated Alcohol, 64° (industrial)	gallon	0	3	1
Naphtha (Wood), Solvent	*gallon	0	5	6
Naphtha (Wood), Miscible, 60° p.	gallon	0	5	6
Potassium Bichromate	lb.	0	0	5¾
Potassium Carbonate, 90%	ton	27	0	0
Potassium Chlorate	lb.	0	0	3
Potassium Hydrate (Caustic Potash), 88/90%	ton	33	0	0
Potassium Hydrate (liquid), 50° Bé.	ton	18	10	0
Potassium Chloride 80%	ton	8	10	0
Potassium Nitrate (refined)	ton	25	0	0
Potassium Permanganate (commercial)	lb.	0	0	8¾
Potassium Prussiate (yellow)	lb.	0	0	9¼
Potassium Prussiate (red)	lb.	0	2	3
Potassium Sulphate, 90% (ex ship)	ton	11	0	0
Potassium Sulphocyanide	lb.	0	1	6
Salammoniac, lump (sublimed) 1st & 2nd	cwt.	55/-	&	52/3
Sodium Acetate	ton	24	0	0
Sodium Arsenate, 45%	ton	44	0	0
Sodium Borate (Borax), Crystals	†ton	25	0	0
Sodium Bicarbonate (2 cwt. bags)	†ton	10	10	0
Sodium Bichromate	lb.	0	0	4½
Sodium Carb. (Alkali), 58% bags	†ton	7	10	0
Sodium Carb. (Soda Crystals), bags, car. pd.	†ton	5	5	0
Sodium Chlorate	lb.	0	0	3
Sodium Cyanide (100% basis) for export	lb.	8d.	to	8½d
Sodium Hydrate (76% C. Soda), f.o.r.	†ton	19	7	6
Sodium Hydrate (70% C. Soda)	†ton	17	17	6
Sodium Hydrate (60% C. Soda)	†ton	16	17	6
Sodium Hydrate (Liquid, 90° Tw.)	†ton	8	5	0
Sodium Hydrate, 77/78% powdered (99%)	†ton	22	0	0
Sodium Hyposulphite (commercial)	†ton	9	10	0
Sodium Hyposulphite (photographic)	ton	15	10	0
Sodium Manganate (basis 25%)	ton	45	0	0
Sodium Nitrate, 96% ref'd, f.o.r. L'pool	ton	13	5	0
Sodium Nitrite, 100% basis	ton	28	10	0
Sodium Perborate	lb.	0	0	11¼
Sodium Phosphate	ton	14	0	0
Sodium Prussiate	lb.	0	0	5¼
Sodium Silicate (glass), Alkaline	†ton	11	5	0
Sodium Silicate (liquid, 140° Tw.)	†ton	9	0	0
Sodium Sulphate (Saltcake)	†ton	4	10	0
Sodium Sulphate (Glauber's Salt)	ton	3	10	0
Sodium Sulphide (conc.), 60/65%	ton	14	10	0
Sodium Sulphide Crystals (casks)	†ton	9	0	0
Sodium Sulphocyanide (liquid)	lb.	0	0	6
Sulphur (Flowers) ex ship, Sicilian	ton	8	0	0
Sulphur (Roll Brimstone)	ton	8	0	0
Sulphur (Texas Gulf)	ton	5	5	0
Tartar Emetic, 43/44%	lb.	0	1	0
Tin Crystals	lb.	0	1	3½
Tin Perchloride fused	lb.	0	1	10
Titanous Chloride	lb.	0	1	0
Zinc Chloride (solution, 102° Tw.)	*ton	20	0	0
Zinc Sulphate, Crystals	ton	13	10	0
METALS.				
Aluminium (Ingot Metal 98/99%)	ton	115	0	0
Antimony	ton	44	10	0
Copper	ton	61	11	3
Lead (Chemical Sheet), delivered	cwt.	1	17	6
Lead (Foreign Pig)	ton	30	12	6
Nickel	ton	130	0	0
Silver	oz.	0	2	9 11/16
Tin, English Ingots	ton	235	0	0
Zinc (Spelter)	ton	32	12	6
Zinc Dust, 90/92%	ton	45	0	0
OILS.				
Cottonseed	*ton	46	0	0
Linseed, Raw	*ton	45	10	0
Stearine, 115-120° M.P.	ton	48	0	0
Tallow	ton	42	0	0
Turpentine	cwt	3	12	6

PATENT ABSTRACTS (*continued*):—
Chromium Compounds. Mond ... 684
Chromium, Pure. Brewer ... 80
Chromium Residues, Utilisation of. Jucker and Co. ... 407
Chromium Sulphate. Nydegger ... 175
Clay, Purifying. Feldenheimer; and Plowman ... 261
Coal, Recovering, from Sludge. Steen ... 202
Coal Tar, Acid Treatment of. Richards, and Siluminite Insulator Co., Ltd. ... 685
Coatings, Protective, on Metals. Mai ... 577
Colloidal Antimony Sulphides. Wolvekamp ... 18
Colloidal Dispersions, Producing. Hinchley, and Plauson's (Parent Co.), Ltd. ... 717
Colloidal Solutions. Oderberger Chemische Werke Akt.-Ges. ... 115
Colloids in Electro-deposition. Classen ... 80
Condensation Products, Carbazol. Galbraith, Lewcock, and Tallantyre ... 406
Condensation Products, Formaldehyde-urea. Pollak ... 407
Crystallising. Passburg; and Griffiths ... 655
Cyanamide as Vulcanisation Accelerator. Chatelan ... 577
Decolourising Liquids. Cumming, and Klarit, Ltd. ... 49
Decomposition, Catalytic, of Water Vapour. Laurent ... 112
Deodourising Fumes. Donkervoort; van der Voorden, and Donkervoort ... 780
Desulphurising Oils. Zesfield ... 49
Detergents, Aluminiumsilicate. Guernsey, and Electric Smelting and Aluminium Co. ... 288
Diaminoanthraquinone. Imray ... 717
Diaphragms, Electrolytic. Pechkranz ... 316
Digesting and Evaporating Apparatus. Appareils et Evaporateurs Kestner ... 656
Distillation, Dry. Moscicki 469
Distillation Plant. Plauson's (Parent Co.), Ltd. ... 172
Distilling. Cabrier ... 718
Drugs, Synthetic. Imray ... 747
Drying-agents. Moyer ... 717
Dye, Insoluble Black Azo, Produced on Fibre. Bloxam 529
Dyeing Cellulose Acetate. Johnson ... 625
Clavel ... 625
Dyeing Cellulose Ethers. Dreyfus ... 19
Dyeing, Indigo, Bacteria for. Meister, Lucius & Brüning 779
Dyeing, Vat, Lactic Acid in. Morton; and Wood ... 655
Dyestuff Derivatives, Vat. Durand and Huguenin Akt.-Ges. ... 470
Dyestuffs, Anthraquinone Acid. British Dyestuffs Corp., Ltd.; Baddiley; and Tatum ... 407
Dyestuffs, Anthraquinone Vat. Ransford ... 112
Dyestuffs, Azo. Farbwerke vorm. Meister, Lucius, and Brüning ... 19
Carpmael ... 173
Dyestuffs, Basic, Silicates of. Eberlein ... 407
Dyestuffs, Benzanthrone. Johnson ... 591
Meister, Lucius & Brüning 747
Dyestuffs, Benzoquinone Mordant. Durand and Huguenin Akt.-Ges. ... 115
Dyestuffs, Disazo. Carpmael ... 144
Dyestuffs for Cellulose-acetate Silk. Green and Saunders, and British Dyestuffs Corporation ... 79
Dyestuffs, New Vat. Johnson ... 626
Dyestuffs, Perylene. Sokal 407

Page.

PATENT ABSTRACTS (*continued*):—
Dyestuffs, Perylene Vat. Pereira ... 289
Dyestuffs, Perylene Vat, Chlorine containing. Pereira ... 780
Dyestuffs, Sulphur. Soc. of Chemical Industry in Basle 718
Dyestuffs, Sulphuretted. Ransford ... 625
Dyestuffs, Sulphuretted Vat. Pereira ... 112
Dyestuffs, Sulphurised. Atack ... 18
Dyestuffs, Thioindigoid. Carpmael ... 142
Dyestuffs, Thioindigoid Vat. Sokal ... 531
Electro-deposition, Colloids in. Classen ... 80
Electrolysis of Brine, Pure Salt from. Angel ... 718
Electrolysis of Fused Salts. Asheroft ... 112
Electrolytic Cells. Casale ... 288
Scott ... 499
Electrolytic Diaphragms. Pechkranz ... 316
Electrolytic Oxygen and Hydrogen. Scott ... 779
Electrolytic Production of Alkali Bichromates. Jouve, Helbronner, and Soc. Hydro-Electrique and Metallurgique du Palais ... 595
Electrolytic Production of Carbonates and Sulphites. Plauson's (Parent Co.), Ltd. ... 779
Electrolytic Production of Glyoxylic Acid. Marks ... 175
Electrolytic Production of Per-compounds. Chemische Fabrik -Weissenstein Ges., and Baum ... 145
Electrolytic Zinc Production. Electrolytic Zinc Company of Australasia, Ltd. ... 592
Emulsions, Bituminous. Mackay ... 457
Enamels. Chemische Werke vorm. Auerges ... 112
Evaporating Liquids. Bollmann ... 145
Evaporators, Spray and Film. Plauson's (Parent Company), Ltd. ... 347
Explosives. Hawkins ... 252
Fats, Purifying. Bedford ... 173
Fats, Vulcanising. Van der Meulen ... 748
Fertilisers. Soc. d'Etudes Chimiques pour l'Industrie ... 112
Brewer ... 145
Fibres, Animal, Treatment of, with Acetic Anhydride. Ransford ... 111
Film and Spray Evaporators. Plauson's (Parent Company), Ltd. ... 347
Filter-bed Resistance, Recording. Kent ... 80
Filter-presses. Jackson, S. R.; Jackson, A. E.; and Jackson, T. D. ... 18
Filtering Media. Torley ... 347
Bechold ... 457
Filters, Funnel. Giacobbe ... 145
Filters, Pressure. Hurrell ... 529
Filters, Rotary and Others. Jung ... 80
Fire-extinguishing Agents. Fohlen ... 717
Fire-extinguishing Chemicals. Eckelmann ... 576
Fireproof and Washable Paper. Hydroloid, Ltd. ... 499
Fireproofing Compositions. Eichengrün ... 500
Fluxes. Yamanouchi ... 558
Formaldehyde. Hirchberg ... 260
Soc. des Etablissements. Barbet ... 779
Formaldehyde-urea Condensation Products. Pollak ... 407
Formamide. Johnson ... 591
Formic Acid. Nielsen; and Laing ... 145
Fractionating Liquids. Bloomfield; and Boake, Roberts and Co., Ltd. ... 591

Page.

PATENT ABSTRACTS (*continued*):—
Fuel, Agglomerating. Du Boistesselin and Dubois; Tabb; Varnier; and Hertenbein ... 115
Fumes, Deodourising. Donkervoort, van der Voorden & Donkervoort ... 780
Fumigants. Evans-Jackson 18
Fungicides and Germicides. Koholyt Akt.-Ges. ... 747
Funnel Filters. Giacobbe ... 145
Furfural. Quaker Oats Company ... 592
Gas Analysis, Apparatus for. Macdonald ... 376
Gases and Vapours, Separating. Plauson's (Parent Co.), Ltd.; Plauson, H. ... 48
Gases, Compressed and Liquefied, Storing. Soc. Anon. d'Applications des Gaz Liquéfiés ... 655
Gases, Metallurgical, Sulphur Dioxide from. White ... 591
Gases, Poisonous. Van Meter ... 144
Gases, Purifying. Taplay; and Galbraith ... 457
Gases, Treating Liquids with. Shaw; and Peachey Process Co. ... 49
Germicides and Fungicides. Koholyt Akt.-Ges. ... 747
Glass Manufacture, Iron Oxide in. Chance Bros. and Co., Ltd.; and Forster 48
Glass, Thermo-resistant. Van Nieuwenburg ... 261
Glue Manufacture, Chlorine Dioxide in. Köln-Pottweil Akt.-Ges. ... 747
Glyoxylic Acid, Electrolytic Production of. Marks ... 173
Halogen-substituted Hydrocarbons. Farbwerke vorm. Meister, Lucius, and Brüning ... 19
Hydrazine, Production of. Joyner; and Nobel's Explosives Co., Ltd. ... 260
Hydrocarbon Polymerisation with Aluminium Chloride. Soc. Ricard, Allenet et Cie 469
Hydrocarbons, Halogen-substituted. Farbwerke vorm. Meister, Lucius, and Brüning ... 19
Hydrocarbons, Purifying. Dunstan ... 626
Hydrocarbons, Refining, with Acid Sulphates. Plauson's (Parent Company), Ltd. ... 469
Hydrogen and Oxygen, Electrolytic. Scott ... 779
Indigo Dyeing, Bacteria for. Meister, Lucius & Brüning 779
Ink, Removing, from Printed Papers. Bourcet and Regnault ... 175
Inks. Mellersh-Jackson ... 261
Insulin, Production of. Feeny ... 591
Iron-free Alumina Salts. Chemische Fabric Griesheim Elektron ... 592
Iron Oxide in Glass Manufacture. Chance Bros. and Co., Ltd.; and Forster ... 48
Iron Oxides, Reducing. Constant and Bruzac ... 590
Ketones, Aryl-oxy-naphthyl. Imray ... 747
Lactic Acid in Vat Dyeing. Morton; and Wood ... 655
Latex, Preserving. Bostock 780
Lead Arsenate. McDougall and Howles ... 655
Lead Hydroxide. Topp ... 347
Lead Metallurgy, Sulphur Chloride in. Ashcroft 516
Lead, Powdered. Shimadzu 18
Leucite, Alkali and Alumina from. Jourdan ... 19
Lignone Sulphonic Acids. Cross and Engelstad ... 457
Liquids, Chlorinating. Van Meter ... 576
Liquids, Decolourising Cumming, and Klarit, Ltd. ... 49
Liquids Evaporating. Bollmann ... 145
Liquids, Treating, with Gases. Shaw and Peachey Process Co. ... 49
Mercury Fulminate. Barnes 142

EFFICIENCY

¶ It is of the utmost importance, under present conditions, to secure the most efficient plant service in order to ensure successful production.

¶ The scrubbing, absorbing or condensing of gases or vapours in Chemical Works by means of towers filled with packing elements, is done with a widely varying degree of efficiency, dependent almost entirely upon the nature of the packing.

¶ The Propeller Tower Filling is unique in design, and unapproachable in efficiency, It is based upon the soundest scientific principles and gives more effective scrubbing, more free space, better distribution and contact of gas and liquor, better drainage, more easy packing and less trouble than any other tower filling so far devised.

THE
MULTIPLEX PATENT FILM EVAPORATOR

surpasses all other known types and offers the following advantages:—

Continuous and automatic working.
Evaporation occupies only a few minutes, no deterioration of product.
No entrainment losses, scaling reduced to a minimum.
Mechanical cleaning of tubes, when necessary, more quickly carried out.
Lowest steam consumption and radiation losses using exhaust steam.
Skilled operating labour not required or continual supervision.
Simple construction and ample mechanical strength of all parts.
Built in standard sizes in all our own works.
No special buildings or expensive structural work required.
Low prime cost and minimum running and repair expenses.

The Evaporator which has proved in operation to be the most efficient and economical

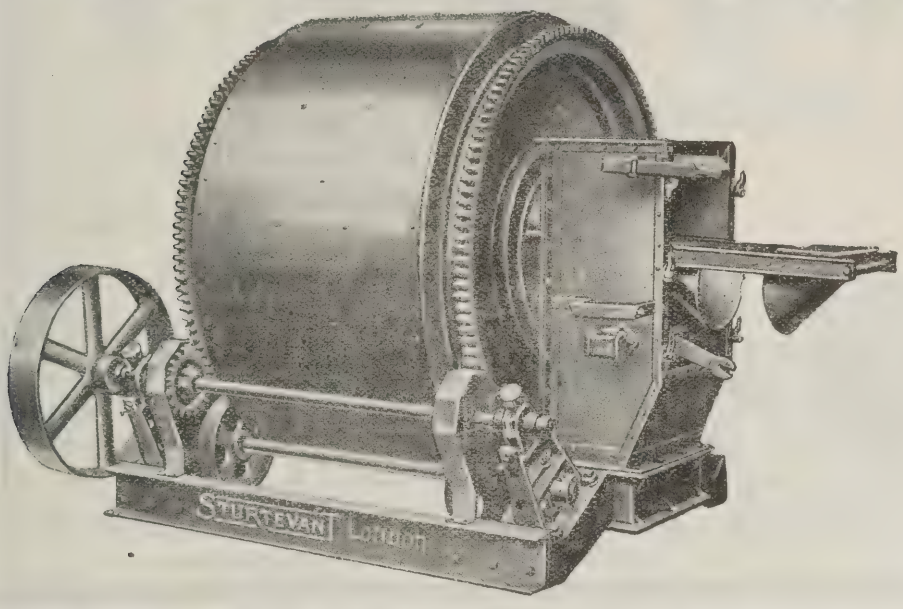
STURTEVANT

Fertiliser Mixers



ensure quick and intimate mixing. They have only one opening for receiving and discharging, and there is consequently only one opening to seal against the escape of dust.

A large door, which is easily removable, in the end of the drum gives the fullest access for cleaning, inspection, etc.

Ten minutes is ample time for cleaning Sturtevant Mixers.

Write for descriptive leaflet No. "C 1860."

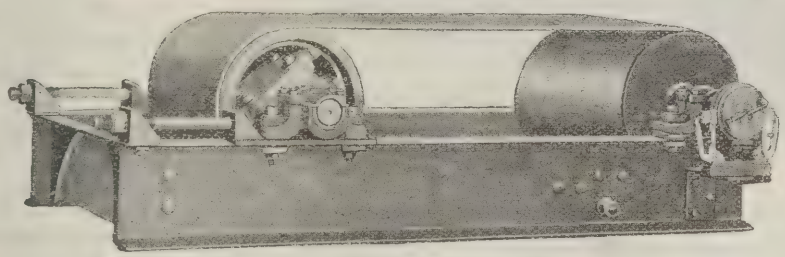
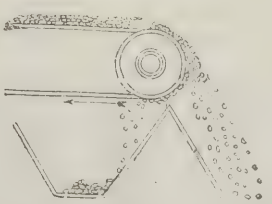
MAGNETIC SEPARATION.

"IGRANIC" MAGNETIC SEPARATOR PULLEYS



View of Separator Pulley (on right) mounted with belt and idler pulley.

are easily the most efficient method of separating magnetic material from non-magnetic, and are installed in widely varying industries with uniform satisfaction.



How it operates:

The material to be separated is deposited on the belt by a hopper or other means, and is carried forward over the separator pulley. The magnetic flux causes the iron or steel to adhere to the belt until the latter leaves the pulley underneath; non-magnetic material being loose upon the belt, is projected forward into a separate compartment.

Senior Crozier & Co., Union Works, Stratford, London, E.

Bisulphite of Soda—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
J M. Collett and Co., Ltd., Chemical Works, Bristol Road, Gloucester.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Garroway, R. & J. 694, Duke St., Glasgow.
Laporte, B., Ltd., Luton, Beds.
John Nicholson and Sons, Limited, Hunslet, Leeds.
Riley, John, & Sons, Ltd., Hapton, Lancs.
Wilkinson, J. B., Dudley Hill, Bradford, Yorks.

Bisulphite of Lime—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Garroway, R. & J., 694, Duke St., Glasgow.
Wilkinson, J B., Dudley Hill, Bradford, Yorks.
J. M. Collett and Co., Ltd., Chemical Works, Bristol Road, Gloucester.

Blanc Fixe—
Burton, W., & Sons, Green Street, Bethnal Green, London, E.
Laporte, B., Ltd., Soap and Chemical Works, Luton.
Sampson & White, Ltd., 6, Holborn Viaduct, London, E.C.
Stockton-on-Tees Chemical Works, Limited, Stockton-on-Tees.

Bleaching Powder—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.
United Alkali Co., Ltd., Cunard Building, Liverpool

Boiler Covering Compositions—
Leroy, F., & Co., 11, Gray St., near Philpot St., Commercial Rd., London, E.
Wm. Kenyon and Sons, Ltd., Dukinfield, near Manchester.

Bone Steamers—
Fuller, W. M., jun., 87-89, Edmund Street, Birmingham.

Borax, Boric Acid, and Borax Glass—
Borax Consolidated, Ltd., Miners and Manufacturers, 16, Eastcheap, London, E.C. 3.
Christopherson, Clifford, and Co., 6, Lloyd's Avenue, London, E.C. 3.

Breaking Machinery—
Waller, Geo., & Son, Phœnix Iron Works, Stroud, Glos.

Brick & Tile Manufacturers—
Accrington Brick & Tile Co., Ltd., Accrington.
Buckley Brick and Tile Co., Ltd., Buckley, near Chester.

Butyric Acid—
Boake, A., Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
Shawinigan, Ltd., 83, Cannon Street, London, E. C. 4.

Cadmium—
The British Metal Corporation, Ltd., 3, Abchurch Yard, London, E.C. 4.

Calcium Carbide—
Shawinigan, Ltd., 83, Cannon Street, London, E. C. 4.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Calcium Chloride (Exsic)—
Senior Crozier & Co., Union Works, Stratford, London, E.

Calcium Chloride (Pure Fused)—
Senior, Crozier & Co., Union Works, Stratford, London, E.

Calcium Hydrate—
Sofnol, Ltd., Anchor and Hope Lane, Charlton, S.E. 7

Caramel (Burnt Sugar)—
Senior Crozier & Co., Union Works, Stratford, London, E.

Carbolic Acid—
Brotherton & Co., Ltd., City Chambers, Leeds.
Lowe, C., & Co., Reddish Stockport.

Carbonic Acid Gas—
Carbonic Acid Gas Co., London, Manchester, and Newcastle-on-Tyne.
Washington Chemical Co., Ltd., Washington, Durham; and Hawthorne Road, Bootle, Liverpool.

Carbon Black—
Boake, A., Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
G. H. B. Brotchie and Co., Limited, 32, Fenchurch Street, London, E.C. 3. Tel.: Avenue 4.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Shawinigan, Ltd., 83, Cannon Street, London, E. C. 4.

Carbonate of Ammonia—
Brotherton & Co., Ltd., City Chambers, Leeds.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Dunn Bros. & Co., Northern Assurance Buildings, Albert Square, Manchester.
Western Chemical Co. (Paisley), Ltd., Sandyford Works, Paisley.

Carboy Hampers—
Harris, P. L. & G. S., Ltd., Lostock Gralam, near Northwich.

Carboy Hampers (Iron)—
Leigh, R. & H., & Sons, Ltd., Orlando Works, Bolton.

Carboys (Glass)—
Cannington, Shaw & Co, Ltd., St. Helens.

Casein—
Casein (Industries), Ltd., Culvert Works, Sheepcote Lane, Battersea, London, S.W. 11.
Sampson & White, Ltd., 6, Holborn Viaduct, London, E.C.

Cask-making Machinery—
Ransome, A., and Co., Ltd., Stanley Works, Newark-on-Trent.

Caustic Potash—
United Alkali Co., Ltd., Cunard Building, Liverpool.

Caustic Soda—
Crosfield, Jos., & Sons, Ltd., Warrington.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Celluloid—
Cowley Celluloid Limited, Bridge Works, Cowley, Uxbridge.

Celluloid Scrap (Washed Films, etc.)—
The Southall Bye-Products Co., Inverness Road, Southall, Middlesex.

Centrifugal Machines—
Broadbent, Thos., & Sons, Ltd., Central Ironworks, Huddersfield.
Manlove, Alliott & Co., Ltd., Nottingham.
Pott, Cassels & Williamson, Motherwell, N.B

Chalk (Precipitated)—
Levermore, Aug., & Co., Ltd., 8, 9, and 10, Great St. Helens, London, E.C. 3.

Chemical Merchants—
Allan Clark and Co., 23, Rhannan Road, S.S., Glasgow.
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.
Bruce, W. T., & Co., 3, Lombard Court, E.C.
Higginbottom & Co., 21, Spring Gardens, Manchester.
Hulsen, Julius, & Co., Newcastle-on-Tyne.
MacKechnie, R. D., and Co., 57, Gracechurch Street, London, E.C. 3.

Chemical Lead and Pipes—
Cookson & Co., Ltd., Newcastle-upon-Tyne.
Grey and Marten, Ltd., City Lead Works, Southwark Bridge, London, S.E.
Foster, Blackett & Wilson, Hebburn-on-Tyne
Taylor, Joseph, and Co., Blackhorse Street Mills, Bolton

Chemicals—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.

Chemical Plant—
Baker, Jos., Sons, and Perkins, Ltd., Kingsway House, Kingsway, London, W.C. 2.
Blair, Campbell & McLean, Woodville St., Govan, Glasgow.
Cortin, J., Ltd., Newcastle-on-Tyne.
Clark, T. & C., & Co., Ltd., Wolverhampton.
Daglish, R., & Co., Ltd., St. Helens, Lancs.
Joseph Taylor (Saturators), Ltd., Blackhorse Street Mills, Bolton.
Johnson, S. H. & Co., Ltd., Stratford, E.
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.
Livingston, James, Ltd., Imperial House, Kingsway, London, W.C.
Manlove, Alliott & Co., Ltd., Nottingham.
Meldrums, Ltd., Timperley, near Manchester.
Neill, W., & Son, Ltd., St. Helens.
The Premier Filterpress Co., Finsbury Pavement House, London, E.C.
Widnes Foundry Co., Ltd., Widnes.

Chemical Plumbers—
E. G. McNicol, 25, Belgrave Road, Plaistow, London, E.
Grey and Marten, Ltd., City Lead Works, Southwark Bridge, London, S.E.

Chloracetic Acid—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Chlorates (Potash & Soda)—
Murray, O., & Co., Ltd., 69/70, Mark Lane, London, E.C.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Chlorbenzenes—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Chlorine (Liquid)—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.
The United Alkali Co., Ltd., Cunard Building, Liverpool.

Cobalt (Metal, Oxide, and Salts)—
Brown, James M., 35, Surrey St., Strand, London, W.C. 2.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.

Coils—
Edward Le Bas and Co., Dock House, Billiter Street, London, E.C 3.

Coils and Tubes—
Blair, Campbell & McLean, Woodville-street, Govan, Glasgow.
Edward le Bas & Co., Dock House, Billiter Street, London, E.C. 3.
Stewarts & Lloyds, Ltd., Albion Tube Works, Birmingham.

Copperas—
Allan Clark and Co., 23, Rhannan Road, S.S., Glasgow.
Garroway, R. & J., 694, Duke St., Glasgow.
Horatio Crowther & Co., Amberley Road, Armley, Leeds.
Scales, W. T., & Co., Ltd., Cleveland Works, Birkenhead.

Copper Carbonate—
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.

Copper Oxide—
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.
Newcastle Alloy Co., Ltd., Milburn House, Newcastle-on-Tyne.

Copper Oxide (Wire Form & Pure)—
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.

Copper Precipitate—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.

Copper Sulphocyanide—
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.

Cream of Tartar—
Chance & Hunt Ltd., Chemical and Cement Works, Oldbury.
Pickford, W. J., and Co., 21, Mincing Lane, London E.C. 3.

Decolourising Carbon—
V. C. North and Co., 76, Finsbury Pavement, London, E.C. 2.

Dextrine—
Sampson & White, Ltd., 6, Holborn Viaduct, London, E.C. 1.

Drying Apparatus—
Blair, Campbell & McLean, Woodville St., Govan, Glasgow.
Francis Shaw and Co., Ltd., Corbett Street Ironworks, Bradford, Manchester.
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.
Livingston, James, Ltd., Imperial House, Kingsway, London, W.C.
Manlove, Alliott & Co., Ltd., Nottingham.
Pott, Cassels & Williamson, Motherwell, N.B.
The Sturtevant Engineering Co., Ltd., 147, Queen Victoria Street, London, E.C.

Drying Machinery—
Richard Simon and Sons, Ltd., Phœnix Works, Vernon Rd., Basford, Nottingham

Dust Collecting Machinery—
Harris, Albert E., 19, Russell Square, London, W.C. 1.

Electrical Precipitators—
Lodge-Cottrell, Ltd., 51, Gt. Charles Street, Birmingham, and 18, Iddesleigh House, Caxton Street, S.W. 1.

Elevators for Acids—
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.

Enamelled Cast-Iron Plant—
T. & C. Clark & Co., Ltd., Wolverhampton.

Epsom Salts—
Allan Clark and Co., 23, Rhannan Road, S.S., Glasgow.
Garroway, R. & J., 694, Duke St., Glasgow.
William Blythe and Co., Holland Bank Chemical Works, Church (Lancashire).
Joseph Townsend, Ltd., 19, Crawford St., Port Dundas, Glasgow.
Strother, J., and Co., Peninsular House, Monument Street, London, E.C. 3.

Evaporators—
Blair, Campbell, and McLean, Ltd., Govan, Glasgow.
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.

Exhausters and Compressors—
Waller, Geo., & Son, Phœnix Iron Works, Stroud, Glos.

Fans for Acid Gases—
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.

Filter and Press Cloths—
Porritt Bro., & Austin, Stubbins Vale Mills, Ramsbottom.
The Premier Filterpress Co., Finsbury Pavement House, London, E.C.

Filter Presses—
Daglish, R. & Co., Ltd., St. Helens.
Johnson, S. H., & Co., Ltd., Stratford, E.
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.
Livingston, James, Ltd., Imperial House, Kingsway, London, W.C.
Manlove, Alliott & Co., Ltd., Nottingham.
Neill, W., & Son, Ltd., St. Helens.
The Premier Filterpress Co., Finsbury Pavement House, London, E.C.

Fine Chemicals—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.

Flint Pebbles for Grinding and Other Purposes—
The British Flint Pebble Co., Branscombe, Beer, S.O., Devon.

Fluoric Acid—
Cruickshank, R., Ltd., Camden Street, Birmingham.
Wilkinson, Jas., & Son, Tinsley Park Road, Sheffield.

Fluor Spar—
Beck, A., Mine Owner, Matlock.
Cruickshank, R., Ltd., Camden Street, Birmingham.

Formaldehyde—
Singer and a Brassard, 46, Vicar Lane, Bradford.
The Lothian Chemical Co., Ltd., 3, Broughton Road, Edinburgh.

Formic Acid—
Laporte, B., Ltd., Luton, Beds.

French Chalk—
W. Harrison & Co., Ltd., 16, Mincing Lane, London, E.C. 3.

Gas: Petrol-Air Safety Gas—
The Aerogen Company, Ltd., 50, 51, 52, Bolsover Street, Great Portland Street, London, W. 1.

Gelatine—
Sampson & White, Ltd., 6, Holborn Viaduct, London, E.C.

Glass—
Ackroyd and Best, Ltd., Morley, near Leeds.

Glue—
Sampson & White, Ltd., 6, Holborn Viaduct, London, E.C

Glycerine Plant—
Blair, Campbell & McLean, Woodville St., Govan, Glasgow.
Kestner Evaporator and Engineering Co., Ltd., 5, Grosvenor Gardens, Westminster, London, S.W. 1.
Manlove, Alliott & Co., Ltd., Nottingham.

Glauber Salts—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Garroway, R. & J., 694, Duke St., Glasgow.
Goodwynne, Limited, 12, Charterhouse Square, London, E.C. 1.
William Blythe and Co., Holland Bank Chemical Works, Church (Lancashire).

Glycerine—
Crosfield, Jos., & Sons, Ltd., Warrington.
Gossage, William, & Sons, Ltd., Soap Works, Widnes, Lancs.

Grinding Machinery—
The Sturtevant Engineering Co., Ltd., 147, Queen Victoria Street, London, E.C.

PATTINSON'S
MAGNESIA
SOLE MANUFACTURERS:—
THE WASHINGTON CHEMICAL COMPANY, LIMITED,
WASHINGTON STATION, COUNTY DURHAM, ENGLAND.

Heat Insulating Materials—
Wm. Kenyon and Sons, Ltd., Dukinfield, near Manchester.

Hydrochloric Acid—
F. W. Berk and Co., Ltd., 1, Fenchurch Avenue, London, E.C 3.
Horatio Crowther and Co., Amberley Road, Armley, Leeds.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.
Spencer, Chapman and Messel, Ltd., 36, Mark Lane, London, E.C.
Union Acid Co., Ltd., 17, Cooper St., Manchester.

Hydro Extractors—
Pott, Cassels & Williamson, Motherwell, N.B.

Hydrogen Gas in Cylinders—
Lea and Son, Oxygen Works, Runcorn.

Hypochlorite of Soda—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Hyposulphite of Soda—
Hulsen, Julius, & Co., Newcastle-on-Tyne.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Iron Perchloride—
Stockton-on-Tees Chemical Works, Limited, Stockton-on-Tees.

Ivory Black—
Hunt, J. T., & Son, Ltd, Stratford, London, E.

Jacketed Pans, Ordinary and Acid Proof—
Brinjes & Goodwin, Ltd., Messrs., 14, Fieldgate Street, London, E.
Meldrums, Ltd., Timperley, near Manchester.

Laboratory Furnishers—
Baird & Tatlock, Ltd., Sarsden Building, 34, Great Ducie Street, Manchester, and 164, Brownlow Hill, Liverpool.

Lactic Acid—
Hickson, E., 38, Well St., Bradford, Yorks.

Lamps, Miners' Safety—
Ackroyd and Best, Ltd., Morley, near Leeds.

Lead—
Cookson & Co., Ltd., Newcastle-upon-Tyne.
Locke, Blackett and Co., Ltd., York House, 5 and 7, St. Mary Axe, London, E.C. 3.

Leadburners—
Grey and Marten, Ltd., City Lead Works, Southwark Bridge, London, S.E.

Lead Nitrate—
Wm. Blythe and Co., Ltd., Holland Bank Chemical Works, Church, Lancs.

Liquid Ammonia—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.

Magnesia—
Washington Chemical Co., Ltd., Washington, Durham, and Bootle (Liverpool).
Western Chemical Co. (Paisley), Ltd., Sandyford Works, Paisley.

Magnesite—
Blackwell, Geo. G., Sons, and Co., Ltd., The Albany, Liverpool.
Everitt & Co., Ltd., 40, Chapel St., Liverpool
Magnesite Syndicate, Ltd., 310A & B, Winchester House, Old Broad St., London, E.C.
Western Chemical Co. (Paisley), Ltd., Sandyford Works, Paisley.

Manganese and Mineral Merchants—
Everitt & Co., Ltd., 40, Chapel St., Liverpool

Magnesite and Chrome Bricks—
Mason, Adam, & Sons, Ltd., Horwich, near Bolton.

Mercury Yellow Oxide—
Brown, James M., 35, Surrey Street, Strand, London, W.C. 2.

Metals—
Walter H. Barnard, Metal Broker, 24, Lime Street, London, E.C.
Moss, Isaac, Ltd., Old Iron, Steel, & Metals, 122, Cannon Street, London, E.C.
The British Metal Corporation, Ltd., 5, Abchurch Yard, London, E.C. 4.

Mixing and Grinding Plant—
Albert E. Harris, 19, Russell Square, London, W.C. 1.
Brinjes & Goodwin, Ltd., 14, Fieldgate St., London, E.

Muriate of Ammonia—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
United Alkali Co., Ltd., Netham Works, Bristol.

Muriatic Acid—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Garroway, R. & J., 694, Duke St., Glasgow.
Riley, John, & Sons, Hapton, Lancs.
Spencer, Chapman & Messel, Ltd., 36, Mark Lane, London, E.C.
Union Acid Co., Ltd., 17, Cooper St., Manchester.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Nitrate of Ammonia—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
The Nitrate Trading Co., Ltd., 41, Eastcheap, London, E.C. 3.

Nitrate of Iron—
Horatio Crowther & Co., Amberley Road, Armley, Leeds.

Nitrate of Lime—
The Nitrate Trading Co., Ltd., 41, Eastcheap, London, E.C. 3.

Nitrate of Soda (Refined & Extra Refined)—
Cross, Alexander and Sons, Ltd., 56, Dale St., Liverpool.
The Nitrate Trading Co., Ltd., 41, Eastcheap, London, E.C. 3.

Nitric Acid—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.
Blythe, William, & Co., Holland Bank Chemical Works, Church, Lancs.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Crowther, Horatio, and Co., Amberley Road, Armley, Leeds.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Hickson and Partners, Ltd., 38, Well Street, Bradford
Nitrate Trading Co., Ltd., 41, Eastcheap, London, E.C. 3.
Spencer, Chapman, and Messel, Ltd., 36, Mark Lane, London, E.C.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Nitrite of Soda—
The Nitrate Trading Co., Ltd., 41, Eastcheap, London, E.C. 3.

Ochres, Oxides, and Venetian Reds—
W. Harrison & Co., Ltd., 16, Mincing Lane, London, E.C. 3.
H. S. Willcocks & Co., Ltd., 5, Beaver St., Whitworth St., Manchester.

Oleum (Sulphuric Acid Fuming)—
Spencer, Chapman, and Messel, Ltd., 36, Mark Lane, London, E.C. 3.

Oxalic Acid—
Laporte, B., Ltd., Luton, Beds.

Oxygen Gas in Cylinders—
Lea & Son, Oxygen Works, Runcorn.

Para Amido Phenol.
Warrington Chemical and Drug Company, Ltd., Paddington, near Warrington.

Perborate of Soda—
Burton, W., & Sons, Green Street, Bethnal Green, London, E.
Laporte, B., Ltd., Soap and Chemical Works, Luton.
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Peroxide of Hydrogen—
Burton, W., & Sons, Green Street, Bethnal Green, London, E.
Laporte, B. Ltd., Soap and Chemical Works, Luton.

Peroxide of Soda—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Peroxide of Sodium—
Burton, W., & Sons, Green Street, Bethnal Green, London, E.

Petrol Gas Plants—
The Aerogen Company, Ltd., 30, 31, 32, Bolsover Street, Great Portland Street, London, W. 1.

Phosphate of Soda—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
Dunn Bros and Co., Northern Assurance Buildings, Albert Square, Manchester.

Phosphoric Acid—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
Hovey and Lowther, Ltd., Wheelock Works, Sandbach, Cheshire.

Photographic and General Chemicals—
Johnson and Sons Manufacturing Chemists, Ltd., 23, Cross Street, Finsbury, London, E.C.

Pressure Blowers and Valves—
Bryan Donkin Co., Ltd., Chesterfield.

Prussian Blue—
Gas Light and Coke Co., Dauntsey House, Fredrick's Place, Old Jewry, E.C. 2.

Pumps (Centrifugal)—
Meldrums, Ltd., Timperley, near Manchester.

Pumping Machinery—
Beaumonts, Ltd., Brinksway, Stockport.
Daglish, R., & Co., Ltd., St. Helens, Lancs.
Drum Engineering Co., Ltd., 28, Humboldt Street, Bradford, Yorks.
Neill, W., & Son, Ltd., St. Helens, Lancs.
Waller, Geo., & Son, Phœnix Iron Works, Stroud, Glos.

Pure Hydrochloric Acid—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Railway Points and Crossings—
R. White and Sons, Widnes.

Respirators—
Siebe, Gorman and Co., Ltd., "Neptune" Works, Lambeth, London.

Rock Sulphur (99.99 per cent.)—
John Nicholson and Sons, Limited, Hunslet, Leeds.

Sacks and Bags—
Paiva, J. de, and Co., 165, Mansion House Chambers, 11, Queen Victoria Street, London, E.C.

Salammoniac—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
United Alkali Co., Ltd., Netham Works, Bristol.

Salicylic Acid—
Bush, W. J., and Co., Ltd., Ash Grove, Hackney, London, E. 8.
The Warrington Chem. & Drug Co., Paddington, near Warrington.

Salt—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Middlewich Salt Co., Ltd., Middlewich, Cheshire.
The United Alkali Co., Ltd., Cunard Building, Liverpool.

Salt Cake—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.
Spencer, Chapman, and Messel, Ltd., 36, Mark Lane, London, E.C.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Saturator Makers—
Joseph Taylor (Saturators), Ltd., Blackhorse Street Mills, Bolton.

Screening Machinery—
Huntington, Heberlein and Co., Ltd., 18, Iddesleigh House, Caxton Street, Westminster.
The Sturtevant Engineering Co., Ltd., 147, Queen Victoria Street, London, E.C.

Silicate—
Gossage, William, & Sons, Ltd., Soap Works, Widnes, Lancs.

Silicate of Soda—
Crosfield, J., & Sons, Ltd., Warrington, Lcs.
Gossage, William, & Sons, Ltd., Soap Works, Widnes, Lancs.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Silver Salts—
Johnson and Sons Manufacturing Chemists, Ltd., 23, Cross Street, Finsbury, London, E.C.

Smoke Helmets—
Siebe, Gorman and Co., Ltd., "Neptune" Works, Lambeth, London.

Soda Ash—
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
The United Alkali Co., Ltd., Cunard Building Liverpool.

Soda Crystals—
Allan Clark and Co., 23, Rhannan Road, S.S., Glasgow.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
The United Alkali Co., Ltd., Cunard Building, Liverpool.

Soda Lime—
Sofnol, Ltd., Westcombe Hill, Greenwich, S.E. 10.

Soda Salicylate—
The Warrington Chem. & Drug Co., Paddington, near Warrington.

Sodium (Metallic)—
The Castner-Kellner Alkali Co., Ltd., 257 Royal Liver Building, Liverpool.

Sodium Silico Fluoride—
George, D. A., Hall, 83, Mosley Street, Manchester.

Solvent Esters—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.

Stampings and Pressings, Etc.—
Ackroyd and Best, Ltd., Morley, near Leeds.

Sulphate of Copper—
Allan Clark and Co., 23, Rhannan Road, S.S., Glasgow.
McKechnie Bros., Metal Works, Widnes, Lancs.
Mond Nickel Co., Ltd., 39, Victoria Street, London, S.W.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Sulphate of Ammonia—
Hunt, J. T., & Son, Ltd., Stratford, London, E.

Sulphide of Iron (74-76 per cent.)—
John Nicholson and Sons, Limited, Hunslet, Leeds.

Sulphide of Soda—
Horatio Crowther and Co., Ltd., Amberley Road, Armley, Leeds.

Sulphide of Sodium—
B. Laporte, Limited, Luton.
Wilkinson, J. B., Dudley Hill, Bradford, Yorks.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Sulphite of Potassium—
Wilkinson, J. B., Dudley Hill, Bradford, Yorks.

Sulphite of Soda—
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
J. M. Collett and Co., Ltd. Chemical Works, Bristol Road, Gloucester.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Garroway, R. & J., 694, Duke St., Glasgow.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.
United Alkali Co., Ltd., Cunard Building, Liverpool.
Wilkinson, J. B., Dudley Hill, Bradford, Yorks.

Sulphur—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Sulphur Chlorides—
The Castner-Kellner Alkali Co., Ltd., 257, Royal Liver Building, Liverpool.

Sulphur Dioxide and Sulphites Plant—
Humphries, H. B. P., 14, Old Queen Street, Westminster, London, S.W. 1.
Sachsenburg (London) Engineering Co., Carlton Chambers, 12, Regent St., London.

Sulphur Flowers—
Nicholson, John, and Sons, Ltd., Hunslet, Leeds.

Sulphur Rolls—
Nicholson, John, and Sons, Ltd., Hunslet, Leeds.
Riley, John, & Sons, Ltd., Chemical and Copper Works, Hapton, Lancs.

Sulphurous Acid—
Berk, F. W., and Co., Ltd. 1, Fenchurch Avenue, London, E.C. 3.
Boake, Roberts and Co., Ltd., Carpenters Road, Stratford, London, E.
Cruickshank, R., Ltd., Camden Street, Birmingham.
Garroway, R. & J., 694, Duke St., Glasgow.
Wilkinson, J. B., Dudley Hill, Bradford, Yorks.

Sulphuric Acid—
Berk, F. W., and Co., Ltd., 1, Fenchurch Avenue, London, E.C. 3.
Brotherton & Co., Ltd., City Chambers, Leeds.
Brown, J., and Co., Ltd., Savile Town, Dewsbury.
Chance & Hunt, Ltd., Chemical and Cement Works, Oldbury.
Garroway, R. & J., 694, Duke St., Glasgow.
Nicholson, John, & Sons, Ltd., Leeds.
Riley, John, & Sons, Ltd., Hapton, Lancs.
Spence, P., & Sons, Ltd., Manchester Alum Works, Manchester; and Goole Alum Works, Goole, Yorks.
Spencer, Chapman & Messel, Ltd., 36, Mark Lane, London, E.C.
United Alkali Co., Ltd., Cunard Building, Liverpool.

Superphosphate and All Fertilisers—
Amsterdam Superphosphate and United Chemical Works, 150-151, Fenchurch St., London, E.C. 3. (London Agency.)

Synthetic Perfumes—
Boake, Roberts and Co. Ltd., Carpenters Road, Stratford, London, E.
Bush, W. J., & Co., Ltd., Ash Grove, Hackney, London, E. 8.

Talc Manufacturers—
W. Harrison & Co., Ltd., 16, Mincing Lane, London, E.C. 3.

Talcum—
Sampson and White, Ltd., 6, Holborn Viaduct, London, E.C. 1.

Tank Manufacturers—

MELDRUMS LTD

FORCED DRAUGHT FURNACES

FOR STEAM BOILERS, STILLS, KILNS, ETC.

EVEN PRESSURE UNDER CLOSED ASHPIT which creates a Plenum.

NO HOLLOW BARS to get choked up.

SPECIAL SMOKE PREVENTING FEATURES—only on the "Meldrum."

NOTE: SMOKE CURE OFTEN MEANS A DIVIDEND PAYING PROPOSITION AS OUR FURNACES ENABLE A MUCH CHEAPER FUEL TO BE USED, GIVING AS MUCH AND SOMETIMES MORE STEAM.

What of possibilities on your own boilers?

OUR SPRINKLER STOKER, WITH FIXED GRATE & FORCED DRAUGHT, GIVES ABOVE ADVANTAGES, AND ALSO SAVES LABOUR COSTS, AND GIVES STEADY STEAMING.
